NOT only in Hampshire, but further north as well, experiments with regard to laying dust on the roads are in progress, and Mr. John A. Brodie, the City Engineer, of Liverpool, who has for many years taken an interest in self-propelled traffic, has been experimenting on portions of the Prescott Road, St. Oswald Street, Rathbone Road, and Derby Lane, Liverpool. The materials used are as follows:—Creosote oil (hot); creosote oil (cold); creosote oil mixed with small proportion of pitch; creosote oil mixed with small proportion of resin; creosote oil mixed with small proportion of tallow; coal tar (hot); cheap waste oil from coal tar; common petroleum; crude Texas petroleum. The cost varied from $\frac{1}{4}$ d. to $\frac{1}{2}$ d. per superficial mile, and the results have been equally diverse. That portion of the road coated with creosote oil mixed with tallow had the least odour; whilst that covered with ordinary petroleum was the first to show the dust subsequently to treatment. Unfortunately the weather was not favourable during the time the road was thus treated, so that a further series of experiments will doubtless be made. About three weeks had passed before dust was visible on the surface after the oil had been laid, and the experience thus gained serves to confirm that which has been shown in the Hampshire experiments. We understand that recently a second coating has been laid down. The result of this will be watched with interest.

Fast Times in America.

SEVERAL world's records were broken at the Narragansett Park races of the Rhode Island Automobile Club, on the 24th ult., in spite of heavy mud and the threatening clouds. Six cars competed in the two-mile race for electric vehicles, viz., four Waverleys, a Buffalo, and a Neftel. The last named proved itself faster than the rest, and had a long lead when it passed under the wire in 4 m. 23 sec. In the three-mile race for steam carriages, the winning vehicle proved to be a Toledo, with a Stanley and a Locomobile in second and third positions. The time was 5 m. 9 1-5 sec. Mr. Alexander Winton with his "Bullet" next essayed to establish a new ten-mile record. Every one seemed to know that the event of the day was about to take place, and the long, low car, with its rakish lines, was keenly watched. At the start it looked as if a sensational performance would be recorded. The mile was covered in 1 min. 6 1-5 sec., and the next was 4-5 sec. faster. From then on, however, the speed slackened, until, when six miles had been covered, the attempt was given up, owing to the roughness of the track and the difficulty of making the turns. As it was, however, the five-mile performance was better than any yet made—the time being 5 m. 30 3-5 sec. The next event, a five-mile race for light petrol carriages, proved almost a walk over for a Stevens-Duryea car, it winning easily in 7 m. 42 1-5 sec., an Oldsmobile being second. The steam car built by Mr. George C. Cannon, the young student, was next given a chance to distinguish itself against time, its two-man control barring it from the competition events. Manned by Cannon and a friend, it made the fastest mile of the day, 1 m. 5 1-4 sec., although its five-mile time in a subsequent trial was behind Winton's, being 6 m. 5 sec. The best race of the day was the one which brought together

five Winton touring cars for five miles. Mr. F. Tudor was the winner, he finishing almost an eighth of a mile to the good. The time was 9 m. 13 $\frac{1}{4}$ sec. A five mile race for heavy petrol cars limited to thirty horse-power gave Mr. Percy Owen a chance to bring out Winton's light racer, called the "Pup." He had against him two Wintons, a Stearns and a Darracq. Owen, however, proved an easy winner, in 6 m. 25 $\frac{1}{2}$ sec. Owen was again leader in a five-mile free-for-all race for petrol cars, in which the other contestants were Mr. Winton, with his big racer, and Mr. Harold Brown, on his Darracq. Owen's time was 6 m. 43 $\frac{1}{2}$ sec. He did better in the sweepstakes for winners, in which he was practically the only starter.

The Tyre Trials.

mileage:—

				Marks lost in running the 4,000 miles.
T 7.	Collier	45
T 2.	Dunlop	87
T 1.	"	102
T 3.	"	152
T 4.	"	322
T 6.	Maison Talbot	698
T 12.	E. Midgley...	199

Mr. Midgley has not yet completed his total run, so that the place of his tyre in the list cannot yet be fixed. The extra test over a course strewn with broken glass bottles, which was to have been held on Saturday, has been postponed, and the factors still to be taken into account in awarding prizes are—price, loss of weight, condition as shown by periodical examinations, by photographs taken during the trial and by examination at the end of the trial, resiliency, "resistance to road traction," facility of attachment and detachment, and rigidity.

THE "Tatler" is offering a motor-car as a prize in connection with a series of picture puzzles now appearing in its pages.

MR. PAGE, of the White Lion Hotel, of Banbury, contemplates making adequate arrangements for motorists passing that way.

REFERENCE to Captain Longridge's paper on the Oil Motor-cars of 1903, read at the Institution of Mechanical Engineers on Friday, the 17th inst., will be made in next week's issue.

A THOROUGHLY equipped motor school will shortly be inaugurated at the Polytechnic, Regent Street, W. In this an entire vehicle will be constructed, from the preliminary drawing to the finishing coat of varnish.

MR. BALFOUR drove from Mr. Leopold de Rothschild's country seat to Downing Street on Monday on his motor-car. Passing Buckingham Palace, where a crowd was awaiting the coming of Lord Roberts and Lord Kitchener, his motoring costume proved an effectual disguise for the Premier, so far as the general public was concerned.

THE AUTO-LUBRINE COMPANY, Fairfield, near Manchester, inform us that they have made arrangements with Messrs. J. Hutton and Sons, 115, Summerhill, Dublin, and the Northern Motor Company, Montgomery Street, Belfast, to hold stocks of Auto-Lubrine both for cylinders and gears. At present these are the only two places in Ireland from which Auto-Lubrine can be obtained.

ON Wednesday the adjourned case against Mr. G. Wilder, referred to in our furious driving cases on another page, came before the Worthing Bench. Mr. Staplee Firth, who defended, asked that Colonel Wisden, chairman of the Bench, should retire, and quoted the chairman's reported observation that it would be a good job if the motor-car industry were destroyed. Colonel Wisden, however, remained and the defendant was fined £10 and costs. Mr. Firth intimated that he should go to the High Court in order to quash the proceedings.

THE TRAPPER AND THE TRAPPED; OR, A LAND OF LAW AND EN- LIGHTENMENT.

BY MRS. MARY E. KENNARD.

ON the 16th of September, 1902, that gallant veteran "Sir Charles" (Napier) undertook her third journey to the North. We were bound for Falkirk, and the party consisted of my husband, self, and *mecanicien*. Owing to a defect in the pump, which necessitated a spare one being sent for from London, we were somewhat late in effecting a start. We did not take the road until half-past eleven. One turn of the handle, and "Sir Charles" fired with his usual alacrity and responsive-

ness. anon its pulsations died away and threatened to cease altogether. All the symptoms pointed to the fault lying either with the carburettor or the supply pipe. The astute Brooks hunted about for the seat of trouble like a ferret in a rabbit hole. He removed the offending pipe and blew down its entire length. There was no obstruction, however, neither was one apparent in the carburettor. After some delay we renewed our journey, but, alas! the same intermittent strokes of the pistons greeted our ears. We laboured along to Northallerton, and here my husband cried a halt for luncheon. The day was a Sabbath, so we repaired to the principal hotel, where a sumptuous cold collation was laid out in honour of passing cyclists and motorists. After refreshing the inner man and woman, my husband vowed he must have some exercise. He, therefore, walked on ahead, telling us to follow

SIR THOMAS LIPTON ON HIS NEW 22-H.P. DAIMLER.

Photo by]

[The Biograph Studio.

ness. The day was fine and we were all three in the best of spirits. A pleasant, uneventful journey brought us to Doncaster towards six o'clock, and here my husband elected to remain for the night. As most motorists furnish accurate accounts of the number of meals they partake of *en route*, and the various dishes of which they are composed, I will not enter into more gastronomic details than are indispensable to my narrative. Suffice it, that the human being fed and rested after the manner of his kind. The following morning we got off betimes, but had not gone twenty miles before "Sir Charles" commenced gasping and gurgling in a mysterious fashion. At first we attributed this to a fit of wheeziness, but when we found our trusty conveyance showed a tendency to jib at the hills and to crawl along the level we knew that all was not quite as it should be. Sometimes the engine ran merrily,

with the car. It appears he met a policeman about a mile from the town, and, overflowing with the milk of human kindness, entered into a sprightly conversation with this official. He offered him some tobacco, which the gentleman accepted, although he said he was not permitted to smoke on duty. Upon this, my better half jocularly asked him if he were there to catch motorists. "Not particularly," was the answer. My husband then remarked that his motor-car was coming along in the rear, and expressed a bantering hope that the officer would not bring its occupants to a standstill for exceeding the legal limit. He wended his onward way serenely, and shortly afterwards we followed all unsuspecting in his tracks. Brooks had spent the interval in tussling with the carburettor, and, being anxious to ascertain if he had effected an improvement, I resigned the helm

to him. Good "Sir Charles" was still in a refractory mood, however. Somewhat despondent at the non-success of our endeavours, we were travelling at a compulsory slow rate of speed when, all of a sudden, a policeman shot up from behind a hedge exactly like a Jack-in-the-box. He waved his arms peremptorily and ordered us to pull up. I was so utterly astonished that I exclaimed, impulsively: "Why, what on earth are you stopping us for?"

It took several seconds to din into my head that we were being brought to on a charge of furious driving. The absurdity of the accusation was patent. We had been struggling along under difficulties all the forenoon, depressed in spirit, tried in patience, and now we were accused of driving at a speed injurious and dangerous to other users of the King's highway. It really would have been ludicrous save for the annoyance. As it was, I laughed out loud, with a laughter, however, that was mirthless. We were ordered to remain in a standing position until the inspector arrived on the scene. This individual shortly turned up on a bicycle, panting and breathless, having travelled considerably faster from North-allerton than ourselves. He was perspiring, but civil. I explained the state of the case to him and he listened with scornful incredulity. His was evidently a prejudiced mind. His orders were to trap the road vermin, and the more he succeeded in catching, the higher he stood in favour with the county authorities.

"Well!" I ejaculated at last, in tones of exasperation, "it is clearly useless speaking the truth. Take our names and addresses by all means. I do not blame you, but I pity you from the bottom of my heart for having such horrid, mean, sneaking, unmanly work to perform. I wonder what our country is coming to when fair play and justice give way to traps and ambushes!" To my great surprise both policemen heartily endorsed my observations. They confided to me that they disliked the work exceedingly, but the mandates issued by their superiors were so peremptory they dared not disobey them. They explained that so many fast cars passed through the neighbourhood on their way to Scotland, the farmers had insisted upon the county magistrates putting a check on their advent. Yorkshiremen were a horse-loving people, opposed to everything injurious to the equine interest. After some further conversation—for it was useless losing one's temper with mere tools of an ignorant and prejudiced bench—the inspector consulted his stop-watch, and magnanimously declared that we had only very slightly exceeded his legal limit. Indirectly, he gave us to understand he would deal indulgently with our case. Judas of the hedge confirmed his statement, and we went on our way, not rejoicing, but soberly. A few seconds later, and within full view of our friends, "Sir Charles" came to another stop, as if to emphasise our arguments. We coaxed him to renew his labours, and after a little picked up my husband, who wondered at our non-appearance. We explained to him into what a nice trap he had fallen, and how we had been the victims of his guilelessness. Ere long we put up in a yard and took the whole carburettor to pieces, only to find nothing amiss. To cut a long story short, it eventually transpired that a piece of corroded metal was blocking the orifice from the petrol tank to the supply pipe. My hat pin remedied the mischief. By the by, motorists would do well to carry one or two of these useful articles with them. It is wonderful how frequently they prove of service. "Sir Charles" now perked up splendidly and carried us in customary form to Newcastle. Owing to the delay, however, we did not reach that town until half-past eight at night.

(To be continued.)

It is reported that on Sunday a new service of motor-omnibuses was started running from New Cross Station (S.E.R.), to Forest Hill, via Lewisham High Road, Brockley Road, to Forest Hill Station. The vehicles carry twelve inside and fourteen out. The fare for the whole journey is 3d., with intermediate 1d. rides. A motor char-à-banc is also running from Lewisham Junction Station to Eltham, via Lee Green, the fare being 4d. the whole distance.

THE ROSER-MAZURIER BALANCED PETROL MOTOR.

AFTER the working stroke of a petrol motor is completed the ignited gas, which in the ordinary engine is cleared out through the exhaust valve, still possesses a certain degree of expanding pressure. With the view of utilising this pressure, and at the same time of obtaining a well-balanced engine, Messrs. Roser and Mazurier, two French engineers, have recently devised the motor illustrated in section herewith. As will be seen, it is a three-cylinder vertical motor; the two outer cylinders, A B, work with petroleum spirit or with petroleum in the usual way. Instead of the burnt gases from these passing to a silencer they are conveyed into a third central cylinder C, which is twice the size of the others, where air, previously compressed to avoid loss of work due to the sudden expansion of the burnt gases, is heated, this cylinder C working like a hot-air motor. The small cylinders are water cooled, and the big one air cooled. The two outer cylinders work on the four-cycle principle, but with a difference of two periods one to the other; that is to say, although there is only one explosion in each cylinder for two revolutions of the crank shaft, the latter receives an impulse at each revolution; the hot-air cylinder gives, however, one effective stroke per revolution, so that the crank shaft

really receives two impulses at each revolution. To the left of the motor shaft is a gearing which drives at half speed an intermediary shaft with seven cams acting on as many valves arranged in a line at the rear top part of the cylinders. The burnt gases pass alternately from the outer cylinders into the central one, escaping finally by a large valve. This escape occurs only during a part of the return stroke of the piston in the cylinder C; the valve shuts prematurely, and the rest of the gases is then compressed into the end of the cylinder C, being reheated at this moment by the burnt gases admitted from one or other of the outer cylinders. A governor controls the admission by means of a butterfly valve. The crank-case, hermetically sealed, contains an oil bath into which the cranks dip. M. N. Roser, of St. Denis, Paris, the maker of the new motor, not only claims steadiness of running owing to the balancing of the impulses, but a great economy in fuel. He is, we understand, anxious to arrange for its construction under licence in England.

PRETORIA is to have a public service of motor-cars, a company with a capital of £15,000, called the Pretoria Motor-Car Company, Limited, having been formed for this purpose.

THE Town Council of Johannesburg, South Africa, are contemplating the employment of motor-vehicles in the sanitary department.

THE RAIL RING TRACTOR.

As mentioned in our issue of the 4th inst., the War Office Committee on Mechanical Traction has recently been carrying out some trials with a novel vehicle known as a Rail Ring Tractor. The wagon, which was illustrated in our issue of March 24th, 1899, is the invention of Carl Keller, of Laggenbeck, Westphalia, and some time ago was brought under the notice of Mr. Chas. T. Crowden, of Leamington, who was invited to proceed to Germany to inspect its working. For the weight of the tractor, he found it excellent as regards pulling power and travelling over obstacles; it would, in fact, run where there were no roads at all. The tractor first tested was fitted with a heavy oil engine, and the consumption of fuel was exceedingly small for the work done. Seeing there would be a great future for such a machine in South Africa for military purposes, Mr. Chas. T. Crowden approached the War Office authorities, and laid his results and particulars of this tractor before them. These were afterwards verified by an expert deputed by the War Office to go out to Germany and test the vehicle. The expert's report was of such a character that Mr. Crowden was asked to design a tractor to meet their requirements, one weighing 7 tons and the other 13 tons, to be capable of running twenty-four hours without replenishing with fuel or water. Before finally

iron sleepers. Directly the tractor was attached it started away with the load to the weighbridge, and the tractor was detached from the load and weighed. The truck was next weighed and found to be 6 tons. For comparative tests this was reduced to 5 tons.

On the next day the tractor left the Army Service Corps' Yard at 8 a.m. for a thirty-mile run with a 5-ton truck load, Lieutenant Anderson, R.E., acting as observer. The route taken from Aldershot was over Hale Hill into Odiham, thence to Hartley Bridge, where a stop was made for lunch. Some difficulty was occasioned here by the low-tension sparking arrangement of the paraffin engine. The tractor was, however, soon on its way again, mounting the hill on to Hartford Bridge Flats, where it did a mile in 8 min. 15 sec. on the level, and Bagshot, without using the low speed. Here the vehicle returned to Aldershot, through Frimley and Farnborough, the Army Service Corps' Yard being reached at 4 p.m. The consumption of oil was about 5 gallon per ton mile.

On Wednesday, the 1st inst., the tractor left the Yard at 7.15 a.m. for a forty-two mile course with the same load. Captain Kennedy, R.E., acted as observer. The route taken was from Aldershot to Alton, through South Wansborough, to Odiham, thence to Hartley Bridge, Hartford Bridge Flats, Blackwater, Camberley, and then on to Farnborough and Aldershot, arriving at the Yard at 5.30 p.m. After deducting stoppages through

A 34-H.P. DE DION VOITURETTE ON THE STELVIO PASS, IN THE TYROL, AT A HEIGHT OF OVER 9,000 FEET ABOVE SEA LEVEL.
(La France Automobile.)

deciding, however, to order these machines, it was decided to bring over one of the machines for a six days' trial at Aldershot. The vehicle brought over by Herr Keller was a light one, weighing only about 5 tons, and provided with two speeds—5 and 10 kilometres per hour. It was also fitted with two benzine motors, each having two cylinders, one of which was converted to use paraffin, to show it was possible to burn paraffin when required. These engines ran at a speed of about 600 revolutions per minute, and developed 14-h.p. each, or 28-h.p. collectively. On a level road one of the motors can be stopped when not required. The tractor would not in any way comply with the requirements of the War Office, but was merely brought over to demonstrate the practicability of the Rail Ring system.

On Monday, 29th September, the tractor was inspected, empty, by several officers and the Committee on Mechanical Traction, including Colonel Crompton, R.E., Colonel Nugent, Captain Kennedy, Colonel Templar, and Major Lindsey Lloyd, R.E., &c. Mr. Crowden was called upon to describe the construction and principles of the Rail Ring Tractor. An order was then given to fill up and measure the oil and water tanks. The tractor was next started up and driven over the Army Service Corps' yard, which was in a rough and broken condition. The tractor was manoeuvred over this ground, and trials were also made of the smallest radius in which it would turn. It was then attached to a Fowler traction engine truck, loaded with rails and

horses and vehicles, lunch, and electric ignition troubles, a uniform speed of 4.6 miles per hour was obtained.

On Thursday, the 2nd inst., the tractor left the Yard at 9.30 a.m. for an eight-mile run with a 5-ton truck load round the Long Valley, with Mr. Bagnall Wild as observer. The course was a very difficult one, having very steep hills, the roads being sandy and loose, and almost impassable for motor-vehicles. At the end of this course the tractor was met by Major Lindsey Lloyd, R.E., General Lord Elmslie, General Wace, and others. The vehicle was then directed into the road leading to the Long Valley. After ascending and descending almost impossible hills and places, the tractor was detached from its load and sent through a sandy chasm very much like an empty canal or river, which it did in a creditable manner. This concluded the trials for the fourth day, the motor-car being then attached to the 5-ton truck, which it took back to the depot.

On Friday, the 3rd inst., the tractor left the depot at 10.30 a.m. for the entrance to the Long Valley, where its capabilities were inspected by Colonel Holden and other military authorities. On this occasion the vehicle was sent right across country, ignoring all roads, over grass, furze, bushes, &c. The machine left Aldershot on Saturday morning, the 4th inst., under its own power, for St. Katharine's Docks, London, whence it was shipped back to Germany.

Throughout the whole of the trials no breakdown of any

serious character was experienced, with the exception that a small fan for cooling the radiators came adrift. A certain amount of trouble was experienced with the low-tension sparking, especially on the paraffin engine. The vehicle proved that it is applicable not only for low speeds, but for speeds up to thirty miles an hour, as on several occasions during the trials the tractor travelled at this speed in descending some of the hills.

CONTINENTAL NOTES.

BY AUTOMAN.

THE organisers of the hill-climbing competition at Stelvio, in the Tyrol, are leaving no stone unturned to make the meeting one of the important events of next year's motor-racing calendar. The month of August has been chosen for the competition, and as there remain about ten months in which to complete the arrangements, the public, and likewise the trade, may expect everything to be in perfect working order.

IN addition to the hill climb, there is to be a speed contest on a level road seven miles long and without any villages en route. It is even proposed to hold races for motor yachts on Lake Como, which is not far distant.

M. SERPOLLET ON THE "WHALE."

THE GAILLON HILL-CLIMBING TRIALS.

THE Swiss Automobile Club held its annual hill-climbing competition on Sunday, the 5th inst., on the road between Trelex and Saint-Cergues. It consisted in a stretch of $6\frac{1}{2}$ miles with a 5.3 per cent. climb. There were two sections, one for racing and the other for touring vehicles. The following are the best times for each of the different categories:—

RACING CLASS.

Motor-cycles—				
Benoit (Zurcher et Luthi)	h.	m.	s.
			19	5 1-5
Light Cars—				
Perrot (Rochet-Schneider)	1	24	17
(Stopped on the way by an accident.)				
Heavy Cars—				
Mauthen (Mercedes)...	...		25	0

TOURING CLASS.

Voiturettes—				
Masing (Darracq)		35	52 1-5
Light Cars—				
De Ville (Georges Richard)...	...		28	11 1-5
Heavy Cars—				
Kitabji (Panhard)		28	2

THE question of the use of alcohol for the propulsion of motor-cars is exciting the attention of the authorities in Italy, and an exhibition is about to be held at Conegliano, during which there will be a race meeting on the roads between Conegliano and Padua. Alcohol will be the only fuel used, and it will be supplied free to the competitors.

THE competition for delivery vans, omnibuses, and lorries, which was to have taken place from the 23rd to the 29th inst., has been postponed until the end of November, and a judging committee is to be formed, half of the members being elected by the trade, and the other half by the Race Committee of the A.C.F.

AS I mentioned some weeks ago, the timekeepers at Deauville found at the end of the meeting that their watches did not agree. The A.C.F. has therefore declared the meeting null and void, and Vanderbilt's record of 29½ seconds becomes the official time for the kilometre on the Continent. Jarrott's record at Welbeck stands as the world's record, with the proviso that the course at Welbeck is slightly down hill.

THE "Auto-Velo," commenting on the Deauville mistake, gives the opinion that the error was not a gradual one, but a sudden error just between the arrival of Rigolly and the start of

M. HEATH ON THE RACING PANHARD.

They, who expected to do the kilometre in 37 seconds, and who was quite surprised when his time worked out at 30 seconds. If this opinion be taken as correct, Regal did the best time at Deauville—28½ seconds.

IT is most disappointing to the manufacturers of automobiles who went to the expense of going to Deauville to see the results of the meeting rendered invalid, and it points to the necessity of some mechanical means of timekeeping. With a view to accomplishing this the "Auto-Velo" has put itself into communication with Messrs. Hanger and Pescheuse, who have invented a self-registering chronometer which has just been experimented with by Mr. Robert Ball before the Royal Institution in London, and which, after forty-five minutes' working, did not show a variation of one-twentieth of a second.

THE mystery of the fiasco at Gaillon last Sunday week has been cleared up. It seems that the organisers of the competition never asked leave of the Prefet of Police of the department in which the trial was to be held. Instead of this they went to the Ministry for their authorisation. The law, however, requires

that the Prefet of Police shall give his consent, and this official was naturally furious that he had not been consulted.

He was also annoyed that it had been said that he was a friend of the organisers of the first hill-climbing trial, which he had duly authorised, and that he had been influenced by them to stop the second event. Fortunately for the organisers of the second event, M. Leon Serpollet was with them when they went to make their peace with the Prefet, and as M. Serpollet explained that a great injury would be done to the trade should the meeting not be held, the Prefet gave his consent to the trials taking place as last Sunday. The official document was, however, pointedly addressed to M. Serpollet and the automobile manufacturers who were therein duly authorised to hold the meeting.

SUNDAY last broke with a dull, cloudy sky in Paris, and the roads were wet and muddy. A heavy shower about 8 a.m. did not improve matters, and it was with all precautions and many misgivings that Paris automobilists set off for Gaillon, decked for the most part in "umbrellas," which are truly the only garments in which motorists can brave the weather with impunity.

GAILLON is just about sixty miles from Paris, and after passing through Saint Germain the roads are excellent. The

THE GAILLON HILL-CLIMBING TRIALS—OSMONT TESTING HIS DE DION RACER.

weather, though it did not improve much, as we neared Gaillon got no worse; the rain, fortunately, kept off and rendered the competition possible and interesting.

AT Gaillon M. Leon Serpollet was, by special order of the Prefet de l'Eure, put in supreme command as organiser of the competition, and particular instructions were given to the police and military that they must obey his orders only. The Prefet de l'Eure is a man not to be trifled with; he knows his rights and the law better than the Minister who is above him, and all those who come into his district must bear it in mind if they want to be successful in their undertakings; thus it was that M. Serpollet stepped into the breach and saved the meeting by assuming the post of organiser and giving passes to the press and orders to the guardians of the law.

AT 10.30 a.m. the competition commenced with the motor-bicycles, and from that time until about 3.30 there was a constant succession of rushes up the Gaillon hill. It will be remembered that Gaillon starts at once with the steepest pull and then eases off towards the summit, the average gradient over the kilometre being 9 per cent.

THE winner of the day was Le Blon on a Serpollet, who established the wonderful record of a speed equal to 100 kilometres (a little over 62 miles) an hour up the hill. Serpollet, therefore, holds the record for public competitions, both on the level and up hill, and curiously enough his times are exactly 120 and 100 kilometres per hour. A Serpollet, with Rutishauser driving, also won the category for light cars.

THREE categories fell into the hands of Clement, for Derny was the winner of the light motor-bicycles and Holley of the heavy bicycles, on the new Clement four-cylinder bicycle, on which, by the way, after the competition, Holley in another trial established a wonderful record, doing the kilometre in 37 seconds, just one second more than Le Blon, and attaining a speed of over 97 kilometres per hour. Volatum on a Clement voiturette was the winner of his class.

IN the heavy-car class, after Le Blon came two Panhards driven by Heath and Teste, and then Gabriel on a Mors, who, although he did not succeed in carrying off the day's victory, still remains the champion hill-climber, for his results for the two events, Chateau-Thierry and Gaillon, add up to the best time for the double event.

THE following is the official classification of the two events, Chateau-Thierry and Gaillon:—

Driver.	Make.	Chateau-Thierry.	Gaillon.	Total.
MOTOR-CYCLES (Under 30 kilos).				
		M. S.	M. S.	M. S.
1. Derny ...	Clement ...	1 3½	1 2½	2 5½
2. Coudert ...	Lurquin et Coudert	1 37½	1 20½	2 57½
3. Barre ...	Bruneau ...	1 40	1 24	3 4
MOTOR-CYCLES (Over 30 kilos).				
1. Lamberjack	Griffon ...	0 55½	0 49½	1 45½
2. Demester ...	" ...	1 1½	0 58½	1 54½
3. Barre ...	Bruneau ...	1 0½	0 59½	1 59½
MOTOR-CYCLES (from 50 to 250 kilos).				
1. Loste ...	Buchet ...	0 49½	0 41½	1 31
2. Holley ...	Clement ...	0 51½	0 40½	1 32
3. Osmont ...	De Dion ...	0 55	0 44½	1 39½
QUADRICYCLES (two places occupied).				
1. Osmont ...	De Dion ...	1 1½	0 52½	1 53½
VOITURETTES (from 250 to 400 kilos., one place occupied).				
1. Thellier ...	Passy-Thellier ...	0 58½	1 2	2 0½
2. Volatum ...	Clement ...	1 14	1 0½	2 14½
3. Harriot ...	Passy-Thellier ...	1 19	1 14½	2 33
LIGHT CARS (from 400 to 650 kilos, two places occupied).				
1. Rigolly ...	Gobron-Brillie ...	0 52	0 46½	1 38½
2. Baras ...	Darracq ...	0 54½	0 46½	1 40½
3. Thery ...	Decauville ...	0 59½	0 44	1 43½
HEAVY CARS (from 650 to 1,000 kilos, two places occupied).

IN connection with the projected competition of the famous Stelvio Pass in the Tyrol, it will no doubt be of interest to mention that quite recently a German motorist—Herr Wolfgang Vogel—succeeded in making the ascent on his 3½-h.p. De Dion voiturette. This is not the first time the Stelvio has been climbed by a motor-car, but for a vehicle of such a small power the feat is noteworthy.

THERE is every prospect that the next exhibition at the Grand Palais here in Paris will far and away eclipse those hitherto held. Among the latest list of exhibitors issued I notice the name of the Wolseley Tool and Motor Car Company, Limited. If I recollect rightly this is the first time English-built motor-cars have been exhibited in France.

THE flying machine made by M. Bradsky was for some time awaiting favourable weather to make its trial trip from the balloon works of Lachambre at Vaugirard. On Monday morning last, the weather being most favourable, he started off soon after

seven o'clock, together with an electrician named Morin. The machine was on somewhat similar lines to that of Santos Dumont, and was propelled by a Buchet four-cylinder motor; it had, however, a special fan placed underneath the car for the purpose of raising or lowering the machine in the air.

It had been the intention of the aeronaut to go to the manœuvring grounds at Issy-les-Moulineau to make his evolutions and test his aerial craft, but a southern current of air carried them over Paris, and at 8 a.m. they were over the Opera House at a height of 400 metres. It was then quite evident that they had lost control over the craft, for it turned round and round and described circles in the air, and finally swept away sideways towards St. Denis. At Stains, while preparing to descend, the keel of the car seemed suddenly to detach itself from the balloon, and, lurching forward, it plunged to the earth with the unfortunate aeronauts clinging to it. They were dashed in pieces and instantly killed, whilst the balloon shot upwards and then sailed away over Paris.

SHORTLY after the accident I drove out to the scene and found the remains of the flying machine in a turnip field beside the road. The motor seemed practically uninjured, and even the glass lubricator was intact; the keel, of course, was bent into all shapes. What really happened will never be known, but either the piano wires which attached the car to the balloon were not strong enough for their work, or else a part of the machinery caught some of the wires and caused a breakage which put too much strain on the other wires. There is a sad similarity between this fatal accident and that which occurred to M. Severo in May last. Both took place on a Monday, and each was steering for Issy-les-Moulineau. There were two in the balloon in each case, and also both accidents have nothing whatever to do with aeronautics, and are clearly avoidable.

THE 1903 Nice week programme has been issued. On Sunday, the 29th March, there will be a decorated motor-car competition. Races will be held on the following three days. The Nice-La Turbie race will be held on the 2nd April, while the mile competitions on the Promenade des Anglais will be run off on the 5th April.

I HEAR that the 1903-model Benz car will comprise some striking departures. A new 12-h.p. car is being introduced, with a two-cylinder vertical motor and a water-cooler on the lines of the Mercedes. The transmission will comprise neither belts nor chains, and on the top speed the drive will be direct.

THE hill-climbing competition on the road between Spa and Malchamps under the auspices of the Belgian Automobile Club duly came off on Monday last. The course was over a distance of 5,300 metres (3½ miles). Appended are the fastest times in each class:—

Class.	Make.	Time.
		m. s.
Light motor bicycles ... Prudhomme ...	Red Star ...	6 2½
Heavy motor bicycles ... Vand den Born ...	Antoine ...	9 58½
Motor tricycles... Joostens ...	Korn ...	6 54½
Voiturettes ... Oury ...	Clement ...	5 39½
Light cars... Roland ...	Gobron-Nagant ...	4 32½
Racing car (1,000 kilog)... Hautvast ...	Pipe ...	5 33½
Touring cars ... De Bron ...	De Dietrich ...	6 46

The best time of the day was made by Roland, whose speed up the hill works out at nearly forty-four miles per hour.

THE success of Mr. Archibald Ford's School of Motoring at Liverpool is now beyond doubt. This week a clergyman from Leeds, and other gentlemen from Malpas and Sidcup, in Kent, are amongst the pupils. Not only are driving and management taught, but lucid instructions are also given as to the necessary procedure should the car from any cause break down.

THE MOTOR-CAR INDUSTRY IN THE UNITED STATES.

FOR the first time the bulletin reports of the U.S. Census Bureau statisticians contain a chapter devoted to motor-vehicles. The bulletin itself is on the special subject of the manufacture of locomotives in the United States during the year 1900, with a section devoted to motor-vehicles. This latter term, the report states, is intended to "embrace all classes of self-propelled carriages, wagons or trucks used for the conveyance of passengers or the transportation of merchandise." Of such vehicles, according to the report, 4,192—1,575 electrical, 1,681 steam, and 936 petrol—were constructed in the United States during the census year 1900, and their aggregate value, as reported by 109 manufacturers, was £979,888, an average of about £230 per vehicle.

A comparison of the relative popularity of the three motive powers, steam, electricity, and petrol, conclusively shows that conditions two years ago were not as they are to-day. Petrol undoubtedly leads in the total output of the three different classes of motor-vehicles at the present time, and has led throughout the past year, but in 1900 it was a very poor third. The total value of the electric vehicles turned out in that year exceeded the combined total values of the other two powers, was three times as great as the total value of the petrol-car output, and almost twice that of the steam vehicles, although the number of steam vehicles manufactured was greater.

The report concludes:—"Notwithstanding the large number of motor-vehicles constructed during the census year the industry was only in the experimental stage, and its development promises to be as remarkable as the expansion of the bicycle industry. Few industries involving such a degree of mechanical skill and ingenuity, and presenting so many new problems for solution, have developed so rapidly, both in ideas and in commercial results."

COLONEL LOCKWOOD, M.P., is a motorist, having a 9-h.p. Renault.

SIR ARCHIBALD MACDONALD, BART., is having his 22-h.p. Daimler fitted with Collier tyres.

A PETITION in favour of the Registration of Motor Vehicles Bill is to be presented to Parliament on behalf of the Scottish Trade Protection Society.

THE office staff of the Daimler Motor Company held their annual outing on Saturday, journeying to the Swan's Nest Hotel, Stratford-on-Avon, on a Daimler wagonette.

THE DUMFRIES COUNTY COUNCIL is petitioning Parliament in favour of the Registration of Motor Vehicles Bill, despite the protest of Mr. Brooks, the only one of its members who is a motorist.

THE success attending the recent trials, made by the Postal Authorities in the E.C. district, with the "Oppermann" electrical mail van, has induced them to further test the suitability of this type of motor-van on another and more difficult route in the Battersea district. The trials started on Tuesday last.

THE AERONAUTICAL INSTITUTE AND CLUB held a meeting at St. Bride's Institute, Fleet Street, E.C., on Friday, the 10th, Dr. F. A. Barton, the President of the Institute, in the chair. There was a large attendance of members and their friends. Mr. P. L. Senecal gave an interesting paper on a somewhat novel flying machine, a parachute with flapping wings. Mr. Senecal stated that he considered the project quite feasible, the parachute being built upon a frame to prevent it collapsing, and the wings being used to guide the machine when gliding. Mr. Aug. E. Gaudron followed with a short lecture on modern balloon manufacture, in which he explained the details of construction. A lantern lecture by Mr. Gaudron wound up the evening, some very fine pictures being shown.

MOTOR-CYCLING NEWS.

A SUGGESTION has been made that trials for motor-cycles should be held independently of the car trials which will probably be organised by the Automobile Club next year.

MR. E. LYCETT, of the firm of Messrs. Edward Lycett, Limited, Cycle Saddle Manufacturers, Deritend, Birmingham, is introducing the new pulley for motor-bicycles, illustrated herewith. The pulley is V-shaped, and takes either a round or V belt; the sides of the pulley are grooved with dovetailed slots, compressed leather blocks being inserted in the slots. The bottom of the pulley is also covered with leather. Mr. Lycett, who has given the pulley an extended trial on his 2½-h.p. Excelsior motor-bicycle, informs us that although he runs with a loose belt, the grip appears to be as positive as a chain drive, the motor running as smoothly as can be desired.

MESSRS. WERNER BROS. are about to build new and more extensive works in Paris, and have also removed their show-rooms from 40, to 10 bis, Avenue de la Grande Armée, Paris.

NEWS of the resuscitation of the Motor Cycling Club comes in the announcement that on Sunday, the 19th inst., there will be a run to Dunstable, the meet taking place at the Marble Arch at 10.30 a.m.

MESSRS. A. W. GAMAGE, LIMITED, of Holborn, E.C., have been appointed sole agents for the United Kingdom for the Red Star motor-cycle, which has just won the Belgian Hill-Climbing Competition at Spa.

THE Rex Motor Manufacturing Company, Limited, of Earlsdon, Coventry, have completed a 3 h.p. water-cooled motor-bicycle. We hear that an attempt will be made shortly by Tessier to create a new world's record on this machine.

MESSRS. SALSBURY AND SON, the well-known motor lamp makers, have just introduced a new pattern horn for the use of motor cyclists. It is claimed for the new pattern that it is better suited to the shape of the cycle handle-bar, and as the clip is on a turntable, the horn can be placed in the position most convenient to the user.

TO-DAY (Saturday) the Motor Cycle Union of Ireland will hold a meeting at the Ashtown track, Dublin. The programme comprises a ten-mile motor-bicycle handicap, one mile motor-bicycle scratch race, and a petrol consumption trial for motor-bicycles, in which each rider will be allowed a specified quantity of petrol. The rider covering the greatest distance will be adjudged the winner. Minimum speed, fifteen miles per hour.

THE Fabrique Nationale Company, of Herstal, Belgium, are introducing a new model of their now well-known F.N. motor-bicycle. The new machine, which will make its appearance next month, will be fitted with a 2-h.p. motor, and will embody several important structural improvements. Messrs. W. R. McTaggart, Limited, 102, Grafton Street, Dublin, inform us that they have been entrusted with the sole agency for these motor-bicycles for the United Kingdom, and are about to open a large distributing store in London.

THERE has been on view at a motor and cycle depot in Hobart, a new motor-bicycle, which has been specially

constructed by Mr. A. M. Campbell for Tasmanian roads. It is fitted with a 1½ Hobart "L'Universal" engine, and the total weight of the machine is 65lbs. A distance of 125 miles is said to have been covered by this motor-bicycle at a cost of 2s. The machine being the first motor-bicycle turned out in Hobart has given Mr. Campbell the distinction of being the maker of the first automobile built in Tasmania.

INCLUDED in our list of furious driving cases are some summonses of interest to those who ride motor-bicycles. At Birkenhead, Mr. Robin Hill was summoned for having ridden a motor-bicycle to the danger of the public. Police-constable 385 stated that the defendant was riding a motor-bicycle, pulling behind him a basket carriage in which was another man. It was very dark, and he was going at a speed of twenty miles an hour. The defendant, however, said he absolutely denied having ridden the bicycle, and after a long hearing the Chairman of the Bench said it was possibly a mistake with regard to the identity. Referring to the police officer's statement as to the speed, he said exaggerated views did not do such a case any good. The case would be dismissed. What a good thing Birkenhead is not in Surrey!

AMONG our American visitors lately was Mr. C. A. Persons, the chief of the Royal Motor Works in New York. Mr. Persons, who is interested in the Royal motor-bicycle, has since his return been giving his views on the movement on this side. "Motor-bicycling in England and France is," he says, "far ahead of America, and this despite the fact that the best machines all bring prices close to £50, and are comparatively complicated in their construction. In one afternoon I passed in a stretch of twenty-five miles, between Kingston and Guildford, five motor-bicycles to which trailers carrying passengers were attached. For such work their motors seemed surprisingly small, yet they were invariably doing the work required of them on the level and up fair grades. The average efficiency impressed me as being higher than Americans would get from the same machines, and I was again compelled to admit the value of the Englishman's characteristics of method and thoroughness. The Englishman knows his machine, and he keeps it right—'fit,' as he would say. In many miles of touring through the open country, out of the scores of motor-bicycles, tricycles and quads met I did not see a single rider 'stuck.'"

THE Crypto Works Co., Ltd., of Clerkenwell Road, E.C., have just introduced a new motor-bicycle, of which an illustration is given herewith. Motors of either 2 or 2½-h.p. can be fitted as desired, the former being Continental made, while the latter are M.M.C. engines, which have lately met with so much

success. The cycle part of the machine is made entirely in the Crypto works to special design. Unlike the first of the Crypto motor bicycles, the belt drive is now used instead of the chain, a triangular belt being employed with the 2-h.p. machine and a 1-in. flat belt with the 2½-h.p. A spray carburettor furnishes the mixture, while an exhaust valve lifter is fitted.

HERE AND THERE.

THE motor-car was the cause of *Punch* breaking forth into poetry last week.

MR. BEST, the county surveyor of Brecon, uses a motor-car when on his tours of inspection.

THE Irish agency for the James and Browne car has been entrusted to the Automobile Agency, of 3, Cope Street, Dublin.

THE Aberdeenshire and the Perthshire County Councils are petitioning the Secretary for Scotland with regard to the speed of motor-cars.

A CORRESPONDENT wishes for the experience of motorists as to the best road from Liverpool to London. We shall be pleased to hear from readers on the subject.

THE Massachusetts Automobile Club is installing a turntable in its garage to facilitate the handling of the long cars, which are displacing the short wheel-base vehicles of one or two years ago.

"THE LIGHTNING CONDUCTOR" is the name of a new book by Mr. and Mrs. C. N. Williamson, to be published almost immediately by Messrs. Methuen and Company. It is a novel, but not a novel on ordinary lines. Apart from the interest of an amusing story, it is a romance of automobilism and travel, containing vivid descriptions of the most beautiful parts of France and Italy, in which the adventures of the hero and heroine—a young Englishman and an American girl—take place. Mr. Williamson is an expert automobilist who has driven his own car across the whole Continent; and the book, which is the first of its kind, deals largely with the delights and difficulties of motor-car touring.

HIS EXCELLENCY the Governor of the Cape Colony, Sir Walter Hely Hutchinson, G.C.M.G., K.C.B., etc., has, we learn, accepted the position of President of the Automobile Club of South Africa.

THE accompanying illustration shows one of the latest types of Scotte steam tractors, so largely used in France, hauling a locomotive, weighing $16\frac{1}{2}$ tons, on a trailer. The total load to be moved by the tractor, including its own weight, was $25\frac{1}{2}$ tons, and the task of conveying the engine to its destination was accomplished without trouble, notwithstanding that the route included gradients of one in sixteen. It is estimated that at least twenty horses would have been required to have hauled the locomotive had not the Scotte vehicle been available.

THE simple word *garage* has not yet become universally known in this country. Mr. H. M. Penneman, of the Motor-Car Supply Company, writes as to an incident which came under his notice on the occasion of the cars in the Reliability Trials visiting Brighton. A labourer, who was somewhat awestruck with the trade a certain firm was doing in petrol, volunteered the following:—"They wer'n't half doing a trade in petrol down at Brighton, and nearly all the cars went to that chap 'Garage' to be filled up, as they kept going in and out and backwards and forwards to get more."

CAPTAIN J. E. LYALL, of Grantham, has joined the Lincolnshire Automobile Club.

MR. A. HARMSWORTH suggests that the Automobile Club should hold an investigation into the question of side slip.

THE first annual cycle and motor carnival in aid of the Coventry and Warwickshire Hospital took place at Coventry, a few days ago.

FURTHER developments with regard to the employment of motor traction in place of horses may be expected in connection with the London Fire Brigade.

A GERMAN contemporary gives publicity to a report that the Cannstatt Daimler Company is building a 15-h.p. 1903 Mercedes car for King Edward.

IN the course of the correspondence now proceeding in the columns of the *Times*, Lord Ribblesdale says that "a man should be able to adapt his horsemanship and accustom his back to changing conditions of traffic, whatever they may be. If he cannot, let him give up riding."

A 100-MILE trial will be held during the present month by the Automobile Club if there are entries.

THE title, "How to Buy a Camera," is perhaps the least happy phrase in the whole of Mr. H. S. Shelley's book just published by Messrs. George Newnes, Ltd. The difficulty with most people is "how to use a camera"—to say nothing of the variable-ness associated with development and the subsequent processes necessary for perfect prints. But in giving a concise account of the principal features of the many cameras now on the market Mr. Shelley has done well, and the result is the production of a useful little manual

which should be carefully read before purchase of a camera is decided upon. Photography adds to the pleasures of motoring, and this little book will facilitate progress in the art.

A SUGGESTION has been made that a badge should be adopted by the Automobile Club, which could be utilised for the various provincial clubs by the mere addition of the name—Nottingham, Manchester, etc.—of the particular local organisations. The idea seems to be a good one, and possibly those who are interested may be inclined to urge it upon the Club Committee.

THE Auto-car Construction Company, Limited, has been registered with a capital of £25,000, to adopt an agreement with Mr. T. Pollock and Mr. C. W. Milne for (*inter alia*) the acquisition of the business of the Pollock Engineering Company, and to carry on the manufacture of motor-cars, etc. The first directors are Messrs. C. W. Milne, J. M. Hewitt, W. J. Davy, and J. L. Altham.

RECENTLY we recorded some experiments in the Midlands with regard to the conveyance of fruit from producer to consumer. An echo of this comes from the Worcester Bankruptcy Court, where the creditors of a market gardener of Evesham met to hear a statement of affairs showing a loss alleged to have happened in regard to the delivery of produce by motor-car. It appears that the debtor hired a motor-car for conveying tomatoes but bad weather intervened, the crop was spoiled, and the result was that he suffered financial loss.

A SCOTTE STEAM TRACTOR HAULING A LOCOMOTIVE.

Le Chauffeur.

THE Chief Constable of Cornwall has promised to give special attention to motor-cars passing through Wadebridge.

THE Perth County Council is about to memorialise the Secretary for Scotland in favour of new legislation with regard to motor-cars.

MR. GEORGE BONFIELD, of 39, East Street, Bridport, is keeping a stock of petrol, and has also facilities for the charging of accumulators.

THE NEW 6-H.P. DE DION VOITURETTE.

THE Ormonde Motor Company have just completed a new racing motor-bicycle. It is built very low, with saddle well back, duplex front forks, and a novel-shaped handle-bar. The motor is a $2\frac{3}{4}$ -h.p. Kelecom, and is placed in the usual position.

At the annual conference of the National Union of Conservative Associations at Manchester, a resolution has been adopted, on the motion of Sir Howard Vincent, M.P., in favour of legislation for the adequate control of motor-car locomotion on the high roads, and especially in the direction of affording means for the identification of motorists driving to the common danger of vehicular and pedestrian traffic, and the licensing of motor men, as in all other countries. Mr. Wm. Glossop, of Rostrevor, deprecated any undue interference with a new and important industry, and contended that the present legal limit of speed was totally unsuitable.

THE standard Minerva motor for the 1903 season will have a bore of 66 and a stroke of 70 millimetres, and will develop 2-h.p. Among the new features are mechanically operated inlet and exhaust valves. By this device the inlet valve is automatically opened the moment the piston commences its descent in the charging stroke, with the result that a full charge of mixture can be taken. A further advantage is that the valve cannot stick, while the exhaust and inlet valve springs, being interchangeable, only one spare of each need be carried. The present surface carburettor will be replaced by a spray carburettor. An entirely new device will be fitted whereby one lever on the tank will operate the sparking, lift the exhaust valve, and cut off the electric current. As, however, many do not care to take their hands off the handlebar, the switch thereon will be retained. The cylinder and head will be cast in one piece without joints. The bearings will be lengthened, and the radiating fins on the lower part of the cylinder will be omitted, as, after exhaustive experiments, it has been found that they in no way assist the cooling of the motor. As regards the ignition, the fixing of the ignition cover will be improved; the platinum pointed screw will be fitted in a different position, whereby it becomes adjustable from outside; while the trembler blade will be made adjustable, and will be so fitted that the two platinum points will always be in their exact position. In order to meet the demands of those who prefer an engine designed for a vertical position, a $1\frac{3}{4}$ -h.p. set, comprising motor and accessories made at the Minerva works, will be put on the market, under the name of the "Romania" motor. The main lines will be as described for the Minerva, except that in this engine the new mechanically-operated valves will not be fitted.

THE number of motor-car drivers who have received the official *permis* in Turin, Italy, to date is 286.

THE Prefect of the Seine has made a grant of £20 towards the funds of the French National Federation of Motor-car Drivers.

AN evening class in motor and cycle construction, under the guidance of Mr. H. J. Taylor, has again been started at the Battersea Polytechnic.

THE exports of automobiles and parts from the United States during August last reached a value of £14,381, as against £11,260 in the corresponding month of 1901.

MR. ROGER H. FULLER has lately returned from a tour on his 10-h.p. Panhard from London to the Lakes, traversing Kirkstone Pass, High Stock, and the rough Yorkshire Moors.

THE syllabus of the Birmingham Association of Mechanical Engineers for the Winter Session includes a visit to the works of the Motor Manufacturing Company, at Coventry, on the 3rd prox., and a paper by Mr. Hygo Gibson on the Diesel Oil Engine, to be read at the monthly meeting on November 1st.

AT a recent meeting of the Committee of the Automobile Club of America the request of several manufacturers that the Club organise an endurance test for heavy lorries and commercial vehicles was considered. It was decided to reply that the matter would be discussed with the trade at the next automobile show, and the form and date of the test then determined.

THE West London Cycle and Motor Repository, the Broadway, Walham Green, S.W., have just placed upon the market a 2-h.p. motor-bicycle. The engine is placed vertically in the frame, power being transmitted to the rear wheel by means of a twisted raw-hide belt. The motor is equipped with a float-feed carburettor and exhaust valve lift. The petrol tank has a capacity sufficient for a run of 200 miles.

IN addition to their well-known sparking plugs, the Electric Ignition Co., of Unity Works, Birmingham, have now taken up the manufacture of switches or circuit breakers for use on motor-cars. Two patterns of the switches, a two-way and a three-way, are being made, an illustration of the three-way type being given herewith. This is intended for use with duplicate sets of accumulators, four terminals being provided, a pair for each battery. With the switch handle in the central position, the circuit of both accumulators is broken; by pushing the lever to

1 or 2, either one or the other of the batteries is connected up. The switch is useful at all times, for not only are the positions well marked, but, even in the dark, the driver can hear the click which indicates the correct position. The connection between the two terminals is made by an ingenious and positive contact maker, which, it is claimed, cannot be displaced by vibration or jolting when the car is travelling over bad roads. The two-way switch is identical in size and in its action to the three-way type, but is intended for use with a single accumulator, the wires having to be changed over when the reserve battery is brought into use.

CORRESPONDENCE.

TOURING ON SMALL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is quite evident that Mr. Peake is not getting full power from his engine, and the symptoms point to one of two things: either his carburettor is defective, or he runs his engine on too strong a mixture, or the waste gases do not get a free exit, either from insufficient lift of the exhaust valve or soot in the pipe or silencer; in fact, the engine is choked, and will, of course, only run, if at all, with the throttle partially open. To give its utmost power for long runs I find that a De Dion engine requires the weakest mixture that will explode, which also quite does away with dirty sparking plugs and explosions in the silencer.

I think too much stress is laid by the public on the nominal horse-power of the engine, usually estimated on the size of the cylinder, while the true horse-power of a car can only be measured at the road-wheels, and by the speed of a car on a given incline. So much power is lost nowadays in complicated transmission that even in well-known makes over 50 per cent. of the power of the engine is dissipated in this way. Small engines, when run at a very high speed, give far less trouble than larger ones under the same conditions, and where the transmission is exceedingly simple, as in the case of a Mabley, the results obtained are astonishing.—Yours truly,

H. M. W. BRIDGMAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—After reading Mr. Peake's letter in your issue of the 4th inst., re lack of power in his $3\frac{1}{2}$ -h.p. De Dion engine, I should like to mention the one thing which I have found to be most necessary. Presuming that it is fitted with the ordinary trembler and platinum-tipped screw adjustment usual with these engines, from my own experience I should say that the screw was screwed too far in, i.e., too near the trembler, so that when the engine commenced to slow down at the beginning of a hill, the trembler had time to rest on the screw instead of vibrating on it, as it should and would have done if the screw had been a little further away.

The following may interest your correspondent. I have a $3\frac{1}{2}$ -h.p. De Dion voiturette, and my only troubles in the two years I have had it have been through not knowing how to adjust the sparking device. The other Sunday I ran down to Maidenhead, and from Marble Arch to the bridge over the river I took only 1 hour 35 min., which I do not consider bad running, the distance, I believe, being just over twenty-five miles, and there were four up.

The previous Sunday I went to St. Albans and only put on the low gear for the first time when about thirty yards from the top of Brockley Hill, just beyond Edgware. The twenty miles were done in 1 hour 22 min., and on a very hilly road, as everyone knows. My only regret is that I have not a higher gear for the level, as I could then do even better time. In conclusion, I may say that I was also told by a man who did a small repair for me that the engine was out of date, and that my carburettor was no good, as it was one of those old cork float things; but I have had nothing changed, and am more than satisfied that, originally, all I needed was more experience. Trusting I have hit the right nail on the head.—Yours faithfully,

HUMPHREY M. MYER.

IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The reason of the trouble complained of by Mr. Breese, in his substituting a dry battery for a four-volt accumulator, is not that the accumulator is less constant than a battery, but that its voltage is different. A four-cell dry battery is something over six volts, and evidently his coil was constructed to be worked with this pressure, and so when losing two volts the spark is not sufficient to ignite the charge. This is the same as with the De Dion troubles mentioned in the letters published some few weeks ago, and was overcome by joining two accumulators in series, so giving an output of eight volts; but there is a danger of burning the insulation off the primary wire of the coil if the current be left on continuously for a short time. There is no danger if the engine is running, as the current is interrupted by the trembler. In a De Dion car, in which I am using two accumulators connected up as above, I have put in a small piece of lead wire, so that should the current be accidentally left on the lead melts, thus interrupting the current and saving the coil. What is wanted is a six-volt accumulator to work the coils of motors and constructed to work with four dry cells. Coils are made to work with current at four volts.—Yours truly,

GEORGE BONFIELD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Breese's letter last week re Ignition Troubles with Ariel tricycle, I should advise him to buy a 6-volt accumulator next time. His dry battery has a total E.M.F. of 6 volts, and it is easy to see the cause of misfiring when he changes it to 4 volts. The De Dion coil is made to work with 6 volts.—Yours truly,

J. B.

THE RIPLEY POLICE AND THE AUTOMOBILE CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Residing, as I do, near Guildford, I am surprised to see the number of motorists who go to London through Ripley, instead of the few miles further and safer, if rather hilly, road through Leatherhead, thus running into the arms of Sergeant Jarrett, who every Sunday regularly "bags" some half-dozen. I note that in the case of Mr. Savory, recently summoned there, his lawyer stated that he had measured the distance given as 176 yards, and found it to be 143, and he also stated that had the sergeant's watch been correctly timed, Mr. Savory would have been found to be driving at twelve and not eighteen miles per hour. As over forty motorists have been summoned and fined at Ripley, may I make, through your columns, the following suggestions to the Committee of the Automobile Club:—(1) That they send an independent surveyor to measure the 176 yards. (2) That next Sunday they send an "observer" with a tested stop-watch, to station himself opposite the police in Ripley, and to time and watch their proceedings, as I feel sure that if the Club can show that there has been any mistake in the timing or marking, the local magistrates will act fairly in the matter.

Various suggestions have been made in your columns with reference to motorists passing and warning one another of underhand "traps." May I make another, viz., raising by the driver of the left arm vertically and sounding one or more "toots" to signify per mile—look out so many miles ahead of you. Mine, like other suggestions, will be useless unless given out to be used, say, semi-officially by the leading Club. I hope you will allow me to ask that body to consider these suggestions?—Yours truly,

W. G. C.

CAR FOR TRAVELLERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very desirous of obtaining what information I can about motor-cars, as I wish to substitute my horse by a car, if not more expensive, and as reliable, and possibly some of your numerous readers can enlighten me.

Let me say my business calls for, say, twenty-five to thirty miles per day, five days per week, in all weathers, in daylight and also at night. My horse and bicycle divide the journeys between them, but I want a mode of getting about to dispense with both, and yet not entailing more expense. The roads I pass over are mostly country bye-roads, narrow, dirty (in winter) and rough; part of the roads are through fields, where in three miles four gates have to be opened.

I notice in your *Journal* cars advertised at great prices, but I presume that the greatness of the price is regulated by the elaborate manner in which the car is got up, and such embellishments are not essentials to the working of the car. I am of opinion that, for my work, pneumatic tyres are out of the question; therefore I seek information about solid-tyred wheels.

1. Would a $3\frac{1}{2}$ -h.p. carry myself and another in all weathers safely?
2. Is there any danger in snowy, frosty weather in slipping down hill, and brakes useless to stop car?
3. What would be the original cost, annual cost of maintenance, and cost per 100 miles for petrol?
4. What would be the life of the tyres and the car if kept in order?
5. What is the difference between a Benz and other cars?

Any other information that would assist in arriving at a decision will be highly appreciated by—Yours truly,

W. J. S.

RE POLICE PERSECUTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I intend to continue my system of patrol every Saturday and Sunday on the Ripley and other roads, and should be most happy if one or two good sportsmen would be willing either to meet me on the Ripley Road, say, at the White Lion, Cobham, or at 4H, Portman Mansions, Baker Street, W., in order to co-operate with me in patrolling, as I find it a little difficult to be at both ends of a measured distance at the same time, and, as was the case last Sunday week, I was only able to warn motorists coming towards London, when, if I had had a little assistance, motorists coming from London would also have benefited. To show how vindictive the above persecution has become, last Sunday I was at the top of the hill at the entrance to Ripley (London side), where the police were doing all they knew to have a good catch in the town, and I placed pieces of blue paper in the road, and at the side of same. Having done so, I went as far as the end of the village, to patrol; when I returned in five minutes the police had actually gone to the top of the hill and collected every morsel of the warning paper. Surely this only proves that we as a body should be determined to outdo the persecution, and if one or two of us are willing to give up our long Sunday runs, surely it ought not to be a difficult matter to find a few others who are willing to do so, in the interest of the industry and sport, especially those who have an opportunity of using their cars every day in the week, and not on Saturdays and Sundays only. I intend to use no more blue paper, but I shall in future put down a quantity of powdered whitening or French chalk, mixed with water, and shall throw this in the middle of the road. This will not be quite so easy to deface as paper, and cannot be carried away.—Yours faithfully,

JOHN D. HILL.

Mr. J. NIELD writes:—"I have an 'Eadie' quad. (2½-h.p. De Dion engine), and find great difficulty in getting up hills, with one up. Can any of your readers advise me what to do; and would a water-cooled head improve matters?"

Mr. C. T. CROWDEN, Leamington, writes: "My attention has been called to a motor steam fire-engine, which has been constructed from the designs of Commander Wells, by the London County Council, at their repair workshop in Southwark. As early as 1900 I constructed a motor steam fire-engine for the Worcester Depot of the Norwich Union. The success of this led me into communication with the London County Council, and further to Commander Wells putting himself into correspondence with me, and in January, February, and March, 1901, I met Commander Wells to discuss the advisability of converting their existing steam fire-engines into motors. An engine was selected for the purpose, and I was asked to furnish designs and specifications for carrying out the work, which I did according to instructions. I also took him the plans and working drawings of the Worcester engine, which were examined both by himself and Mr. Gordon, his engineer, who communicated with me several times. The two designs submitted and chosen by Commander Wells were not quite the same as carried out by him, although in detail they closely resemble the principles I adopted on the Worcester engine. The motor fire-engine was not entirely

over by his motor-car. According to a number of witnesses who were called by the police, the defendant was driving a motor-car down Carrington Street on September 20th. A driver of one of the electric cars named Wigley stated that he was driving towards the Market Place and met the defendant with his car near the fountain. He was going about fourteen miles an hour, and was on his wrong side of the road. When he neared witness's car he swerved suddenly across the road and went "flying" past. The conductor of the same car said he saw the motor-car go past and looking back he saw a woman being knocked down by the vehicle. The defendant was sworn, and said he was proceeding down Carrington Street on this night, using the lowest of three speeds on his car—six miles an hour. He first saw the woman on the pathway, and when he was a few yards away she attempted to run across the road. Suddenly she appeared to trip and fall five feet in front of him, and although he promptly applied his brakes, the wheels passed over her before she could stop. He offered to convey her to the hospital, but she said she was not hurt, and that she lived close by, and some friends accompanied her home. Other witnesses gave similar evidence, and after hearing them the Bench observed that they did not wish to discourage the police in any way in this connection. The pace at which motor-cars were driven in Nottingham, in common with other large towns, was much too great for the public safety. Motor driver,

PLAN OF THE 40-H.P. MERCEDES SIMPLEX CAR (see issue June 14th last).

[La France Automobile.]

made at the County Council workshop, but is of an old standard pattern, which they have converted in a similar manner to the one I did for the Norwich Union Fire Insurance Company. I feel that after the considerable amount of trouble I took and the expense I was put to by Commander Wells, I have not been treated fairly in the matter."

FURIOUS DRIVING.

Mr. GEORGE WILDER, of Stansted Park, Emsworth, who appeared at Worthing in answer to an adjourned summons for driving a motor-car at an excessive rate of speed, was told by the chairman that he had treated the Court with the grossest disrespect. Had the defendant not appeared that day they would have issued a Bench warrant for his arrest. A magistrates' court was to be respected, and when they issued a summons they intended, whether the defendant was a county magnate or a pauper, that it should be obeyed. An adjournment was made to enable the defendant to prepare his case.

Mr. H. W. BARTLETT, a member of the Nottingham Automobile Club, has been summoned by the police for furiously driving a motor-car, and being concerned in an accident whereby a woman was injured by being run

were far too selfish, and had too little consideration for others. But, in view of the evidence which had been brought forward in this case, they had decided not to convict. After hearing the witnesses for the defence, they had decided to give the defendant the benefit of any doubt they might have in their minds as to the speed at which he was proceeding, and as to how far he was responsible for the accident. Mr. Page added that he considered six miles an hour far too great a speed for a motor to be driven down Carrington Street; the speed should be reduced to three miles an hour at the highest.

Mr. EDW. KENNARD, J.P., of Market Harboro', in paying a fine of £10 13s. imposed upon his motor servant, G. Brooks, for a first offence in exceeding the legal limit, by the Thirsk bench of magistrates, declared that the law was daily broken by the highest personages in the land, every time they mounted their motor-cars. He further remarked, "We hunting men of the Midlands always regarded Yorkshire county magistrates as sportsmen. He would be sorry to express his opinion on those who employ the police to set offensive traps for ladies as well as gentlemen. Mrs. Kennard was peacefully returning from Scotland on 'Sir Charles.' In other counties," he continued, "sensible magistrates (realizing that motor-vehicles are under complete control) did not go out of their way to interfere with automobilists who were doing no harm to anybody."

ERNEST PARKER, of Hartland Road, West Kilburn, has been summoned, at Marylebone police-court, for driving a motor-car to the common danger. Sergeant Meek, X Division, saw the defendant driving along Donaldson Road, West Kilburn. He turned suddenly into Hartland Road, and a girl who was crossing the roadway had a miraculous escape from being knocked down. The defendant would have escaped, but he stopped at the house where he lives. When asked for his name and address he refused to give them and continued to resist until he was taken to the police station. The defendant's reply to the summons was that he was going at eight miles an hour. Mr. Curtis Bennett fined him £2 10s. with 2s. costs.

ARNOLD STANCOMB WILLS has been summoned at the Long Ashton (Bristol) Petty Sessions for driving a motor-car at a greater speed than 12 miles an hour; also for driving a motor-car to the common danger of the public, on October 1st, at Clevedon. Police-constable Moxey stated that the car was driven along the Old Church Road at a rate of between 29 and 30 miles an hour. Sergeant Hayes said that he saw the motor-car, which was going at a furious rate. He was with Police-constable Moxey at the time, and, considering the speed very dangerous to the public, he instructed the constable to go and make inquiries as to the person driving it. Mr. Leach, for the defence, said that his instructions were that the two police officers and the other two witnesses were entirely mistaken as to the speed at which the machine was travelling. Mr. A. S. Wills said that he was the owner of the motor-car in question. He had been in possession of it since the 30th of last month. Charles Andrews said that he had been constantly driving motor-cars for the past three years. With regard to the car in question, he understood the whole of the mechanical arrangements. The engine ran better on some occasions than others. He was sitting at the side of Mr. Wills at the time, and thought the car was going between 8 and 10 miles an hour. In answer to Mr. Leach, witness said that at no point on the road where Mr. Wills was summoned did the speed exceed that rate. In reply to the magistrates, witness said that if the engine were going at the second gear it could average 16 miles an hour, and under favourable conditions 18 miles an hour. Charles Sparkes having also given evidence for the defence, the Chairman of the Bench said they had carefully considered the matter, and the magistrates had decided to convict on the charge of driving to the danger of the public, and inflicted a fine of 40s. and costs. They dismissed the other summons.

In the case of Maurice Capellen, Marylebone Road, W., it was stated that the speed was 25 miles per hour. This the defendant denied, saying that it was absolutely impossible for his vehicle to travel more than 12 miles per hour. He invited the magistrates to go a journey with him for 30 or 40 miles, and they would see what the machine could do. The Chairman asked if he would bring his car on the following Court day, and he consented. To this Superintendent Brice objected, as the defendant was a dealer in motor-cars, and could bring which car he liked. The case was then adjourned.

THREE drivers were each ordered to pay £7 on Monday by the Spelthorne magistrates for furiously driving their cars at Staines and Ashford

MR. W. E. ROWCLIFFE, the Chairman of the Manchester Automobile Club, appeared for Rupert Williamson in the case at Altrincham. He had two witnesses for the defence; but as the Chairman of the Bench had on the previous case declared that "motorists were simply on sufferance on the roads," he was probably not surprised to hear a fine of £5 inflicted on his client.

At Wokingham, on Tuesday, several owners of motor-cars were fined for excessive speed on the London road at Ruscombe, near Twyford, on October 2nd.

At the Huntingdonshire Quarter Sessions at Godmanchester, on Tuesday, the chief constable, Colonel Chichester, reported that since June 8th, 1901, there had been eighty prosecutions against motor-car drivers in the county; thirty had given false names, twenty had not stopped when called upon, and there had been five attempts to bribe the police. The sum of £405 had been paid in fines.

DURING the past few days the Crawley police have stopped twenty-two motor-cars, which they allege were exceeding the speed limit of 12 miles an hour on the main London to Brighton road.

At Arundel Petty Sessions, Mr. George Wilder, of Stansted Park, Emsworth, has been summoned for driving a motor-car at an excessive speed on the Chichester and Arundel road, at Walberton, on October 8th. Defendant did not appear, but was represented by Mr. A. H. Goodall, who informed the Bench that Mr. Wilder wished him to apologise for his absence. He had gone away to consult a solicitor about a case which was to come up at Worthing on Wednesday. He pleaded guilty in the present case, but he intended defending the one at Worthing. The full penalty of £10 and £1 costs was imposed.

SIDNEY SMITH, of the Public Service Motor-Car Company, Gravesend, was summoned for driving a car at an excessive speed at Hawkhurst, on September 14th. The police-constable stated that about noon he saw defendant driving a motor-car, containing fourteen men, and it covered a quarter of a mile in thirty seconds, which was at the rate of thirty miles an hour. Defendant was fined £2, and also ordered to pay 12s. costs.

MEASURED DISTANCES.

WE shall be glad to hear by post, or by telegram on Wednesdays, of any measured distances prepared by the police. In our "Correspondence" columns is a reference to the subject so far as it relates to the Ripley road, and we learn, by telegram from Glasgow, that "Robert has a measured length on the Stockie Muir Road on the descent to Finnick Toll commencing from Glasgow."

At Cranbrook Petty Sessions, Mr. Paddon, who was driving a motor-car for Mr. Peck, of Iden Manor, Staplehurst, was summoned for exceeding the speed of twelve miles an hour. A sergeant of police stated that he had measured a quarter of a mile, at the commencement of which another sergeant was situated, who put up his arms when the car passed the mark. He then took the time by his watch, and he found that the motor-car covered the quarter of a mile in 30 secs., which was at the rate of thirty miles an hour. The second sergeant corroborated this evidence. Mr. Staplee Firth, who defended, called for the watches to be produced. The one produced by the first sergeant was a common watch with a small second hand, and the watch produced by the other officer was a stop watch. It was elicited, on cross-examination of the first witness, that he put up his hands to stop the car immediately it reached the end of the measured quarter of a mile. He admitted that the only calculation of speed that he knew was the one he swore to—namely, that if the car travelled over the piece measured in 30 secs., it was going at the rate of thirty miles an hour. After hearing Mr. Firth for the defence, the Bench dismissed the charge.

A MEASURED half-mile on the Snailwell road, near Newmarket, has resulted in the capture of two motorists by the local police.

THE police have a-measured quarter of a mile in the township of Sandhutton, situated in a favourable gradient for speed. They lie concealed in a cottage close to four cross roads, and about eight or nine miles this side of Northallerton.

HILL-CLIMBING IN THE MIDLANDS.

THE Midland Automobile Club held a hill-climbing competition at Gorcott Hill on Saturday last. Although the weather was very dull and threatening in the morning rain kept off; the roads were, however, muddy from the previous night's rain. The distance covered by the cars up the hill was a fraction over two-thirds of a mile. The following are the results:—

RACING SECTION.

Entered by.	Car.	Time.	Marks.

(Only one entry, no award given.)

MOTOR-CYCLES.

G. D. Leechman ...	Singer Tricycle ...	2 10½	—
--------------------	---------------------	-------	---

(Only one entry, no award given.)

There was a very large attendance, and amongst those present we noticed the president, Mr. J. Broughton Dugdale, on a powerful Serpollet, Mr. and Mrs. C. Dixon, Messrs. F. Lanchester, Alfred Herbert, J. A. Holder, E. M. C. Instone, Alfred Bird, and many others. Owing to the success of the meeting, it is highly probable that another competition will be held next month.

LEAVING A CAR UNATTENDED.

Nor often is a motor-car left unattended, although such is frequently the case with ordinary horse-drawn vehicles. Albert Holloway—a motor-car driver in the employ of the Folkestone Motors, Limited, has, however, been summoned for leaving his car unattended, to the common danger of the public, at Cheriton, on September 14th. Police-constable Strand said about 8.55 p.m. on September 14th he saw a motor-car standing outside the White Lion Hotel unattended. During the absence of the driver the car started across the road and collided with the water fountain. There were three or four passengers in the car when it started, but they jumped out behind. As this was the first case of the kind to come before the magistrates, they imposed a penalty of £2 only, including costs.

CLAIM FOR DAMAGES.

JAMES CHAPMAN ANDERSON, Bengal Civil Service (retired), 8, Aikenhead, Blairgowrie, sued the Hon. J. D. Logan, Dalguise Castle, in the Perth Small Debt Court for £1 2s. 6d. as loss and damage alleged to have been done to the pursuer's carriage in the High Street of Blairgowrie, on July 30th last, through defender bringing his motor-car close up on to the pursuer's landau, thereby causing the pursuer's horse to take fright and wheel round suddenly. The defender denied fault. The sheriff attributed the accident to a slip on the part of the carriage driver just before the automobile came on, and to some extent to an error of judgment in the car not being stopped soon enough. He absolved defender.

REFUSING TO STOP.

SHERIFF SYM, at Perth, has had to try a case in which Lord Cairns was the offender. He was charged with having on September 18th, on the public road leading between Perth and Murthly, near New Farm, failed to cause a motor-car which he was driving to remain stationary so long as might be reasonably necessary when signalled to by John Pettigrew, coachman, by holding up his hand. Mr. Walter Anderson, solicitor, said he was present for Lord Cairns, and wished to object to the relevancy of the complaint. Mr. Melville Jameson, Procurator-Fiscal, objected

to this, and the Sheriff held that Mr. Anderson had no *locus standi*. Evidence was then led. John Pettigrew, coachman in the service of Colonel Richardson, of Ballathie, said he was driving Colonel Richardson's daughter and her maid to the station, when near Lister's farm a motor-car, driven by Lord Cairns, came along the road. Witness's horse became restive, and he had great difficulty in restraining it. The car continued to come along at the same rate of speed, and although witness held up his hand twice to stop, Lord Cairns failed to do so, and passed him without slackening speed. The Sheriff imposed a fine of £5.

NO NAME ATTACHED.

MESSRS. MAYHEW, of 112, Church Road, Battersea, have been summoned for allowing a motor-van to be used without a name and address upon it. Police-constable 459 P said he saw the motor-van in Wastdale Road, Forest Hill, without a name. The driver told him the name of the owners. A fine of 20s. and 2s. costs was imposed.

AN automobile club is in course of formation at Cannes.

THE Rhenish Automobile Club is organising a hill-climbing competition from Heidelberg to Konigstuhl for the 26th inst.

THE Austrian Automobile Club will hold its third annual exhibition in March next.

THE American Consul at Johannesburg reports a brisk demand for automobiles in that rapidly-developing section of South Africa.

MESSRS. SKINNER AND CO., who have taken over some motor-cars running in Hastings, have just declared a dividend of 7½ per cent.

A PRIZE of 250 francs was offered by Mr. E. W. Hart, of Luton, to be awarded to the light car doing the fastest time on the hill in the recent Gaillon trials.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, OCTOBER 25, 1902.

[No. 190.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON Sunday morning the Earl of Dudley, the Lord-Lieutenant of Ireland, and Countess Dudley, accompanied by Captain Fetherstonhaugh and the Hon. C. Ward, with suite, arrived in Galway on a tour through the West of Ireland. A few local gentlemen were presented to his Excellency on the platform, and after luncheon in the Railway Hotel the company started for Oughterard, where they took the road by motor-cars to Cashel. At Cashel a halt was made for the night. Three motor-cars had been placed at the service of the Viceregal party, whose tour through Connemara has thus given them an excellent opportunity of seeing the conditions of life in the country districts.

The Tyre Trials.

SOME time will elapse ere results of the tyre trials can be made known. Since we last wrote on the subject the tests for detachability and resiliency have been completed, and now the tyres are to be forwarded to Professor Hele-Shaw for tests with the dynamometer and recording apparatus designed for the British Association. We understand that Mr. Midgley has reported to the Committee that he was unable with the set of tyres used in the trial to complete the few remaining miles which would make up the four thousand miles. He placed himself at the disposal of the Committee to undertake the resiliency, detachability and other tests, and they decided that, as he was not running for an award, he might be permitted to undergo the tests, which he did, in company with T1 and T6, over a rough piece of road in Regent's Park on Saturday last. In response to application from T1 the Committee have decided not to penalise that tyre (a Dunlop) to the extent of six marks on the occasion of a repair when there was no jack on the car and other help had to be improvised. This reduces the total marks lost by T1 from 102 to 96.

Motor Hooligans.

AGAIN we feel compelled to join issue with those of our contemporaries who seem to think the terms "motor ruffians" and "motor hooligans," to say nothing of "motor blackguards," fit epithets by which to designate the gentlemen who own automobiles. Motorists do not drive recklessly; they are not less human than other users of the road; and any wantonness on their part would be simply suicidal. Where the roads are clear of traffic they may—in fact they do—drive fast; but to say that they are a reckless class of people, heedless of other people's lives and limbs, is to charge them with insane folly and calculated to damage automobilism to an unpardonable degree. Burke declared in one of his speeches that an "indictment could not be brought against a whole nation," neither should attempts be made to fix a general charge upon a large body of gentlemen merely because some rural councillors have been alarmed at the quickened speed of locomotion on the

road. A close study of the evidence in the cases of alleged furious driving which have appeared in our columns from time to time affords proof that motorists are not reckless. Why, then, continue to use the offensive terms we have quoted?

The Yorkshire Automobile Club.

THE members of the Yorkshire Automobile Club again turned out for a run to Ilkley on Saturday, and, fortunately, the weather kept fine, although the state of the roads necessitated careful driving. The meet was at the pretty village of Burley-in-Wharfedale at 3 p.m., and amongst the arrivals there were noted: Mr. Kirk and Mr. Bolton, 16-h.p. Panhard; Mr. and Mrs. Jackson, 10-h.p. Daimler; Messrs. A. W. and A. Dougill and Mr. Walsh, 8-h.p. Loidis; Mr. Martin and Mr. Milner, De Dion; Mr. and Miss Armitage, 8-h.p. Korti; Mr. Mortimer, 3-h.p. tricycle; Mr. and Miss Burrows, 8-h.p. De Dion; Mr. Brookes, 2½-h.p. bicycle; and Mr. Hey and Mr. Lanchester. After waiting for the late arrivals for half an hour, during which time the party had been well looked after by a local constable—a general move was made for Ilkley, and the cars were drawn up at the Crescent Hotel. At 6 p.m. a start was made for home. At an informal meeting it was decided to arrange runs throughout the winter, it being the general opinion of those present that, providing the weather is fine, a winter run is as pleasant as a run in summer, and without the disadvantages of the dust.

Ten Days in Prison.

AT a meeting of the County Council of Perthshire, Mr. Andrew Hutcheson proposed a resolution in support of further legislation with regard to motor-cars, and in the course of his speech said he had received from Mr. Macpherson, the Chief Constable, a statement which pointed out the advisability of taking stronger measures for regulating the traffic, and Mr. Macpherson had expressed the opinion that ten days' imprisonment would be more beneficial than a £10 fine. The police, he thought, should be empowered to apprehend anyone and take him direct to the Sheriff. The statement mentioned that from December, 1901, to October, 1902, there had been nineteen prosecutions, and the number of cases reported had been forty-one. A committee was thereupon appointed to act with other Scottish counties in securing Parliamentary attention to the matter.

A Scottish Meet.

TO-DAY (Saturday) the members of both sections of the Scottish Automobile Club will lunch with Mr. W. S. Steel, of Philiphaugh, Selkirk. They will meet at the east lodge entrance at 12.45 p.m., and proceed in procession up the avenue to the house. At a meeting of the General Council of the Club it has been decided that Mr. Norman D. Macdonald, the present Chairman, shall act as Secretary *ad interim*, all correspondence being sent to him to 15, Abercromby Place, Edinburgh. Sir J. Miller, Bart., has been elected a vice-president, and Mr. R. J. Smith asks that members should make suggestions as to a suitable circular road route for the Gordon Bennett Cup race.

Automobile Clothing.

THE introduction of the motor-car has not found all tailors prepared with ideas for the production of new styles of garments; they have not had the experience necessary to adapt themselves at once to the requirements of the situation. A large number of orders have, therefore, been carried out by workmen who have had no other qualification than that they were accustomed to work with leather. Neither has it been an easy task for the ordinary cutter or master tailor to go a-motoring, and learn from actual experience the necessities of motor garments. The most successful makers of motor-car garments are those who have been accustomed to the cutting of sporting garments. Many of the garments are made from leather or material that will offer the maximum of resistance to the wind and rain. The speed at which some of the cars are driven makes it a necessity that the garments must be wind and water proof, or else the wearers would suffer seriously in health. Leathers used for making garments are usually submitted to a waterproofing process, and they are also lined throughout with a material which resembles a Witney blanket of cinnamon colour. Jackets, vests, and knickers or breeches are made of leather and lined throughout with woollen material or swandown calico. One of the main features in the designing and cutting of motor garments is to provide for the protection of the chest, neck, head, and ears. During the last exhibitions of motor-cars the "Tailor and Cutter" observed quite a number of garments being exhibited, and while leathers were being pushed very hard as the most appropriate class of material, our contemporary also noticed keen rivalry from the woollen makes of goods.

Motoring in Wales.

CAPTAIN D. HUGHES MORGAN is a keen motorist, and has been making some good trips in Wales on his 10-h.p. Wolseley car. In fact, since May last he has travelled 5,000 miles on the car and never once had to stop for any repair whatever—a tribute to the way in which his driver has overhauled the vehicle

CAPT. D. HUGHES MORGAN, J.P., ON HIS 10-H.P. WOLSELEY.

after each day's run. Given a good car and regular attention on the part of the driver, there is no reason why equally good records should not be universal. Captain Morgan made a trip to St. David's from Tenby, where his motor-vehicle was "stabled" for five weeks on very reasonable terms by Messrs. T. and H. Rees, of St. Julian Street, who intend putting down a pit for the use of motorists. He travelled from Tenby to St. David's *via* Haverfordwest, thus enjoying beautiful scenery and thoroughly testing the hill-climbing capacity of his car. Between Haverfordwest and his destination—a distance of only sixteen miles—there are seventeen hills, all of which were negotiated by the Wolseley car without incident.

The Conversion of J.P.'s.

ACCOMPANYING Captain Morgan (who is also a magistrate for the county of Brecon) on his car is Mr. Lewis Williams, J.P., of Brecon, who at one time was strongly in favour of the twelve miles an hour limit. But several trips on the car illustrated have convinced him as to the absurdity of the legal restriction—a conversion that leads to the suggestion that motor-car owners should take J.P.'s for runs wherever possible, so that they may be able to recognise the control that the driver can have over his car.

Mechanical Engineers and Motor-Cars.

RARELY, if ever, has the lecture-hall of the Institution of Mechanical Engineers' headquarters at Storey's Gate, S.W., had within it such a large assembly as came together on Friday evening, last week, on the occasion of Captain Longridge's paper on "The Oil Motor-cars of 1902." If the large attendance may be taken as any indication, it would seem that mechanical engineers as a body are at last beginning to realise that the motor-car is not merely a pleasure vehicle for the wealthy, but is something which will within a few years bring about a radical change in the ever-increasing traffic in all large centres. Here and there among the representative audience we noticed a number of familiar faces in the automobile world, including Major Crompton, Messrs. Worby Beaumont, Holroyd Smith, Lyons Sampson, C. T. Crowden, G. Iden, R. E. Phillips, H. G. Burford, and many others. After the ordinary business was over, the Secretary of the Institution was called upon for the paper; owing to its length, however, the bulk of it had to be taken as read.

The Oil Motor-Cars of 1902.

IN another part of the present issue we commence the publication of Captain Longridge's exhaustive paper. Before the discussion the author added a few remarks, drawing attention to the points on which he would particularly like criticism and discussion. Among these points were the development of the impulse-every-revolution motor; the use of steel cylinders in place of cast iron; the question of lubrication at high temperature, etc. The discussion itself was opened by Professor Turner, of Birmingham, who confined his remarks to metallurgical matters, first drawing attention to the unsuitability of white hematite for cast-iron cylinders. He then referred to the probable adoption of steel in place of cast-iron for this part of petrol motors. The Professor recommended the use of a steel containing only just sufficient carbon to give the desired properties, and considered that a steel having 15 per cent. of carbon would meet all requirements.

English Spring Makers Behind.

MR. FREDERICK GROVER, of Leeds, a well-known authority on internal-combustion engines, followed with a few brief results of tests he had made with regard to products of combustion, after which Mr. Geo. Iden, of the Motor Manufacturing Company, offered some interesting remarks. In the first place, he urged the members of the Institution to take more interest in the automobile industry, and to study its requirements. In this connection Mr. Iden related the difficulty he had experienced in obtaining, among other things, English-made springs for motor-cars, and how, after many trials, he had had to fall back on French-made springs, which were incomparably better than those of home manufacture. As regards steel cylinders, Mr. Iden stated that so long ago as 1897 he had experimented with these, as the result of which he favoured cast iron. The question of the success of cast-iron cylinder and jacket castings was largely a matter of design and suitable quality of metal. As indicating

this, he pointed out that whereas three years ago the failures in cylinder castings ranged from 16 to as high as 60 per cent., now they were not more than 1 per cent. With regard to the explosion-every-revolution motor, Mr. Iden considered that there will be great difficulty with the exhaust valves. Even with Otto-cycle motors this trouble had been experienced; he himself had found valves made of pure nickel gave by far the best results. At this point the Chairman (Mr. Maw) brought the meeting to a close by announcing that as so much interest had been evinced in Captain Longridge's paper, the Council of the Institution had decided to hold a special meeting on Friday evening, the 31st inst., when the discussion will be continued.

New Railway Regulations.

THE exclusive information we published last week with regard to the new regulations of the railway companies concerning the carriage of petroleum spirit was read with considerable interest by all motorists, and with alarm by not a few. The Anglo-American Oil Company, Limited, has now declared that "whatever may be the outcome of the railway companies' sudden resolution not to carry petroleum spirit, etc., except they are indemnified by the consignor against all loss and claims for damage of every kind, we refuse absolutely to accept the new consignment note in its present form. We are notifying all our customers of this fact, and we are informing them that for the execution of their orders in future it will be necessary for them to forward to us with each order one of the new consignment notes duly signed by them as the consignors. We do not recommend to them, however, to take the risk which they would certainly incur by so doing." Similarly, Messrs. Carless, Capel and Leonard have informed their customers that "as it must necessarily take some time before we can hope that the railway companies can be induced to reconsider their decision and withdraw Clause 2, and as in the meantime they will not accept the traffic unless the consignment notes are signed without alteration, in case you should be willing to take the risk of accepting Clause 2, we enclose a form which, until further notice, authorises us to sign the consignment note, and to pay the railway carriage on your behalf. We, ourselves, under no circumstances, will sign the note."

Safety in the Past.

No explanation of their new restriction on trade is offered by the railway companies, and from all we can learn the regulations previously in force have been amply sufficient, as is proved by the trifling losses that the railway companies have sustained during the past twenty-five years in consequence of this traffic. Such regulations have included the setting apart of special days for the reception of these articles; the providing of separate trucks for their carriage; the affixing to each package in a conspicuous manner of a label plainly stating the nature of the article, etc. Moreover, the rates of carriage for this class of goods have always been exceptionally high. There would seem, therefore, to be no substantial reasons why the railway companies should have adopted these additional and prohibitive measures, unless it is that they wish to thwart the advance of a likely competing interest.

Anticipating Matters.

In connection with this matter it is said—but we have had no opportunity of confirming the statement—that the King, having been informed of what was likely to occur, promptly gave an order for 400 gallons of petrol for his motor-cars, to be despatched to Windsor and Sandringham. The War Office also has given an order for fifty barrels to be sent to Aldershot for the purpose of carrying out some experiments with motor-cars. It is not only the owners of automobiles that will suffer by the dispute, for the prescribed inflammable liquids are needed for cleaning clothes and many manufactured articles, and consequently the outlook is decidedly serious.

Unattended Horses.

FOR leaving a horse and cart unattended at Westham a farmer has been fined 15s., and we would congratulate Mr. J. B. Coles, the motorist, who prosecuted, on thus administering a salutary lesson. There is too much neglect in this matter, and if motorists generally would bring actions against those foolish people who leave horses and carts unattended on the highway there would be considerably fewer cases of shying horses.

LA BELLE OTERO ON THE NEW 6-H.P. DE DION VOITURETTE.

Mr. Edge on Proposed new Racing Rules.

ON Friday of last week the Nottingham and District Automobile Club inaugurated their winter session with a dinner at which Messrs. S. F. Edge and Charles Jarrott were the guests. Mr. G. W. Wells (vice-president) occupied the chair, the company including Colonel L. L. Powell (Melton Mowbray), Messrs. M. R. Browne, W. H. Warburton, D. G. Cole, T. Hardstaff, A. F. Houfton, R. Harbidge, G. H. Kirk, H. Belcher, W. D. Wells, H. Rimington, J. Carson, A. P. Stevens, P. C. Mey, H. W. Bartleet, Clifford (Loughborough), H. V. Stevens, W. J. Dexter, and A. R. Atkey (hon. sec.). Mr. Edge referred to a new rule which French motorists are advocating with regard to racing, so that the weight of the frame without the body will have to be 1,000 kilos. That would mean that racing motorists in this country would be at a great disadvantage, for if the rules could be altered so quickly French makers would be able to alter the rules to suit the carriages which they were intending to construct in the following year, while the English makers had to keep well forward with the construction of their own machines, and would

thus be greatly handicapped. He intended to take the matter up, through the Automobile Club, and attempt to get the business stopped, on the ground of its unfairness. Rules should not be altered without at least twelve months' notice, as if the matter went through English manufacturers would not be able to make cars to compete with the French machines.

Trapping by Battery.

AT the Hailsham Petty Sessions a police constable has described the system adopted for trapping motorists. He was on special duty at the Dicker, timing the speed of motors with the new electric battery supplied by the County Council. A furlong of the road had been measured, and at one end a constable was stationed, witness being at the other end with the battery. The battery was connected by a wire with the constable, who when a motor passed over the point pressed the button, and started the watch, witness stopping it when the motor passed him. The motor-bicycle on which defendant was riding passed over the measured furlong, the electric apparatus was put into operation, and witness ascertained that the motor-bicycle covered the furlong in slightly over nineteen seconds—equivalent to twenty-three miles an hour. Sergeant Allchorn, who was at a point lower down the road, was signalled to and stopped the defendant.

Police Education.

IN view of the increasing number of vexatious cases in which well-meaning motorists are entrapped by the police, a correspondent suggests that the Automobile Club should arrange a series of trial runs with either the police themselves or those responsible for their present tactics, in order to demonstrate what is the real danger of motor driving so far as the public are concerned. To the uninitiated the idea of one travelling at twenty or thirty miles an hour is certainly somewhat alarming, but to one who knows what perfect control the cars are under the pace counts for nothing, provided, of course, that the road is clear and other users are not inconvenienced. The question of pace is one of education simply. All different modes of progression have encountered similar difficulty and prejudice, and in days to come we shall laugh at the grandmotherly legislation which limited the speed to twelve miles an hour on open country roads. Seeing that the effect of the education of the Chief Constable by the Club some time ago seems to have worn off, something of the same kind might be repeated in Surrey, where the police are doing very little real good by their present tactics. In confining their efforts to entrapping car drivers on main country roads, they are losing their opportunities of doing real service by stopping reckless men who drive fast through villages and round corners, where real danger exists.

Lacking Enterprise.

WHENEVER progress is made in any department of activity someone is almost certain to suffer. It was so when railways were introduced, as those interested in the turnpike roads could tell; and now, apparently, something of the same kind is occurring with regard to livery keeping. A Leamington stable keeper, who has just met his creditors, assured the meeting that since he had been in that town the use of motor-cars had so greatly increased that the demand for horses, either for purchase or hire, was much less than it had been. He could, he said, give the names of people who had purchased motor-cars to the detriment of his business. There is no doubt that isolated instances of this kind will be reported from time to time during the next few years; but it demonstrates that livery stable keepers should move with the times and be willing to turn a portion of their present stabling accommodation to account for the storage of motor-vehicles. If they would be wise in time and do this, there is no reason why any of them should appear in the bankruptcy court to lament their lack of enterprise.

In Ireland.

ONE of the oldest coachbuilding establishments in the town of Waterford is now occupied by Mr. W. F. Peare, who has developed an extensive business in automobiles in the district. The premises are complete in every department and not only can petrol cars be overhauled and repaired there but electric cars can also be recharged. On one of the upper floors is a club room at the disposal of visiting motorists, while above one of the spacious workshops Mr. Peare is providing a roof garden after the manner of the Automobile Club in Paris.

A Useful Suggestion.

ONE of the best things that we have seen in connection with foreign competition in the great trades of the country comes in the notice which has been issued to the workmen employed by Messrs. Vickers, Son, and Maxim, in their Barrow Works, inviting them to communicate to the firm any idea they may have tending to the economical production of the work on which they are employed. An awards committee has been appointed, and ten suggestions have lately been handed in. In six cases these have been adopted by the firm, and prizes of varying value have been given. The idea is not a new one, for it has long been in vogue in some of the leading ship-building yards in Scotland, but it gives a hint to some of our British makers of automobiles that might help them in meeting the competition from the Continent that they have to face.

A 7-h.p. Star car has been purchased by the Automobile Club for the use of that organisation.

THE Hon. T. A. Brassey employed a motor car in his election contest at Devonport.

AT the recent Sanitary Institute Congress in Manchester, Professor A. Sharp read a paper on "Municipal Motor-Waggons."

REPLYING to Sir Howard Vincent in the House of Commons, Mr. Walter Long has expressed his view that there is no probability of the Registration of Motor Vehicles Bill being proceeded with during the present session.

MESSRS. PETO AND RADFORD, LIMITED, have issued a new list giving full particulars and prices of the "P.M." system of electrical ignition, for which they are sole agents in this country.

THE annual display of the Metropolitan Fire Brigade took place in Victoria Park, E., on Saturday. Heading the procession of steam fire engines was the experimental motor-engine which has been designed and turned out in the workshops of the Fire Brigade.

THE Hydroleum Motor Company, Ltd., whose system of steam raising attracted so much attention at the exhibition at the Agricultural Hall in April last, have now taken works at Hythe Road, Willesden Junction, and are settling down to active operations. Users of steam cars will be interested in the Hydroleum system, as the company are supplying a crude oil at 2d. per gallon in quantities, which will, it is claimed, produce more steam per gallon than petrol or petroleum, and reduce the cost of fuel to one-eighth of a penny per mile.

DURING the recent military manoeuvres in Ireland, four motor-cars were in use—the Brooke, Gladiator, Napier and Panhard. The Duke of Connaught's Napier experienced a mishap, and while it was under repair his Royal Highness had a front seat on Major Nugent's Brooke car, Mr. Maudslay Brooke having the honour of being at the helm. Shortly after the Napier had been repaired a bad side slip disconcerted the front wheels of the Gladiator. The roads were in an abominable condition, being made with limestone and covered about 1½ in. thick with slime. The culverts were also particularly bad, especially in the Bog District, and the cars would sometimes leave the road entirely, all four wheels striking it together.

THE TRAPPER AND THE TRAPPED; OR, A LAND OF LAW AND EN- LIGHTENMENT.

BY MRS. MARY E. KENNARD.

(Concluded from page 645.)

THE following morning my husband went off with Brooks to find a blacksmith, as our governor hammer required a little attention. We stayed at the Metropole, and in his absence I whiled away the time by perusing a motor-car journal I had brought in my bag. The head chambermaid was a stout middle-aged woman of singularly officious temperament. She either could not or would not leave me alone. Possibly she did not wish to allow me to escape without a guerdon. Anyhow, she kept popping in her head and disturbing me by saying, "There is a reading room downstairs, madame." "Thank you," I rejoined. "I am quite comfortable here." The woman annoyed me as she continued to intrude. Presently she appeared at the door again. This time her face was wreathed in smiles, and she evidently

disgust. Was this England—the just, the free, the tolerant? For the first time in my life I blushed for my country and countrymen. Surely, it was monstrous in a civilised and enlightened land for a lady to be hounded in this manner. When harmlessly touring with her husband and staying at an hotel, she was rendered an object of suspicion. It appeared to me simply abominable. Yorkshire and its horsey squires had always been typical of hospitality in my mind hitherto. I never wished to set foot inside the county again after my treatment. Putting personal animus aside, however, the struggle clearly resolved itself into a duel between the jog-trot horse and every new form of locomotion. To me the question was simple enough. Was the horse for ever to retain sole possession of our highways, and bar the introduction of any swifter and more reliable mode of transit? Who could foretell the future? We might hereafter be conveyed from one place to another by undreamt-of methods, by unknown factors, much more rapid than the persecuted motor. Was every improvement, every invention to be tabooed because of the equine animal and his owner's fears about his behaviour? Personal cowardice was at the bottom of the whole problem. If drivers were sure of the steeds they drove between

MR. RANDLE KAY, OF LYTHAM, ON HIS NEW 12-H.P. DAIMLER (see page 668).

enjoyed revenging herself for my unresponsiveness. "There's a policeman downstairs as wants to see you," she said gleefully. "A policeman!" I exclaimed incredulously.

I descended the stairs, and found a burly constable who said my presence was required at the police-station for the furious driving of a motor-car. I could have kicked him, so great was my indignation and sense of injury. Of course I did nothing of the kind. As a matter of fact I followed him meekly. Thank goodness! at last one came across a sensible person. The head inspector was unshackled by the bonds of prejudice. I told him the number of hours we had been on the road and the exact time of our entry into Newcastle.

It so happened he had witnessed the arrival of the car. He informed me they had telegraphed on from Northallerton warning him to be on the alert, but I elicited in course of conversation that the offending car was brown in colour, whilst ours was painted blue and yellow, and it had passed through the village of Thormanby, whilst we had taken the Boroughbridge route. Electric trams were cutting about Newcastle in every direction, at much beyond the legal limit for motorists. I returned to the hotel in a high state of dudgeon. My sensations were those of utter

the shafts, we should soon hear very little about the danger to the public occasioned by mechanically-propelled vehicles. Nine times out of ten the public have only their stupidity to blame when accidents do occur. None but the motorist knows with what an inconceivable lack of intelligence our roads are used. Give the human animal sense as well as the equine and there would not be much trouble. But there lies the difficulty.

"Sir Charles" performed the remainder of the journey without falter or hesitation, and we arrived at our destination in safety, but with feelings considerably ruffled by our experiences, which had quite robbed the drive of its pleasure. Exactly a week after the date of our departure from home, my husband went to St. Andrews to play golf, and Brooks and I were entrusted with the responsibility of driving the car back to England. Well, perhaps it is fitting and right that Sabbath-breakers should pay the penalty of not going quietly to church, staring at their neighbours, and putting on their best bibs and tuckers. We left on Saturday, and Sunday brought us once more into the dreaded region of Northallerton, the scene of our former discomfiture. Very cautiously I crawled through the town, and not until we were well beyond its confines did I resign the helm to my com-

D

panion. I had driven most of the forenoon and was glad of a rest. When about ten miles from Northallerton we began to think we were safe, and congratulated ourselves on having passed successfully through the danger—I mean sneak—zone. A gentleman, riding a restive bay horse, delayed our progress. We pulled up for him to get by without an accident. The nervous rider dismounted and lugged his steed past "Sir Charles." He thanked us for our courtesy. This little episode at an end, we made a fresh start. Before us stretched a long, straight road, with not a human being in sight. Far as eye reached nothing was visible, save a solitary cottage situated at four cross roads. The gradient was slightly downhill, and a more favourable spot for speed could scarcely have been devised. We sped down it with glee. Alas! for our short-lived pleasure. We had momentarily forgotten the stealthy hunter set by a body of gentlemen to hunt down his own kind like vermin, exclusive of sex. All honour and

in thirty-four seconds according to our accusers, and remonstrance on our part was useless. I pointed to the clock on our dashboard, and intimated that the same gentleman who presented stop watches so freely to the police ought in fairness to give them also to poor, unoffending motorists like ourselves. But pleasantry and politeness were thrown away, especially if flavoured with a dash of truth. It was the old story. These men had strict orders to stop *every* car. They admitted as much, and alluded with pride to the bag made that very Sunday. They talked glibly of the public danger, but as there was not a living soul save our party on the road, their remarks failed to appear appropriate. In the end, we were allowed to proceed sorrowfully and indignantly on our way. All the dash was taken out of us for the time being. In its place remained a sense of burning shame, not for our own misdeeds, but for the folly, the deceit, and lamentable pig-headedness of our compatriots. I asked myself if it could possibly

THE PASSY-THELLIER FOUR-CYLINDER CAR, the winner of the Voiturette class in the Chateau-Thierry and Gaillon hill-climbing trials.

[La France Automobile.

glory to these brave, upright Yorkshiremen, who would be even greater heroes if they were not heroes in disguise! Just before we reached the cottage, out darted two policemen from its open door, and with stentorian voices and authoritative gestures commanded us to stop. We did so. Short of committing murder, no other course was open to us. To describe our disgust is beyond my pen. And now, appearing as it were from the bowels of the earth, a benevolent-looking, middle-aged gentleman clad in a big checked suit rode up on a bicycle. His face was one sparkle of a smile, and he showed his yellow teeth with a liberality which fascinated my attention. Snake in the grass! He, too, belonged to the fraternity. He produced a stop watch, and the inspector also produced one. They placed their heads close together and consulted. Then, in accents of triumphant assurance, these worthies pronounced their ultimatum. Twenty-five miles an hour was what they estimated our mad career to have been. Wicked, dangerous, illegal! We had covered a measured quarter of a mile

be right for a lot of slow-going old county magistrates to destroy the uprightness and *morale* of the police? Skulking, prowling, laying traps and ambushes is no fit work for honest men. The effect both on trapper and trapped is distinctly harmful. It engenders mutual distrust and suspicion, and lessens the esteem in which the public have hitherto rightly held the blue-coated upholders of law and order. The whole system is wrong, and not only wrong, but almost incredibly foolish; seeing that it serves no efficient purpose. The motorist who sins to-day will sin again to-morrow to a certainty, only with increased stealth and evasion; whilst his persecutor must necessarily deteriorate in character owing to the sneaky, mean, underhand nature of the work he is called upon to perform. Given a certain amount of concession on either side, and surely some more satisfactory understanding could be arrived at. Play the game fair, and if it must be war to the knife, at all events let the strife be conducted in an honourable, straightforward fashion.

CONTINENTAL NOTES.

BY AUTOMAN.

THE last echo of the Paris-Vienna motor-car race comes from the racing committee of the A.C.F., which has decided to disqualify all the motor-cycles in the event. It seems that the Arlberg was fatal to them all, and protests and counter-protests rained on the devoted heads of the commissioners. If all accounts are true, the local peasants and mountaineers and the horses also helped the two and three-wheeled vehicles to scale the Alps.

PENDING the decision in this matter the *Auto-Velo's* cup for regularity has been held over, and it is now awarded to the firm of Georges Richard, who made the best time with their two 10-h.p.

in France than any other living man, has found an ideal site on the road which runs from Saint-Arnoult to Dourdan (Seine-et-Oise), joining the two great roads from Paris to Bordeaux. At each extremity there is a wide place suitable for turning round. The road is excellent, and if it is not exactly as level as a billiard table, the inclination is only four ten-thousandths per cent. There is about 1,500 yards at each end to get up speed and slow down. There are no cross roads, and the road is thirteen yards wide. It is about 30 miles from Paris, and there is a railway station close by. It only remains for the A.C.F. to tar it in order to lay the dust, and put up posts for the kilometre and mile, and it will be as near perfection as possible.

THERE have been automobile races in Russia, to close the season, from St. Petersburg to Strelna-Gatchina and back, in

BEFORE THE RACE—WEIGHING THE CARS.

PREPARING TO START.

POLICE ANNOUNCING THE PASSAGE OF THE CARS THROUGH A VILLAGE ON THE ROUTE.

THE CARS AT PEZENAS.

THE CIRCUIT DE L'HERAULT.

voiturettes, driven by Georges Richard and Gaston Riviere, which accomplished the journey from Paris to Vienna in the total time of 57 h. 2 mins. and 30 secs. Gardner-Serpollet is next with 151 h. 13 mins. and 9 secs. for five cars, and Georges Richard is third with his three light 20-h.p. cars.

THE A.C.F. has taken up seriously the question of kilometre records on the road, apart from public competitions. It has long been evident that as the site of the record was left to the owner of the car making the trial, the records could not be considered as really serious, and now the A.C.F. has requested M. Tampier to recommend a particular kilometre to be used for this purpose. M. Tampier, who knows probably more about the roads

which about thirty cars took part. Most of them, however, broke down on account of the bad roads. The *Passe Partout* and its crew were present at the races. The following were the results:—

1. Surmetz on a 10-h.p. Georges Richard.
2. Barbay " " " "
3. Kapoustine on a "24-h.p. Panhard."

THE numbering of automobiles in and around Berlin is doing an irreparable harm to the trade in that part of Germany, and keeping hundreds of people from becoming owners of motor-cars. The proceedings, as far as the police are concerned, are reduced to the simplest expression. There is just a little red note-book in which the number of the car is jotted down, and the next morning

a police notice of one or many fines. The speed is simply left to the appreciation of the police.

FROM January 1st to August 31st of this year the value of motor-cars exported from France reached the enormous sum of £800,000, and there is no doubt that one million pounds will be reached before the end of the year, and the trade is increasing by leaps and bounds. All this is due to intelligent legislation which, whilst it has protected the pedestrian and the other users of the roads, has allowed road racing under proper conditions and under proper supervision. Road racing has been, and is still, the prime factor in the automobile industry. It has transformed in a few short years the ponderous, underpowered, ugly Daimler (whether of German, French, English, or Belgian make), with its 300 to 400 lbs. weight per horse-power, into the smart Panhard, Mer-

THE CIRCUIT DE L'HERAULT—MAP OF ROUTE.

cedes, or Mors, with only 50 to 60 lbs. weight per horse-power, and the improvement is not nearly complete yet. It must not be imagined that this reduction in weight per horse-power is to the detriment of the solidity of the vehicle; all those who have predicted such a result have been hopelessly wrong, and it is unquestioned that the average car of to-day is much more able to resist the wear and tear of the road, and costs much less in repairs, than the car of two years ago.

THE easiest way to sell a motor-car now a days is to say that it is just exactly like the Mercedes. A most amusing instance of this occurred to me only a few days ago. I happened to be in a French provincial town one evening when a motor-car put up for the night at the principal hotel. The car shall be nameless. The driver invited me to inspect it, telling me that it was a copy of the Mercedes. The first thing that struck me was the radiator, which was of the usual form, and I remarked that it was not a Mercedes honeycomb radiator, to which came the reply, "Oh, no, but everything else is the same." Passing on to the motor, I said, "Of course the valves are mechanically worked," and was surprised to learn that the inlet valve was worked by suction. Finding the change of speed gear to be of the usual Panhard type, I ventured to ask where the similarity with the Mercedes came in, but when I was told that it was the Mercedes frame, which is, of course, angle iron, and found it to be "bois arme," I thought the cup was full, but it was not, for my friend started the engine up and I heard it cut out with a fine Panhard "vrrum, vrrum," and then he assured me that that was the new Mercedes throttle governor.

ON Thursday, October 10th, the competition known as the "Circuit de l'Hérault" took place under the patronage of the

Society for the Encouragement of Agriculture. The points which counted in the trials were the following:—

Consumption of alcohol	10
Regularity of running	8
Hill climbing	5
Comfort and elegance	5
Speed for a kilometre	2
	<hr/>
	30

The distance to be covered was a little over 100 miles, from Montpellier to Lodève, Lodève to Cette, and Cette back to Montpellier.

OUT of twenty-one entries there were fifteen starters. The weather was most propitious, and the spectators were very numerous all along the roads. The following are the results and awards:—

I.—CARS UNDER 700 KILOS.

Maker.	Consumption in cubic centimetres per kilometric ton.	Speed, kilometre.	Percentage.
SILVER GILT MEDAL AND 400 FRANCS.			
Peugeot...	83.7	51	22
SILVER GILT MEDAL AND 250 FRANCS.			
Automotrice ..	91.2	43.300	18
SILVER MEDAL AND 150 FRANCS.			
Renault Freres ..	106.5	46.500	16
SILVER MEDAL.			
Darracq...	114.9	64.500	13
Darracq...	105.2	40	11
Gladiator ..	123.800	64.280	8
BRONZE MEDAL.			
Gladiator ..	116.800	53.400	6
Georges-Richard ..	108.600	30.200	4
Clement ..	100.8	38.700	2

II.—CARS OVER 700 KILOS.

SILVER GILT MEDAL AND 400 FRANCS.			
Bardon ..	68.4	35.140	40
SILVER GILT MEDAL AND 200 FRANCS.			
Brouhot ..	99	81.400	25
SILVER GILT MEDAL AND 150 FRANCS.			
De Dietrich ..	105.600	43.500	20
WORK OF ART.			
Gladiator ..	109.200	75.600	10
SILVER MEDAL.			
Peugeot..	118.500	53.500	5

THE delivery wagon competition organised by the A.C.F. has been definitely fixed for November 20th to 26th. The entrance fee is 200 francs, and must be sent to the A.C.F., Place de la Concorde, Paris, on or before November 5th, after which date it will be increased to 300 francs.

THE Holborn Viaduct was originally the centre of the motor industry in the metropolis, but it was soon seen that the trade was one for the West End. At present there are only two distinctly motor firms on the Viaduct, and these, we understand, will shortly be removing—the Motor Manufacturing Company, Limited, to Bond Street, and Messrs. Friswell, Limited, to Portland Road, where they have acquired the spacious premises known as the Albany Repository.

PUNCH has been studying rural police methods, and in the current issue has three cartoons on the situation. In the first we have the contempt of the policeman for the rapidly-approaching horse-drawn vehicle; in the second his nonchalant treatment of the cyclist speeding along at a good pace, and in the third, a picture of a dejected motorist who is being towed by a horse, expostulating with the bucolic Robert, who retorts, "Tain't no use tellin' me you've broke down! Stands to reason a motor-car goin' down 'ill's bound to be goin' too fast. So we'll put it down at about thirty mile an hour. Your name and address, Sir, hif you please."

MOTOR-CYCLING NEWS.

A USEFUL little booklet containing practical hints on building a motor-cycle and keeping it going, with special reference to the Fafnir motor engines, has been issued by the British agents, Messrs. Straus and Co.

THERE is talk of a motor-bicycle contest in New Zealand at an early date; the Oamaru-Christchurch course (112 miles) is spoken of as the most suitable, and already a number of New Zealand motorists have notified their intention of competing.

THE W. A. Lloyd Cycle Fittings Company, Limited, are putting a motor-bicycle set of fittings on the market for next season, which will include an engine of their own manufacture. The new 2-h.p. motor comprises some novel features, chief of which is a very simple form of electrical make and break.

IN a case at Exeter, in which the defendant was summoned for ill-treating a dog, it came out in evidence that the animal in question had been running after a motor-bicyclist. The defendant thereupon struck the dog, and an action was brought. This was dismissed, the magistrates apparently recognising that dogs must be educated to good behaviour in the public streets.

WITH reference to the controversy between the London agents for the "Minerva" and the "Kolecom" motors, we have received a letter from the Ormonde Motor Company saying that they do not intend to follow up the challenge made to Mr. Citroen for a match with the engines used in a recent Continental race, as it is now too late to carry it out on the conditions originally suggested.

SUNDAY runs will be held by the Motor Cycling Club, Ltd., throughout the winter, the routes being chiefly in a northerly direction from London. The next four runs will start from the Marble Arch at 10.30 a.m., the destinations being as follows:—To-morrow, to Hitchin, calling at the Salisbury Arms at Barnet at 11.15 a.m.; the 2nd prox. to Aylesbury *via* Harrow Hill; the 9th prox. to Bishop's Stortford *via* Barnet; and on the 16th prox. to Buntingford. Should the Club membership in the southern suburbs increase, runs will also be organised to towns south of the Thames.

THE Motor-Cycling Club run on Sunday last took a dozen enthusiasts to Barnet. Before leaving that place it was mutually agreed to change the destination from Dunstable to Wheathampstead, as better roads were anticipated by the latter route. Ten sat down to lunch at the Bull, Wheathampstead, including the captain, Mr. E. Arnott, Messrs. J. van Hooydonk, Wyers, Burley, and Page. The return journey was made *via* St. Albans. The roads after Hatfield on the outward journey were really very good, but the road to Barnet and Hatfield out of London could not have been worse; the grease was terrible, and this, combined with the heavy fog which hung over London up to about 11.30 a.m., had its effect on those riders who prefer either butterfly conditions for riding, or bed. There was not a single side-slip during the day, though in ascending Barnet Hill the grease was so bad that the back wheel of Mr. Arnott's Werner, owing partly to the extra weight of the trailer, occasionally revolved without gripping the road or propelling the machine.

PARTICULARS of the 1903 models of motor-bicycles of different makers are coming to hand at a rapid rate. The Quadrant Cycle Company are bringing out a new machine, in which they have adopted a curved frame, the engine being fixed in an inclined position in the centre of the bottom tube. The mechanism is controlled, as in the earlier pattern, by a single lever, which performs every function except oiling and regulating the mixture,

the air lever being fixed on the opposite side of the top tube. The "single lever" makes the electrical connection, opens the inlet valve, closes the compression, and regulates the spark. The principal improvement in the motor consists in a new contact-breaker, for which it is claimed that no adjustment is required, the wear being taken up automatically. The trembler is abolished, and its place is taken by a right-angled rocker. The company have also got over the difficulty of oil escaping from the crank chamber, so that the outside of the case is free from all grease and dirt and the driving belt is also kept free from oil. Two varieties of engine are being made, one giving 2-h.p. on the brake, and the other 3-h.p.

AT Dublin on Saturday last the Irish Motor Cycle Union held its first race meeting at the Ashtown track. The ground was sodden after recent rains, and the corners proved greasy, so that fast times were impossible. In the two races a Phoenix

MRS. LODER ON HER "IVEL" MOTOR-BICYCLE.

proved itself by far the fastest machine, and, being steered by a racing man skilled in negotiating dangerous corners, it secured a runaway win in each event. The handicaps proved totally inadequate, though they were scientifically framed. Very interesting results were gleaned from the consumption trial. A 1½-h.p. Ariel with a pint of petrol accomplished over 21 miles at a minimum pace of fifteen miles an hour. This works out at 168 miles to the gallon; but these figures are not quite correct, as darkness set in ere the pint had been worked off completely, and the machine looked good for a few miles more when the judges ordered it to stop.

PREVIOUS to this event considerable excitement was caused by a portion of the cinder track suddenly taking fire. Some competitors, in preparing for the consumption trial, had emptied their carburettors on the track, and on this a lighted match had been dropped. Consternation reigned for a few moments, whilst the quick darting flames sought out everything which flavoured of petrol. Cans and measuring instruments were dropped forthwith, and it was only by determined efforts on the part of their owners that several cycles were snatched from the flames. The results were as follows:—Ten miles handicap: (1) R. W. Stevens (2¼-h.p. Phoenix), 310 yds.; (2) H. A. Huet (2-h.p. James), 1,368 yds.; (3) M. Thomas (1½-h.p. Excelsior), 1 mile 476 yds. Winner's time, 20 min. 45 4-5 sec. Twelve started. One Mile Scratch:—(1) R. W. Stevens (2¼-h.p. Phoenix); (2) H. A. Huet (2-h.p. James); (3) J. J. Cahill (2-h.p. Mitchell). Time, 2 min. 12 3-5 sec. Won by thirty yards. Consumption Trial—(Each machine allowed one pint of petrol. The minimum speed to be fifteen miles per hour):—(1) M. Summers (1½-h.p. Ariel), 21 miles in 58 min. 36 sec.; (2) H. A. Huet (2-h.p. James), 14½ miles in 41 min. 32 sec.; (3) F. A. Wallen (1½-h.p. Excelsior), 13¾ miles in 38 min. 15 sec.

MOTOR-BICYCLE FORE-CARRIAGES.

HEREWITH we illustrate (Fig. 1) an attachment known as the Trimo, which is being introduced by Mr. J. Van Hooydonk, of the Phoenix Motor Works, Upper Holloway, for converting a motor-bicycle into a three-wheeled machine for two persons. The advantages over a trailer are obvious—both occupants are within speaking distance, the passenger is out of

FIG. 1.—THE "TRIMO" FORE-CARRIAGE.

the dust, mud, and smell; while the machine having but three wheels only a 15s. license is required, and, furthermore, the six-mile-an-hour trailer limit is evaded. The machine may be compared to a quad, but it scores over this type on account of its lighter weight, $1\frac{1}{2}$ cwt., complete, as against 4 cwt. or 5 cwt.

Referring to the illustration, it will be seen that two special steps are screwed on the back hub spindle, from which two curved $1\frac{1}{2}$ in. tubes run right to the front of the machine, where they are joined by another tube of the same dimensions, this forming the bridge, and terminating in two ball heads. To the latter the hub spindles are fitted, and the extensions connecting the two wheels together with a $\frac{3}{4}$ in. tube. The moving of the handle-bar by suitable connections imparts the required steering motion to the front wheels in exactly the same way as on a car. On the head tube of the bicycle a clip is fixed, to which, by means of two bolts, two stay tubes are attached; the latter terminate in a pair of lugs brazed on to the two curved main tubes, and so supporting

FIG. 2.—THE "LEONARD" FORE-CARRIAGE.

the front portion of the machine on to what is really the frame of the whole carriage. The two main tubes being 4 ft. 6 in. each long, and the front part of the machine resting on them, these become to all intents and purposes a gentle spring, with the result that even the roughest roads are claimed to lose all their objectionable bumpiness. The front seat is attached to the machine by a couple of C springs; the seat is thus insulated from the frame, with the result that no vibration is apparent.

The body shown in the illustration is merely an experimental one; a roomy well-upholstered carriage body will be fitted, with a leather apron to protect the passenger from the wind, etc. To alter the Trimo into a bicycle, or *vice versa*, takes but little more time than that occupied in attaching a trailer. The two nuts on the steps on the back wheel are unscrewed, two bolts are taken out of the clip round the head of machine, and the spindle on front forks slid out of the hollow distance piece. The whole then comes away, and only the front wheel has to be replaced to complete the change.

The machine described has been run about 200 miles, with a 2-h.p. Minerva engine has attained a speed of twenty-five miles an hour, and has climbed Barnet Hill with two persons up. It is intended, however, to use a $2\frac{1}{2}$ -h.p. motor as the standard, so as to have plenty of power available.

Fig. 2 represents still another front carriage arrangement intended for converting a motor-bicycle into a two-seated motor-tricycle, which is being introduced into this country by Mr. J. J. Leonard, of 107, Brockley Grove, S.E. The front carriage can be quickly attached to any type of motor-bicycle; it is of French manufacture, and as it is being put on the market at a relatively low price, it should soon become as popular as the trailing car; particularly, as pointed out above, it gets over the six-mile-an-hour difficulty and requires only a 15s. license.

THE WILSON AND PILCHER PISTON RING.

THERE would not seem room for much inventive genius in connection with the piston rings of petrol motors, but Messrs. Wilson and Pilcher have brought out a new device which appears to possess some merit, the object of the arrangement being to render the split in piston rings gas-tight

without affecting the elasticity of the same. From the sketch it will be seen that the split in the piston ring is of a special shape. A tongue piece, B, is provided at its centre with a projecting piece C, which fits in the corresponding recess in the piston ring; one end of the tongue-piece has a turned-over projection, D, which fits in a small groove formed in the piston body to receive it. The tongue-piece ensures a gas-tight ring, even when the latter is worn, and at the same time prevents the ring from turning on the piston.

MESSRS. JOHN BROADWOOD AND SONS, LIMITED, the pianoforte makers, have a light motor-van on order, specially intended for their particular work.

THE TREATMENT OF CLUTCHES.

THERE are still quite a large number of people who prefer to have a belt connection between the engine and the gear-box on their cars because "clutches are such an awful nuisance, you know." It is certainly true that very often clutches are a great nuisance, but the trouble may usually be traced, either to the fact that the driver does not understand how to use and adjust his clutch, or that the clutch is of inferior design and construction. Generally speaking, the driver is at fault, and makes matters worse by treating his clutch with various compounds, all of which are more or less detrimental to its life and wearing, though they may remedy the trouble for a short time. Clutches may roughly be divided into two classes. 1. Leather-faced clutches. 2. Metal to metal clutches. And these two classes may be subdivided as follows:—Leather clutches (i.) The ordinary cone clutch. (ii.) The expanding type. Metal clutches: (i.) The ordinary cone type. (ii.) The expanding type. (iii.) The coil or spiral type.

Let us commence with the leather clutches and consider their troubles. In nearly every case it will be found that the trouble is either—(i.) The clutch is very fierce and engages with a violent

touches the surface can be made even and the leather will touch evenly all round.

So much for fierce clutches, and now the next and most common complaint comes, viz., the clutch slips. This may be due to want of adjustment, and consequently remedied by tightening up the clutch spring and the thing is done. Very often slipping is due to the presence of grease, oil, etc., on the leather, in which case the leather should be well washed with petrol and slightly roughened with a rasp, and adjusted up a little by the spring. A light tin screen should be placed between the clutch and the gear-box from where the oil usually splashes. Of course, if the leather is badly worn and fired, there is only one remedy, and that is a new clutch leather. The latter gets badly burned by injudicious driving, such as slipping the clutch continually on the high speed on a hill, instead of changing on to the lower speed. Beware of putting resin and other concoctions on the leather of a clutch: the cure by such agents as resin is only temporary and very detrimental to the leather, and resin, it should be noted, has the unfortunate property of becoming heated by the friction, and consequently sticking up the clutch so that it cannot be withdrawn when required! Beware also of having a car washed

A RAIL RING TRACTOR HAULING EIGHT WAGONS (*see last issue*).

[Der Motorwagen.]

shock, or (ii.) The clutch slips badly and at times refuses to drive the car at all. Now a fierce clutch is generally due to very new leather which has not been treated with castor oil to make the leather pliable, as all new clutch leathers should be; or, again, it may be due to the fact that the male cone does not engage truly with the female—that is, the leather only bites in certain places. As above stated, the first trouble may be remedied by castor oil. The clutch pedal should be depressed and the oil laid on lightly with a small brush; it will be found that the fierceness will very soon disappear, owing to the leather becoming pliable, and as soon as the fierceness has worn off it will be advisable to slighly tighten up the clutch spring. As regards the clutch which does not engage truly, this is a more difficult matter to deal with, as it means taking the clutch right down and truing up the leather; if, however, the latter is only very slightly out of truth, the cure may be effected without taking the clutch right down: the connections must be undone, the spring removed, and the male cone pulled back; then, by turning the male cone round in the female portion it can be seen where the leather touches; by gently rasping the spots where the leather

when the clutch is held out by the hand-brake, as the effect of water upon the leather is by no means good.

Passing on to metal clutches, there is not much to be said, as the only method of treating these till actual wear sets in is adjustment. It should be noted, of course, that oil will cause slip, which may be cured by washing out the clutch with petrol and fitting up a metal shield as described above. A word about the coil clutch. This type of clutch, as used on the Mercedes cars, depends for its grip upon a steel spiral binding upon a sleeve. The idea may well be illustrated by winding a clock spring up round the finger until it binds tight upon the latter. It will be seen, therefore, that oil on this type of clutch is necessary, or there may be some difficulty in releasing it.

R. A. C.

ENCOURAGED by the success of their car in the recent Reliability Trials, the White Sewing Machine Company now proposes to build a racer, in the event of the United States sending a team to compete for the Gordon Bennett Cup next year.

HERE AND THERE.

PROFESSOR HELE-SHAW will give the Juvenile Lecture at the Royal Institution this year, taking as his subject "Locomotion."

THE ROAD CARRYING COMPANY, LIMITED, have twelve 12-h.p. Daimler cars on order, the first of which has been sold to Mr. Randle Kay, of Lytham, who is shown on his new car in the photograph reproduced on page 661.

THE SHIP INN, PORLOCK.

THE 1903 Darracq light car will have a 12-h.p. motor, with a governor acting on the admission. Three speeds forward and a reverse motion, all controlled by a single lever, will be available, while a number of minor improvements are also being introduced.

THERE is a possibility that the Baker electric "torpedo," which was the cause of a fatal accident in the United States a few months ago, may shortly be seen in France, as the owners are anxious to put it through a series of speed trials on a straight level road.

THE English and Irish agency for the Delahaye cars has been placed in the hands of Mr. H. T. Cheswright, 73, Queen Victoria Street, E.C. The latest Delahaye has the engine in front under a bonnet, the connection between the motor and the change gear box being by means of a long belt. The single-cylinder car is of 8½ to 9-h.p., and the double cylinder one 13½ to 14-h.p.

IN regard to the future work of the Liverpool Self-Propelled Association, we learn it is possible that a trial of motor-vehicles for heavy traffic will be held a clear twelve months after the passing of the proposed new Act, should it become law during the 1902-1903 Session of Parliament. In regard to pleasure carriages, it has been suggested that a speed contest should be organised by the Association early next year over a course in the neighbourhood of Liverpool.

CONSIDERABLE interest is being shown in the new 6-h.p. De Dion light car with motor in front. In general arrangement it is practically the same as the present 8-h.p. car with two-speed gear, but made considerably lighter, the 8-h.p. car weighing 12 cwt., and the new 6-h.p. only 7 cwt. It is provided with a two-speed gear with expanding clutches on the well-known De Dion principle, connected direct on to the differential and driving the rear wheels by Cardan axles. The engine has a valve regulator, actuated by the foot as well as by a handle on the steering column. These cars are made in France as a standard without reverse and with wire spoke wheels, but for the English trade it is intended to fit a reversing gear, and to use artillery wheels.

OUR Dumb Friends' League is urging that the roads in Westminster should be sanded—in the interests of motor-cars as well as of horses.

OUR congratulations to Mr. E. H. Arnott on his recent marriage. Appropriately enough, he went for his honeymoon trip on a motor-car.

A MOTOR-CAR is the principal feature in a case about to come before the Irish Courts, in which two military motorists figure as plaintiff and defendant respectively.

A RESIDENT of Westerham has just driven a Belsize car over the same course up the hill as was used in the Reliability Trials. He accomplished the climb in 3 minutes 28 seconds.

THE HON. ARTHUR STANLEY, M.P., has asked the Prime Minister to appoint a Departmental Committee to prepare evidence with regard to the condition and regulation of roads, which shall afterwards form the basis of reference to a Royal Commission.

REMINISCENCES of pleasant holidays are constantly crowding upon the motorist, whose capacities for seeing the country are so much superior to those of the ordinary individual. A new guide to Weston-super-Mare, Cleveland, Minehead, and the Somersetshire coast, issued by Mr. E. J. Burrow, of Cheltenham, under the auspices of the Councils of those places, calls to memory many happy days in that country of beautiful landscape and healthy atmosphere. Weston is reputed to have the lowest death-rate of any seaside resort in the kingdom. Clevedon's green-clad cliffs were described by Tennyson in language that will never fade, and nestling under the North Hill, on the borders of Exmoor, is Minehead, which is rapidly developing into a first-class watering-place. All these places are described and pictured by Mr. Burrow in a guide that is at once reliable and interesting. Minehead is a splendid centre for the holiday-maker. The town itself came into prominence among motorists in the autumn of 1900, when a 16-h.p. Napier car achieved the distinction of being the first automobile to ascend the steep Porlock Hill in the vicinity. Porlock village is about six miles to the west of Minehead, and is a picturesque little hamlet, as may be imagined from the accompanying illustration, reproduced from Mr.

THE PARISH CHURCH, MINEHEAD.

Burrow's guide book. All around are equally delightful old-world scenes. There is Dunster with its high-perched castle and quaint old yarn market, while its church is unique within a twenty-mile radius by reason of its central tower, which has weathered the storms of five centuries. Verily the Minehead country is one that we love to recall, and one to which motorists should journey whenever they contemplate going westward.

MR. A. JOYNES, of Leamington, has been fined 5s. and costs at Warwick for driving a motor-car without a red light in the rear.

MRS. EDWARD KENNARD has written a story which Messrs. Hutchinson will issue under the title "A Motor Maniac." As this indicates, motoring has a conspicuous place in its pages.

UNITED MOTOR INDUSTRIES, LTD., are introducing on the English market an improvement on what is known as the Aster type of commutator made by Messrs. Basse and Michel. As will

be seen from the accompanying illustration, a glass window is fitted in the aluminium cover, so that the platinum points can be seen making contact, a convenience which will be readily appreciated. The commutator is all ready for placing on the dashboard if so desired. Of course it is nothing new for commutators to be placed on the dash and to have a glass front, but hitherto this has had to be done specially, and has been a rather costly job. Now that the thing

is standardised, it only means a few shillings instead of several pounds.

SPEAKING at the annual buck feast at Andover, Mr. E. B. Faber, M.P., has been advocating the numbering of motor-cars and the licensing of their drivers. After a man had been fined three or four times for reckless driving he should have a term of imprisonment.

ON the premises of the Bradford Motor-Car Company at Bradford, Mr. Albert House, the manager of that enterprising concern, has held the third automobile auction of the season. There was a large attendance, dealers and buyers being present from Leicester, London, Stockton, Newcastle, Manchester, and York, and the prices obtained were very good. A Minerva bicycle realised £21 10s., a 2-h.p. Humber motor bicycle, £35, an 8-h.p. Darracq car £155, a Sirene £125, and altogether forty-eight lots were offered.

RICHMOND BRIDGE has been the subject of a somewhat heated discussion in the Richmond Town Council. The old bridge was built in 1777. To reach it from the heart of the town a long gradient, in parts of one in twenty-nine, has to be faced in Hill Street, and then at a sharp angle the road dips downward at one in sixteen, to rise again nearly as steeply to the crown of the bridge, a long slope leading down on the other side. The roadway is but 16 ft. 8 in. wide, and the footpaths are narrow in proportion. A proposal that the County Councils of Surrey and Middlesex should be approached with regard to rebuilding has been postponed.

AMONG those who enjoy the pleasures of motoring will be found many a lover of Nature in her varying moods. No other travellers have such opportunities of enjoying the countryside as the men and women who, scorning railways and neglecting the pains of travellers by foot, speed along our roadways revelling in the changes of the landscape that they pass. Such will appreciate "The Country Month by Month," which has been written by Mr. J. A. Owen and Professor Boulger, F.L.S., and published by Messrs. Duckworth and Company. This is really a new edition of a popular and useful work, and has the advantage of some notes by the late Lord Lilford. The authors are observant writers, and here we have the results of their study and attention arranged in a way that facilitates reference by those who wish to know something of what they see month by month in the country. A valuable and accurate index adds to the value of the work, which must be regarded as "a boon and a blessing" to all town dwellers anxious to become acquainted with the diverse features of rural England.

MOTOR-CAR races are just now a very general feature at country fairs in the United States.

MESSRS. J. H. WINTER AND CO., electrical engineers, are about to open a new depot at Merchant Street, Bristol, for the repair and storage of motor-cars.

ON Tuesday Mr. Stanley Spencer made an airship ascent from Blackpool. He descended at Alnes Walton, three miles from Leyland—a distance of twenty-six miles from the start.

MESSRS. G. T. RICHES AND COMPANY, of 4, Gray's Inn Road, Holborn, London, W.C., inform us that they have been appointed sole distributing agents for "Plaxine." Although the liquid has only been on the market a short time, it has rapidly come to the front for restoring greasy clutches, brakes, or belts to their original gripping capacity.

MR. WALLACE BENTLEY'S *Machine Shop Companion* (the Bentley Publishing Company, Halifax), has now reached a second edition. It is a useful little handbook, intended to supply engineers and mechanics with simple notes, rules and tables to enable them to solve some of the problems which arise in their daily occupation in the workshop. Motor-car repairers will find much in the little work that should prove of service to them in the various jobs they are called upon to undertake.

THE White Sewing Machine Company is preparing to place on the market a new steam delivery van. A number of these vehicles are under construction, the first two taking part in the New York-Boston and return endurance contest. The vehicles have a carrying capacity of about 14 cwts. of packages. They are equipped with a flash boiler somewhat larger than the one in the phaeton, and the engine—8-h.p.—is correspondingly larger. A London depot for the sale of the White steam cars has now been established at 19, Prince's Street, Westminster.

THE illustration herewith shows the Bell odometer, which has recently been put on the English market by the Automotor Accessories Company. The apparatus is not only an odometer, but is also a mileage timer, as it is fitted with a bell which can be made to ring at every mile or every kilometre, as desired. It can be attached to the front wheel or on to the dashboard of a motor-car where it can be seen and heard at all times by the driver, who thus can, with the assistance of a motor clock or his watch, figure the time required to cover each mile. The odometer can be

fitted to any kind of wheel, attachments being made for the various standard sizes. It is made in a variety of forms; model A records up to 1,600 miles and repeats. It contains three indexes, each of a different colour; the red index registers a mile every time it makes a complete revolution and rings the gong; the yellow index registers every forty miles, each division representing one mile, while the blue index shows the total distance covered up to 1,600 miles.

OIL MOTOR-CARS OF 1902.*

By CAPTAIN C. C. LONGRIDGE.

IN offering this paper, the author does not wish to burden it with details, but rather to advance for discussion debatable points in the principles of construction embodied in the latest cars.

Types of Motors.—With very few exceptions, petrol car engines are of the vertical single-acting Otto type; variations where made consisting chiefly of horizontal Ottos, or more often horizontal motors, in which one cylinder contains two pistons, between which explosion takes place, such as the Koch, Gobron-Brillie, Pretot, Hyler-White, Lucas, and a number of others. There are, therefore, two prevailing positions and two classes of engines. As regards position, the vertical is far the more common. From the standpoint of the automobile engineer, the case stands thus:—Advocates of vertical fixing assert better accessibility and adaptation to the usual method of drive; those of the horizontal claim less vibration, lower centre of gravity, easier lubrication, and room for a longer stroke—a requirement for the use of alcohol and heavy oils. In America, there is a tendency to adopt the horizontal position, and it is not unlikely that Europe will follow suit. Between the types of engines the comparison stands thus: Simplicity and probably economy lie with the single-acting Otto; greater smoothness of running with the one-cylinder two piston type. From the persistency and extension of its use, it is clear that manufacture consider

A PICTURESQUE VIEW NEAR TOLEDO, OHIO.

[Automobile Topics.]

this latter advantage to more than compensate for increased complication, which, after all, in these small motors, is not so great. The author himself holds that neither type is going to stay. The ultimate evolution will be the impulse-every-revolution engine. The aim of manufacturers is obviously towards elimination of change-speed gear by increasing the flexibility or elasticity of the motor. The car explosion motor has to be more and more assimilated to the character of the steam-engine. To this assimilation there is only one successful road. To obtain steady running from the highest to the lowest speed, impulse must be multiplied; and as the number of cylinders is limited—the fewer the better—recourse must be had to the impulse-every-revolution motor. In this belief, the author has recently patented an engine in which impulse in every cylinder is obtained at every revolution. The cycle is exceedingly simple, and as high compression is used efficiency and economy should result. The motor consists of two, or multiple of two, side-by-side cylinders, closed at both ends. The rear end forms the compression chamber, in which explosion takes place; the front end is an air-receiver. The front end or air-chamber of each cylinder is connected by a pipe or passage to the rear end or compression chamber of the other cylinder. This tube or passage is provided at both

ends with valves, and serves to transfer air from the air-chamber of the one cylinder to the compression chamber of the other. The compression chambers are provided with ample exhaust valves, and the air chambers are fitted with automatic inlet valves. All other valves are mechanically operated. The oil, atomised by a small compressed air-jet, is fed, under control of the governor, into the combustion chamber, at the end of the compression stroke. The action is as follows:—Assume the piston in No. 1 cylinder to be at the end of its compression stroke, and that in No. 2 cylinder at the end of its working stroke. The front of No. 1 cylinder is full of air; the rear of No. 2 cylinder is full of burnt gases. The compressed charge in No. 1 is now carburetted and fired, the piston advances, compressing the air in front; the piston in No. 2 retreats, expelling the waste gases. At about half-stroke, the exhaust valve in No. 2 is closed, and simultaneously the inlet valves (one at either end of the inlet tube) are opened, and the full charge of air, already under compression, is pumped from the front of No. 1 cylinder into the compression chamber of No. 2. On the completion of the No. 2 cylinder compression stroke, atomised oil is injected (the Diesel engine illustrates the method) and is fired; at starting, by the electric spark, and afterwards, perhaps, by hot surface contact ignition, oil injection can be effected at once or gradually, as desired.

The advantages claimed are:—1. Impulse every revolution in each cylinder without extraneous pumps. 2. Very perfect cushioning and easy running. 3. Very high compression, with diluted charge, and, therefore, economy. 4. Absolute immunity from premature ignition, a factor that militates against high compression in other engines. 5. High charge temperature of the charge, without corresponding rarefaction. Therefore very favourable conditions for easy ignition, rapid inflammation, and high power. 6. A method of oil injection that admits of the engine being run as an explosion at constant volume engine, or a combustion at constant pressure engine. 7. Equal adaptability to petrol or heavier oils.

The feature that will, no doubt, be pronounced peculiar, if not objectionable, is the large proportion of exhaust gases left in the cylinder. The author, however, believes that when, as in the present case, the weight of incoming charge can be made independent of rarefaction by imparted heat, and the risk of premature ignition is avoided, the presence of exhaust gases, even to a large amount, is not detrimental, and that, in view of the higher compression used, the engine will be more economical than the petrol motors now on the market. Nearly two years ago the author strongly recommended a motor company to adopt governing on the exhaust (i.e., reducing the volume of fresh charge by retaining a portion of the exhaust), in preference to volume throttling. But the management could not be brought to recognise the economy to be obtained, and adopted volume throttling. It is some satisfaction to the author to find—first, that motors governed on the exhaust have since established their claim to greater economy; and, secondly, that the 1894-5 conducted experiments of Mr. Frederick Grover bear out the views held by the author. The advantage of high compression, claimed for this engine, opens up another and what might be termed a negative feature of present car-engines. Reduction in fuel consumption is the great advantage of increased compression, or, to state it otherwise, in any given mixture, the explosion pressure produced by ignition is proportional to the charge compression. In practice there are, of course, limits to the degree to which the charge can be usefully compressed. These limits are fixed mainly by four conditions: First, the difficulty of keeping piston and valves tight; secondly, the necessity of seeing that the negative work and the increased friction due to high compression do not exceed the greater efficiency obtained (the ratio of increase in efficiency decreasing as the pressure is increased); thirdly, the desirability of avoiding the excessive shock of a rich charge fired under high compression; fourthly, the risk of premature ignition in a highly compressed charge. It may be useful to consider how far these facts affect present practice as regards compression. A very considerable advance on prevailing compressions will have to be made before the first two causes of limitation come into play. The influence of the third factor, namely, the automobile requirement of an easy-running engine, is already at work. But the complete and satisfactory fulfilment of this requirement is not incompatible with the use of higher compressions than are now in use. All that is required is to reduce the richness of the charge by using less petrol, until the violence of the explosion is sufficiently reduced, the result being an easy running motor, working under the conditions of maximum economy, namely, high compression and less loss of heat owing to the lower combustion temperature. Poor charges may, it is true, lead to increase in cylinder dimensions, but to obviate increased weight we may yet have recourse to steel cylinders and light water-jackets. The third consideration, namely, danger of premature ignition, is also a matter of present moment. Two ways of surmounting this obstacle to high compression may be suggested. The first is, as in the Diesel engine, to admit the petrol at the end of the compression stroke. The second method is a system of internal cooling by water injection. In the matter of piston speed, this year's engines show a general return to the earlier speeds given by 700 to 800 revolutions per minute normal running. This gives less wear and tear on the motor, gear, and firing accessories, and less difficulty in filling the cylinder; while reserve power by acceleration is held in hand. In respect of slow, yet steady action, the impulse-every-revolution motor would possess a decided superiority.

Material and Methods of Manufacture.—Here, again, there is plenty of room for improvement. With very rare exceptions the present car motors are cast-iron, solid-head, water-jacketed cylinders, cast complete with valve-box in one piece. It is scarcely possible to imagine a design better adapted to give trouble in the foundry or the workshop; or one less

* Abstract of Paper read before the Institution of Mechanical Engineers, on Friday, Oct. 17th, 1902.

in accordance with metallurgical requirements. A casting of this description, intricate in shape, full of angles, curves, bosses, ribs, varying thicknesses, etc., enormously increases the difficulties of moulding and producing sound castings. Apart from this commercial objection, a casting of this design is ill suited to its purpose. First, because the variations of thickness and the ribs between the walls produce irregular expansion and contraction. Secondly, because it almost precludes the possibility of using the best iron for the purpose, the founder naturally working with a very fluid running mixture. While the majority of makers have been caught by the "drawing-office" solid-head, water-jacketed design, a few more practical makers have followed the plan of casting the cylinders separate, and adding a light aluminium, or rolled metal, water-jacket. This method admits of a simpler casting, for which the best metal can be used.

FIG. 1.—Showing the exhaust valve, so placed that the gases are diverted into a new direction while passing the valve; also that the discharge is greater on one than on the other side.

On the question of what is the best metal, there is a difference of opinion. Professor Hiorns inclines to white hematite, cast in metal moulds. Theoretically this is no doubt correct, but commercially the limited output and the constant changes of design might not justify the cost of moulds and the expense of grinding the cylinders. For these reasons, both Professor Hiorns and Professor Turner recommend, as an alternative, the use of the closest and hardest iron that can be conveniently machined. The class of iron suggested by Professor Turner as typical is:—Combined carbon 0.55, silicon 1.80, sulphur 0.10 or less, manganese 0.50, phosphorus 0.75. The casting of a cylinder, where there is any intricacy of design, should be a matter for special precautions. In view of the troubles arising from porous cylinders and for other reasons, the author favours the substitution of steel tubes for cast-iron cylinders. Lightness, strength, freedom from flaws, easy cooling, and probably, on the whole, cheapness, are much in favour of this material for small motor cylinders. Steel tubes screwed into a cast-steel or cast-iron head should make a good job. Some years ago, the author saw a small German motor with steel-tube cylinders, in which no running troubles were experienced. Another instance, probably known to all, is the Holden cycle motor. The class of steel used by Colonel Holden contains 0.35 per cent. carbon, and no trouble has occurred. In the new "Centaur" motor, in the 40-h.p. racer of Messrs. Charron, Girardot et Voigt, and in the Cannstatt Daimler racing cars, steel is the material used; and, under the severe conditions of racing, no running difficulties have been recorded. There is really no reason why steel should not successfully and advantageously replace cast iron. In a recent communication, Professor Turner wrote: "My impression is that solid drawn steel tubes would be best. They would be stronger, weight for weight, and more trustworthy."

The author's opinion is that the method of casting cylinder and jacket together is wrong; and that if the cylinder is of cast iron, it should be cast alone, and a light jacket added. In using steel cylinders, cast-iron piston rings might be retained. For these, a strong, fine-grained, elastic iron would be the best.

Engine Details.—The Valves.—The present usual practice is an automatic spring induction valve, opened by the suction of cylinder; and a mechanically lifted, but spring-closed, exhaust valve, commonly cam-driven by a half-speed shaft. The combination is exceedingly crude, and a few manufacturers are now waking up to the advantages of mechanical operation for both valves. The leading German firm, the Cannstatt Daimler Company, have adopted this practice in their new Mercedes Simplex, and there can be little doubt that other makers will be forced into line.

There are several reasons why with high-speed motors mechanical operation of the valves should be adopted. Owing partly to clearance and partly to back pressure from the silencer, the cylinder at the end of the

exhaust stroke is filled with burnt gases above atmospheric pressure. When the piston, therefore, begins the induction stroke these have to expand before air can be drawn in by suction, hence one of the disadvantages of the automatic inlet valve is that it is sluggish in opening. This is just the reverse of what should be—for in high-speed motors the valve should not only open promptly at the very beginning of the stroke, but might preferably be given a "lead," thereby promoting scavenging of the combustion chamber. Again, the automatic valve closes at the end of the suction stroke, whereas it might be better to keep the inlet valve open a trifle after the piston had begun the compression stroke, that is, before the slight vacuum in the cylinder has been converted by the piston into compression above atmosphere. By so doing, the momentum of the air in the inlet pipe tends to add to the volume of the charge. It may be noticed that where governing by volume throttling is used, if the spring of the exhaust valve weakens, the increased suction of the piston on the intake stroke may cause exhaust gases to be drawn back through the valve into the cylinder, with the risk of a miss or a slow firing through the presence of exhaust gas round the sparking plug, or of premature ignition, if the gas is hot. The advantages of mechanical valves, therefore, are sure and proper action.

As regards the material for valves, their seating and fitting, there is again difference of opinion. There can be no question that the spindle and head are best made of different material. For the head, the author favours nickel steel; cast iron wears well, but for small valves it seems hardly strong enough. Where trouble has arisen, and there has been plenty of it, with burning, irregular wear, and breakage of valves, it has usually been ascribed to weakness in the neck, unsuitable material, faulty methods of lift, throttling of the exhaust by insufficient area of the valve, exhaust pipe, or silencer. Any deficiency here may lead to broken valves. With a choked exhaust, the pressure left in the cylinder combined with the spring may produce hammering of the valve on its seat. In time this leads to brittleness and fracture.

There is, however, another cause of a very different nature which the author suggests as a probable source of much of the irregular wear and ultimate fracture of valves. Those conversant with the construction of horizontal plunger pumps will recognise a defect frequently found in otherwise well-designed machines. This is the placing of the valve seat on a level with the waterway. The effect of such an arrangement is that not only is the discharge greater on one side than on the other, but the water, diverted into a new direction, while in the act of passing the valve, exerts a tilting force on it, pressing the valve towards the waterway. The results are irregular wear, sticking, and hammering of the valve on its seat. Now, the usual disposition in the vertical motor is similar—a horizontal port with a vertical exhaust valve, the latter seated on a level with the former. An analogous state of affairs is thus established, a flow of gas, in lieu of water, being diverted into a new direction while passing the valve. There is, therefore, the same unequal discharge, with the similar tilting action and tendency to force the valve from its true position. See Fig. 1. But there is this difference: in the pump the stroke is comparatively slow, the flow tardy, the pressure low, the valve, spindle, seat, and guides cold, and in the best condition to resist wear; whereas in the motor, the valve heat is extremely rapid, the gas-flow swift, the pressure high, and all surfaces so highly heated as to be in the worst condition to withstand attrition and deformation. Thus the evils of bad design in the pump are much aggravated in the case of the motor, the tilting action being greater and the irregular burning and side wear more rapid. The remedy in both cases is the same. The valve seats should be kept respectively below the waterway or the gas passage, so as to permit the flow of water in the one case to rise upward until clear of the valve before taking a new direction, or the rush of gas in the other case to acquire a straight downward course before reaching the valve, Fig. 2. All tilting action is thus eliminated. Naturally the usual precaution of tully equal area in the annular space round the valve to that of the valve outlet must be preserved.

FIG. 2.—Method of countersinking valves to give direct flow.

Far the better practice would be to avoid port passages, and place the inlet and the outlet valves on the head of the combustion chamber. With the heavier oils this position has the additional advantage of direct charge admission without a possible condensation by contact with the port and cylinder walls.

(To be continued.)

DE DION-BOUTON, LIMITED, have brought out a poster illustrating the End-to-End journey by Mr. J. W. Stocks on an 8-h.p. De Dion car. Copies will be sent to motor-car agents applying for the same.

IMPORTS OF MOTOR-CARS, MOTOR-CYCLES, AND PARTS THEREOF.

BELOW are the official returns showing the imports of motor-cars, motor-cycles, and the parts thereof into Great Britain for the month of June. Already we have given the general statistics for that and later months; but the following analysis of the countries of origin will be of particular interest to the trade:—

BELGIUM.

ABOUT eight hundred motor-cars have called at Warne's Hotel, Worthing, during the past season.

CORRESPONDENCE.

THE FURRING OF BOILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in recent issues of your *Journal* that several of your correspondents who own steam-cars find the boiler and pipes become considerably furred through the mineral matter present in the hard water they employ for the boiler, etc. I had exactly the same trouble with my steam-car until I regularly employed a solution in my feed-water called "Vulite," and, by blowing the boiler out regularly, it keeps it splendidly clean, also the pipes.—Yours truly,

FRANK THATCHER.

WARMING MOTOR CAR SHED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the winter is coming on, I would be glad to know what means of heating my car shed I may safely employ. The shed is only a temporary structure—brick, with wood roof and tile floor; and as it is only temporary I do not wish to put in a hot water installation. Would it be permissible to use a coke stove of the "Tortoise" type in a corner of the shed, or would the stove have to be outside, and the flue simply carried through? Petrol is stored outside, and only the small supply in the tank and carburettor is in the shed.

Does a private owner of a car have to apply for and obtain a "petroleum licence"?—Faithfully yours,

WM. D.

IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the event of Mr. Bonfield's letter in last week's *Journal* giving rise to a misapprehension as regards the voltage required for a 4½-h.p. De Dion voiturette, I may explain that my use of 8 volts was only temporary, and that the constant use of such a high voltage might injure the coil. I use three (Peto and Radford's) cells of 2 volts each, making 6 volts, in accordance with Mr. Guest's recommendation.—Yours truly,

DOCTOR OF MEDICINE.

RE POLICE PERSECUTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read Mr. John D. Hill's letter, re the above, published in the last issue of your paper, and I most sincerely hope that he will be able to help to put down in time the present unfair persecution by the police, and with such a co-operation as he wishes for, no doubt something could be done. Might I be permitted to ask, what has become of the "Brighton Road Motor Patrol"?—Yours truly,

H. M. PENNEMAN.

CHAINS ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should much like to hear from users of chain-driven motor-cars their experience on the following points:—

- (1) How long do chains last, say, on cars weighing about 14 or 15 cwt.?
- (2) Were the chains oiled or covered with grease? Or cleaned and boiled in tallow?
- (3) What degree of tightness were the chains run at?
- (4) How many miles did the sprockets run, and the number of teeth?
- (5) How often were the chains tightened?

I have heard of chains doing 10,000 miles, but have not been able to obtain that particular brand. My own experience is that after 3,000 miles they become unsatisfactory. They may run longer, but they then have become usually tight in one part of the revolution, and slack in another.

I occasionally boil the chains in tallow, but I never run them without giving them a good dose of grease or oil.—Yours truly,

D. E. STEPHENS.

KICKING ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your numerous readers inform me why my engine gives a sort of kick when running slowly? It is a 5½ to 6-h.p. Has it anything to do with the exhaust not freeing itself sufficiently soon enough? Any hint to overcome the difficulty will be much appreciated by—Yours truly,

PUZZLED.

BELGIAN-MADE DURYEAS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Our attention has been called to an advertisement offering a number of 6-h.p. Duryea dog-carts for sale at reduced prices, and we have been asked many questions concerning them, as their description does not correspond with that given in our catalogues. Permit us, therefore, to explain that the cars in question are made under the Duryea patents of 1898, which were chiefly taken out by Mr. Frank Duryea (a brother of our Mr. Charles E. Duryea), and by a company which was formed in Belgium for the purpose. Our power carriages, however, are made under Mr. Charles E. Duryea's later patents of 1900. We desire to point out that they

are not built by us, and do not embody our three cylinder 10-h.p. balanced motor, our one-hand control, and the many other features of Duryea construction to-day.—Yours truly,

THE DURYEA COMPANY.

THE CARRIAGE OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Re the newly-enforced railway regulation against the carriage of petrol and kindred inflammable spirits except upon owner's risk, as far as I can find out by enquiry the manufacturers and factors of these goods decline to send further consignments per rail under the regulation mentioned. Yesterday I had an interview with one of the leading oil merchants of Birmingham, and his opinion appeared briefly to be this. That the whole matter might be calmly settled by the vendor or wholesale purchaser giving in to the railway companies' demands, and in self-defence heavily insuring all consignments against damage or compensation risks. This would, of course, force the retailer, at no advantage to himself, to charge a penny or twopence more per gallon to the motorist.

Now, when you consider that the provincial motorist is already paying 1s. 4d. to 1s. 7d. per gallon for the same spirit that is sold in London at 1s. (solely by reason of extortionate railway rates and restrictions), is it likely that he will quietly submit to further imposition in this form? Motor-ing is expensive enough already for the middle-class business man (who, after all, will form the largest class of motor buyers and users) by reason of railway extortion, revenue and police restriction and every other kind of hindrance that is allowed by a Government which seems bent upon throttling instead of fostering an industry that is providing work for thousands of its people. What it will become if this sort of thing is allowed to go on unchecked one is almost afraid to think. To myself, and to many others, this appears only the initial step of a determined attempt by the railway companies to crush the motor trade.—Yours faithfully,

FREDERICK S. JACKSON.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-cycle case.

At the Rotherham West Riding Police Court, on Monday, Fred Parish, engineer, of Surrey, was summoned for furiously driving a motor-car. He did not appear, and the clerk handed a letter from him to the Bench. Superintendent Macdonald stated that the offence was committed on September 9th. At 1.30 o'clock in the afternoon Police-constable Marow was on duty at Tinsley, and saw defendant travelling at the rate of thirty to thirty-five miles an hour from Sheffield to Rotherham. The constable was unable to get defendant to stop, and therefore telephoned to the headquarters at Rotherham a description of him and his motor-car. A constable was sent out, and he saw defendant in High Street. Evidence having been called Superintendent Macdonald added that defendant had been

fined three times previously in the present year for similar breaches of the law, the last occasion being at Oxford, where the penalty was £4 and 12s. 6d. costs. The Bench imposed a fine of £5 and costs.

In the case against Captain Bernhard Liebert, the Bench, after retiring for a short while, decided that there was no traffic on the road, and no danger, and the driver had stopped when called upon, but the car was travelling at more than the statutory limit, and a small fine of £1 would be inflicted with costs.

F. M. VIREL, of Halstead, motorist, has been convicted on the ground that sufficient care was not exercised in driving his motor-car.

THE invasion of the Highlands by motorists has provided the police with a new sport, and catching automobilists has proved a pleasant alternation to the ordinary weary "beats." Lord Cairns has been fined in Perth; Mr. Cornwallis West has paid the penalty at Banff; Mr. Phipps, who rents Beaufort Castle from Lord Lovat, has also suffered; and Mr. Breeze, an American, who rents a place in Inverness-shire, has had the option of paying a fine or imprisonment.

In the cases at Newmarket, reported last week, J. Trevesa was fined 2s. 6d. and 7s. 6d. costs, and G. Violon 10s., including costs. The chairman of the Bench stated at the time that the magistrates were not prejudiced against cars, and that many of them drive them, which is a fact. Mr. G. Harding Newman, who has driven a car in the district for nearly a year, and has friends who do so too, writes:—"We have always found the police most considerate, but then we always try to drive with consideration to other users of the road, and in a place like Newmarket, with numerous valuable horses about, care is very necessary. I am not in any way interested in the case reported, but I think it only fair to the magistrates and police here, who are not given to the dirty tricks and traps of their brethren elsewhere, that this should be stated. It seems to me that the paid mechanic is our greatest enemy, and until something can be done to curb his abominable recklessness we shall always have to contend with prejudices created very greatly thereby. Nobody enjoys motoring more than myself, or is more opposed to numbering proposals and the present ridiculous speed limit, but I am sure it is the reckless and inconsiderate driver who is our enemy."

MR. LINDSAY SCOTT, Foxborough Hall, Melton, Woodbridge, Suffolk, was summoned at St. Ives for furiously driving a motor-car along the highway in the parish of Fenstanton, to the danger of the public on September 15th. George Briers said he was in Fenstanton in charge of a two-wheel cart containing empty barrels. When by Mr. Gifford's house a motor-bicycle passed, and directly after a car came along. He was on the right side of the road, and as near the hedge as he could get. The car was going like an express train—he should say at the rate of 35 miles an hour. The car caught his wheel, broke the axle, and himself and a man named Cook were thrown out of the cart, with the empty barrels. He first looked after the horse, and then asked the driver of the car, which had come to a standstill, for his name and address. This he refused. For the defence Mr. Scott said it was simply impossible for a car to go at such an extraordinary pace up a hill. It was a pure accident, and caused by the horse jibbing, and backing partly across the road. After retirement, the Chairman of the Bench said they had decided that the charge was proved, and fined the defendant £8 and 11s. 6d. costs.

MEASURED DISTANCES.

THERE is a measured mile on the main road through Steyning.

TIMING on a measured furlong by means of a battery is the latest sport of the police at Hailsham.

THERE is a measured half-mile on the Leeming road, in the North Riding of Yorkshire.

FIVE motorists have been summoned before the Wokingham County Magistrates as the result of a trap laid by Sergeant Jannaway and Police-constable East, who had measured out half a mile of the London Road at Ruscombe, with an officer at each end. The constable gave the signal with a handkerchief when the car entered the measured area, and the sergeant noted the time by the aid of a stop-watch, with the result that some fast times were placed on record, and subsequently the reward was reaped—£1 and costs.

On the Caerleon Road, in the parish of Llanhennoc, the police have a measured mile, and the policeman stationed there with a stop-watch is a watchmaker by trade—a fact proudly urged by the police superintendent in the case against Mr. W. Parker Thomas, recorded in this week's list.

POLICE traps are still numerous in and around Crawley, Hailsham and district.

BETWEEN Rotherham and Sheffield the police have a measured distance which has enabled them to trap a local motorist.

THE police are watchful at Southwick, on the Brighton and Shoreham road; also at Washington, near Steyning. A Shoreham reader of the *Journal* is going that way on Sunday, and, should he find any traps, will place confetti on the road.

IGNORING THE POLICE.

A DRIVER named James Brown appeared before Bailie Murray in Edinburgh Police-court on a charge of having, while driving a motor-car, failed to obey the directions of a constable. Bailie Murray fined defendant 21s.

DAMAGES AGAINST A MOTORIST.

At Altrincham County Court, Mr. H. Bailey sought to recover the sum of £50 damages from Mr. F. Bradshaw, of Manchester, for alleged negligent driving of the defendant's motor-car, and Miss Lucy Bailey, daughter of the first-named plaintiff, claimed £30 under similar circumstances. The defendant Bradshaw counterclaimed for £25 damages to his motor-car, and paid into court £16 in satisfaction of the claim of the Baileys. The action arose out of a collision on the Knutsford road between a trap driven by Mr. Bailey and the motor-car driven by Mr. F. Bradshaw. His Honour, Judge Rowlands, K.C., awarded Mr. Bailey £30 and Miss Bailey £25, with costs in one case, and in their favour on the counter claim.

AN APPEAL ALLOWED.

At the Carnarvonshire Quarter Sessions, Harold Maurice Bater, motor-car driver, in the employ of the Marquis of Anglesey, appealed against a conviction by the Conway magistrates for furiously driving a motor-car on the road between Deganwy and Llandudno on July 7th last. The circumstances were that the motor-car was driven furiously round a corner, and almost came upon four young women, who had to jump into the hedge to avoid injuries. It was calculated that the car was proceeding at the rate of twenty to thirty miles an hour. Evidence in support of these facts was tendered by seven persons who were on the road at the time. Mr. Dew, for the appellant, contended that the evidence on the other side was grossly exaggerated, and was due to the high state of nervousness which seemed to characterise the ladies. The probabilities were also against furious driving, inasmuch as it was only the same morning that the defendant was fined at the Conway Police Court for furious driving, and he then gave an undertaking that the offence would never be repeated. Moreover, Mr. Rowland, the solicitor who defended Bater at Conway, was also riding on the car, and he would swear to the reasonableness of the pace. The defendant, called, denied that he was driving furiously, the reason why he came to the hedge being that he did not know the road until Mr. Rowland told him how to turn. Other witnesses were called in support of the appeal, including the town clerk of Bangor, who was on the car at the time, and who denied that the pace was in any way unreasonable.

The Court, after deliberating in private, announced that on account of the conflict of evidence they had decided to allow the appeal without costs.

ASSAULTING A MOTORIST.

A BUTCHER named George Hosking, of Ripley, has appealed at the Surrey Quarter Sessions, held at Kingston, against a sentence of one month's imprisonment passed on him by the Guildford justices for an assault on Mr. Campbell Muir. The evidence showed that on June 15th Mr. Muir, accompanied by Lady Cecil Montagu, was driving in a motor-car on the Ripley Road, near Guildford. As the car approached, Hosking stepped into the middle of the road, and as Mr. Muir passed Hosking struck him with a stick on the mouth, cutting his cheek and lip and knocking out a tooth. He admitted that it was an unjustifiable assault. The chairman said that had the case come before the justices present, they would have acted in the same way as those at Guildford. But having regard to Hosking's admission and his good character they thought that justice would be done if they affirmed the decision, and mitigated the penalty to a fine of £5 with costs.

THE STORAGE OF PETROL.

At Marlborough Street (London) Police Court, on Monday, Mr. Robert Willis, trading as the Ormonde Motor Cycle Company, at 79, Wells Street, Oxford Street, W., was summoned, before Mr. Denman, for keeping petroleum to which the Petroleum Acts of 1871 and 1879 applied, without a licence from the London County Council.

In opening the case, Mr. Helman-Pidsley, who appeared for the London County Council, said the defendant had a licence for the sale of petroleum spirit up to 100 gallons under certain conditions. It appeared that on September 5th a fire broke out on the defendant's premises, and a boy was burnt to death. At the inquest the jury added to their verdict a rider respecting the caution necessary in storing the spirit. On September 8th a County Council inspector called at the premises and found two cans containing petroleum spirit in the foreman's office instead of in the store-room specially built for the purpose. The evidence would show that the inspector was told it was kept there for convenience to supply small customers. The case for the prosecution was that having thus broken the conditions of the licence the defendant, in consequence, was practically unlicensed now.

Mr. Robinson, for the defence, said that at the inquest that had been referred to it was admitted that the boy was smoking a cigarette at the time and that he met his death through his own carelessness. The defence was that the petrol kept in the office was for use in testing motors at the premises, and a provision in the regulations made by the Home Secretary in 1900 allowed that to be done. His client had complied with all the regulations under which he kept the spirit, and moreover could rely upon the decision given in the case of "Godfrey v. Napier" before the Lord Chief Justice and Justices Darling and Channell. The County Council inspector was mistaken in stating that Mr. Willis said the spirit was kept in the office to supply customers. It was kept there for testing motors only.

Mr. Denman said he must find against the County Council in this case. A summons might have succeeded if brought for a breach of the regulations

of the Secretary of State, but that was not done, and, by the diligence of the advocate for the defence, the decision in the case of "Godfrey v. Napier," which was very much to the point, was brought to his notice. The summons would be dismissed.

LEAVING CARS UNATTENDED.

MR. H. PHIPPS has been fined £1 ls., with £3 expenses, for leaving a motor-car unattended on the public roadway at Fasnakyle, N.B.

REGINALD COCKLE, motor-car driver, has appealed at the Newington Sessions against a conviction for quitting a motor-car without having taken due precautions against it starting in his absence. The motor-car, as reported in the *Journal* at the time, was left in the main road at Wandsworth to await the arrival of its owner. Shortly afterwards it started on its career, knocking down a man, mounting the pavement, and finally coming to a dead stop in the window of the London and South-Western Bank. Mr. Grimwood Mears, who appeared for the appellant, said that before leaving the car the driver put on both brakes, threw the machinery out of gear, and put down the clutch. The fact that it required three distinct operations by a skilled person to restart the car was proof that it was re-started by some such person out of pure mischief. Down in the courtyard, he went on, was an exactly similar car, and he invited the Bench to endeavour to start it, venturing to declare that not one member of the court who was not an expert could set it in motion in any number of hours. The Hon. C. S. Rolls gave evidence that what the driver did before leaving the car rendered it quite safe and impossible for anybody but an expert to set it in motion. Mr. McConnell, K.C., did not accept the challenge, but, remarking that if a person left a car entirely unguarded that would not be taking due precautions, affirmed the conviction, with costs.

THE "Passe-Partout" and "Argyll" round the world cars left St. Petersburg for Moscow on the 15th inst.

IT is reported that M. Henry Fournier is preparing for an attempt to lower the mile automobile record established by Mr. W. K. Vanderbilt, jun., on August 5th. He will use a Mors car identical with that of Mr. Vanderbilt.

TO CORRESPONDENTS.

All communications intended for insertion in this *Journal* or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, NOVEMBER 1, 1902.

[No. 191.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN the House of Commons, on Monday, Mr. John Ellis asked the President of the Local Government Board whether he would next session introduce and press forward a Bill to place the law respecting motor-cars on a more satisfactory footing, by removing the present hard and fast limit as to speed, by requiring registration, by making the use of public roads by these vehicles subject to respect for the rights, convenience, and safety of all other users thereof, and by enacting a heavy maximum penalty for breaches of these conditions. In reply Mr. Long said he indicated last May the general lines on which amendment of the law relating to motor-cars should, as it seemed to him, proceed, but he pointed out there were considerable difficulties in the way of a settlement of the question. He could not at the present time give any pledge as to legislative proposals for next session, but it would be a matter of satisfaction to him if he found it practicable to deal with the matter then.

Postponement of the Legislative Dis- cussion.

IN consequence of the statement recently made in the House of Commons by the President of the Local Government Board, to the effect that it was improbable that amended legislation affecting motor-vehicles could be introduced during the present Session, and also in view of the fact that the alterations and decorations of the new Club premises in Piccadilly have taken longer than was anticipated, the discussion on the Hon. John Scott Montagu's Bill, which was announced to take place on Thursday, the 6th November, has been postponed. Further notice will be given concerning the date fixed for this discussion.

The Anniversary Run.

At a meeting of the Executive Committee of the Automobile Club, held on Thursday last week, it was decided that the sixth anniversary run to commemorate the passing of the Light Locomotives on Highways Act of 1896 should take place on Saturday, the 8th inst., to Oxford, *via* Reading. This run is open to all automobilists, whether they be members of the Club and the Motor Union or not. Non-stop diplomas will be given in respect of vehicles which complete the journey from London to Reading, and from Reading to Oxford, without a stop (except stops for traffic or restive horses), and at a moderate speed. Diplomas will not be granted if the average speed, exclusive of luncheon stop, is under eight miles per hour. No entries can be received after midday on Wednesday, the 5th inst. The entrance fee for (a) non-stop certificate, including cards of identification, time cards, and storage for vehicle at Oxford, is 10s. per vehicle; (b) entrance fee, including cards of identification and storage at Oxford (but not non-stop certificate), 5s. per vehicle; (c) entrance fee, including cards of identification (but not non-stop certificate nor storage at

Oxford), 2s. 6d. per vehicle. No entry can be considered unless it be accompanied by a remittance. At the same time the following particulars regarding the car must be furnished—make, horse power, and number of seats (including the driver's).

The Programme.

THE start will take place from Grosvenor Place, Hyde Park Corner, at 9.30 a.m. The vehicles will draw up and start in the order of their arrival. Lunch will be taken at Reading, from which place the route to Oxford will be *via* Pangbourne, Streatley, Wallingford, Shillingford, Dorchester and Sandford. The vehicles will remain at Sandford until the signal is given to start, and will then proceed in procession to St. Giles, Oxford and there receive instructions as to storage. The Club Committee have decided that the vehicles taking part in the run shall again be identified by names instead of by numbers. Those who enter for the run will be supplied by the Club with cards bearing the names selected for the vehicles, and these cards must be attached, one to the front and one to the back of the car, during the run. The names may be selected by the owners of the cars. They must not, however, consist of more than ten letters. Owners who enter cars are requested to communicate to the Club Secretary, as soon as possible, the name selected for their car. No other signs, and no advertisements, must be attached to the vehicles. Claimants for non-stop diplomas must lodge their claims in writing, together with time-cards, at the Automobile Club not later than 8 p.m. on Monday, the 10th inst. It will be remembered that last year the entries totalled considerably over 200, and it is probable that this year that number will be exceeded.

The Annual Dinners.

THE annual dinner of the Automobile Club will be held at the Trocadero Restaurant, Shaftesbury Avenue, W., on Friday, the 7th inst., at 7.45 for 8 o'clock, when it is expected there will be a large and representative gathering. A dinner will also be held at the Clarendon Hotel, Oxford, at 8 p.m., on the night of Saturday, the 8th inst., at which all those (including ladies) taking part in the run may attend. Morning dress may be worn on Saturday evening. Admission will be by ticket only, which may be obtained from the proprietor of the Clarendon Hotel, Oxford, price 5s. each, which includes the cost of dinner, exclusive of wines, etc.

The Carriage of Petrol.

THE carriage of petrol by rail is still the "turning" question of the moment with motorists, and we would again urge the suggestion made in these columns some time ago that those great firms trading in petrol should secure proper motor-vans and convey their specialities by road. This would render them independent of the railway companies, who would quickly come to their senses when they found their traffic going. Already we have hinted that this is possibly a revival of the old antipathy between the railway companies and the road motor conveyances; and if such is the case, a game of "tit for tat" would be productive of the best results.

A Bradford Suggestion.

ON this question our correspondence columns contain a very useful letter showing how one Bradford firm is determined to meet the hostility of the railway companies. The present is a very critical time for the industry, and it behoves the trade to show a very united front; and in that they must be supported by private owners. Surely motorists are influential enough to be able to approach railway directors and managers and show them how, unless a spirit of tolerance is shown now, they will be bringing disaster upon themselves—so far as one valuable source of revenue is concerned—in the near future.

A Question in Parliament.

WE are glad to see that the action of the railway companies has been brought before Parliament, Mr. Gerald Balfour, President of the Board of Trade, having stated, in answer to a question by the Hon. J. Scott Montagu, M.P., that he will consider whether the Board of Trade can approach the railway companies on the matter. We understand that full particulars of the railway companies' new regulations are being laid before Mr. Balfour for his consideration, and it is to be hoped that some arrangement will be arrived at in due course.

THE DUKE OF CONNAUGHT ON MAJOR NUGENT'S 10-H.P. BROOKE CAR, MR. MAWDSLEY BROOKE AT THE HELM.

The Freight to Dublin.

A GOOD item of news comes from Ireland, where, unfortunately, so many of the roads seem to have been constructed on anti-automobile lines. The Dublin and Glasgow Steampacket Company and the Glasgow, Dublin, and Londonderry Steampacket Company, Limited, have reduced the freight on motor-cars from Glasgow to Dublin to 45s. per ton. As the freight on motor-cars is exceptionally high, this reduction will be much appreciated by those in the trade on both sides of the Irish Sea.

A Novel Trip.

ONE of the historical landmarks of Copenhagen, Denmark, is the Round Tower erected by Christian IV. for astronomical purposes. The tower is 100 ft. high, and has the novel feature that, instead of by a staircase, the top is reached by a winding road 12 ft. wide, having an equal gradient of 1 in 4. As we briefly reported at the time, a successful attempt was made in July last to drive a motor-car up and down this novel course. As a result of inquiries, we find that the vehicle in question was a 6-h.p. Beaufort, of the Beaufort Motor Co., London, and was driven by Mr. Lorenzen, their works foreman. The ascent was made in the early morning, and took exactly one minute. The drive down from the tower, although the most

dangerous part of the trip, was equally successful, the round trip being made without the driver leaving his seat or using any help or assistance whatever, other than that of the engine. Our illustrations on pages 684 and 685 are reproduced from photographs of the tower and of the car during its noteworthy ascent.

English-made Induction Coils.

As a result of the complaints made with regard to English-made induction coils, in connection with the Gordon Bennett Cup races, a good deal of attention is at present being centred on this all-important part of electrical ignition. The other day we had an opportunity of inspecting a new English coil, which will give a spark of sufficient intensity to fire the charge, even when using only a 2-volt battery in place of the usual 4-volt accumulator. It will, however, work equally well with the latter, and, as showing the high insulation of the coil, we may say that we connected it up to a 6-volt battery, the result being a fat flaming spark over $\frac{1}{2}$ in. long, and this without injury to the coil. Those who have experienced the joys (!) of finding themselves miles from everywhere, with a battery showing 3.5 volts, yet too low to give the requisite spark, will, we imagine, welcome a coil that furnishes it at an accumulator pressure of only 2 volts. As to the use of the coil on high-speed motors, Mr. Sanders, of Hammer-smith, the maker, assures us that he has tested it up to an engine speed of 2,600 revolutions per minute with satisfactory results. In view of this, we are not surprised to learn that already the new coil has been adopted by a number of well-known motorists.

Proposed Changes in Racing Rules.

THERE are two propositions going the rounds of the automobile clubs on the Continent. One emanates from the Austrian Club, and is to the effect that a general congress of all the affiliated clubs shall be held at the Paris Exhibition in December, with the object of framing international racing rules and the formation of an International Racing Committee. The second proposition consists in a circular letter which according to the "Chronique de Bruxelles," has been addressed by the Committee of the A.C.G.B.I., to all the affiliated Clubs except the A.C.F., proposing a united action to revise the racing rules by the introduction of six alterations: (1) That on international committees there shall only be *bona fide* owners not interested in manufacture; (2) that duplicate times cards, written in ink, shall be given to each competitor to prevent mistakes; (3) that a failure to get a card at any control shall disqualify a competitor; (4) that the driver or *mecanicien* of one car shall not assist or give spare parts to the driver of any other car; (5) that although petrol and water may be carried and handed to the driver of any car, all filling and work of any kind shall be done by himself alone or his *mecanicien*; (6) that no one, save the driver or *mecanicien*, shall push any car under any circumstances after it has left the first starting point in a race until it has completed the whole course.

A Free Garage.

IN our last issue we briefly mentioned that Messrs. Friswell, Limited, had acquired the building known as the Albany Repository, near Portland Road Station, Regent's Park, N.W., which they will shortly be making their head-quarters. The enormous extent of these premises, which are fireproof, and are lighted by electricity, may be gauged from the fact that in the course of a chat with Mr. Friswell he informed us that there is accommodation for over 700 motor-vehicles. It is the intention to arrange the premises in three different sections. Block A will be used entirely for offices and show-rooms for the Peugeot cars. In Block B large repairing shops will be established. The auctioneering business will also be carried on in Block B, it being intended to hold, from time to time, and upon separate days, special auction sales. For instance, one sale will be entirely devoted to motor bicycles and tricycles, another day will be set apart exclusively for steam

ears, another for voituresses of a value not exceeding £150, and still another day for a sale of higher-priced carriages. The most novel departure in connection with the new premises is the decision to set apart a large portion, to be known as Block C, as a garage for the use of clients absolutely free of charge. There is a lift in the centre of the building on to which cars can be driven from the road, taking vehicles immediately to any part of the building. The use of this lift will also, we understand, be quite free. The idea of a free garage is a radical departure, and its result will be watched with interest. Messrs. Friswell have not arrived at this decision without full consideration, but estimate that they will receive compensation for the accommodation they are able to offer by supplying oil, petrol, and grease to their clients, and also by carrying out any necessary repairs on the spot. The new depot is to be opened as soon as the necessary alterations are completed.

water, remaining wet when other portions of the road have dried. The experiment is much too promising to be allowed to drop, and probably some means of applying the oil will be found which will get over the difficulty.

Testing Petrol Motors.

ON Thursday last week we were present at a practical test of the Mathot explosion recorder, which is being introduced into this country by Messrs. T. S. McInnes and Co., Ltd., of Glasgow.

As we gave an illustrated description of the device in our issue of March 15th last, it is only necessary to briefly mention that the apparatus is intended for registering the explosions in petrol motors with the view of practically controlling their conditions of operation. Although it has been possible up to the present to control the state of regulation of such motors by means of diagram indicators, the results have been relatively satisfactory only when the

THE MEET OF THE SCOTTISH AUTOMOBILE CLUB AT PHILIPHAUGH. (See page 679.)

[Alex. A. Inglis.

Motor-Cars in Victoria.

THE Belgian Consul-General at Melbourne in a recent report states that a strong movement is on foot in Melbourne for the utilisation of automobiles as a means of transport. The question of their use for the postal service in the environs of Melbourne is under consideration, the collection of letters from the letter boxes within a radius of six miles from the central office being at present made by means of vans, necessitating the employment of from 40 to 50 horses. The Consul-General adds that trials are being made with motor-cars, and a comparison instituted with regard to the rapidity, regularity, and cost of transport of the mails. In the event of the adoption of the new system, it is said that tenders for the supply of motor-vehicles will shortly be called for.

Oiling the Roads.

THE experiment with the oiled road at Farnborough has, it appears, not altogether resulted satisfactorily during the recent wet weather. Replying to a question at the Farnham Rural Council, the surveyor stated that the experiment was satisfactory while the dry weather prevailed, but under wet conditions the road was in a bad state. It seems to hold the

velocity of the motor to be tested has remained within the limits of speed of from 300 to 400 revolutions per minute. Since the motors of automobiles exceed such velocity, and easily reach from 1,000 to 2,000 revolutions, the most skilful experimenter cannot obtain a diagram under such conditions, and consequently cannot ascertain what phenomena are taking place during the running of the motor. The apparatus devised by M. Mathot, on the contrary, owing to its ingenious construction, permits of following in an absolute manner, for a determinate time, the conditions of operation of any motor, whatever be its rotary velocity. The apparatus having been secured to the motor, its piston is forced by each of the explosions to a height corresponding to the power of the latter, and a tracer controlled by a lever registers them one alongside the other upon a band of paper in motion. The resulting diagram indicates not only the number of the explosions and revolutions within a given time, but also their regularity, their alternations with the "miss-fires," and their pressure in atmospheres, measured by the scale of flexion of the opposing spring. The diagram obtained permits of determining experimentally the most favourable dimensions to give to the admission and exhaust valve, by reason of the different velocities; of avoiding the resistance during suction and the counter-pressure during the exhaust that are the principal causes of losses of useful effect in high-speed motors; and of estimating the role of

compression, etc. It is possible, also, to fix the amount of the resistance during suction and exhaust. To this effect, it suffices to compare the origin of the lines of explosion with the atmospheric line marked by the tracer. The complex phenomena that accompany the operation of explosion motors are by this apparatus verified in a scientific and positive manner, and its use by manufacturers should undoubtedly permit them to introduce modifications in the design they have adopted, with the effect of improving the efficiency of their motors.

Magistrates and Motor-Cars.

ON Tuesday last the "Morning Leader" published an interesting map showing the towns in Surrey and Sussex where motorists have lately been fined, and where measured distances have been established by the police, compiled from the information published in these columns. Our contemporary remarks that:—It is, of course, impossible to express with absolute accuracy the results of a long series of cases extending over many weeks before such varied jurisdictions. But the substantial fact remains that, more particularly in the South of England, the country benches have got into the habit of selecting a standard fine to be imposed on all offenders alike, without regard to the particular circumstances of the case, and based merely on the taste and fancy of the justices. This is too often simply a measure of the prejudice entertained by country gentlemen, whose habits are nearly always equestrian, against automobiles as a class. We have not the slightest sympathy with motorists, any more than with politicians, who indulge their preferences at the risk of other people's lives. Any reasonable regulations to secure the punishment of serious offences against the public convenience which Mr. Long may be able to introduce will no doubt be loyally welcomed by the respectable class of motorists. Meanwhile, the existing system is not only unjust, it is utterly ineffective, even for its purpose.

Motoring in Lakeland.

THE excitement experienced in motor-ing along mountain roads like those in Westmorland and Cumberland is really thrilling. Along the margin of Lake Windermere and on the roads across to Conistown every track is a switchback, mile after mile. Fifty miles of dashing down declivities and of steadily climbing up-gradients is exciting. On an ordinary road you see what is coming. Nothing of the kind in Lakeland, however, according to a writer in the "Echo." All round the lakes the roads are beautifully constructed, and are thus a joy to the automobilist. "My friend," continues the writer, "who rusticates in autumn in his sweet villa near Bowness, meeting me at Windermere Station with his car, immediately shot down a steep decline on the road for Rydal Water and Grasmere. With a significant smile he remarked, 'I had a narrow escape last week.' Seeing that while these remarks were being made we appeared to be rushing at a terrific rate along a precipitous and sinuous narrow lane, I was profoundly impressed with a sense of the incongruity of this discourse. My only response at the moment was a feeble smile. I was constantly speculating as to what might happen at any one of the countless obscurantist twists in this lovely but perilous track. Soon I learned by observation that my friend was all the time keenly on the alert with eye and hand, and that the car answered like a living creature to all the delicate manual impressions of the steering process."

Lakeland Rambles.

LAKELAND, while presenting many delights to the motorist, is an even more enjoyable experience for those who love rambling on foot. For both classes of holiday makers Mr. W. T. Palmer has written a pleasing volume of "Lake Country Rambles," just published by Messrs. Chatto and Windus. Within the space of thirty chapters Mr. Palmer

presents a vivid series of word-pictures of the incomparable and diverse scenery of the Lake Country. He writes with the ardour of an enthusiast and the knowledge of one who for a dozen years has wandered o'er tarn and fell, ascending precipitous heights and feeling his way down hill sides until the Lake country has become as familiar to him as the roads of Surrey are to the Metropolitan motorist. These Rambles are congenial companions for all who love Nature and are familiar with her ways.

On the South Coast.

FOR five whole days, with the aid of our new car, we have been enabled to escape both rain and fogs, touring along the south coast, staying at a different hotel every night. The roads were in grand condition, there being no dust, while the air was balmy and mild. It may be mentioned that we have thus far travelled over two thousand miles on our 40-h.p. Mercedes, and never once has it needed adjustment of any sort on the road. While at Brighton we travelled the whole length of the "front" on the second speed, at about six miles an hour, the engines running at from 100 to 120 revolutions a minute. Except for the "tapping" of the valves the car was absolutely noiseless.

PANHARD and Mors cars will represent France in next year's Gordon Bennett Cup race.

ON Saturday, the 8th inst., Scottish automobilists will commemorate the passing of the Locomotives on Highways Act, 1896, by a run to Luss, Loch Lomond.

ON Wednesday afternoon we had an opportunity of inspecting a new 10-h.p. Belgica car which M. L. Mettewie has just brought over from Brussels with the view of opening up an agency in this country.

MESSRS. MERRYWEATHER, of Greenwich, have built a steam motor fire-engine for the municipal authorities of Cape Town, and have one in hand for Wanganui, New Zealand.

ON Thursday last week the King paid a visit to Windsor Castle, arriving from London by motor-car. He left the Castle about 3.15, and, entering his motor-car, drove through Frogmore and Old Windsor back to London. The roads were in perfect order, and the car ran splendidly.

WE understand that the resignation of Mr. E. Shrapnell Smith, who has been acting as Hon. Secretary, *pro tem.*, of the Liverpool Self-Propelled Traffic Association, has now taken effect. Pending the appointment of a successor, the secretarial duties will be undertaken by Messrs. Lloyd and Walker, of the Accountants' Department of the Liverpool body. There are now upwards of 160 members on the register of the Association.

As a result of the action of the railway companies, a scarcity of petroleum spirit is already being experienced in Surrey and Sussex. None is at the moment available at Eastbourne or Brighton, although at the latter resort arrangements are in hand to get in a supply by road. At Horley, the Horley Motor Company are also arranging to have delivered by road 200 gallons at a time, daily if necessary, so that they will be able to supply motorists on demand.

UNDER the name "English Bilar" Messrs. John Child Meredith, Ltd., are introducing a new sparking plug, which is, we are informed, of English manufacture throughout. One of the great features of the plug is its special porcelain, which is practically indestructible, having been submitted to the following test:—The porcelains are made white hot, and immediately plunged into cold water. The components of which the porcelain is made are perfect in insulation; it contains the advantages of mica without its disadvantages. In order to further encourage the use of their sparking plugs the firm are making arrangements to receive back through their agents all broken plugs which have been used, and to exchange them for new ones, making a small allowance for the old ones.

THE SCOTTISH AUTOMOBILE CLUB.

ON the invitation of Mr. W. Strang Steel, the members of the Scottish Automobile Club held their run on Saturday last to the historical and romantic Philiphaugh. The modern mansion stands in the centre of one of the sternest battle grounds of the Scottish Covenantry period. The Laird, in July of last year, was kind enough to invite the Club to his beautiful home, and so successful was the run on that occasion that, upon another invitation being extended this year, the Club most readily accepted. The advanced state of the season, however, prevented the western section of the Club taking part in the run. The major number of the western members were at least 80 miles from Philiphaugh, so that really in the dark and in so uncertain weather as prevails at this time such a journey would really have made a labour of a pleasure. The eastern section, reinforced by Jedburgh and Aberdeen, made up a splendid party, and, even in the face of inclement weather, a thoroughly enjoyable time was spent.

From Edinburgh to Philiphaugh the distance is 42 miles, and, with cars of varying speed in their membership, the Club

Mr. Steel to make a very short speech. He apologised for the absence of the western section, who had not come owing to the lateness of the season, and they regretted their inability all the more as they remembered Mr. Steel's unbounded hospitality. He also apologised for the absence of their President, Lord Kingburgh, but perhaps he, as the Lord Justice Clerk, felt more secure on the Bench dealing with the malefactors at the bar than in the hands of the police at Galashiels. He thanked Mr. Steel on behalf of the Club for his generosity, and concluded by proposing a very hearty vote of thanks. Mr. Steel briefly replied that the motorists were always welcome at Philiphaugh.

The party subsequently were photographed in front of the mansion, and shortly after four o'clock left for their various destinations. The cars present were:—Mr. W. S. Steel, (Philiphaugh), 12-h.p. Arrol-Johnson; Dr. Blair (Jedburgh), 3-h.p. Benz; Messrs. Jas. Ballantyne, 22-h.p. Daimler; D. Cameron, 12-h.p. Gladiator; Jas. Cruickshank, 8-h.p. Argyll; R. D. Croall, 9-h.p. Napier; A. J. Drake, 5-h.p. Stirling; P. Drummond, tricycle; Jas. Macdonald, 7-h.p. Daimler; G. Macmillan (Secretary), 7-h.p. Panhard; A. Melvin, 6-h.p. M.M.C.; Sir John Murray (Vice-President), 8-h.p. Albion; Messrs. J. E. Naismith,

Photo by]

GROUP OF MEMBERS OF THE SCOTTISH AUTOMOBILE CLUB AT PHILIPHAUGH.

[Alex. A. Inglis.

decided that no formal meeting should take place in Edinburgh, but that owners should leave the city at the hour which suited them, and all the cars gather at the Main Lodge at 12.45, thereafter proceeding up the avenue in line. The early forenoon was a beautiful autumn one, and as the cars quitted the Scotch metropolis the conditions promised to be ideal. The route lay past Liberton and Shank's Bridge to Heriot, on past Galashiels to Selkirk, and thence to Philiphaugh. All went well until the high ground near Heriot was reached, and with heavy mists sweeping down the hillsides they were soon into a drizzling rain and chilling atmosphere. The roads turned very bad and speed had to be slackened. Several of the cars were a little late in arriving at the rallying point, while Mr. George Macmillan, the Honorary Secretary of the Club, burst his tyre near Stow, and, determined at all hazards to fulfil his engagement, completed his journey along with his party by the aid of a horse.

At half-past one the company, numbering over a hundred, sat down to luncheon in the magnificent old oak dining hall, with the Laird of Philiphaugh at the head of the table. After an excellent repast, Mr. Norman Macdonald, Chairman of the Scottish Automobile Club, proposed a hearty vote of thanks to their host, Mr. W. Strang Steel. He had received a strict injunction from

6-h.p. Stirling-Daimler; J. H. Paterson (Aberdeen), 12-h.p. Peugeot; Dr. Bruce Ronaldson, 10-h.p. Delahaye; Messrs. Thos. Sanderson, 3½-h.p. Benz; W. L. Sleigh, 10-h.p. Clement and 16-h.p. Waverley; Professor Dawson Turner (Vice-President), 10-h.p. Delahaye; and Mr. John Wilson, 8-h.p. Peugeot.

THE Portsmouth Automobile Club has decided to hold meetings during the winter months for the discussion of automobile topics.

A CURIOUS electric "runabout" attracted some attention in the City one evening last week. The vehicle had unusually large rear road wheels, of the cycle type, the electric motors being contained in the hubs.

THE Roadway Autocar Company, Limited, have lately despatched several Mors and Renault cars to India. Calling at their depot the other day, we had an opportunity of inspecting a fine 15-h.p. Mors car which is also being shortly taken out to India by its owner, a military gentleman. The car body, which was built by Messrs. Edwards, of Ashford, is of the double tonneau type, having seating accommodation for six persons. With its canopy, dust screen, and white-painted body, the vehicle has a very striking appearance.

NEW ELECTRICAL IGNITION DEVICES.

A NOVEL method of attaching the sparking plug—or in this case plugs, for two are used to each cylinder—has lately been introduced by the Automobile Equipment Company, of Chicago. As will be seen from Figs. 1 and 2, the arrangement consists of a T-shaped casting, provided with a pair of sparking plug receptacles, a three-way valve and a nipple. A compression tube is fitted to the lower end of each plug receptacle.

FIG. 1.—SIDE VIEW.

FIG. 2.—FRONT VIEW.

In the application of this device the nipple is screwed into any canal leading to the compression chamber of the engine cylinder, while in motors fitted with incandescent tube ignition the tube can be taken out and the new device inserted in its place.

Being unable to speak of the device from our own practical experience, we quote the description of the action of the arrangement from the particulars sent us by the makers:—"In operation the gas is compressed through the nipple past one of the plugs, when it is ignited at the desired period, the expansion cycle of the

FIG. 3.

engine then taking place. On the return or cycle of exhaustion the gases are exhausted to substantially that of the engine or nearly atmospheric pressure, leaving a certain quantity of dead gas, which is forced into the compression tube on the next compression cycle to such an extent that the combustible gas passes through and fills the plug receptacle, insuring ignition under variable compression. The troubles caused through deposits of

carbon or other electrical conducting material on the insulation of the plug are removed through gaseous friction, the insulation and electrodes being always in a polished condition. The advantage obtained through the duplex construction is that the operation of the engine can be continued indefinitely, for if any missing of ignitions through defects in the active plug are detected the electric current can be switched to the other plug. The useless plug can then be removed and a new one inserted at leisure."

A somewhat similar arrangement was exhibited at the last Paris Motor-car Show by M. Ruffin, 77, Avenue de la Grande Armée, Paris. A section of the device, which is known as the "Meteor," is shown in Fig. 3. As will be seen, instead of the plug being screwed directly into the explosion chamber, it is attached to a small hollow piece, which is in turn attached to the cylinder top between the inlet and exhaust valves. The arrange-

FIG. 4.

ment is claimed to possess a number of advantages, chief among which being that there is less chance of fracture of the porcelain of the sparking plug, owing to its location in such a position that it is not subjected to so high a temperature as in the usual practice. Another point to which attention is drawn is that there is less danger of the sparking points being "sooted," and that, owing to the explosion tube being filled with fresh mixture at each suction stroke, a more powerful explosion is obtained. The intermediate piece, which is known as the "electric burner," is sold separately, so that motorists may fit it to their engines themselves, the threaded portions being made to suit the standard sparking plug threads. The "electric burner" is made in two types—for slow-speed motors it is of the form shown in Fig. 3, while for high-speed motors it is made with a small air valve as shown in Fig. 4.

New members of the Automobile Club include Lord Stanley, Lord Pirbright, Sir W. C. Quilter, Bart., M.P., Mr. Leicester Harmsworth, M.P., Col. W. G. Wyndham, and Col. R. Mirehouse.

At Newport, Essex, Mr. H. S. Choppen has a motor repair shop, where he also stores petrol, grease, &c., and is able to prove a handy man to motorists in distress. He has also the advantage of location, being on the London main road.

The new road from Monifeth to Barry, N.B., was formally opened a few days ago. Lord Provost Hunter, Dundee, presided, and in his address intimated that Mr. J. Thomson, assistant burgh engineer, Dundee, who had officially inspected the new road, had stated that the work had been carried out in a satisfactory manner, and that the road as designed and formed was sufficient for traffic similar to that on the main roads in the district.

SPEAKING at the annual display at Victoria Park, E., of the Metropolitan Fire Brigade, with reference to the experimental motor fire engine which has been constructed in the workshops of the Fire Brigade, Captain Wells explained that the engine was on that occasion really only undergoing a workshop trial. It had reached its destination from head-quarters in something under half an hour, and this notwithstanding that it had had to pass through crowded traffic *en route*. It was also stated that the same machinery which drives the engine works the pump. The engine, which ran smoothly and steadily, if not so speedily as the steam engines drawn by horses, aroused a good deal of interest among the spectators.

CONTINENTAL NOTES.

BY AUTOMAN.

THE long delay in according the *Auto-Velo's* prize for regularity in the Paris-Vienna race was due to the fact that the Racing Committee of the A.C.F. had not made up their minds what to do about the motor-cycles, which had been the subject of many protests. The climb up the Arlberg had been too much for them. The Racing Committee decided to disqualify the whole of them, and thus it was that the prize fell to Georges Richard.

MESSRS. WERNER FRERES, however, objected to this wholesale disqualification, and their protest was so strong and so well backed up by honourable and trusted witnesses that the question was opened up again; and it was decided to render official the performance of Messrs. Bucquet and Labitte, who rode Werner motor-cycles from Paris to Vienna, and for whom the Arlberg had no terrors. This decision changes, therefore, the hands into which the *Auto-Velo's* cup falls, and the definite holders of it now are Messrs. Werner, whose two machines did the best combined time of all the combined entries in the race.

TALKING about the Paris-Vienna race, I may mention that it has just been decided by the Committee of the A.C.F. to continue the series of International motor-car road races—which began with Paris-Amsterdam in 1898, continued with Paris-Berlin in 1901, and Paris-Vienna in 1902—by the organisation of a Paris-Madrid race in 1903. The race will most probably take place during the month of May, and will perhaps be divided into two stages, namely, Paris to Bordeaux as a speed contest, and Bordeaux to Madrid as a reliability trial, the object of the A.C.F. being to show that French cars can score for reliability as well as for speed. As to how the contest will be arranged is, as yet, uncertain; there are two propositions before the Committee, the one being to make speed the only factor for success, and the other to make the contest a question of the aggregate points gained by the total number of cars entered by one firm, speed being counted, of course, as a factor.

THE partisans of the two propositions cannot agree, and have decided, very wisely I think, to consult the various makers. The result of such a consultation cannot be doubtful, for if there are three or four, or perhaps five, makers who are particularly cut out to make powerful and fast vehicles, there are at least a dozen who are not specially adapted for the construction of racing cars, and who will have a good chance of gaining fame for reliability.

FROM Paris to Bordeaux is about 360 miles of splendid roads, on which the highest average speeds may be looked for. From Bordeaux to Biarritz there are about 130 miles of fair roads; from Biarritz to Madrid about 850 miles of bad roads, including the passes over the Pyrenees, which are badly kept and where there are some terribly steep climbs. This, however, seems to be the most practicable route from Paris to Madrid, and totals up to something over 1,340 miles.

A PARIS-MADRID race is the natural sequence of the success which the other International races have brought to the French automobile industry. The Belgians, Germans, and Austrians have each had a demonstration of the high efficiency of the French nation as regards the new locomotion, and now it is the turn of the Spaniards.

THERE remains, however, the question of the authorisation to be dealt with, both from the Spanish and the French side. From the Spanish side it is said that very high influences have been at work suggesting the organisation of the race, and from the French side the use of alcohol will be a great factor in deciding the Government to countenance the competition, and there is little doubt but that big prizes will be offered to those competitors who use the national product instead of imported petrol.

USING the word petrol, so universal in England, to describe the particular benzo-naphtha used for motor-cars, reminds me to give a word of warning to English automobilists driving in France. Always ask for "essence," as the word "petrole" is used in French to designate kerosene or ordinary paraffin.

Now that the year's racing is practically over, the time has come for settling the details of next year's important events, and the first of these is, of course, the Nice meeting. It is to begin on March 28th and last until April 6th. The 28th of March falls next year on a Saturday, and the meeting is to commence with a competition for brakes. On Sunday, March 29th, there will be an automobile battle of flowers; Monday, Tuesday, and Wednesday, March 30th and 31st and April 1st, will be devoted to automobile races, the particulars of which will be settled later; on Thursday, April 2nd, there will be the Nice-La Turbie hill-climb and the appearance competition at Monte Carlo; Friday and Saturday will be devoted to an exhibition; on Sunday there will be the mile record and the Rothschild cup, and the meeting will be brought to a close on Monday, April 6th, by the competition for the de Caters cup. Entries must be sent in by March 15th with single fee, or March 28th with a double fee. The entrance fee is £3 for cars under 400 kilos and £6 for vehicles over that weight.

Photo'by)

A WAYSIDE SCENE IN FRANCE.

(Mr. D. M. Weigel.

It is probable that the automobile races on March 30th, 31st and April 1st will consist of an alcohol race and a "Circuit du Sud Est à l'Alcohol." The heavy-weight caravan from Paris to Nice, which was so successfully organised this year, will be repeated under the same able organiser, M. Paul Meyan.

UNDER the auspices of the Automobile Club de Namur and Luxembourg a hill-climbing competition was held at Huy on Sunday last, over a course 1,364 4-5 metres long. The winners of the various categories are given below:—

	Rider.	Machine.	Time. m. s.
Motor-bicycles (under 50 kilog.)...	Kinet	Antoine...	1 31½
Motor-bicycles (over 50 kilog.) ...	Van den Born...	Antoine...	1 59½
Tricycles	Joostens	Korn	2 14½
Voiturettes (under 400 kilog.)	Oury	Clement...	1 40½
Voiturettes (over 400 kilog.)	Barbaroux	Clement...	1 19½
Cars (700 kilog.) ...	Hautvast	Pipe	1 52½
Light touring cars...	Baron de Crawhez ...	Clement...	1 28½
Heavy touring cars...	De Melotte	Gobron Brillie...	1 53½

THE Edinburgh Town Council is discussing a proposal to purchase a motor-fire engine.

MOTOR-CYCLING NEWS.

ON Sunday next the Motor Cycling Club will hold a run to Aylesbury. The members will meet at the Marble Arch, W., at 10.30 a.m.

MR. S. HOLMES, of Bradford, sends us a few particulars of a roundabout tour he recently made through North Wales and the Lake district, visiting, among other places, Rhyl, Betws-y-Ced, and Snowdon. Leaving the latter point he journeyed on

to Chester, thence to Birkenhead, across the ferry to Liverpool, and through Ormskirk to Preston, finishing the day's run at Blackpool. After staying a few days at this popular seaside resort, Mr. Holmes set off to Morecambe, journeying through Poulton-le-Fylde, St. Michaels, Garstang, and Lancaster. From Morecambe a visit was made to Cark, passing through some lovely scenery on the way. A very heavy thunderstorm was encountered during this part of the run. Leaving Cark, a start was made for the lakes, Windermere, Ambleside, Derwent Water, and Thirlmere being visited; thence to Bowness, Kendal, and on to Kirby Lonsdale, and from this place home to Bradford. During the whole of the journey Mr. Holmes's machine, which is a 2½-h.p. De Dion quad, fitted with Mercie two-speed gear, behaved splendidly, not a single puncture or stoppage from engine troubles occurring. The illustration shows Mr. and Mrs. Holmes on the machine at a pretty little spot just outside the village of Grasington, about 10 miles beyond Skipton, Yorkshire.

MR. A. RIVETT, of Leytonstone, writes:—"I have noticed that at different times well-known motor-cyclists have made attempts at a long-distance ride on the track. Nothing very successful has been done in the way of a long non-stop ride, and I would like to suggest the holding of a long-distance non-stop race, to be held on the following novel lines at an early date before the weather gets too cold:—Engines not to exceed 75 by 75 mm. bore and stroke. The race to be for six hours, any stop whatever to disqualify rider, who should retire. All machines to be fitted with cyclometers, tested officially, for a mile or two, for accuracy before the start. Each rider to provide their own cyclometer and vouch for its correctness; the distance recorded by it to be accepted as correct. Every competitor stopping to have his time taken, and an official certificate given him of his own non-stop ride. One time-keeper to be employed to time, start, and stop competitors at end of race. Entrance fee to be £1 1s. per machine. All money beyond time-keeper's fees to be spent on a prize for the winner. Track to be the Crystal Palace or Canning Town. I feel sure a race on above lines would

provide good sport, and prove a good advertisement for motor-cycling and motor-cycle manufacturers."

THE value of the motor-bicycle in urgent cases of medical importance is well illustrated by the experience of Dr. E. S. Forde, of Kenbank, Dalry, Galloway, who writes:—"This day week I saw a case of lockjaw in a boy. I wired to several places to see if I could obtain Behring's serum, and found I could get it only 66 miles from here, but if it came by post or train I would not get it for forty-eight hours, when it would be useless. So I mounted my Singer motor-cycle, and accomplished the double journey in 5½ hours and some odd minutes. The boy is now on the high road to recovery, and the case has had the effect of making several people take a very different view of motors."

ON Sunday, the 19th ult., the members of the Liverpool Motor-cycle Club held an enjoyable run. Llangollen was the place appointed, but on reaching Mold it was proposed that a turn should be made homewards, *via* Chester, as, the roads being extremely slippery, they were somewhat treacherous. From the time of leaving Birkenhead until the return home in the evening not a single machine misbehaved itself.

THE first motor-bicycle road race in Spain was run off a few days ago—the route being from Barcelona to Tarragona and back, a distance of about 125 miles. It cannot be said to have been a very exciting affair, as out of seven entries only two turned out, and only one of the couple covered the whole distance! The winner, Senor Saroma, used a machine of his own construction, his time being 8 h. 7 min. 30 sec.

FOR the 1903 season the Singer Cycle Company, Ltd., in addition to continuing the manufacture of the direct-driven machine, are bringing out a new form of their well-known motor-bicycle. In the first place, the gear drive is to be replaced by a chain. The motor will be extremely accessible, as the spokes on one side of the wheel are dispensed with. The carburettor is to be complete in itself, and the petrol supply will be carried in a separate tank. As regards the motor itself a new piston-ring system has been worked out, reducing the chance of loss of compression owing to leaky rings. The chain drive system comprises two chains, one running from the motor pinion to a specially-designed spring buffer sprocket wheel at the crank shaft. On the other side of the crank shaft is arranged an internal gear system, and, from a sprocket, the driving chain runs to the driving wheel, effecting a second reduction. The pedal crank spindle passes through the hollow pinion axle, and roller bearings are fitted between the two axles. Owing to the design of the spring chain wheel, the impulses of the engine are absorbed, and the drive is claimed to be as elastic as a belt and with the great

THE NEW SINGER CHAIN-DRIVEN MOTOR-BICYCLE.

advantage of being positive. The engine can be entirely removed from the wheel without difficulty, even the tyre not having to be touched. The new arrangement will be fitted to motor-bicycles only, the tooth gearing being still retained for the Singer tricycles and tri-voitures.

THE AMERICAN 500-MILE RELIABILITY CONTEST.

THE start of the six-day Reliability Run of the Automobile Club of America at New York on Thursday, October 9th, was all that could be desired. The cars were sent off promptly according to schedule, and the confusion that had marred previous contests was avoided. The first car away was

promptly at 9 a.m. the Club officials sent off the first car, and the others followed at fifteen second intervals. At Hartford the competitors and passengers were entertained to luncheon by the Hartford Rubber Company. The night at Springfield was a most enjoyable one. the greater number of the contestants spending it at Cooley's Hotel, where a banquet was given by the Knox Automobile Company. This proved a pleasant affair, and it ended with speeches by Messrs. Shattuck and Scarritt, Geo. F.

THE SCENE AT THE START FROM NEW YORK.

C1, a 24-h.p. Packard tonneau touring car entered by Mr. Harlan W. Whipple, and it was sent over the line at exactly 9 o'clock. The other vehicles followed at half minute intervals, until finally the last of them had crossed the line, and seventy-five of the eighty machines entered were under way for New-haven (79 miles), which was safely reached by seventy-two. Only three participants were reported missing, two of whom failed to reach Norwalk, the halfway stop, during the noon

Chamberlin, of the A.C.A., and other well-known American automobilists.

The vehicles lined up shortly before 8 o'clock on Saturday morning. the 11th ult., ready for the journey to Boston (96 3-5 miles). All the cars seemed to be in good condition and prepared for the run, which was said to be the hardest stage of the contest. The start was made, as usual, promptly at 9 o'clock. Of the starters on the third day there were only two which did not

THE CARS ARRIVING AT NORWALK.

control. A canvass of the drivers on the day's run shows that fully 80 per cent. of the vehicles had a clean record, with no stops of a penalising character. Of the trouble encountered, the bulk of it came in the form of punctured tyres. On Friday, the 10th ult., the journey was continued from New Haven to Springfield (68 3-5 miles). There was more or less adjustment to be done on all the cars which lined up on both sides of the street,

report at Worcester, where lunch was taken. The first car to reach Boston was B 39, a De Dion 8-h.p. light car, which skidded along into the control, its occupants wet to the skin by the heavy drizzling rain that was falling. According to the "Horseless Age," of the seventy-five cars starting from New York sixty-eight reached Boston. Tired out, but still happy and jubilant, the motorists who had successfully completed the first

half of the six-day run spent Sunday, the 12th October, quietly in Boston. Despite the threatening weather, Monday morning, October 13th, dawned bright and clear, and there was every prospect of a pleasant run on the first day's trip toward New York, as far as Springfield (96 3-5 miles), which was safely reached by the bulk of the cars. On Tuesday, the 14th ult., New Haven (68 3-5 miles) was once more reached. Between Springfield and Hartford, the roads are such that an average speed of fourteen miles an hour can be easily maintained, and practically all the vehicles arrived in as close succession as they had started. At New Haven large crowds thronged the road near the control. The leading vehicles arrived at about 4 p.m.,

THE ROUND TOWER, COPENHAGEN (SEE PAGE 676).

in close succession, running, [when close] to the control, at a very slow pace to avoid getting in ahead of time. On Wednesday, the 15th ult., nearly all the machines reached the Norwalk control before half-past 11, having made the thirty-five miles from New Haven in good time and with very little trouble. On the morning of the last day of the contest printed slips were distributed to the competitors announcing that in the afternoon no contesting vehicles would be allowed to pass the Club Committee's vehicles, two in number, which would be recognisable by pennants bearing a large C. Disregard of this rule would result in disqualification. The Committee of the A.G.A. acted wisely in this respect, for without this rule the contest for first arrival would undoubtedly

have resulted in racing within the city limits. As it was, there was the usual scramble for first place when the vehicles neared the control. The Committee's vehicles passed the control at 4 o'clock sharp, and they were followed closely by two Stevens-Duryeas, two Oldsmobiles, a Knox, Darracq, De Dion, Elmore and Foster. Fifth Avenue was crowded with sightseers from Seventieth Street down to Fifty-seventh Street, where the observers gave up their record books and the vehicles were released. Over 90 per cent. of the vehicles that started arrived within half an hour. Of the seventy-five cars which left New York sixty-eight arrived back, a very creditable result. The official results are, of course, not yet to hand.

HERE AND THERE.

MR. J. GORDON BENNETT is reported to have placed an order for a 60-h.p. 1903-model Mercedes car.

THE Amsterdam Fire Brigade have decided to purchase a new electric motor fire engine, which will be capable of carrying nine men.

MR. MCGREGOR has been appointed to represent the Cleckheaton Chamber of Commerce at the forthcoming trial of delivery motor-vans.

ANOTHER motor-cycle contest will be held at the Ashtown rack, Dublin, to-day (Saturday), under the auspices of the Irish Motor-Cycle Union. Two events are down for decision—at five miles handicap and a petrol consumption trial.

THE Fillebrook Cycle Company, of Leytonstone and Walthamstow, have removed their Leytonstone business from the Kirkdale Road to 787, High Road, where they have erected new and larger premises for the storage and repairs of all types of automobiles.

THE Ridley Autocar Company has been registered with a capital of £2,000 to adopt an agreement between J. Ridley of the one part and J. H. Chilton (for the company) of the other part, and to carry on the business of manufacturers of and dealers in motor-cars, cycles, mechanical engineers, etc.

THE special prize of £25 offered by the Continental Caoutchouc Company to the driver of the gold medal car which had its "Continental" tyres in the best condition at the end of the Reliability Trials has been awarded to Mr. H. Prosser, of Messrs. Rennie and Prosser, Glasgow, who drove the Wolseley 10-h.p. car (No. 41).

REFERRING to our report last week of the discussion on Captain Longridge's paper on "Oil Motor-Cars," the omission of a decimal point made Professor Turner's recommendation with regard to the amount of carbon in steel appear somewhat doubtful. The steel he recommends should have, of course, 15 per cent. of carbon—not 15 per cent.

TURNER'S MOTOR MANUFACTURING COMPANY has been registered with a capital of £10,000 to acquire the business of motor manufacturers carried on at Archos Works, Walsall Street, Wolverhampton, by Thomas Turner and Co., including the benefit of agreements between that firm and R. Pincock and the Miesse Steam Motor Syndicate, and to carry on the business of manufacturers of and dealers in steam generators, motor-cars, and vehicles, etc.

ON the night of the 27th ult. burglars entered the house of Mr. A. C. Davison, 366, Camden Road, N., and stole two motor-bicycles. They should be easily identified, as one, the "Davison," was of a new pattern, and has a frame quite different to any other on the market. It has also glass oil gauges let into the petrol and oil tanks, and other improvements which the owner was working out. The other bicycle was an Ormonde of the usual well-known pattern, but has an additional Lucas valve attached to the oil supply pipe, and the top tube has had the enamel scraped off and touched up by hand. Mr. Davison is naturally anxious to see the machines again, and should any motor or cycle traders have the bicycles offered to them he would be glad if they would communicate with him.

A RUMOUR reaches us that the Hon. C. S. Rolls contemplates an early attack on the mile automobile record.

A PHILADELPHIA company, known as the Hess Steam Vehicle Company, is bringing out a light steam car, in which charcoal is used as fuel.

THE Darracq Company are bringing out, for the 1903 season, a four-cylinder 20-h.p. car, the motor having mechanically-operated inlet valves.

MESSRS. J. FULLBROOK and Co., of Slough, have arranged for the delivery of motor spirit and petrol by road—so that users of the Bath road need have no fear on that score.

THE BEAUFORT CAR CLIMBING THE ROUND TOWER, COPENHAGEN.

As already announced in these columns, the Motor Manufacturing Company, Limited, are shortly removing to the West End, where they have taken premises at 95, New Bond Street.

FROM Messrs. Hartcliffe, Lee, and Malkin, Limited, St. Simon Street Works, Salford, we have received a copy of the catalogue of lubricators for steam and internal-combustion engines, of which they make a speciality.

AN order for a public inquiry into the Maidenhead Bridge Tolls has been made by the Charity Commissioners. This will take place on the 18th inst., at 10.30 a.m., and motorists will look with interest to the result.

THE Firefly Motor and Engineering Company, of High Street, Croydon, have sent us a copy of the new catalogue they have just issued. It gives particulars of their 9-h.p. and 12-h.p. Firefly cars, and also the rates for the hiring and storage of motor-vehicles.

THE Century Engineering and Motor Company, Ltd., have recently despatched several Century light cars from the works, amongst others a handsome 12-h.p. brougham, specially built to the order of Lord Ebury, and a 12-h.p. tonneau for Mr. Courtney Warner, M.P.

A BALLOON carrying despatches will ascend from the Crystal Palace at about mid-day on Saturday, Nov. 1. In connection therewith a prize is being offered to the member of the Automobile Volunteer Corps who follows the balloon to its descent and captures the despatches.

THE London Motor Garage, Ltd., have acquired the sole rights for the United Kingdom and Colonies in the Pipe car, a vehicle which has already earned a reputation in Belgium.

WESTON MOTORS inform us that in the recent reliability trials, held under the auspices of the Automobile Club of America, from New York to Boston and back, a distance of 500 miles, two of their Weston steam cars (manufactured by Messrs. Grout Bros., of Orange, Mass.) went through without the loss of a single mark. Special arrangements were, of course, made for tank filling, but otherwise the cars were of standard design.

It is stated that the Mors Company has already sold its output for the whole of 1903.

ARRANGEMENTS are in hand to hold an automobile exhibition in the Idrotts Park, Stockholm, in May next.

THE HON. ARTHUR STANLEY, M.P., has been elected Vice-President of the Roads Improvement Association.

L'ASSOCIATION GENERALE AUTOMOBILE OF PARIS has voted a sum of 500 francs towards the cost of experiments with tarred roads in the Alpes Maritimes.

THE commandant of the North-Western Military Academy of Illinois, U.S.A., has organised an automobile gun detachment in connection with that establishment.

LAST week Mr. A. R. Atkey, of the Nottingham Automobile Club, sailed for South Africa. During his six months' absence, his local duties will be undertaken by Mr. M. R. Browne.

MR. J. BIGGS, managing director, informs us that the Whippet Motor and Cycle Manufacturing Company has taken over the business of the Whippet Cycle Syndicate, Limited (in liquidation), of the Whippet Works, Falcon Terrace, Clapham Junction, S.W.

A SPECIAL six-seated electrical motor-wagonette has just been completed by the City and Suburban Electric Carriage Company to the order of Baron Schimmelpenninck van der Oye, a member of the Dutch Legation in London. The vehicle is propelled by two 6-h.p. electric motors, which drive the rear road wheels through spur gearing. The accumulators have a capacity of running the car a distance of 80 miles at an average speed of 12 miles per hour.

"THE LIGHTNING CONDUCTOR," which, as we announced recently, was nearly ready for publication, is now on the bookstalls. It is a novel on novel lines, for the illustrations are photographs of scenery, and include reproductions of the Orient Express, Mr. Cecil Edge driving a car, Mr. Capellen—if we mistake not—dismounting from an automobile, and a view of the White Lion Hotel, Cobham, before which a gentleman who was prominent in motoring circles two or three years ago is standing. The opening scene of the story, which is published by Messrs. Methuen and Co., begins in the Oak Room at the White Lion, the proprietor of which, we may note in passing, makes no charge for motor-cars standing in the yard whilst their passengers refresh in the hotel.

AMONG the latest novelties for lady motorists introduced by Messrs. A. W. Gamage, Limited, are the "Adele" combination mask and wrap and the "Desiree" combination mask and hood.

In the "Adele," the combination of clear fine mica, firmly attached to the face shape of silky net, allows an unimpeded vision, with free respiration and ventilation; the pure Japanese silk wrap is attached firmly to both mica and net, and a simple arrangement of elastic and ribbon is drawn around the hat or toque, and is pulled together in gathers at back and front to the neck; the front gathers are so arranged that they can easily be loosened for a lady to use her handkerchief without disarranging the wrap in the slightest. The "Desiree" hood has the same combination of mica, net and silk, and covers hat, head, and face completely, preventing dust getting into the hair or blowing in the face, at the same time giving an uninterrupted and clear view, with free breathing and ventilation. The hood is easily attached, buttoning up the side with four small buttons, and, having the same ingenious arrangement of draw silk as in the Adele wrap, a lady is at no inconvenience, though fully protected from dust and sun.

EVIDENCE of the progress of automobilism comes to hand in the *Canterbury Times* of New Zealand, which, we understand, has commenced a series of Motor-Car Notes for its readers.

OIL MOTOR-CARS OF 1902.*

By CAPTAIN C. C. LONGRIDGE.

(Continued from page 671.)

Valve Area.—In this year's motors, there is among the best makers a marked and very praiseworthy tendency towards increased valve area. Where the sluggish-acting automatic inlet valve is retained, the difficulty with high piston-speed of ensuring a full charge is increased; and, in such cases, if 80 ft. per second for induction and 100 ft. per second for exhaust are to be at all approximated, it is evident that the valve areas can scarcely be too ample. There is little doubt that the sharp blast considered necessary in the aspiration method of carburation to secure proper suction and mixing of the petrol has hitherto militated against the use of large-sized inlet pipe and valves. The necessity for this sharp blast is purely imaginary, as there are many very obvious ways in which the difficulties, real or apparent, are easily overcome. So far as the author is aware, no clear rules for determining the valve areas of explosion engines have been published. There is no difficulty in calculating the induction-valve area, but the problem of the exhaust valve is less simple. In any case the common practice of making inlet and outlet valve of equal area cannot be right.

Carburettors and Carburetting.—These are roughly divisible into two systems—*aspiration carburettors*, and *positive-feed carburettors*. Of the two, the latter, in the author's opinion, is unquestionably the better system. Most aspiration carburettors draw the petrol from a jet, communicating with a constant-level chamber or reservoir. The result is inaccurate and faulty petrol supply, since the force of the suction varies with the speed of the engine. Rich charges are thus obtained when the engine is racing, and poor charges when it is slowed down from over-load—the reverse of what ought to be. Makers are now recognising this defect, and are introducing devices more or less closely approaching positive measurement. As instances of the introduction of positive fuel measurement in petrol motors may be cited the Koch pump, the Gobron-Brillié bucket measurer, the adjustable stop-jet in the Mercedes Simplex, &c.

There is a good deal of evidence to show that the problem of carburation is at present eliciting the attention of inventors—a sign that something yet better is wanted. To take one among many, Messrs. E. F. Bradley and W. R. Pidgeon have recently published a new design of carburettor. They found by experiment, as might have been surmised *a priori*, that, to get the maximum power at any number of revolutions per minute, the jet of the carburettor must be larger for low speeds than for high ones, and, as it is difficult to adjust so small a thing as the hole in the jet, they insert a small air-spring valve in the air-pipe between the carburettor and the induction valve. This auxiliary valve opens wider and wider as the engine speed increases, closing again as it decreases, thus decreasing or increasing the suction on the jet. At starting, as the jet is a large one, the petrol supply is also large and the engine starts readily, then as it speeds up the air-valve comes into action, and automatically letting in more air reduces the mixture to and maintains it at the proper proportions.

In connection with carburation, the author raises the point whether it be better to carburate the incoming air, or to first introduce the air and then carburate it, that is, add the fuel, at the end of the compression stroke. This latter method avoids all possibility of premature explosion, and thus enables higher compression to be used. On the other hand, it is urged that the charge will be imperfectly mixed, and give imperfect and irregular combustion. The author is doubtful whether for petrol and gasoline there is anything in this objection, or whether, if there is anything, it is not more than discounted by the advantage to be gained. It is certain that a number of petrol motors run, and run successfully, by merely injecting the petrol into the cylinder and letting the air and heat do the rest.

On the whole, the author thinks that, for petrol at least, a good deal more stress is laid on pre-mixing than need be, and that carburation at the end of the stroke, inasmuch as it admits the use of higher compressions and has another important advantage, is probably as good as, if not better and more economical than, the more ordinary method. It probably requires high compression.

The Fuel.—The consideration of the fuel used is a very important portion of the subject. It seems to the author astonishing that petrol should have been so long in use and yet so little known about it. He believes he is correct in stating that in this country at least neither the maximum explosion pressures of various petrol mixtures, nor the times of attaining maximum pressure, nor the rates of cooling are yet ascertained. Under these circumstances makers, as far as carburation is concerned, must be working more or less in the dark. A few years ago Dr. Boverton Redwood contributed some valuable information on the subject. The results of his experiments are as follows:—

"With seven volumes of the liquid (pentane and gasoline) to 100,000 volumes of air the combustion is a silent one, while with four times that proportion of liquid the mixture also burns without explosive violence. With between eight and nine volumes of liquid to 100,000 of air, there is a marked increase in the energy of the combustion, and, when the quantity of liquid is augmented to 10.5 volumes, a sharp explosion occurs. When the proportion of liquid is increased beyond about seventeen volumes there is a perceptible decrease in the violence of the explosion, with corresponding gain in the volume and duration of the flame, and with twenty-one volumes of liquid to 100,000 of air the explosion is as mild as with 8.4 volumes."

* Abstract of Paper read before the Institution of Mechanical Engineers

These results, adequate for Dr. Redwood's purpose, are not sufficiently comprehensive for the requirements of the motor manufacturer. For his purpose, estimation of the value of any explosive mixture involves knowledge, not only of the maximum explosion pressure as one factor, but also of the rates of cooling as another factor. It is only from the faculty of producing pressure and the capacity of resisting cooling, that we arrive at the mean pressure which determines the true efficiency of the mixture. The determination of these factors is still wanting. It is, however, likely that the deficiency will soon be supplied, for the author is in a position to state that the necessary experiments are in progress. The results will be awaited with considerable interest, and there is little doubt that they will establish the value of petrol-measuring devices for carburettors when efficiency and economy are rigorously followed.

Under the head of fuel it may be noticed that the motor-cars of to-day, more especially those of French makers, show a tendency to acquire greater range—that is, to be equally suited for the consumption of either petrol or alcohol. Is this a precursor of the supersession of the refined product of nature by the purely artificial production? That is a question for the chemists to decide. There is, however, an interesting phenomenon which the trial of alcohol has made sufficiently prominent to merit attention. The point is clearly put in an article in *Engineering*, on "French Spirit Motors":—"In theory, the consumption of spirits for an equal power is 1.8 times the consumption of petrol; in practice, however, the presence of water in the spirits increases the elasticity and efficiency of the power, and the proportion is only 1.25 to 1. . . . Spirit motors have more elasticity than petroleum motors, and work more softly; the pressure of the explosion can be increased without disadvantage to the machine, the expansion curve being very regular. . . . It has been asserted, from results of tests carried out in Germany, that the efficiency of spirit motors is 23 per cent., against 15 per cent. for petroleum, and 13 per cent. for steam engines."

Why should the presence of water in the alcohol motor give this increased efficiency? Before attempting a reply, it may be stated that the same phenomenon has been observed in the petrol motor; for, if the published reports are to be credited, the addition of water to the charge in the Banki engine reduced the consumption to 0.45 pints per b.h.p. per hour. There, again, in general terms, the advantages claimed were greater economy, greater elasticity, and smoother running.

In July of this year, Mr. C. Rainey, at the author's request, made some experiments with water injection in a petrol motor. Owing to want of appliances no very close work could be done, but the general results reported by Mr. Rainey are these:—(1) That while maintaining the petrol supply constant, the addition of water gave increase of power and cooler running; (2) that this effect was maintained until the water reached a quantity equal to the amount of petrol; (3) that a larger quantity of water interfered with the sparking, and caused frequent failures of ignition, which, after a short time, failed altogether.

As far as the author is aware no very complete explanation of these better results has so far been published. The advantages of water have been described as a contribution of mechanical energy in the form of steam, as a cooling agent obtaining increased charge volume and higher compression, as an absorber of the violence of explosion, etc. To these explanations the author will add another. During the recent testing with tube ignition of a petrol motor, in which the cylinder wall developed porosity, admitting moisture to the combustion chamber, a sudden advance in ignition was observed, together with an increase of exhaust temperature, leading to burning of the valves. The author considered the following to be the possible reason:—Assuming the cylinder charge to be pentane, C_5H_{12} , the addition of water or aqueous vapour in contact with the incandescent tube might lead to partial decomposition, carbon combining to carbon monoxide, hydrogen being liberated. In other words, water-gas would be formed. The advance in ignition would be due to the greater inflammability of the gas, and may be illustrated thus:—The molecular weight of pentane being 72, 256 of oxygen would be required for its perfect combustion. On the other hand, the molecular weight of the water-gas, $CO + H_2$, being 32, the oxygen needed for complete combustion would be 48. One part by weight of pentane, therefore, would require 3.5 O, and one part of water-gas 1.5 O. This at once shows why the ignition is advanced, the greater inflammability of the water-gas being due to the lesser amount of oxygen wanted for combustion. The increased temperature of exhaust might be accounted for by assuming that the nascent water-gas, burnt with a fierce heat and acting as an extended flame carrier, produced more rapid and complete combustion of the charge. Unfortunately, the testing department in question is entirely destitute of any laboratory or appliances for following up questions of research, and the author was unable to analyse the exhaust gases, and thus determine whether the hypothesis of more complete combustion was correct. The above is not an isolated case, nor is it confined to one size or type of motor nor to tube ignition only, the same facts being observed when electric ignition is in use. It has been suggested that earlier ignition is due to the explosion gas entering the water-jacket, and, by driving the water from the cylinder walls, increasing the heat of the combustion-chamber. But there are a number of arguments against this suggestion, and the phenomena of earlier ignition and hotter exhaust when a little water is present, with increase of power and cooler running when a large and regular supply is added, need another explanation.

Treated mathematically, as a purely thermal problem of profit and loss, it can, no doubt, be shown that, whatever be the physical condition of the water at the beginning of the compression stroke, and whatever be the laws of specific heat, the addition of water to the charge is an entry on the

wrong side of the balance-sheet of an explosion motor; and that the advantage of water injection can lie only in the possibility it gives of employing much higher compression without risk of premature ignition; of obtaining heavier charges; and of reducing heat loss through the cylinder walls. But does this academical statement meet the whole case? Does it explain the phenomena above? Does it satisfactorily explain the increase of power without the increase of compression, to which Professor Meyer attributes the results of the Banki motor? And does it explain the remarkably high and maintained mean pressure of that engine when water is used?

Several arguments might be advanced for the entry of an additional factor into the problem, the possible improvement of combustion by the presence of water vapour. The idea is not new. Proposals to improve combustion by decomposing the fuel with steam or aqueous vapour occur in many patents. The more perfect combustion by simultaneously and together evaporating water and vaporising oil is ascribed by Altmann to an oxidising action of the water vapour. Under the influences of high temperature, the close contact of compression, with the physical and chemical disturbances of explosion, it does not seem impossible that water vapour may cease to be inert, and, under certain conditions, may promote the splitting of a hydrocarbon into light gases, olefines, hydrogen, burning at lower temperatures (1,124 degs. F.), and into heavier residues, carbon monoxide, etc., requiring a higher temperature (1,200 deg. to 1,350 degs. F.) for their combination with oxygen. It would be to the presence of these light gases that earlier ignition might be due, while the hotter exhaust might be attributable to the later, and probably better, combustion of the heavier products, by reason of the rapid and extended initial inflammation. Communicating with the author on this question, Mr. H. J. Bult, F.C.S., wrote: "The decomposition of petrol in the presence of water might take the form you suggest, and could be explained by the equation: C_5H_{12} (pentane) + $H_2O = C_2H_6$ (ethane) + $CO + C_2H_4$ (ethylene) H_2 ." But he expressed an opinion that the reaction might rather be more in accordance with $C_5H_{12} + H_2O = C_4H_{10} + CO + H_2$. Another reason for attributing the phenomena possibly to decomposition is, as Mr. Bult proceeded to add, that it is well known, when petroleum compounds, especially those belonging to the paraffin series, are superheated, they partially decompose into olefines and gases, at the same time leaving a deposit of carbon. The author's suggestion, therefore, is that the presence of water vapour, at a certain temperature, may disturb the chemical equilibrium of the oil at the critical point, hastening and promoting its decomposition. That a hydrocarbon, even without the presence of water, would, in the combustion chamber, decompose into light and heavy constituents, seems very probable—the result being combustion and heat evolution more or less of an irregularly progressive nature. Comparing the oil with the gas engines, using similar compressions, the ratios of maximum pressure to compression in oil motors are, if anything, higher than those in gas engines; while the ratios of mean pressure to maximum pressure are much lower. May it not be legitimate to attribute the high initial pressures of the oil motor to the rapid inflammation of volatile gases, and the low mean pressures to the slower and imperfect combustion of the residual products of the decomposition? It is claimed that the addition of either hot or cold air to steam serves to lower the point of condensation. Now, is it possible that some analogous action takes place when water vapour is mixed with the explosion gases? Is there a development of latent heat? Is there a marked retardation in the rate of cooling, and therefore a higher exhaust temperature? Is there a retarding effect on dissociation, and so the attainment of a higher initial temperature; or is there an acceleration in recombination after dissociation, and so the maintenance of a higher mean temperature? But, as Mr. Clerk puts it, without exception the actual pressure of explosion falls far short of the calculated pressure; in some manner the heat is suppressed or lost; for some reason nearly one-half of the heat present, as inflammable gas, in any explosive mixture, true or dilute, is kept back and prevented from causing the increase of pressure to be expected from it. There is, therefore, a very wide margin for greater initial heat development, and it may be that the presence of water vapour, true or decomposed, has some developing action on this latent potentiality. The whole question is obscure, and automobilists must not conceive the idea that even if water is proved to be a useful addition to the charge, the problem is at once solved. Probably correct employment of water will demand certain conditions that have yet to be studied, and may require a change in the motor design. Anticipating the objection likely to be raised, that water will corrode the valves and cylinder, the author replies that this does not appear to be the case. With alcohol, containing water, it has been found that where the curve of the motor was regular, indicating perfect combustion, the condensation liquid of the exhaust was neutral, and there was no attack of the valves and cylinder walls. Three years of experience with the Banki oil and benzine motors show no corrosion from the use of water.

In another direction also, and this time with more definite knowledge and purpose, improvements in fuel are under consideration. These lie in chemical additions of explosive nature as petrol enrichers. The idea is not new, and frequently recurs in past patents. There is no theoretical difficulty in chemically increasing the explosive power of petrol. But there are difficulties of a practical character which consists in finding an enricher that fulfils the two conditions—of not increasing the cost of the fuel per horsepower, and of not introducing any element of danger in its use. Picric acid has been experimented with, but it is manifestly dangerous to handle, and is said to leave a highly explosive deposit in the exhaust pipe and silencer. Bisulphide of carbon has been frequently suggested; but it will certainly need to be deodorised. Curiously enough, salt also has been recommended.

The effect of this ingredient, if any, would be due to the formation of chloride of nitrogen and hydrochloric acid, quite prohibiting its use. There are, however, other possible means of enriching petrol; and the author, in conjunction with Mr. H. J. Bult, is now considering one of a promising nature.

Ignition.—Lamp ignition, except as a standby, may be said to have disappeared. A little while ago some interest was excited by a new catalytic ignition. Such a method, however, has neither the flexibility, the inflammation capacity, the certainty, nor the suitability of properly designed electric firing. The only method, therefore, to be considered in detail is the electric. This divides itself into dynamo, accumulators, magneto-electric, or combinations. The dynamo is rarely used alone; more generally it serves to ignite the charge, while the surplus current goes to the accumulators, which are thus kept ready for emergency or for lighting purposes. This seems an excellent if not the best system. As regards accumulators the author's experience is that they never run nearly the mileage claimed and are otherwise troublesome. In this country, the best-known magneto ignition is the Simms-Bosch. In whatever form it is applied, electric ignition is a notable advance over previous methods. It provides absolute immunity against fire; it furnishes a spark well suited to explosive mixtures, it increases efficiency by enabling the charge to be fired at the moment of maximum compression, and it admits of the employment of higher compressions. Existing systems of electric ignition admit, among other directions, of improvement on two lines—automatic timing and automatic consumption of current. The timing of the spark should automatically adjust itself to the speed of the engine. To illustrate this by an extreme case, assume a motor running at high speed and the spark set to pass at the moments of maximum compression; if suddenly, by the application of the throttle or other cause, the speed is greatly reduced, premature

FIG. 3.

FIG. 3.—AUTOMATIC SPARK CONTROLLER. The fibre contact-breaker disc is mounted on a sleeve V, rotatable round the motor shaft A. As the speed accelerates, the centrifugal masses P P', pivoted on studs D D', are forced outwards, causing partial rotation of the toothed sectors S S'. The motion of the sectors by means of the sleeve V, loose on the shaft A, advances the position of the disc, so that the brush M establishes earlier touch with the contact plate C.

ignition will result, with considerable shock to the engine, crank-pin and bearings. But between this danger point and the period of correct firing is a gamut of speed variations, in all of which to maintain correct periodicity the timing of the spark should be altered. To repeat this in other words—for the matter is more important than many makers seem to think—with early ignition there is injurious strain on the engine, probable heating of the crank-pin, and undue wear on the crank-shaft bearings. With late ignition there is considerable loss of power, high exhaust pressure with increased strain on the exhaust valve gear, incomplete combustion, sufficiently prolonged, perhaps, to cause gradually burning of the valves, and possibly back-firing of the fresh charge. With regard to the period of normal ignition, the author's own view is that it might be well so to dimension the compression chamber and stroke as to produce at the dead points slightly more compression than it is intended to use for explosion, thus allowing the crank to pass the dead point and gather way before igniting the mixture at the working compression point. On the indicator diagram, the explosion line, instead of being vertical, would then slightly incline towards the expansion curve. In any case efficient running greatly depends on accurate ignition, and should be treated accordingly. At present timing is mostly left to hand regulation by the driver; but attention is now being given to automatic spark controllers, one of which is illustrated in Fig. 3. A second line for improvement is automatic regulation of the amount of current used. Naturally this is of chief importance where accumulators only are used. At present the flow of current is usually made by a brush brought in touch with a contact piece on a rotary disc. If this contact piece is made of sufficient width to ensure the passage of enough current when the motor is running at high speed, it will pass more than sufficient current when the engine speed is reduced.

(To be continued.)

CORRESPONDENCE.

WATER CIRCULATION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any, among your numerous readers, explain how it is that after running ten miles the water in my tank boils, and I cannot bear my hand on the brasses at the end of the piston rod? I carry four gallons of water. My car has pump, radiator, and electric ignition. The engine is 5-h.p., the cylinder being 5 in. diameter by 5 in. stroke. The car is of the Benz pattern, with belt transmission. The grease in the cup on the crank turns to oil. When I hear of cars running many miles without unduly heating, I feel disheartened. I have had the combustion chamber attended to, also all pipes, etc., but it all makes no difference. Several have had a turn at the trouble, but all fail to tell me the cause. May I be more fortunate among your readers.—Yours faithfully,

PUZZLED.

HEATING OF MOTOR HOUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had a Tortoise stove burning all last winter in my motor stable, quite satisfactory. An asbestos-lined screen in front, in case of overheating, is desirable. Re furring of boilers, I found the water-jacket, etc., partially furred on my petrol car, and half an inch of oil, etc., in bottom of water tank. This may be a hint to some.—Yours truly,

A. C. D.

CARS FOR TRAVELLERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "W. J. S.," about eighteen months ago my requirements were similar to his. Requiring a car for working a medical practice in town, after due consideration, I invested in a Locomobile steam car, and have used it regularly since. I must say the vehicle has fairly fulfilled my requirements, but this type of car requires close watching and attention; the joints and packing require constant tightening and replacing—a work which can only be done by a skilled mechanic. The car is an excellent one for light work about town, where the roads are good, but it has one great drawback—the fire blowing out if the car is left standing any time. Many ingenious devices are used to overcome this fault, but their success is doubtful.

As to internal combustion cars, more than half their failures on the road are due to faults in electrical ignition, carburettor, and tyres. In my opinion, the most suitable car for your correspondent's requirements is the Roots and Venables; it is fitted with solid tyres, has tube instead of electrical ignition, and common paraffin is used, which practically ensures freedom from fire. My experience of this car is limited to a preliminary run, and I was agreeably impressed with its ease of running, though shod with solid tyres.

As to cost of running, a two-seated petrol car will run 20 to 30 miles on one gallon of petrol, a paraffin car about the same distance on a similar quantity of paraffin, and a steam car about 10 miles. The cost of fuel is, however, a small proportion in the cost of maintenance. In my case I would put it for a steam car per week: Petrol, 6s.; stabling, 6s.; repairs, renewal of tyres, 10s., on a weekly distance of 80 miles.

As to the query about Benz cars, the principle is similar to the present petrol cars, with this difference—the Benz was belt-driven, whereas the modern cars are nearly all gear-driven. Yet the Benz is a most popular and reliable car; hundreds of them are still doing useful work, and I believe one of the great secrets of its success was that it was shod with solid tyres.—Yours truly,

MEDICUS.

MECHANICALLY-OPERATED INDUCTION VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sure the majority of your readers will peruse with pleasure the paper read by Capt. C. C. Longridge, reported in your last issue. The author touches on several points of great value to the motor industry, and I notice he lays great stress upon the value of mechanically operated induction valves. Being deeply interested in this matter, I hope it will be made a subject for discussion. Some four years ago I experimented with a motor manufactured by the Progress Motor Company, and designed by Mr. E. J. West, which had the induction valve mechanically operated. I found that the burnt gases in the combustion chamber, due to the back pressure of the silencer after completion of exhaust stroke, would "blow back" though the carburettor, filling the pipes and carburettor with foul gas and dirt, instead of their being filled with a rich charge waiting the opening of the valve. I tried giving the valve "lead," but found the blow-out of the carburettor considerably increased (so much for scavenging), but by giving the piston the "lead" and so allow the burnt gases to expand in the cylinder almost to atmospheric pressure before opening the valve, the difficulty with the carburettor was overcome.

The motor was afterwards fitted with an ordinary automatic spring induction valve, and gave out practically the same horse-power on the testing stand as long as the valves did not stick or become dirty; only

then did the mechanically-operated valves show any advantage. Again, the spring automatic valve does not close immediately on the completion of the suction stroke with high-speed motors. The momentum of inflowing gases, and the inertia of the valve, keep the same open for an appreciable time after the end of the stroke—quite long enough to overcome the vacuum in the cylinder. It is worthy of note that in this position the piston is not moving so rapidly. The engine I refer to was well designed and had valves of ample size. Should this question not be raised at the meeting, I consider it is well worthy of discussion in your columns. I think it a pity to add unnecessary complications to a motor. With my present car (a Progress 8-h.p.) I have this year run over 9,000 miles without the slightest hitch, and can always depend upon doing forty miles per gallon of petrol with full load of four passengers up. Surely that is economical.—Yours truly,

H. J. WIMSHURST.

RAILWAY COMPANIES AND CARRIAGE OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We, along with the whole of the trade, have received the expected notice from the railway company re the carriage of petrol. I have been to see the railway company which have done our carrying, and asked them to give us the consideration our business should demand (we have paid in carriage during the past eleven months over £600), and have told them that if they are not prepared to carry our petrol as before we shall take all our cars at the port of entry and bring them to our depot by road, thus taking away from the railway company the carriage that we, as one company, have paid. I suggest that a meeting of the trade be called and that a united resolution be passed that all cars coming into the country be driven from the ports and delivered by road, wherever possible. We are making our arrangements to run a car specially for carrying petrol from Gooles to Bradford, and hope to see a united movement made to bring the railway companies to a more sensible arrangement.—Yours truly,

THE BRADFORD MOTOR CAR CO.

POLICE TRAPS IN SUSSEX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I trust you will allow me space in your valuable paper for the benefit of motorists who journey from London to different resorts on the south coast through Crawley, by giving them a special warning against the police in the neighbourhood, who are lying in hedges and ditches to catch them. It seems to me, and also my friends, that as soon as a policeman hears a motor-car coming from any direction, he takes the speed from the noise of the engine, and consequently stops his watch and states that they are then travelling at a furious speed. Surely something could be done to save the motorist from this unwelcome and unmanly way of catching them. The way they are trapped in this district is mostly by two or three plain-clothes men and one in uniform. I also wish to mention that the measured distances are from the West Sussex boundary, situated at the foot of Hoggs Hill, on the Brighton side of Crawley (a distance of about half a mile from the village) to the county boundary of Sussex and Surrey, situated on the London side, about one and a half miles below Crawley. I should therefore advise all motorists between these points to take care.—Yours truly,

SUCCESS TO THE MOTOR.

THE ROUTE TO LIVERPOOL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent, I can strongly recommend the following route to Liverpool. Once out of the London district the road surface is good practically the whole way till Warrington is reached, seventeen miles from Liverpool, and the hills are not severe nor particularly numerous. According to the Contour Road Book in which this route is given, the steepest are only one in fourteen. The route I suggest is Holloway Road, through Finchley to Barnet, St. Albans, Dunstable, Stoney Stratford, Towcester, Daventry, Coventry, leaving thence by the Radford road to Kingsbury, Lichfield, Rugeley, Stone, Newcastle-under-Lyne, Holmes Chapel, Knutsford, Warrington and Liverpool. A great advantage of this route is that all the very large towns are avoided. The distance from London is about 200 miles. Those who take an interest in small cars might like to know I drove there and back this last April in a 3½-h.p. Georges Richard voiturette, air-cooled going, and with a water head returning, doing the double journey without a hitch.—Yours faithfully,

E. WILLIAMS MARSHALL.

THE NUMBERING OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I believe this important point is to be debated by the A.C.G.B. and I. next week. Those of us who are opposed to this need no better declaration of our views than that officially issued by the A.C.G.B. and I. itself a short time ago. In a circular manifesto to the County Councils of England and Wales the Club, in 1901, very wisely said:—

"18. English gentlemen have the greatest repugnance to having their private vehicles identified and disfigured by numbers, and this objection is equally strong whether their carriages are drawn by horses or propelled by motor power. The numbering of a gentleman's private carriage would be such a departure from the accepted conditions of life in this country

that it would lead the public to believe that a man who prefers to use a vehicle propelled by an engine to one drawn by a horse is, in the eyes of the authorities, a person likely to misconduct himself. The stigma implied would prevent gentlemen from purchasing motor vehicles if the numbering were insisted upon.

"19. The driver of a numbered motor vehicle would be subject to continual prosecution, since any idler or prejudiced person might, irrespective of the truth of the complaint, state, without warning or notice to the party informed against, that the vehicle was being driven at an excessive speed. It would rest with the driver of the motor vehicle, although taken unawares and thus prevented from obtaining witnesses, to prove to the contrary. In view of the opposition which has always existed in this country to the introduction of a new form of locomotion, the number of persons who are prejudiced against motor vehicles must for some time be considerable, and the continual oppression to which the driver of a motor vehicle would be subjected would probably lead him to abandon the use of motor vehicles for private passenger traffic upon highways.

"20. There is no just reason why the proposed compulsory numbering should apply more to motor vehicles than to dogcarts and other light vehicles drawn by horses, which are frequently driven at a speed of at least fifteen or sixteen miles an hour, and cannot be stopped or directed with the same facility as a motor vehicle.

"21. . . . owners of motor vehicles have a right to claim the same privacy in respect of their motors as is permitted in the case of other private vehicles.

"23. The Committee have also been informed by several intending purchasers of motor vehicles, that if their carriages are to be labelled with numbers they will decline to adopt a method of transport which would be subject to such an unfair and offensive regulation. This is incontrovertible evidence of the damage which will be done, if this proposal were adopted, to what otherwise must be a valuable and important industry."

If we add that Scotsmen and Irishmen also agree with the sentiments above attributed to English gentlemen, then there seems no need for the opposition to say anything beyond asking the Club Committee why they have so suddenly eaten these very carefully weighed and very true utterances of last year. The more one thinks and talks of it to fellow-motorists, the more does it seem imperative that the whole thing should be left in peace till the rapid education of the whole people is completed, and then, perhaps two years hence, the Government and Parliament might take up the consideration of the legislation dealing with the whole subject of road traffic; and this without imposing an ugly, degrading, and dangerous—from a police and J.P. persecution point of view—idea such as compelling a private carriage to have a huge inscription like 101666 stuck on it, suggestive of evil and a career based only on sufferance.

I am in favour of persons who drive at over (say) thirty miles an hour having a certificate of competency if you like, of all and every vehicle on the road having lights, and of other necessary laws—if carried out all round. But why we should ourselves ask to have number-plates as if we were licensed beggars, is going to a very doubtful extreme which cannot be undone. I have made inquiries among English lawyers and I find it is the same as in Scotland—in any appeal in a criminal matter the Supreme Court will deal with points of law, the facts are for the court of first instance. And it could not be otherwise in justice. Hence, whether anything was done or was not to the common danger rests with the views of the lower court; and, therefore, no hope need be placed upon legislation as to appeals to take the place of the gradual education of the absurd Courts (of Justice?) which your English system of J.P.'s entails upon you. Moreover, Parliament in all common sense could never sanction a special law for one class of the community which gave it a direct or novel road to the Supreme Court.

I hope, therefore, that those who are opposed to numbering will not swallow the pill because coated with some doubtful matters about Appeal Courts or that Parliament will not remove the speed limit without plaques. Let time do its usual work in bringing sense to even dull and prejudiced folk.—Yours truly,

NORMAN D. MACDONALD.

In reply to "Puzzled," re "Kicking Engine," Mr. C. W. Pettit writes:—"I think he will find the error due to the cotter pin in the fly-wheel, or the bar across piston that holds the piston rod being loose—either of these will cause the kicking."

OBSTRUCTIONS ON THE ROAD.

At Jedburgh, N.B., last week, Alexander Allan, a farm servant, of Maxton, was accused of having on September 24th laid a large stone upon the highway leading from St. Boswells to Kelso by way of Maxton, between Riddleton-hill Road End and the village of Maxton, so as to cause an obstruction to a light locomotive belonging to Mr. Bertram Gibberd. The Provost said due consideration had been given to all that had been stated on behalf of the accused, and taking all the circumstances into account, the Bench imposed a fine of 10s. with 10s. expenses, or seven days' imprisonment.

DAMAGES AGAINST A MOTORIST.

At Lichfield County Court last week, before Judge Mullholland, Captain Harold Penington Robinson, of Measham, was sued for damages caused by his motor-car to a horse and trap belonging to Mr. Holt W. Ridley, estate agent for Sir C. Forster, Bart. On June 21st Mrs. Holt Ridley was standing

outside her dressmaker's house in Lichfield with the dogcart and pony, when Captain Robinson drove into the city in his motor-car. At its approach the pony became restive and unmanageable. Mrs. Holt Ridley shouted to the driver to stop, but on reaching the pony the animal swerved, slipped, and fell, breaking the shafts and doing other damage. Captain Robinson said he neither saw Mrs. Holt Ridley's hand nor heard her shout. The Judge said drivers of these vehicles should keep a look-out for signals, and gave judgment for plaintiff for five guineas.

HORSES AND MOTOR LURRIES.

In the Salford Hundred Court of Record, before Mr. H. S. Shee, K.C., an action was brought last week by John Hadfield, a carter, against the Manchester Motor Transport Company, Limited, to recover damages for personal injury, caused, it was alleged, by the negligence of the defendants' servants. It was stated that on June 25th plaintiff was loading his lorry at a warehouse in Mount Street, Salford, when a motor lorry came into the street, making a noise, which startled plaintiff's horse. As the animal bolted, the plaintiff noticed a woman with a child in front, and as the horse had got on the pavement and was making straight for them, Hadfield jumped on to the shaft to try and reach the reins. He was kicked off, however, and fell on the pavement, severely spraining his ankle. The horse was afterwards brought to a standstill. In his evidence the plaintiff said the motor lorry did not stop when the horse took fright, and the noise continued. If it had pulled up he was sure he could have stopped his horse. Mr. Overend Evans called evidence to show that the motor lorry stopped before reaching the street in which the plaintiff's lorry stood when the driver saw that the horse had taken fright. Moreover, the motor lorry did not make a scraping noise. The jury gave a verdict for the plaintiff, and awarded £20 damages.

REFUSING TO STOP.

At Bedford last week Albert Okins, of Rushden, was summoned for being the driver of a motor-car on the highway at Podington on July 26th which was not worked according to the regulations (Light Locomotives on Highways Order). Mr. Richard Orlebar, of Podington, stated that on July 26th he was driving a pony and cart past Hinwick House when he saw a motor-car coming. As his pony was shy and restive at motors, witness held up his hand to the driver, who, however, did not stop, though witness also shouted to him. The pony began to turn round, and he had difficulty in holding it. It got nearly across the road as the motor passed him on the grass. Witness called out again to the driver to stop, but he kept on.

Defendant elected to be sworn, and said that just before he reached Hinwick House he saw the trap. He was going about five miles an hour at the time, and watched the driver. When only five yards from him he held up his hand, but had witness stopped his car at that moment the engine would have made more noise, and as there was plenty of room to get by on the grass he decided to go on, so as to avoid an accident. When he was passing the trap the driver appeared to him to pull his near rein and bring the back of his cart towards the motor-car.

In answer to the Bench, defendant said there was not time to stop his engine, and he broke the law by going on because he believed that if he stopped Mr. Orlebar would be in a worse position.

Mr. Whitworth, after consulting with his colleagues, said they thought that defendant ought to have stopped earlier, though when he did pull up he did the best that was possible. On the whole they thought justice would be satisfied by the imposition of a fine of £3, with costs 9s. 6d. This was done as an example to show other people that the law must be obeyed.

TAMPERING WITH A MOTOR-CAR.

A SINGULAR case was heard at Nottingham County Court last week, in which Walter John Dexter, of West Bridgeford, sued George Robertson, formerly landlord of the Hop Pole Hotel, at Ollerton, and George Pinder, jun., of Edwinstowe, for £10 1s. 6d. damage to a motor-car. Mr. C. E. W. Lucas, for the plaintiff, said that on June 27th, Mr. Dexter, accompanied by his wife, drove his motor-car from Nottingham to Ollerton, where they put up at the Hop Pole, and had tea. When the plaintiff wished to return home he found that there was something wrong with the engine of the car, and he could not get it to start. After trying for a long time, he decided to go back by train, and return for the car in the morning. Mr. Robertson told plaintiff to push the car into the yard; the door would be locked at night, and no harm would come to the car. The next day Mr. Dexter went over to Ollerton with a man from Nottingham, and then found that somebody had been tampering with the car. It was afterwards discovered that a young man named Pinder had taken it upon himself to see if he could make the car go, but instead caused damage which cost £10 1s. 6d. to put right. Under the circumstances Robertson was claimed against for negligence as bailee, and Pinder for trespass. Mr. Day submitted that negligence had not been proved against the innkeeper, and his Honour agreed, finding that Robertson had taken the ordinary precautions of an innkeeper, and judgment was entered for him with costs. The defendant Pinder said he had succeeded in repairing other cars, and as he was out of work at the time, he thought he saw a chance to earn something. His Honour said Pinder should have asked permission first, and he would have to pay for the damage he had caused. Judgment was accordingly entered against him for the amount claimed.

FURIOUS DRIVING CASES.

"	A. Jones, Muthill	—	£3.
Woodbridge ...	J. Lindsay Scott, Melton	—	£2, etc.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-cycle cases

At Doncaster West Riding Police Court, on Saturday, Captain Ernest Morrison, Newport Pagnell, was summoned for driving his motor-car at a speed exceeding the 12-mile limit, at Austerfield, on October 2nd. Police-constable Brookes stated that he was stationed on the Great North Road in plain clothes, along with Sergeant Sowray, and about six o'clock defendant passed witness in his motor-car, coming from the direction of Bawtry. Sowray called to witness, and he referred to his watch, and discovered that defendant had covered a distance of a little over half a mile in 1 min. 10 sec. Sergeant Sowray said defendant also travelled over a stretch of road which had been previously measured for 1 mile and 172 yards, and he performed this distance in 2 min. 10 sec. A fine of £1 and £1 1s. 6d. costs was imposed.

At the East Ormesby Petty Sessions held at York on Saturday, A. E. Walster, fourteen, was summoned for driving a motor-bicycle at a greater speed than twelve miles an hour at Dringhouses, on Sunday, September 28th. At the conclusion of the case for the prosecution Mr. Dashwood Carter, who defended, made a technical objection. He said that there was no evidence before the Court that the Local Government Board regulations, under which his client was summoned, existed. No authorised printed copy of the regulations being put in, the Bench had no legal evidence before them that twelve miles an hour was the limit for motors. The Bench dismissed the summons under the technical objection, and Superintendent Knight intimated his intention of summoning the defendant again under the Light Locomotives Act for driving at the rate of over fourteen miles an hour.

At Woodbridge Petty Sessions, last week, Mr. John Lindsay Scott was charged with "driving a light locomotive" at a greater speed than twelve miles an hour, on October 13th, at Martlesham. The defendant did not appear, but the Chairman said a letter had been received from Mr. Scott, apologising to the Chairman of the Bench for his absence, and stating that it was impossible for him to be present. Police-constable Lord stated that on Monday, October 13th, he received a telephone message from Supt. Staunton at the County Police Station, Ipswich, at eleven minutes past four, and in consequence posted himself at the milestone in the Thoroughfare at Woodbridge. At twenty-one minutes past four Mr. Lindsay Scott came up in a white motor-car, in which were two other persons. In reply to the Chairman, the witness said he was asked the time by his watch through the telephone. Supt. Geo. Staunton, stationed at the County Police Station, Ipswich, said he was in the Chief Constable's office on the 13th October, and at 7½ minutes past four he saw Mr. Lindsay Scott drive his white motor-car past the window in the direction of Woodbridge. He called up Woodbridge by the telephone, and spoke to Police-constable Lord, whom he asked the time by his watch, and he replied, "Seven minutes past four o'clock." He (Supt. Staunton) looked at his watch, and it was twelve minutes past four. He gave the officer certain instructions, and received a telephone message from him at 30½ minutes past four. He (the Superintendent) measured the distance from the point where he saw the motor-car at Ipswich to the milestone in Woodbridge Thoroughfare, marked "eight miles to Ipswich," and found the distance was seven miles, 1,026 yards. He calculated the rate at which the motor-car had covered the distance and found it to be 31½ miles per hour. The distance was covered in 14½ minutes. Supt. Staunton said the Chief Constable desired him to state that he did not desire to strictly limit drivers

to the rate fixed by the Act, viz., twelve miles an hour, but "he" had to prosecute in flagrant cases, and in a case where some person was endangered. He looked upon this as a flagrant case. The Bench retired, and on their return the Chairman said they found that Mr. Lindsay Scott exceeded the pace allowed by law, but it did not appear that anyone was endangered. The fine would be 40s. and 8s. costs; in default of distress, seven days' without hard labour in His Majesty's Gaol at Ipswich.

THOMAS MARTIN, who was fined at St. Ives, is the driver of Mr. J. L. Rothschild. Defendant, who pleaded guilty, said he never exceeded six or seven miles an hour through villages or towns, but put on pace when the roads were clear, as in this case. He thought he was not exceeding twenty miles an hour, which pace he did his best to keep under. The Bench did not think it a bad case.

WITH regard to the cases at Bedale dealt with in our last issue Mr. W. P. Brigstocke writes:—"On October 14th I was summoned for obstructing the highway. A policeman, with two others, all in plain clothes, had placed their bicycles on the high road in front of my motor-car and refused to let me go on till I had given them my name and address. The Bench said there was an obstruction, but dismissed the case, as the policeman was on duty, and refused to state a case for a higher court. Thus, as the law stands (according to the Bedale Bench), 'Anyone driving a motor-car is bound to stop and give his name and address to any person who may demand it' for how is one to distinguish a policeman except by his uniform? This law has cost me over £30 to discover, but I am afraid I am not yet satisfied that it is correct. Perhaps you may be able to inform me. I may add that the Bench treated me in a very gentlemanly and not a vindictive manner, as, after fining me £5, they dismissed a similar case against my engineer, although I pleaded guilty on his behalf. It was never suggested by the police that either of us were driving dangerously—on the contrary, the police admitted that no one but themselves were on the road, which was perfectly straight."

MEASURED DISTANCES.

AN Oxford reader informs us that the police have a measured distance on the Henley-Oxford road between the villages of Nuneham and Sandford. The police have a measured quarter-mile at Dringhouses, near York. The measured half-mile on the London road at Ruscombe, Wiltshire, is still in evidence, the police securing three more convictions last week.

FATAL ACCIDENT AT HANDCROSS.

A VERDICT of "Accidental death" was returned at the inquest on Tuesday on the body of Henry Miachbloed, a French Swiss, aged 26, of Chadwell Street, London, who lost his life in a motor-car accident at Handcross, near Crawley, on Sunday. Captain Max de Bathe, of Victoria Street, London, owner of the car, said he considered that the deceased, who was his driver, lost his head when descending the hill, and inadvertently turned the steering wheel, causing the car to run up a slight bank and turn over. The deceased was killed instantaneously, having an extensive fracture of the skull. There was no side slip, and the brakes were applied, the car travelling at about seven miles an hour. The coroner said it was providential that all the persons in the car were not killed.

The car—a 16-h.p. Mors—had just been overhauled, and the deceased had only been in the captain's service a few weeks. The owner, accompanied by Mr. Arthur Cox, was driving down to Brighton, and all went well until Handcross Hill was reached. Here the car suddenly swerved, and running into the bank, was overturned. The driver was thrown out of the car and instantly killed. Mr. Cox and Captain de Bathe were also thrown from the car, the former sustaining serious internal injuries and being rendered unconscious, the latter escaping with a fractured collar-bone. Up to Tuesday night Mr. Cox was still lying at Crawley unconscious.

COMMENTS.

were the wonder of the natives. In addition to his automobiles, the doctor has a Serpollet steam launch, with which he has, he informs us, made some interesting trips on the rivers in Indo-China.

ON another page of the present issue we reproduce two interesting photographs which have been kindly sent us by Dr. Yersin, the chief of the School of Medicine, at Hanoi, Indo-China. Dr. Yersin is an enthusiastic motorist and possesses two cars—a Serpollet steamer and a Clement-Panhard voiturette—which, when they were first introduced into the country,

The Petrol Question.

At the last meeting of the Executive Committee of the A.C.G.B.I., a long discussion took place concerning the recent circular issued by railway companies, in which they announce their determination to enforce Clause 2 of their Regulations governing the transport of inflammable liquids, by which the consignor undertakes liability in respect of damage which might be caused either by accident or by the carelessness of any parties from the time of leaving the consignor's hands until its delivery to the consignee. The Committee decided to appoint a Sub-committee to go into and report upon this matter, and the following gentlemen consented to serve:—Mr. J. Scott Montagu, Dr. Boverton Redwood, Professor C. Vernon Boys, Mr. W. J. Leonard, Major Lindsay Lloyd, and Mr. Staplee Firth. Meantime, it was decided to send a letter to the chairmen and general managers of the different railway companies, the Railway Clearing House, suggesting the expediency of a conference taking place at an early date between the chairmen of the railway companies interested, the Board of Trade, and representatives of the Club. Mr. Leonard undertook to furnish a statement, showing the number of trades involved, in order that organised action might be taken by the whole of the trades affected in conjunction with the Club to combat the attitude of the railway companies.

Petrol in Lincolnshire.

A MEETING of Lincolnshire automobilists took place at Lincoln last week, to consider the new regulations of the railway companies respecting the carriage of petrol. The chairman (Mr. C. W. Pennell) stated that there were three alternatives—(1) insurance, (2) water carriage, and (3) the formation of a limited liability company; but the first was at once dismissed as tending towards increasing the cost of an already expensive article. The second suggestion met with some support, it being pointed out that terms could be arranged with the water carriers at less than the railway rates for such places as Lincoln, Gainsborough, Boston, and other places connected with Hull by water. There are many towns, however, in Lincolnshire which have to rely solely on railway communication, and this eventually led to the meeting deciding to form a limited liability company for dealing in petrol and for supplying various

towns and villages in the county. Over twenty gentlemen at once expressed willingness to join. It was also resolved to ask the Lincoln Chamber of Commerce to appeal to the Board of Trade or the Railway and Canal Commissioners for a withdrawal of the terms at present insisted upon by railway companies.

The Sheffield Automobile Club.

At a general meeting of the Sheffield Automobile Club, it was decided to communicate with all the automobile clubs in England with a view to appointing a deputation to wait upon the railway companies and put before them the hardships that their action *re* the distribution of petrol would entail upon the whole of the motorists in the country. Mr. Harvey Foster, an enthusiastic motorist, was unanimously elected President of the Club, and Messrs. C. Harlow and Percy Thompson were elected auditors. The President invited the members to become his guests for the first Club meet.

The Petrol Question Practically Settled.

PROBABLY one of the most welcome items of news that we can present to provincial motorists this week is the fact that the trouble with the railway companies with regard to the question of the carriage of petroleum spirit is in a fair way of settlement. At the Railway Clearing House on Tuesday the general managers of the various railway companies met a large number of representatives of industries connected with tar distilling, petrol, and kindred substances, motoring users of petroleum spirit being represented by Sir. J. Thornycroft, Mr. Staplee Firth and Mr. C. Johnson, Secretary of the A.C.G.B.I. The injustice of the new consignment note was pointed out and finally, the railway companies offered provisionally to withdraw that portion of the offending clause which saddles the trader or consumer with full responsibility for damage to persons or property arising directly or indirectly from the inflammable quality of the goods. A committee, consisting of two representatives of the traders and two railway representatives, was formed to consider the question of a proper clause in the consignment notes of the various companies with regard to the carriage of inflammable liquids, the Committee probably conferring with the Board of Trade on the subject.—[At the moment of going to press, we understand, semi-officially, that a further hitch has occurred with the railway companies, and that the petrol distillers refuse to "ship" until the matter is made more clear. We further understand that counsel's opinion is being taken.]

The Oil Motor-Cars of 1902.

THE increased interest now being shown in motor-cars by engineers was again evidenced at the well-attended meeting at the Institution of Mechanical Engineers on Friday last week, when the discussion on Capt. Longridge's paper on "The Oil Motor-Cars of 1902" was continued. Mr. Worby Beaumont, while considering that there was no reason why horizontal engines were not equally as good as those of the vertical type, did not agree with the author that Europe was likely to follow America in adopting the horizontal form. With regard to economy of working, the question with the motorist was, in his opinion, not so much one of economy as of simplicity, and

therefore, in small cars at least, the simple engine, although not perhaps quite so economical as one of a more complex design, was to be preferred. Mr. Chambers, in a vigorous speech, urged motor manufacturers to devote attention to a simple car costing from £200 to £250 suitable for doctors and business men. These should be standardised and put through in lots of 500 at a time. The question of spare parts at a reasonable price was another point on which he laid stress—a point, being a motorist himself, on which he spoke from experience.

♦ ♦ ♦

Automatic Ignition.

PROFESSOR BURSTALL dealt with the petrol motor from a technical point of view. In his opinion the bulk of motor troubles lie in connection with the ignition, and he himself preferred the magneto form. He considered that for economical working it was necessary to get at each suction stroke, the maximum amount of explosive mixture for a given volume of cylinder, the temperature of the latter, and the drawn-in charge to be kept as low as possible. He also

The first motor he designed had admission valves mechanically-operated, but he had experienced trouble in getting the valves to close at the right time. With regard to the material used for valves, he had found close-grain cast-iron heads fitted securely to steel spindles to be by far the best. By means of a sketch on the blackboard he illustrated the method adopted by the Wolseley Company to securely attach the heads to the spindles. He claimed priority in the use of cast-iron cylinders with aluminium water jackets, as he had never made a motor-car engine except in this way. Mr. A. New dealt with the question of steel cylinders, considering that their cost will be much greater than those of cast iron. Mr. Rainey recommended the use of a certain proportion of water with the oil in the crank chamber, while Mr. Sennett referred to Captain Longridge's proposed motor and pointed out that it was identical with that used by Butler on his motor-tricycle as far back as 1885. A number of other gentlemen, including Mr. Roots and Mr. Veitch Wilson, announced that they had some remarks to make, but that they would send them to the Secretary to be included in the proceedings. As many other members also desired to take part

Photos by]

AUTOMOBILISM IN INDO-CHINA. (See previous page.)

[Spido Gaumont.]

advocated the placing of the valves directly on the top of the cylinder head. Mr. Crowden followed with a few remarks, advocating water-jacketed pistons and a motor speed of from 400 to 600 revs. per min. The next speaker was Prof. Robinson, who gave particulars of some interesting experiments he had carried out with a 5-h.p. Hornsby oil engine. Without making any other alteration than connecting the feed-pipe to a gasoline tank, and, after heating the vaporiser for about ten to twelve minutes, he had run the engine for over an hour, the ignition being perfect although effected by the compression alone, the latter being from sixty-five to seventy pounds per square inch.

♦ ♦ ♦

Horizontal v. Petrol Motors.

MR. H. AUSTIN, of the Wolseley Company, was the next to mount the platform. Naturally, he dealt with the question of horizontal v. vertical motors, and took up a very liberal view, his opinion being that it was not an easy matter to say which was the better position, horizontal or vertical, good engines being made in both forms. The point to determine which type of motor to adopt was, he considered, the transmission mechanism. He was against the use of mild steel for cylinders, while after experiments he preferred the ordinary suction valve to the mechanically-operated one.

in the discussion, the President announced that it would again be continued on Friday evening, the 21st inst.

♦ ♦ ♦

A Case in Ceylon.

SOME tribute to the universal adoption of the automobile comes from Ceylon, where the first legal action in which a motor-car figures has just been heard. Mr. A. R. Marikar sued Mr. E. Money for the recovery of Rs. 25 as damages sustained by him, in consequence of his horse being frightened by the escape of steam from the defendant's motor-car. In his judgment Mr. White, the Commissioner of Requests, said:—"Horsed carriages have no greater right to the use of the public roads than motor-cars have, and it is not inconceivable that at some distant date they will be as extinct as sedan chairs are now. Of the particular type of motor-car to which this one belongs, it is in evidence that some thousands are in use in America and Europe, and that this one has been constantly driven in Colombo since February last. The discharge of steam when a certain pressure is reached is automatic, and beyond the control of the defendant. The defendant in this case, so far from displaying negligence, seems to have exercised particular care, for he stopped the car when he saw that the plaintiff's horse was getting frightened, and when the accident occurred the motor-car was stationary."

A Historical Parallel.

"I SEE no more reason why he should be mulcted in damages than why the first man who used an umbrella in London should have been assaulted by the mob as he was, or the stoker of the steam-roller assaulted with a whip by the driver of a trap whose horse shied at the steam-roller, an incident I witnessed on Galle Face. It is a matter within the knowledge of everyone that horses take fright at various objects. Some can hardly be induced to pass bullock carts, some have an unconquerable aversion to beef boxes and kerosene oil tins, some to coaches, some to tram-cars, some to steam-rollers, and others to bicycles. Other horses seem to mind nothing. Some years ago I was driving a horse in a dog-cart myself. It shied at the municipal cage on wheels in which stray dogs are or used to be collected, swerved, and broke the shafts, but it did not occur to me that an action lay against anyone. The defendant was driving a legitimate vehicle in a legitimate way, which cannot be said of the majority of drivers of horsed carriages in Colombo, and I cannot, from my point of view, hold him legally responsible for this accident. I find the plaintiff has no cause of action, and that defendant is not liable in the damages sustained by the plaintiff. Plaintiff's action is dismissed with costs."

The Right to the Road.

ACCORDING to the Nottingham "Daily Guardian" "the law gives pedestrians the first right to the road, and next to them horse vehicles have the prior right." Whilst the people who walk have an undisputed right to the pavement, they surely will not desire to have unrestricted use of the road. The middle of the road is not the place for pedestrians, and they must really learn to keep their place, which is on the pathway at the side. This is a point which those who write against automobiles in provincial journals should remember.

A Scottish Agriculturists' Resolution.

THE Scottish Chamber of Agriculture devoted a good deal of time and attention to the question of motor-cars at its meeting in Edinburgh last week. Mr. Hutchison, of Perth, introduced the discussion and said he hoped to see motor-cars numbered and registered. Far too excessive a rate of speed was maintained, and there was far too little regard for the lieges and others who, in the first place, had the right to the road. In Perthshire some cars were driven with circumspection, but other owners gave out that, fines notwithstanding, they would drive at any rate they pleased. Mr. Munro-Ferguson, M.P., moved that, in the opinion of the meeting, rules should be issued by the Board of Trade with regard to the registering of motor-cars and the holding of certificates by drivers of such cars. Mr. Hutchison proposed, as an addition to the motion, that in any regulations for motor-car traffic maximum rates of speed on broad and on narrow roads should be mentioned. This proposal was adopted by Mr. Ferguson, and the motion was unanimously carried.

Roxburgh's Opinion.

A MORE reasonable attitude with regard to automobiles was taken at the October meeting of Roxburgh County Council at Jedburgh, when Lord Polwarth referred to the use of the highways by motor-cars, and said there was not the least doubt that there was a considerable amount of feeling, not on account of the use of motor-cars, but of their abuse. Much of the feeling arose from drivers of automobiles not only going at a high rate of speed, but not stopping when requested to do so. Horses would become accustomed to motor-cars, but not all at once, and courtesy should be exercised. He was afraid there was a tendency to what he might call rough riding over the feelings of the people. He thought this was unworthy of any gentleman, and believed that no gentleman in that district would do it; but

strangers came to the district with motor-cars, and did not know the people, and the people did not know them. He thought it was well that the actual state of the law should be known both to the public and to those who owned motor-cars, for the safety of the general public. He therefore suggested that the special clauses referring to automobile traffic should be printed, circulated, and exhibited, a proposal which was agreed to.

"Minutes to the Mile."

INSTEAD of using the term so many "miles to the hour," "Automobile Topics" of America suggests so many "minutes to the mile" should be employed. Apparently the idea is being seriously discussed by many motorists in the United States. Thus the phrase "twelve miles per hour" would become "five minutes to the mile," and it is claimed by the author of the proposed change that this would simplify legislative phrases very considerably. We do not see that it is likely to prove of advantage to anybody. What we want in this country is not a change of phrases so much as a reform of legislation and the abolition of the speed limit altogether.

"BABY PEUGEOTS" EN ROUTE TO ENGLAND.

Varnish—Its Loss of Lustre.

It not infrequently happens that motor-carriage bodies finished in apparently the most perfect style by the Napoleons of the varnish room soon lose surface lustre or "deadened." The motorist, inexperienced in the ways of varnish, and all that pertains thereto, naturally heaps maledictions upon the varnish when loss of gloss manifests itself. A little investigation, however, should enable him to perceive that if a finishing varnish is possessed of sufficient quality to hold the full brilliancy of its coat to the maximum limit in one instance, it should, other things being equal, do so in another. This being true, it becomes necessary to look to some prior cause for the trouble. Lack of uniformity in methods and mixtures is a prolific cause of the deadening. Moreover, the most approved varnish under the manipulation of some workmen goes to a greasy smear upon the surface, whereas, the same varnish under the magic skill of still other workmen develops the full strength of a superb brilliancy. The lustre of varnish depends in large degree upon the painter's skill in handling it under the brush. An insufficiently hard paint fabric is a strong cause of varnish deadening. When time is at a premium in the paint shop, and the general atmosphere of the shop is not equal to the work of oxidizing or hardening the paint as fast as the circumstances of the case suggest, then the process of crowding one coat of paint upon another, at the risk of "lifting," or softening up the preceding coat, is introduced. The direct and logical outcome of the process is "deadening" in all of its various and villainous forms.

The Scottish Automobile Club.

THE Committee of the Western Section of the Scottish Automobile Club have arranged for a series of meetings during the winter months of an informal and social character, in order that the members may have an opportunity of meeting one another under the auspices of the Club, when discussions will be introduced. The first discussion will take place at the Windsor Hotel, St. Vincent Street, Glasgow, on Monday, the 17th inst., at 8 p.m., when Mr. H. M. Napier will introduce the subject of "Motor Troubles."

The Question of Silence.

IN these enlightened days it is surely time that some consideration should be shown towards silence in automobile construction? Not very long ago we had the Reliability Trials, and, on the whole, they were a great success, and excellently organised, but no consideration was shown towards silent cars. If one half of the cars running on our highways were as silent as, say, the Mercedes car, the number of anti-automobilists would decrease by a very large percentage. It is quite a common thing to hear people say, "Well, I suppose motor-cars are all right, but they do make such a noise. I really could not drive about in them." Let us consider for one moment the great popularity of the little steam car; it is certainly a very reliable little vehicle, but it is its sweetness of running and its silence that sells it. It is high time now for more of our large manufacturers to commence taking the question of silence into serious consideration. Already a few firms have done so, but they are in a minority. A large number of automobiles are absolutely unnecessarily noisy; for instance, there are many cars with most inadequate silencers, and others extremely noisy about the gear. It is these little (?) points that influence the outside public to a very great extent, and the sooner this fact is more generally realised the better both for the public and the automobile industry.

Road Improvement.

At a meeting of the Council of the Roads Improvement Association, last week, it was reported that the Government were giving favourable consideration to a request of the association for the appointment of a small Departmental Committee to inquire into the existing system of highway administration and to some extent clear the ground for the appointment next year of a Royal Commission dealing with the general question of internal communication. The Council of the Association have also resolved to approach the Home Secretary with reference to the regulation of street traffic in London.

The Speed of Motor-Cars.

At a meeting of the Northwich Urban Council last week, it was reported that a resolution had been submitted to the Cheshire County Council urging that the speed of motor-cars should be restricted owing to the danger and annoyance caused by automobiles rushing through Northwich at a great speed. The County Council replied that at present the Local Government Order of 1896 prescribes speeds, and that the County Council could make no further regulations. The Main Roads Committee of the County Council were, however, taking the matter into consideration with a view of supporting a proposal that all cars should be registered.

Yorkshire Motorists Celebrate the Anniversary.

A WEEK-END run to Worksop has been arranged by the Yorkshire Automobile Club in commemoration of the sixth anniversary of the coming into operation of the Locomotives on Highways Act. The members meet to-day (Saturday), at Red House, junction of Wakefield and Pontefract roads, about

five miles north of Doncaster on the Great North Road, at 4 p.m., leaving at 4.30 p.m. for Worksop via Doncaster and Tickhill. The headquarters will be the Red Lion Hotel at Worksop, and it is expected that a number of members who have signified their intention of joining the run, wet or fine, will return on Sunday afternoon.

Alcohol Motors.

SOME time ago, when interest was very keen in France with regard to the use of alcohol for motor-cars and its possible good effect on the industry of the country, we suggested that the Department of Agriculture and Technical Instruction, which has done so much to revive the industries of Ireland, should give the matter its attention. Since then the subject has been closely studied in Dublin, and although the Department is not in a position to directly aid such an industry, the Hon. Horace Plunkett and his associates would doubtless assist the work as far as they could. Certainly the attitude of the Department would be friendly—and possibly, if they were convinced that the utilisation of alcohol in automobiles would extend an Irish industry, their good offices might be obtained in giving effect to the wish of some motorists to run the next Gordon Bennett race in the Emerald Isle.

Motor Highways.

THE proposals which have been put forward to commence the construction of a great motor highway from London to Scotland are, considers the "Engineering Magazine," bound to take actual shape before many years have passed. Such a highway, studded with electric charging stations at convenient intervals, and confined rigidly to pneumatic-tyred vehicles as a matter of course, would give an enormous development to the serious side of automobilism. It is certain that very high speeds on ordinary roads, owing to the danger of swerving and skidding, are akin to the delights of skating over very thin ice; but on a specially-constructed and specially-reserved road there seems no reason why the power of the machine should not be the only limit to the speed attained.

Improvements in Accumulators.

THE accumulator or storage battery, which may be said to be the sole dependence of the electric vehicle, has been much improved since its first application to this work, and recent developments point to even more marked advancement in the direction of lessened weight and cost, greater capacity within the limits of the vehicle, and decreased cost of upkeep, all of which promise a wider field and larger use for electricity as a motive power. If the increasing use of electric vehicles leads to the multiplication of charging stations, the limits of their usefulness will be still further extended.

A DEPUTATION from Crewe Town Council recently travelled to London to purchase a motor steam fire engine. While on a trial trip, the vehicle somehow got beyond control of the driver and two or three of the party were thrown out and slightly injured. But for the accident the Council would probably have purchased a motor-engine, but at the meeting last week the deputation recommended the purchase of a horse-propelled steam fire engine instead of a motor, which the Council agreed to.

THE Continental Caoutchouc and Gutta Percha Company are manufacturing a motor tyre, called the "Extra," in 90 mm. and 120 mm. sizes, which is specially suitable for heavy cars, and lasts longer than the ordinary make of tyre. We are informed that that these "Extra" tyres are largely used in France, and as they have given every satisfaction there, they will doubtless meet with a corresponding success in this country. We have a pair of these 120 mm. "Extra" tyres on our Mercedes, and so far have driven over 2,000 miles without a puncture.

BALLOON HUNTING.

RESPONDING to Mr. Mark Mayhew's note, announcing that a balloon, carrying despatches, would ascend from the Crystal Palace at mid-day on Saturday last, the writer expressed the most willing desire to form one of the corps of Automobile Volunteers whom it was proposed should follow the balloon with a view to the capture of the missives mentioned. The particular balloon was the Vivienne, with a capacity of 35,000 cubic ft. of gas, and the aeronauts were Messrs. Pollock and Leslie Bucknall, the owner. Mr. Frank Butler also intended ascending, but the carrying capacity of the balloon was limited, and would not rise with the weight of a third person.

Our start from town was made with the view of reaching the Palace at twelve, and while en route Dr. Hutchinson was passed on his Benz. As usual in South London, the roads were up, the

experienced on Brixton Hill, one stripping off a tyre and the other sending us straight across the road on to the pavement, where our progress was gently interrupted by a garden gate.

Our 40-h.p. Mercedes was not the first car at the Palace, Mr. Butler's 8-h.p. Renault having preceded us. This was a very handsome car, which Miss Butler drives, and the Limousine body nicely sets off its simple proportions. Upon reporting ourselves it was found the start had been postponed till two o'clock, and the information certainly did not afford any pleasure, as we had hurried from business with a view to being punctual. Better arrangements, it is hoped, will be made in future, and times fixed should be adhered to or means taken to notify those intending to be present of any alterations. Other cars continued to arrive, including Mr. For-dyce's 12-h.p. Darracq, Dr. Hutchinson's 10-h.p. Benz, Mr. Overton's 10-h.p. Georges Richard, Mr. Roger Fuller's 10-h.p. Panhard, Mr. Midgley's 16-h.p. Napier, 7-h.p. Panhard, 16-h.p.

PRINCE HENRY OF PRUSSIA AT THE HELM OF HIS "LOCOMOBILE" STEAM CAR.

[Allgemeine Automobil Zeitung.]

process of "electrifying" the trams proceeding, and slow progress in the rear of an odoriferous cart was made, the Benz car behind likewise getting the full benefit of our "exhaust." The doctor, tiring of his position, mounted and crossed the temporary rails, muttering "*that* would be his only chance of passing our car." The traffic then was found shortly afterwards diverted to a side street, and the last we saw of our friend was his speeding merrily away in a wrong direction, declining to take any heed of our loud "pip-pips" of warning. The Palace was duly reached without incident, but we cannot leave this portion of the journey without mentioning that although the roads were quite dry the "cable" rail always seems to cause a car to have a tendency to "side slip." Why this is so we do not know, but of course in wet weather the tendency is aggravated, and many and uncomfortable have been the "side slips"

Dechamps; Dennis car, Mr. Hutton's 10-h.p. Panhard, with workshop body; Mr. Farman's 30-h.p. Panhard, with racing body; Mr. Rolls' 10-h.p. Panhard, and a second 12-h.p. Darracq.

Punctually at two o'clock the balloon, with its ballast, baro-, hydro-, thermo-, and other metric instruments, quickly rose from the ground and soared away towards the east. Several of the motorists had left their cars near the entrance, and directly the passengers were seen to enter the "basket," these dashed off in the direction of Bromley. The wind was blowing about twelve miles an hour, and soon all the cars were away on the chase, our own "forty" being one of the last to leave. The "field" had already begun spreading in various directions and proceeding cautiously down the hill, Mr. Rolls' car was followed, and when he made for a southerly route we did ditto—until, not liking his dust, our car had to pass, and so for that day our ways were parted. The roads

the car was travelling over were all new to us, but keeping our goal in sight we continued through the Ravensbourne estate until, to our astonishment and gratification, we came out at Bromley. A sporting inspector on horseback suggested our taking the Seven-oaks road, and as this agreed with our own inclinations, the journey in that direction was continued, although the country folks kept on waving us to the left. After a time, and when within about two miles of Riverhead, it was seen the balloon was still going east, and that we were off the track. It was determined to take the first opening to the left, and this looked like the entrance to a farm. However, up this lane we proceeded, it being just sufficiently wide to take the car. The adage is an old one which says "it is a long lane that has no turning." Well, this was a very long lane, miles in extent, with innumerable turnings, long gradients, with sharp, curly twists, necessitating, for the first time since we have had the car, putting the Mercedes on her first speed. Several stoppages were made and embankments climbed, with the view of seeing that the prey did not escape. However, ultimately a ridge of hills hid

imagine it certainly must have been the first, although one slope had two "danger" boards on it—but that was another lane, just before the Maidstone road was struck, a few miles the London side of Wrotham. Immediately opposite the mouth of the lane was an inn, without a sign, but the words in large gilt letters, "Dartford Brewery Ales." From the bystanders an inquiry was made as to whether a balloon had been seen about there lately, and information was given that the Vivienne had passed over the house about ten minutes previously; that two cars had been in waiting, and that as the balloon was sailing along in a straight line, about twenty miles an hour, the motorists had dashed off in pursuit. We speeded after them, over a lonely straight road, with a beautiful surface, and continued until within two or three miles of Maidstone. Not seeing anything of the balloon, and believing that she had come to earth, we decided to retrace our steps, and so turned the car London-ways. Returning, Mr. Hutton was met, and he was gaily pointing forward, looking as if he intended being in at the finish. Mr. Overton was next seen, with a burst outer cover; and

A HUNGARIAN MOTOR POSTAL DELIVERY VAN. (See page 701.)

the balloon from view, after we had been watching it pass through a most lovely valley, with its grappling irons down, the passengers evidently enjoying the delicious sport of trailing. At one spot it looked as if it would drop or else would fail to clear a clump of trees, but the balloon gaily rose, crossed the hills, and was lost to sight, alas, for the remainder of the day. Devonshire lanes are familiar to us, but these particular lanes were narrower, steeper, rougher, more circuitous, than any ever met before. They were lovely lanes, though; the autumn tints were beautiful, the passages through the woods novel, the grass-covered soil soft and springy, the quagmires "squashy," and at times the boughs of the trees were rent asunder by our Limousine top, causing the fear at times that the frail structure would not stand such rough treatment. The country was superb, and to those lanes we are indebted for having seen more beauty in Kent than our previous knowledge of the hop county ever led us to suspect. At one spot, on the top of a high ridge, a wagoner with a team of horses was met. His pipe dropped from his mouth as with astonishment he spluttered, "I never expected to see a motor up here, master." We should

that was the last of the cars seen on Saturday, November the 1st. And the chronicler, in conclusion, says, May there be during the month many more such days, so bright and balmy, affording pleasure equally alike both to the huntsman and the motorist!

The sport of balloon chasing is a most exhilarating one, but when the next "meet" takes place it might be suggested that arrangements be made with the aeronauts for them to descend at a certain time or else to undertake to continue their voyage until nearing the coast. Motorists would then know what to do, and would not be likely to give up the chase, so long as it was known the direction the balloon had travelled and they had the certain knowledge that it was still up aloft.

We have since learnt that the Vivienne descended at 4.45 at Staplehurst, a spot ten miles south of Maidstone, and that Mr. Hutton captured the despatches. Inquiring of Mr. Bucknall whether he had seen any of the motor-vehicles *en route*, he writes that several were seen through the glasses, including our red car, near Wrotham. The Mercedes, he states, "appeared simply to skim over the ground."

CONTINENTAL NOTES.

By "AUTOMAN."

THE Paris-Madrid motor-car race is the engrossing topic in French automobile circles for the time being, and on all sides the proposal meets with approval and support. M. Edouard de Perrodil recounts in the "Velo" his cycle ride with Henry Farman from Paris to Madrid in the famous "Velo-Toro" race. Two points stand out salient in this article, the first being the bad roads in Spain, and the second the enthusiastic reception in Madrid. With regard to the roads, the route taken in Spain by the cyclists was the following, namely, Behobie, Saint-Sebastien, Tolosa, Alsasua, Vittoria, Briviesca, Miranda, Burgos, Valladolid, Mojados, Olmedo, San-Christobal, Villa-Castin, Madrid.

THIS route contains two bad sections, the one on each side of Valladolid, and the other just before arriving at Madrid. The roads are described as morasses of mud or dust with large stones buried unseen, with here and there a better surface, only to lead into lakes of dust. Then, again, on the plains of old Castille there are miles and miles of straight flat good roads, where

M. RENÉ DE KNYFF ON THE PANHARD RACER OF 1898.

THE EVOLUTION OF THE RACING CAR—A FIVE YEARS' CONTRAST.

high speeds may be indulged in, and where there is literally no traffic.

THERE are two chains of hills to cross. The first, the Pyrenees, are not very steep, either to climb the seven miles on the northern side or to descend on the southern, but the second, the Guadarrama, on the southern side, is exceedingly steep and dangerous.

THE A.C.F. has chosen two Panhards and one Mors to challenge the Gordon Bennett Cup next year. These two firms have been informed of the decision, and have accepted the mission. The choice of the drivers is left to the makers.

THE death of M. Buchet, which occurred suddenly last week, is a distinct loss to the automobile industry. He was only 42 years of age, and was present at the hill-climbing trial at Gaillon three weeks ago. He was suffering from a boil in the neck, which he neglected, and which caused his death. Buchet was a self-made man, beginning life as a simple mechanic. He will be chiefly remembered from the *culasse* which bears his name and from the fact that he supplied the motor in the airship in which M. Santos Dumont won the Deutsch prize.

THE action of the "Auto-Velo" in attributing the "Coupe de Regularité" in the Paris-Vienna race to the motor-cycles has been the subject of criticism by the trade, and this has culminated in a letter being addressed to the "Auto-Velo" and signed by no less a personage than the Marquise de Dion. In consequence, the "Auto-Velo" has decided to give two "coupes de regularite," one for motor-cycles and the other for motor-cars. The firm of Georges Richard have therefore been declared winners of the second "coupe."

THE Rhenish Automobile Club held a hill-climbing competition from Heidelberg up the Konigstuhl on Sunday, the 26th ult. The distance was 4.6 miles, and the difference of level 1,500 feet. In the heavy-car section the winner was Herr Opel on a 20-h.p. Opel-Darracq (10min. 15sec), while the light-car class was won by Herr Thum, of Mannheim, on a Benz (22min. 5sec.).

UNDER the title of "Les Coupes de Pioule" the Automobile Club du Var is organising a race meeting to be held in January next, starting and finishing at Pioule, and visiting *en route* Vidauban, Draguignan, Lorgues, Carces, Cabasse, Flassans, and

M. TESTE ON THE PANHARD RACER OF 1902.

Le Luc. The distance is about 50 miles, the course having to be covered twice by the heavy and light cars and once by the voiturettes.

ONE of the competitors in the recent 500-mile reliability contest in the United States fixed a horse shoe to the front of his car for good luck!

THE Board of Trade have received from the Collector of Customs at Port Louis, Mauritius, a copy of a resolution, passed by the Council of the Government of Mauritius, remitting the Customs duties or direct taxes on automobiles, steam road engines and trucks, during the period from July 1st, 1902, to June 30th, 1903.

"IGNITION Devices for Gas and Petrol Motors" is the title of a little work by Mr. S. R. Bottone, which has just been published. (London: Guilbert Pitman.) The author is well known in connection with electrical ignition matters, and, as may be expected, deals very clearly with the various systems of ignition. The work is preceded by an introductory chapter treating of structural details, choice and management of automobiles. The lengthy index provided should enhance the value of the book, which may be recommended to motorists anxious to get some idea of the principles underlying the ignition arrangements on automobiles.

THE "EARL" PETROL CAR.

WE had an opportunity the other day of inspecting a new car of French manufacture known as "the Earl," which is being introduced into this country by the Great Central Garage, Ltd., and of which a general view is given herewith. As will be seen, the vehicle follows the now generally-adopted lines. The engine, which is located under the bonnet in the fore-part of the frame, comprises two vertical cylinders, 4in. diameter by 5½in. stroke, and at a normal speed of 800 revolutions per minute develops 9½-h.p. Electric ignition is adopted, while the water circulation is maintained by a friction-driven pump and radiator. The water-jacket extends well round the valve chambers as well as the cylinders. The transmission gear is on the lines of the Panhard system, the power of the motor being conveyed through a pedal-operated friction-clutch to the gear-box, thence by bevel gear to the differential shaft, which is connected with the rear road wheels by two side chains. Three speeds forward and a reverse motion are provided, these being controlled by a single lever. The frame is built of wood, with steel strengthening plates, while the road wheels are of equal size, and shod with 800 by 85 pneumatic tyres. A powerful hand-brake on the differential shaft is operated by a pedal, while emergency brakes, actuated by a hand lever, are fitted to drums connected with the hubs of the rear wheels. Steering is controlled by an inclined hand-wheel, on the column of which are mounted the ignition and throttle levers. The engine is provided with an automatic governor acting on the exhaust valves; in conjunction with this is a pedal by means of which the engine can be slowed down to

any desired degree. As regards the carriage work, this is a comfortable tonneau body of the Roi des Belges type, upholstered in real leather. The car, which is speeded up to thirty-eight miles per hour on good roads, is claimed to be able to climb any hill with a full load; it appears to run very quietly and with an absence of vibration.

THE annual dinner of the Aero Club will be held at the Carlton Hotel, W., on Tuesday, the 25th inst.

IN connection with the railway companies' action with regard to the carriage of petroleum spirit, Messrs. Strettons, Limited, Cheltenham, inform us that they have made arrangements for a continuous supply of petrol and motor-spirit.

THE second balloon v. motor-car event will take place at mid-day, on Saturday, the 15th inst., from the Crystal Palace. The balloon "The Graphic," 45,000 feet, will be piloted by Mr. Frank H. Butler, member of the Aero Club, accompanied by the Hon. C. S. Rolls. Two prizes will be given for the cars that capture the dummy despatches; the first prize being a long brass motor-car horn, and the second prize a box of cigars. The cars must all start from the Crystal Palace.

THE "P.M." ELECTRICAL IGNITION FOR PETROL MOTORS.

AS mentioned in a recent issue, Messrs. Peto and Radford Ltd., are introducing into England the "P.M." system of electrical ignition for petrol motors—a system which has already met with considerable success in France. To deal first with the self-regulating contact breaker, this is characterised by the absence of mechanical tremblers and platinum screws. The contact breaker is composed of—first, a cam of insulating material, in which is embedded a metal projection or beak, which is in constant connection with the metal of the motor, and is made the negative pole; second, a rigid insulated stem of metal,

FIG. 1.

FIG. 2.

working like a dynamo brush, and connected to the positive pole. The cam is slightly eccentric, and is so constructed that the stem or metal brush will only be in contact at the moment that the metal beak passes it. To prevent any displacement of the brush a spring buffer, which can be regulated and set, ensures a rubbing contact, without any vibration, at the correct moment, and it is claimed, totally avoids any chance of misfiring. The contact also cleanses itself by the rubbing action. The sparking is advanced or retarded by oscillating the base plate, as in other systems. The contact breaker is made for one, two, or four cylinders, the latter being illustrated in Fig. 1. It is pointed out that in use the metal cover supplied with each apparatus should be filled with thick grease. It is claimed that the apparatus which is intended to work with coils without tremblers will work equally well at speeds ranging from 1,100 to 2,200 revolutions per minute.

Fig. 2 illustrates the "P.M." sparking plug adapted for use with Panhard motors. These plugs are composed of a steel pin, the stem of which is first of all enclosed through its entire length in leaves of mica, rolled in tube form. Discs of mica are slipped over this and strongly pressed together under hydraulic pressure, between the head of the pin and the upper nut, and finally a brass mount in any of the various forms and dimensions according to the type of motor. It is claimed that the plug is free from all ill effects due to changes of temperature, and proof against deterioration because of the absence of need for using packing in the joints.

It is not only the motor-car industry which is being hampered by the railway companies' new regulations. They affect tar distillers probably to a greater degree. A meeting of the Association of Tar Distillers, to consider the position, is to be held this week, when it is likely arrangements will be made for a meeting representing all sections of the London Chamber of Commerce.

MOTOR-CYCLING NEWS.

WE are asked to mention that the runs of the Motor Cycling Club are not speed events, and anyone having trouble on the road can be sure of assistance from fellow-members. This was well illustrated on last Sunday's run, when, owing to tyre troubles with one machine and a broken free-wheel on another, between Marble Arch and Harrow, which all the party stayed to put right, the delayed troop were so late at Harrow that the other contingent had gone on, no doubt having given the Londoners up. The late arrivals, including the captain, then decided, as it was about lunch time, to run to Rickmansworth. The return was via Uxbridge. There were about eighteen members at the Marble Arch, and ten at Rickmansworth.

TO-MORROW (Sunday) the Motor Cycling Club will hold a run to Buntingford, the meet taking place at the Marble Arch at 10.30 a.m.

THE Quadrant Cycle Company have sent us a copy of a useful little hand-book to their 1903 motor-cycles, of which a brief description was given in our issue of the 25th ult. We give a general view of the motor-cycle herewith, and may add that two sizes are being made—2-h.p. and 3-h.p. A Quadrant motor-tricycle is also being made with motors on similar lines.

AT the second series of consumption trials, held at Dublin on Saturday last by the Motor-Cycle Union of Ireland, some startling figures were obtained relative to the economy of the motor-bicycle. At the first trials, a fortnight before, one machine accomplished over twenty-one miles on a pint of petrol. At the second trial this record was beaten by five machines, and the winner compassed a distance of no less than twenty-nine miles. The trial was so prolonged that darkness fell, and the winner, recognising the great risks he was running, stopped before his tank was empty. He had travelled at a much higher speed than the others, and yet, despite this, he appeared to have enough petrol remaining to carry him up to the thirtieth mile had he elected to continue. The following table shows the results :—

	Miles.	Yds.	h.	m.	s.
1. Shaw (1½-h.p. Excelsior)	29	—	in	1	18 42
2. Summers (1½-h.p. Excelsior)	28	1710	..	1	26 29
3. Ball (1½-h.p. F.N.)	24	—	..	1	7 49
4. Huet (2-h.p. James)	23	880	..	Not timed.	
5. Evans (1½-h.p. Singer)	23	—	..	Not timed.	

It must be said that the arrangements were very badly carried out, the "pint" measure employed being a whisky bottle, which rather generously interpreted the exact meaning of an Imperial pint. A five miles race was also decided, but, owing to conflicting testimony of the numerous lap-keepers, no satisfactory result was arrived at, and the real winner remains unknown. Our Irish friends seem to have a delightful way of mismanaging their contests.

"To sleep is natural; I suppose that is why I was asleep on Sunday morning last when a member knocked me up," writes Mr. J. Edge, the reporting Hon. Secretary of the Liverpool Motor-Cycling Club. "Although too late to take part in the morning run I went round to the start, and there found only five motor-cycles and about a dozen policemen. As two of the members were in doubt as to their having enough petrol with which to get home, I promised to run out after dinner and meet them with a supply. A little after two o'clock I started in charge of the relief expedition. Reaching Warrington at about 3 p.m. I came in sight of Latchford Bridge and the returning members. They reported a nice run out and a good dinner at High Leigh Farm, where they met other motor-cyclists from Manchester. Taking the country road through Cronton on the return journey, one or two fast sprints were indulged in, which so affected one machine that it needed spiritual assistance. This was promptly

given by my spare tank and proved most beneficial. The run finished in good style, and was thoroughly enjoyed by all who took part in it."

MR. S. BRIGHOUSE, the coroner for South-East Lancashire, arranged an inquest at Woolton for a quarter to six o'clock on Monday last week, but did not arrive until seven o'clock. On arrival, the coroner said it was very seldom he was late, but explained that quite recently he had gone in for a motor-bicycle, and after two or three preliminary runs he thought he knew all about it. He started out, but his troubles came quickly. He could not get the mixture right, and when he did manage to reach Gatacre Brow he had a puncture. He added that if any of the gentlemen of the jury were ever late under similar circumstances he would not only forgive them, but at the same time would be heartily sorry for them!

MESSRS. JOHN CHILD MEREDITH, LTD., are issuing a small booklet dealing with the motor-cycle in general, and the Liberty in particular. In this they give instructions as to the cause of stoppage, the regulation of the carburettor, how to find faults in the wiring; also instructions as to preparing and charging accumulators, instructions how to keep the same in good condition, etc. The booklet is intended, of course, to refer in particular to their own specialities, but it will be found useful by all motor-cyclists, who would do well to apply to the firm for a copy.

OUR French contemporary *L'Auto Velo* has decided to organise a motor-cycle competition, to take place in February next. It is to be known as "Le Criterium du Quart de Litre," and is to be only for those machines which are fitted with motors in which

THE NEW QUADRANT MOTOR-BICYCLE.

the displacement of the pistons in the cylinder approximate to one-quarter litre. The motors which are eligible for competition may therefore have a single cylinder with a piston displacement of 250 cubic centimetres, or a pair of cylinders of one-half this size.

THE Beeston-Humber motor-bicycle has been almost entirely re-designed for 1903. The h.p. has been increased from two to three, and a throttle on the induction valve fitted by which any speed from five miles to thirty-five miles per hour can be obtained. A Longuemare spray carburettor will be provided instead of the surface type. A longer wheel base has been given the bicycle, and a new method of starting has been designed, which does away with the pawl and the ratchet used this year. Immediately the engine is started the intermediate gearing over-runs the bicycle bracket axle automatically; but in the event of the bicycle being required to be pedalled home, the bracket axle can by an ingenious device be instantaneously uncoupled from the intermediate gearing of the engine. The circuit breaker has been removed from the brake over the front wheel to the end of the handle-bar. The engine crank-case has been so designed that the oil from the crank chamber is circulated through all the bearings and keeps both the bearings and the commutator continually lubricated.

HERE AND THERE.

THE Chief Constable of Derbyshire has, we learn, just purchased an 8-h.p. Beaufort car.

A PAPER on electric automobiles will shortly be read before the Institution of Civil Engineers by Mr. H. F. Joel, A.M.I.C.E.

THE Gobron-Brillie Company have opened a depot for the sale of their well-known cars at 47, Albert Gate, Knightsbridge, S.W.

AT a meeting of the Birmingham Association of Engineers on Saturday last, Mr. Hugo Gibson read an interesting paper on the Diesel oil engine.

THE Cambridge Autocar Company, Limited, inform us that they hold a large stock of petrol, which they get down by road from London in their own motor-van.

AT Condover, near Shrewsbury, Mr. A. Constantine, of Handsworth, has been fined 10s. and costs for driving a motor-car past a wagon drawn by three horses without giving notice of his approach.

MESSRS. S. HICKS AND COMPANY, of River Street, Truro, are catering for the wants of motorists by keeping a stock of petrol, oils, greases, and small spare parts. Before next season they hope to add an inspection pit to their equipment.

THE annual dinner of the Yorkshire Automobile Club will take place at the Great Northern Hotel, Leeds, on Friday evening, December 5th. As the membership of the Club is now over one hundred, it is expected there will be a large gathering of members and guests.

FOR the 1903 season the Humber

Company are bringing out a 20-h.p. four-cylinder car; it will be on the lines of the 12-h.p. four-cylinder Humber car with the exception of a larger engine and proportionate strengthening of the gear and parts throughout.

MESSRS. S. F. EDGE, LIMITED, have secured space at the French Automobile Show, to be held in December next. The new four-cylinder 10-h.p. Napier will be shown publicly for the first time, as well as a 16-h.p. double *tonneau* and a Gordon-Bennett model Napier.

THE Lonsdale Motor Company, Limited, has been registered with a capital of £2,500, to adopt an agreement with H. M. Lonsdale, and to carry on the business of manufacturers of and dealers in motors, cycles, etc. The registered office is at 41, Waterloo Street, Hove.

MR. F. PARKER, of High Street, Slough, writes stating that although he signed the consignment note, the railway company refused to carry twenty cases of motor-spirit because the boxes were not dovetailed. He has got in a large stock by road, which he can supply any week day, while on Sundays it can be procured from the Crown Hotel, Slough.

EWART-HALL, LIMITED, has been registered with a capital of £25,000, to acquire the business of W. Ewart-Hall, and to

carry on business as manufacturers of motor or self-propelling vehicles, cycles, and carriages of all kinds. The new concern is opening a large motor garage and showrooms in Nottingham. The buildings are being fitted up with electric light, inspection pit, washing yards, etc., and there will be accommodation for over one hundred cars.

WITH the rapidly growing membership of the A.C.G.B.I., it has become evident that the garage accommodation within the Club premises themselves will not be sufficient. It has been decided, therefore, to take advantage of an offer, subject to satisfactory terms being arranged, to lease large premises within hailing distance from the Club-house, which, besides accommodation for fifty cars, will provide ample room for the growing number of officials and clerical staff of the Club.

UNDER the title of the Carl Oppermann Electric Carriage Company, a new company has been formed with registered offices at 2, Wynyatt Street, Clerkenwell, E.C., to develop the electric carriage and accumulator business carried on by Mr. Carl Oppermann. The authorised capital is £50,000. An influential board has been secured, with Mr. Carl Oppermann as managing director. We understand that arrangements are

now being completed for the acquisition of a large and centrally-situated site for a garage, where every facility for the storage, maintenance and charging of electric automobiles will be available.

THE accompanying illustration shows one of the cars which has been completed by the Lanchester Engine Company, Limited, for the War Office. The whole appearance is very smart, the coach work being finished khaki colour, with a relieving line of red and the Royal cipher of the same colour in the side panels.

THE 10-H.P. LANCHESTER BUILT FOR THE WAR OFFICE, WITH HOOD SWUNG FORWARD FOR BAD WEATHER.

The car, which is a standard 10-h.p. Lanchester, has just been through exhaustive trials on the road, under the supervision of Major F. Lindsay Lloyd, R.E., non-stop runs of 100 and 150 miles respectively being completed over a route which included the well-known Edge Hill, the ascent of which was easily accomplished with a full load. A novel feature of the car is the combined hood and dust shield, providing ample protection alike against dust and bad weather. The hood is centrally hinged, so that it can be used as a dust hood with the back resting on the rear of the *tonneau*, while in bad weather it can be turned over in the position shown in the illustration, so that the occupants of the *tonneau* are shielded from the rain.

ANOTHER new De Dion-Bouton motor-vehicle for the 1903 season is a 10-h.p. car, with two-cylinder engine and four speeds and reverse. The gear of this car will be made on the Panhard sliding sleeve system. The gear case will be bolted direct on to the differential case, and the whole fixed to the frame. The power will be conveyed to the road wheels by the De Dion Cardan axle. This car is being made specially for the English market, to meet the requirements of those who desire a vehicle with the standard type of clutch and gear transmission. For those who prefer the De Dion expanding-clutch system, arrangements are being made to supply the same car with a new-pattern three-speed forward and reverse gear of this type.

A COMPANY has just been formed in Mulhausen, Alsace, to be known as the German De Dion-Bouton Motor-Car Company.

THE Houk Automobile Company has secured the English agency for the International Motor-Car Company's Toledo petrol and Waverley electric vehicles.

PLAN OF THE NEW DE DION VOITURETTE. (La Locomotion.)

|--------------------------------------|------------------------|
| A. Change Gear. | C. Cardan Axle. |
| B. Bevel Gear and Differential Case. | M. Motor. |
| | Q. Longitudinal Shaft. |

MR. J. ROBSON, Butterlaw, Kenton, Newcastle-on-Tyne, has been appointed agent for the Straker heavy steam vehicles in the North-eastern counties.

Two more suits have been brought by the Whitney Motor-Wagon Company, of Boston, U.S.A., for alleged infringement of patents on steam vehicles. The concerns proceeded against are the Prescott Automobile Company, and Messrs. Grout Brothers, Orange, Mass.

MR. A. J. ALLGOOD, of the Cinque Port Cycle and Motor Works, High Street, Sandwich, informs us that he is always able to furnish motorists with petroleum spirit, he not being dependent on the railway companies for supplies.

IN a recent issue we mentioned that the Hungarian postal authorities had placed an order with Messrs. Cudell and Company, of Aix la Chapelle, for a number of light delivery vans to be used in the conveyance of mails between the G.P.O. and the railway stations in Budapest. We are this week able to give, on page 696, an illustration of one of the vehicles. It is equipped with a 10-h.p. double-cylinder governed motor, the transmission being similar to that of the Cudell light car recently described in the *Journal*.

Two policemen who gave evidence at the West Ham Police Court in a charge against a publican of permitting betting have admitted in cross-examination that they wrote up their reports together. Their note-books were called for, and found to tally almost word for word. Mr. Gillespie, the magistrate, in dismissing the case, said it was a most objectionable practice for policemen to make up their reports in each other's presence, and to compare notes. We hope the police in other districts will take note of the remarks of the West Ham magistrate.

THE accompanying photograph represents Mrs. Edward Kennard driving her sister, Mrs. Kennedy. The car is a Progress, and has one of the new 9-h.p. De Dion engines, fitted with a wipe spark and Carpentier's high-speed trembler coil, which quite does away with all back firing. Mrs. Kennard can start the car with the greatest ease generally at the second or third turn of the handle. The car, a short time ago, with two up, accomplished a non-stop run of 105 miles, returning the following day without a hitch. It has two speeds and reverse, a Mulliner tonneau body, and is exceedingly smart, both as regards appearance and performances. It has done a mile in 1 min. 50 sec., and on good roads will average close on twenty-four miles. Altogether the owner considers the car does great credit to the maker. The photo was taken by Mrs. Kennard's son, Lieut. M. A. Kennard, R.N., who has recently been invalided home from the Mediterranean.

ARRANGEMENTS are being made to establish a public service of steam-cars for the transport of passengers, mails, and goods at Braidwood, Victoria.

MECHANICALLY-OPERATED inlet valves for petrol motors appear to be the order of the day. Among the Continental firms which have now adopted them are the Cannstatt Daimler, Peugeot, Mors, Darracq, Hautier, Rochet-Schneider, Pascal, etc.

IN connection with the Anniversary Run to Oxford to-day (Saturday) we learn that the Automobile Agency, 16, George Street, will supply Messrs. Carless, Capel and Leonard's petrol, or the Anglo-American Oil Company's Pratt's motor spirit, providing that early orders for the same be given to them: Messrs. Coxeter and Sons, Limited, Broad Street, petrol and motor spirit; Messrs. Eagleston and Son, Ironmongers, High Street, petrol and motor spirit; R. Foort, 19, Queen Street, petrol; the Oxford Cycle Company, 68, St. Giles, and 7, Michael's Street, petrol and motor spirit; Messrs. Morris and Cooper, 48, High Street, and 100, Holywell Street, motor spirit; and Messrs. Spencer, Sons and Co., 90, High Street, motor spirit.

ELECTROMOBILE COMPANY, LTD., has been registered with a capital of £50,000 to manufacture or cause to be manufactured, buy, hire, sell, let on hire and deal in motor-cars and motor-carriages and their components, fittings and accessories, to carry on the business of automobile, store and garage keepers, suppliers of electricity and motive power, &c., and to adopt agreements (1) with the British Electromobile Company, Ltd.; (2) with the Gloucester Railway Carriage and Wagon Company, Ltd.; (3) with Greenwood and Batley, Ltd.; (4) with T. G. Chambers; and (5 and 6) with T. H. Weguelin and E. Schenk. The first directors are T. H. Weguelin, E. Schenk, and T. G. Chambers, managing director. The registered office is at 4, Bloomsbury Place, W.C.

MRS. KENNARD ON HER "PROGRESS" CAR.

AMONG the prizes offered by the Worshipful Company of Coach Makers and Coach-Harness Makers of London for competition among British subjects engaged in the trades of coach making and coach-harness making and members of drawing and technical classes in connection with such trades, resident in the United Kingdom of Great Britain and Ireland is (1) a silver medal and £6 6s. and (2) a bronze medal and £4 4s. for a design (side view, and front and back views) for a motor-car to carry four persons. The drawings have to be made to a scale of three inches to the foot, on one sheet of paper 6 feet by 4 feet 6 inches. The general design is the main feature; no details of machinery are required beyond what would be visible on the sketches asked for. All drawings are to be delivered at the Hall of the Company, Noble Street, St. Martin's-le-Grand, London, on or before the 30th April, 1903.

THE LIMIT OF ABSURDITY.

FOR an absurdity in the way of anti-automobile ordinance, the idiotic production of the Waukegan Town Council is about the limit. It provides, among other things, that all drivers of automobiles in Waukegan must have a license from the Waukegan or some other municipality.

The clerk is authorised to issue licenses to all persons who apply, upon the payment of two dollars for each license.

Drivers shall be furnished with badges bearing numbers corresponding to that license; the license must always be in full view.

The speed limit shall be six miles within the district: Bounded on the north by Grand Avenue, on the east by Sheridan Road, on the south by Water Street, on the West by the Waukegan River; in any other part of the city the speed shall not be over ten miles an hour.

Upon meeting horses, drivers of automobiles must slacken speed to four miles an hour.

All cars must have gongs or bells not less than four inches in diameter, to be sounded at every street corner.

No part of the machinery of the vehicles shall be left running while standing on the street without an attendant.

Penalties for violation of the ordinance shall be not less than five dollars for the first offence, nor less than twenty-five dollars, nor more than 100 dollars for each subsequent offence.

The foregoing regulations have been seriously considered by an American municipality. Doubtless some English rural council would be willing to approve of their adoption, together with the following:—

A THIRSTY CAR.

When within sight of ladies on the footpath automobiles should be reversed and proceed in an opposite direction.

In the event of ladies coming in both directions, the motor-car to be stopped, the passengers dismounting in the meantime.

On the rear, front, and sides of automobiles should be large placards giving the number of the car and the age of the driver.

Neglect of any of these provisions will be punishable by imprisonment.

THE Sleaford Rural District Council has decided not to take any action in the agitation against the speed of motor-cars.

IN addition to their 8 and 15-h.p. cars, the Mors Company are bringing out two new models for 1903—an 11-h.p. and an 18 h.p. vehicle. Both will have four-cylinder vertical engines, the latter having mechanically operated inlet valves.

THE Leyland Motor-Transit Company, Limited, has been registered, with a capital of £10,000, to adopt an agreement with the Lancashire Steam Motor Company, Limited, and to carry on business as joint-stock carters of passengers, rail, and forwarding agents, as agricultural carriers, etc.

THE ANNIVERSARY RUN TO OXFORD.

THE vehicles entered for the run to Oxford on the 8th inst., according to the list available at the time of going to press, are as follows:—

Official Name.	Owner.	Make.	H.P.
Ace	Mr. C. Cordingley...	Mercedes	40
*Arizona	Mr. E. W. Peall	Renault	8
*Audax	M. T. P. Appleby	M.M.C.	20
*Australia	Mr. S. F. Edge	Napier	16
Alsirdur	Mr. R. W. Buttmer	Decauville	10
*Anglo-Saxon	Mr. G. W. Barnes	Mitchell	2
*Albany	Locomobile Co.	Locomobile	5½
*Baba	Mr. W. Ewart Hall	Oldsmobile	4
Becky Sharp	Mr. H. C. Sharp	Napier	12
Bête Noire	E. Wickens	Panhard	10
*Blind Nan	W. Payne and Co.	M.M.C.	10
*Buffalo	Locomobile Co.	Locomobile	5½
Bogey	Mr. H. A. Hood	M.M.C.	7
*Briton	Mr. F. R. Goodwin	Star	7
*Butterfly	Mr. B. Reyner	M.M.C.	8
*Buzzer	Mr. G. D. Barnes	Dennis	10
Cardinal	Mr. E. H. Cliff	Darracq	16
Caesella	Mr. R. W. Brading	Daimler	6½
*Certiorari	Mr. E. de Wilton	De Dion	8
*Chelmsford	Clarkson - Capel Stearn	Clarkson and Capel	12
Cherub	G. F. Milnes and Co.	Milnes	8
*Chicot	Mr. E. W. Walford	—	7
*Clementina	Mr. W. H. M. Burgess	Clement	8
Clink	Mr. H. J. Chapple	Locomobile	4½
Corona	Mr. H. G. Abrahams	Peugeot	8
*Diana	Mr. H. H. L. Lewis	Daimler	6
Dick	Mr. C. Friswell	Peugeot	10
*Doctor	Mr. W. P. Warren Smith	Hozier	8
Electricia	Electromobile Co.	Electromobile	5
*Ememsee	Mr. A. Burgess	M.M.C.	12
*Excelsior	Mr. H. Martin	Excelsior	2½
*Fidelis	Mr. J. M. Gorham	De Dion	4½
*Fireworks	Mr. W. J. Crampton	Decauville	10
Faithful	Mr. E. Soames	Daimler	7
Giddy Skid	Mr. L. Schlenzheim	—	—
*Good Hope	Mr. E. Martin	M.M.C.	12
Gondola	Mr. T. W. Rogers	Daimler	7
Goliwogg	Hon. A. Wood	M.M.C.	8
*Good Luck	Mr. E. R. Lowe	Excelsior	2½
*Hans	Mr. P. Brodtmann	Adler	8
Inez	Mr. F. S. Peall	Renault	—
Iris	Mr. W. J. Peall	Daimler	14
I Will	Mr. H. Hirst	Daimler	22
Jenny Wren	Mr. A. Hines	De Dion	3½
*Kiddie	Mr. H. Bennett	Oldsmobile	4
Kumfy	Mr. Ernest Owers	—	16
La Ruche	Mr. J. Tubb-Thomas	Benz	4½
*Le Petit Bleu	Mr. E. M. C. Instone	Daimler	22
*La Belle	E. J. Coles and Co.	Coles	7
La Pipe	Mr. F. Atherley	Pipe	15
*Microbe	Mr. H. R. G. Homfray	Gladiator	6½
*Matador	Mr. H. B. Taylor	Gladiator	6½
Magnet	Mr. C. Watney	Panhard	12
*Mammoth	Mr. H. Loeffler	James & Browne	9
Manikin	Mr. C. K. Gregson	Gladiator	12
*Maria	Mrs. Manville	Gladiator	12
*Memphis	Mr. G. Kenyon	Panhard	10
*New York	Locomobile Co.	Locomobile	5½
*Omrah	Mr. F. S. Hallows	Marshall	12
*Old Blue	Mr. J. P. Neave	Peugeot	10
Overtaxed	Mr. F. F. Wellington	Panhard	7
*Paratus	Mr. J. M. Gorham	Daimler	22
*Pax	Mr. J. van Hooydonk	Phoenix	2½
*Perfection	New Automobile Co.	Miesse	10
*Petrols	Hon. C. S. Rolls	Panhard	10
*Philo	Mr. C. Rhind-Tutt	Hurst & Lloyd	6
Pioneer	Simms Mfg. Co.	Simms	8
Phillard	Mr. R. E. Phillips	Rochet-Schneider	8
*Redivivus	Mr. C. L. Schwind	Daimler Co.	6
*Rocket	New Automobile Co.	Rochet	10
*Rambler	Mr. W. C. Allen	Jeffrey	4½

THE ANNIVERSARY RUN ITINERARY.

The following is the route to be followed on the run to Oxford to day (Saturday):—

	Intermediate mileage.	Miles from London.
Hyde Park Corner ...	—	—
Barnes Bridge ...	—	—
Richmond Park (Roehampton Gate) ...	—	—
Richmond Bridge ...	—	—
Twickenham ...	—	—
Staines ...	—	17½
Virginia Water ...	3½	21½
Ascot ...	4½	25½
Wokingham ...	6½	32
Earley ...	4½	36½
Reading ...	2½	39
Purley ...	4½	43½
Pangbourne ...	1½	45
Basildon ...	2½	47½
Streatley ...	1½	49
Wallingford ...	6½	55½
Shillingford ...	3	58½
Dorchester ...	1½	60
Nuneham ...	3½	63½
Sandford ...	2	65½
Littlemore ...	1	66½
Rosehill ...	1½	68½
Oxford ...	1	69½

Lighting-up time, 5.21 p.m.

A blue flag—turn to the right. A lemon flag—turn to the left.

At the moment of going to press we learn that 222 entries had been received for the anniversary run to Oxford.

THE Midland Automobile Club has decided to join in the anniversary run to Oxford, and a good muster of members is expected.

AMONG the guests at the annual dinner of the A.C.G.B.I., which is to be held to-night (Friday) will be Lord Farrer and the Earl of Verulam.

FLYWHEEL WEIGHT.

THE object of the flywheel on petrol motors is to serve as a reservoir between impulses, so that the motor may not stop during that portion of its cycle when no working pressure is being applied to the piston. In the course of a recent letter on the subject to an American contemporary from Mr. C. E. Duryea, that gentleman remarks that "a heavy flywheel does not add to the output of the motor nor does it steady the running after the revolutions reach a point high enough to overcome, for all practical purposes, the tendency to stop between explosions. With a stationary gas engine running at 200 or 300 revolutions per minute, and missing sometimes four or five charges where it fires one, a heavy flywheel is a necessity, and largely on this account is associated with the internal combustion motor as an essential part, but some experiments to determine what flywheel weights are necessary may be both interesting and instructive. We formerly equipped our triple-cylinder motors having 4½ by 4½-in. cylinders with 140-lb. flywheels, most of this weight being in the rim, which was 3 in. wide by 18 in. diameter. We reduced this weight from time to time to 125 lbs., 100 lbs., 85 lbs., 70 lbs., 50 lbs., and 45 lbs., each time not only saving in weight but gaining in flexibility and rapidity of control of the motor, as well as a decrease in the vibrations received by the carriage body—clearly a gain in both directions. A further gain lies in the fact that a sudden throwing in of the clutch does not tend to strip the gears or jerk the vehicle with a light flywheel as with a heavy one.

"Since the aerial navigation problem has begun to attract attention more widely, we have been called upon to furnish motors for aeronautical purposes, and to this end have reduced the weight of the flywheel to 23 lbs., which reduction enables us to turn out with our regular castings an aeronautic motor developing 15 horse-power and yet weighing under 150 lbs. or 10 lbs. per horse power. This is done without the use of aluminium and with practically the same parts as used in our vehicle motors. Having flywheels of this weight, we improved the opportunity to fit them to vehicles, with surprisingly satisfactory results. With such a flywheel it is possible to slow the vehicle until the motor seems to have stopped, when on opening the throttle the motor at once romps away, taking the vehicle with it. We find, further, a perceptible decrease in the vibration transmitted to the carriage body, for the impulse of the explosion is expended in accelerating the motion of the flywheel and not in trying to revolve the vehicle in a reverse direction. At slow speeds there is a tendency to stop between explosions, but it is so seldom necessary to drive at this slow speed, using the high gear, that this is hardly an objection. The general impression, with the light flywheel when throttled low, is that the engine is running very smoothly and using fuel, but as soon as the throttle is opened it bounds forward like a spirited horse. What the limit of weight is has not yet been settled, but our regular 45 lbs. flywheels are certainly an improvement over their predecessors of two or three times their weight. Certainty of action, wide range by throttle and ample power, all of which can be had by the use of light-weight multiple-cylinder motors, will undoubtedly be leading features in the future."

MESSRS. FRISWELL inform us that Messrs. Wayte Bros., of Dublin, have been appointed agents for "Baby Peugeot" in the Leinster district of Ireland.

ON Monday a party of about fifty members of the Birmingham Association of Mechanical Engineers paid a visit to the works of the Motor Manufacturing Company, Limited, Coventry.

THE Creek Street Engineering Company notify us that they have removed from Deptford to more extensive premises in Lots Road, Chelsea, where they will in future be known as the Cremorne Motor Manufacturing Company.

MESSRS. SHIPPEY BROS. have, we learn, been appointed sole agents for England for the new Toledo steam cars of the International Motor Car Company. An illustration of one of the Toledo runabouts was given on page 670 of our issue of October 25th.

OIL MOTOR-CARS OF 1902.*

By CAPTAIN C. C. LONGRIDGE.

(Continued from page 687.)

To obtain automatic regulation of the current consumed, and at the time of sparking, the author has suggested using wedge-shaped contact pieces on the rotating disc, and allowing the disc under the direction of a governor an in-and-out movement on the shaft, Fig. 4. The action would be as follows:—As the motor speed increased, the disc would slide,

FIG. 4.—CONTACT BREAKER (AUTHOR'S), for obtaining automatic regulation of timing and current consumption.

say backwards, bringing the wider portion of the contact pieces under the brush; as the speed decreased the reverse would take place. This would give increased contact surface and earlier firing for high speeds with lessened surface and later ignition for slower speeds, that is, automatic regulation of current and sparking period.

Systems of Governing.—Governing is so intimately connected with valve action, charge formation, and ignition, that it may well be considered next. For the purposes of governing, the old "hit-and-miss," or total cut-out arrangement, has practically disappeared. In its place, four systems are in use. By far the larger number of car motors use a charge volume throttle, Fig. 5, usually a valve fixed on the induction pipe, but occasionally in the form of an inlet valve with variable lift. The throttle,

FIG. 5.—SYSTEM OF VOLUME THROTTLING (MORS). AA throttle valves on induction pipes; BB valve levers, C valve shaft, operating under the action of the governor D. Of the two springs E and F, the former is the stronger, and tends to open the valves. By the use of these springs, the valve action is more sensitive than when the governor alone is used.

worked by hand, or by the governor, or by both, reduces the volume of the charge admitted and thus slows down the motor. The author has no hesitation in condemning this system as theoretically bad. Incomplete filling of the cylinder reduces the compression, and thus renders the conditions for efficient and economical explosion less favourable. Again, the

induction of the charge below atmospheric pressure entails negative work—Thirdly, where jet carburation is used, the mixture is varied.

The second system, less general, is the exhaust throttle. The opening of the exhaust valve is retarded, a certain proportion of exhaust gas remains in the cylinder, the inlet valve opens later, and less fresh charge is admitted. In this case, there is a certain amount of back pressure, and the mixture is diluted with exhaust gases; but the cylinder being fully filled, the compression is preserved, and there is sufficient evidence to show that from this factor alone greater economy results. An illustration of the application of the principle is the De Dion Patent, No. 22762 of 1900, Fig. 6. Where this method of governing is adopted, correctness of mixture would appear very necessary. A third system, in very general use, usually in combination with one of the preceding methods, is by retarding the charge ignition. The effect of delayed ignition is to give the piston time to expand the charge, thus reducing the force of the explosion and the duration of its action on the piston. In other words, the full power value of the oil is not obtained. The method is, therefore, wasteful, and unless automatically coupled with the throttle valve, may, in the hands of a careless driver, lead to premature explosion.

The author inclines to think that the second, or perhaps a fourth, method would be the best, namely, governing by retaining the full charge of air, and reducing the amount of petrol. It might be thought that governing on this plan could not be extended over more than a 50 per cent. variation of speed, the "critical point" of the mixture being then reached. With the ordinary methods of carburation this would probably be the case. But by carbureting at or near the end of the compression stroke, it

FIG. 6.—EXHAUST GOVERNOR (DE DION AND BOUTON). A cam acting, through lever B, on exhaust valve stem tappet J. B lever pivoted to crank C, and movable from right to left, by rod D. Any movement of the lever to the left decreases the lift of the valve, as may be seen from the dotted or maximum position of the lever, at which position the exhaust valve remains closed.

is likely that a far wider range might be covered. The difficulty of ignition could be met by setting the ignition plug in the course of the incoming fuel, thus ensuring locally a mixture sufficiently rich for inflammation.

Charge Expansion.—Having carried the subject as far as the ignition of the charge, there remain a few other points on which it may be wise to add a word or two before describing the application of the motor power to the car itself. The first of these points is expansion during the working stroke. As a direct object of design, no Otto cycle petrol-car motor on the market provides for increased expansion during the working stroke; indirectly, as a result of governing by throttling, greater expansion, under the action of the throttling, is obtained. The disadvantages of this method have already been noticed; loss of fuel value by reduced compression, negative work in suction below atmosphere pressure; and, if gain by increased expansion were in view, reduced power by the diminished weight of charge. Though it is doubtful whether in Otto cycle car-motors any attempt at further utilisation of the exhaust pressure would be successful, efforts in this direction are worth consideration. To overcome the disadvantages enumerated above, some inventors admitted a full charge to the cylinder, subsequently expelling a portion, thus giving greater expansion to the rest. Another method of procuring increased expansion by diminished charge is illustrated in motors governing on the exhaust. To reduce the fresh charge, more or less of the exhaust is retained in the cylinder. It is intelligible that the practice should be economical; for, though back pressure is created and the charge diluted, suction below atmospheric pressure is avoided, and, which is the main point, compression is preserved. Taken broadly, as a principle, increased expansion by charge reduction might, perhaps, be useful in designing motors liable to temporary demands for power in excess of their normal yield, as, for instance, in hill-climbing. In such case, the cylinder would be so dimensioned that a full charge would provide very high compression and increased power for use on occasions when a temporary increase of vibration, etc., would be of no consequence. For normal running, the reduced charge and lower compression would be employed. Against the advantage of this reserve power would be the

* Abstract of Paper read before the Institution of Mechanical Engineers.

slightly-increased dimensions and weight of cylinders, etc. On the other hand, provision of reserve power is, with single-acting Otto engines, the only way to reduce change speed gears to a minimum—a step much to be desired.

Other inventors have worked in quite a different direction, seeking greater expansion by increase of the working stroke. By lengthening the sweep of the piston during the working stroke additional expansion is obtained. A simple device for the purpose was recently designed by the author, the detail being worked out by Mr. A. Suggate. The modifications of the stroke will be easily understood from Figs. 7 and 8. The diagram shows teeth on a fixed pin in the cross-head to gear into a similar wheel fixed to the crank. The pin on the connecting rod is lengthened beyond the teeth to form a bearing, working in a block or roller, the latter sliding or rolling in a groove on the crank. This bearing takes up much of the thrust, leaving the teeth the work of keeping the pin in the proper

FIG. 7.—INCREASED EXPANSION GEAR (AUTHOR'S).

position in the crank. The shaft must, of course, be provided with suitable bearing. From the diagram it will be seen how the other strokes are varied during the cycle. Naturally it is not suggested that such gear would stand the shock of large engines, but for small powers the mechanism might serve its purpose. The cycle itself favours economy, for a light charge is used with high compression and increased expansion.

Other inventors again have aimed at increased expansion by additional cylinders. Excluding the system of compounding, which is not likely to be introduced in light motor-cars, adaptations of the above principle have found, and others may find, a possible application to motor-car work. A clever method initiated, perhaps, by the Atkinson engine and adopted in such motors as the Koch, Gobron-Brillié, Hyler-White, Pretot, etc., is the use of two pistons in one cylinder (in this sense two cylinders). The plan gives rapid and good expansion, but is attended with some obvious disadvantages, which, however, have not prevented it from finding favour with many automobilists.

Cylinder Cooling.—For any but the smallest motors, air-cooling, except as a supplementary aid, is impracticable, or, in any case, vastly inferior to water-cooling. This latter system may be subdivided into forced and natural. Of these, the former, by far the more general, is effected by pump, usually of the centrifugal type; the latter, by placing the water tank higher than the cylinders, circulation following the difference of temperature. The security of this system is its only strong point. In other respects it is inferior to forced circulation. Not only to maintain a given cylinder-temperature does the slower circulation require a larger body of water to be carried, but the very cause of the circulation is defective. In the jacket, water rises upwards round the cylinder, because it becomes hotter. It is thus placed in a condition to exert the least cooling effect where it is most wanted, round the combustion chamber and valves. The result is an increase in the natural tendency to unequal cylinder expansion, which adversely affects the casting, the piston rings, and general running of the engine.

Possibly the best method of all, and certainly the safest, would be a combination of the two systems. Where pump circulation alone is employed, it is advisable to provide against over-heating due to breakdowns. The safeguard usually supplied is a float glass on the dashboard, in which the position of the float indicates the maintenance of the circulation. But this requires the driver's attention, a demand to be avoided. A very ingenious French method for indicating the piston water circulation in gas-engines is to lead the discharge into a tank, fitted with a ball-cock, connected with the gas-valve. If the circulation fails, the tank water-level falls, the ball-cock sinks, cutting off the gas and stopping the engine before damage is done. On somewhat similar lines, the author recently suggested fitting on the pump discharge pipe a lift valve, so connected with the electric ignition or the petrol supply that, as long as the cooling water circulated, the valve and its connection remained in their normal position; but, if the pump failed, the fall of the valve back to its seat broke the electric current or the petrol supply and so brought the motor to a standstill. A mercurial tube in connection with the cylinder jackets offers another method of interrupting the firing, when, owing to a pump failure, the cylinder temperature becomes dangerously high.

The question of what is the proper cylinder temperature is one that admits of two answers, according to the standpoint taken, namely, that of

efficiency or that of power. A very considerable heat loss arises from the cooling of the explosion gases by contact with the cylinder walls and piston. Hence the higher the temperature of these latter, the lower their cooling effect. High cylinder temperature, therefore, conduces to efficiency, considered as the ratio of heat converted into work to the total heat imparted to the engine. Under this aspect, then, the cylinder walls should be kept as hot as they can be efficiently run. But, when power is considered, different considerations intervene. Other conditions being alike, the more charge that can be included in a cylinder of given dimensions, the more power will be produced by the explosion. Thus power depends on the weight of the charge. Now one charge, having half the absolute temperature of another, will have double its weight, and its explosion will generate proportionately greater power. Low temperature, therefore, by diminishing the heat of the incoming charge, favours increased body and therefore increased power. In 1896, Mr. James Atkinson stated that for every $5\frac{1}{2}$ deg. Fahr. by which the charge in the cylinder was reduced in temperature before compression 1 per cent. more power could be obtained from the engine. Low cylinder temperature results in easier lubrication, and, therefore, likely enough, in reduced friction, a possible factor in the increase of power.

Mufflers or Silencers.—Until very recently these have been considered merely as sound-deadeners, and their influence on engine power quite overlooked. Many of the silencers used were thus ridiculously small, giving rise to quite unnecessary back pressure. What is the proper volume ratio between the silencer and the cylinder the author does not know. Mr. W. A. Norris states that it should be a minimum of five to one. The point could be easily settled by any manufacturer that would take the trouble to make the simple experiment. That silencers are probably yet too small, and that considerable throttling still exists, is evident from the fact that certain American makers have added to the exhaust pipe between the cylinder and silencer a bye-pass valve, to free the exhaust, when more power is required. This method has been followed in the Brooke car and the Mercedes Simplex. To ensure immunity from fracture in case of back-fire, a relief valve is sometimes fitted to the muffler.

Communication of the Motor-Power to the Car.—(a) **Crank and Crank-shaft.**—As regards the position of Otto-cycle motor crank-shafts, the practice is to set the centre of shaft below the axis of the cylinder. The method is open to objections. All Otto-cycle motors are single-acting, high-speed engines of accentuated type, in as far as the initial pressure is greater, more violently applied, and more rapidly repeated—constantly in one direction, namely, on the downward stroke. This sudden blow, always applied in the same direction, throws a heavy strain on the connecting rod and crank-shaft, and, in large power gas-engines, necessitates crank-shafts of about half the diameter of the cylinder. This is one of the mechanically weak points of all engines using the Otto cycle. The question is whether the present practice deals in the best way with this defect. The prevailing method of locating the shaft line so as to intersect the cylinder axis, gives equal angularity to the connecting rod on its up and down stroke. The cycle, however, imposes all the working strain during the down stroke; consequently, construction should, perhaps, aim at keeping the connecting rod in the most favourable position to withstand pressure in this period of the cycle. In other words, the angularity should be reduced during the

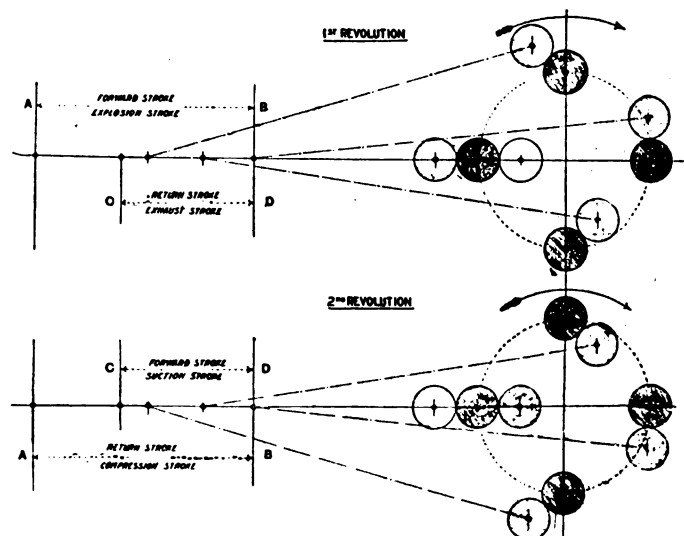

FIG. 8.—The dark shaded wheel is on the crank. The light shaded wheel is on the connecting rod. The plain circles show position of the wheel on the connecting rod at the end of the revolution. *Note.*—Maximum stroke of piston A B equals twice throw of crank plus pitch diameter $\frac{1}{2}$ of wheel. Minimum stroke of piston C D equals twice throw of crank minus pitch diameter $\frac{1}{2}$ of wheel.

working stroke, being proportionately increased for the idle strokes; less angularity when the pressure is great, more angularity when it is slight.

(To be continued.)

CORRESPONDENCE.

CHAINS ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from D. E. Stephens on the above subject in your issue of October 25th, I have pleasure in giving my experience of the length of life of chains on a 6-h.p. Daimler, weighing about 19 cwt. I first tried "blocks," and had one pair run 3,410 miles. After using others over a distance of 3,000 odd miles, I discarded the "block" pattern in favour of "rollers," which I much prefer, and find have about double the life of the others. My first pair ran for 6,987 miles, and only having jumped off twice in that distance; though I should not like to say how many times the old blocks came off when they were getting worn. My practice has been to boil the chains in lard from time to time after first washing them in paraffin, and they are dressed with grease each day before use. As to tightness, motor-car chains should not be as tight as those on bicycles, and where the driving is done by a pair of chains they do not seem to want to be as tight as when there is only one. Chains should be adjusted when they require it, which in my experience is not very often. With regard to sprockets I am now using my second pairs, large and small (twenty-seven teeth and eight teeth), and the first lasted for 7,865 miles. All the chains I have used were made, I believe, by Messrs. Brampton, and considering the work they are required to do and the conditions under which it is done, modern chains to my mind leave little to be desired.—Yours truly,

EDGAR SOAMES.

AUTOMOBILISM IN SOUTH AFRICA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A mail or two back I sent you an account of the first journey from Port Elizabeth to Grahamstown by motor-car. The distance is only eighty-six miles, but the difficulties of the road in gradient, deep wheel-tracks of heavy bullock wagons, sand, and drifts make it a tough job. Mr. Galpin, of Grahamstown, tried it some months ago on a large car, but failed, getting

A SOUTH AFRICAN SNAPSHOT.—THE OLD AND THE NEW.

only about thirty miles and then completely breaking down. My little 4½-h.p. geared Benz did it in splendid style, averaging ten miles an hour, exclusive of stops for refreshments and one stop to repair broken steering spring. Your reproduction of the same car coming up Van Staden's Pass was a great improvement on the original. A few months ago mine was the only motor-car here, now there are several, and there are over twenty more ordered and on the way.—Yours faithfully,

W. E. ALCOCK.

Port Elizabeth.

WATER CIRCULATION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A very probable cause of the trouble experienced by your correspondent "Puzzled" is an inefficient circulating pump. It is increasingly obvious that a really efficient circulating pump (for car use) is a rarity, seemingly due to the fact that the importance of this accessory is generally underrated, and consequently inadequate attention is given to its design. If the large centrifugal circulating pumps used with marine surface condensers were not far more efficient than the former, we could not have the splendid results that are regularly effected in rapid ocean passages, and weeks of continuous steaming without a hitch. If this throws any light on the trouble that "Puzzled" complains of, I shall be glad, and he may be further interested to know that I have designed a really good little circulating pump of high and tried efficiency.—Yours truly,

SIDNEY H. HOLLANDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Puzzled" in your issue of 1st November, it is difficult until one knows the exact relative position and details of his water tank, water-jackets and radiators, to give a definite opinion as to the cause

of his trouble, but several explanations present themselves:—1. Insufficient lubrication in the cylinder; 2. Faulty pump, such as breaking of the cogs therein; 3. Slipping of the pinion on the pump shaft or spindle, whereby the pump is not rotated, though externally it appears to do so unless one carefully notes whether the spindle is also rotating with the pinion or not; 4. A "steam lock" in the water-jacket, which prevents circulation. I have had experience of each of the above, and, until I found it out, was considerably puzzled over the last. The remedy in each of the first three is obvious; and, as regards No. 4, it is only necessary to disconnect the unions on the pipes leading from the water-jacket and run the engine till water gushes out, then connect up again.—Yours truly,

"T."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Puzzled" will introduce a piece of wire with a small hook at the end into the short water pipe which enters the water-jacket, he will probably feel and hook out a small plug of asbestos or tow mixed with red scale, which has been acting as a bad valve, stopping circulation when the engine is running. When the car is at rest the water percolates through and fills the jacket, making one think circulation is all right; as the engine works, however, it uses up this water and overheats. I was five weeks finding this out on a car of similar type.—Yours truly,

A. FENNINGS.

"MOTOR-TRICYCLES" OF B.C. 700!

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The old saying, "there is nothing new under the sun," is exemplified in a passage in Homer's *Iliad*, Book XVIII., line 368-380, where three-wheeled automobiles are mentioned as being built by Vulcan. As Saturday is the sixth anniversary of Emancipation Day (first stage) for automobiles, this appears to be an appropriate occasion for bringing this record to light. The translation freely rendered by Pope is as follows:—

368. So they. Meanwhile the silver-footed dame
Reach'd the Vulcanian dome, eternal frame!
High eminent amid the works divine,
Where heaven's far-beaming brazen mansions shine.
There the lame architect the goddess found,
Obscure in smoke, his forges flaming round,
While bathed in sweat from fire to fire he flew;
And puffing loud, the roaring billows blew.
That day no common task his labour claim'd:
Full twenty tripods for his hall he framed,
That placed on living wheels of massy gold,
(Wondrous to tell) instinct with spirit rolled
From place to place, around the blessed abodes
Self moved, obedient to the beck of gods:
For their fair handles now, o'er wrought with flowers,
In moulds prepared, the glowing ore he pours.
Just as responsive to his thought the frame
Stood prompt to move, the azure goddess came.

This takes the date of the first idea of motor-cars back some two thousand six hundred years!—Yours faithfully,

H. R. BELCHER HICKMAN.

SUPERHEATERS FOR STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I bought one of Messrs. Strickland and Co.'s superheaters about three months ago and find it a splendid thing, economising both water and petrol on my Locomobile to an astonishing degree. Twenty gallons of water will now carry me over forty miles, and with three gallons of petrol I can do fifty-five miles. My car used to average fourteen miles an hour, now the speed is a good eighteen. The fitting and fixing being simple, I did this myself, no alteration being needed in engine, lubricator, lubricating, or glands. Drivers of these handy little cars who are troubled with back-draught should shorten their chimney to about eighteen inches, and fit an elbow about three inches long on each end opening upwards. I have used a similar contrivance for the last six months and my fire has not blown back once. "Forced draught" is wasteful and unsatisfactory in every way.

A pilot light is badly wanted on these cars, for a very slight side wind will extinguish the fire when the automatic regulator has damped it.—Yours truly,

ROBERT CROSS.

AN INCIDENT NEAR IPSWICH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Last week, while driving an 8-h.p. Gobron-Brillie in company with a friend from Ipswich to Bury, we nearly overtook a horse and cart, but upon the driver thereof holding up his hand we stopped, and my friend got out and went towards the horse to lead it. The driver would not wait for my friend to come up, but instead drove on; we followed slowly some way behind till again the driver put up his hand, and again we had to stop. The driver then opened a gate and took his horse and cart into a field, and we drove on and stopped a mile or so further on for tea. On again joining the car I was accosted by a policeman who demanded my name and address, saying that the horse (which I have mentioned) had run away in the field. Is one responsible for horses in fields? and has a policeman

a right to demand one's name and address when manifestly one has done nothing contrary to the law? I gave mine after first obtaining that of the owner of the horse which won't face motors.

We had no idea that the horse had run away till the policeman told us, on going back to investigate matters, both man, horse, and cart had vanished.—Yours truly,

J. REGINALD EGERTON.

A MOTOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers inform me why a petrol-motor should not be designed to give two propulsions every other revolution instead of one, by exploding the mixture at each end of the cylinder. The chief objection I see is the need for extra parts, such as piston rod, stuffing-box, slide blocks, etc., entailing greater liability to break down; but would not the increased power, without necessarily increasing the weight in proportion, be more than sufficient to counterbalance this? I presume there must be some great mechanical disadvantage, owing to its absence in the market, as far as I am aware.

May I also express my fervent hope that Mr. J. D. Hill will meet with the success which he so well deserves? The misguided "Robert," when pulling up an innocent motorist driving, say at 10 miles per hour, and swears it is twenty, is probably under instructions to allow a "factor of safety" of two.—Yours truly,

O. B.

MR. W. F. PEARE, of Waterford, writes: "In your issue of the 25th ult., referring to the military manoeuvres in Ireland, you say:—'The Duke of Connaught's Napier experienced a mishap, and while it was under repair his Royal Highness had a seat on Major Nugent's Brooke car.' I wish to correct this, as it was distinctly the reverse which occurred. On the second day of the manoeuvres the Brooke car, on which his Royal Highness was travelling, had a mishap. Mr. W. G. D. Goff, who was following, took his Royal Highness on board his 16-h.p. Napier, and continued to drive him during the remainder of the manoeuvres."

MR. J. G. KIRSTEN writes: "'Vulite' is mentioned by your correspondent, Mr. Frank Thatcher, in the issue of the 25th ult. Will that gentleman kindly inform me the name of the makers of this?"

BRAKE AND MOTOR-CAR COLLISION.

At the Brompton County Court, last week, before Judge Stonor, Albert Olley, Enfield, brought an action against Mr. Owen Macklin, job-master, Fulham, S.W., claiming £10 in respect of damages to a motor-car and lamp, said to have been caused through negligence on the part of a man in the defendant's employment. The plaintiff's case, briefly, was to the following effect. On June 18th last, having attended the Ascot Races, he was returning to London along the Datchet road. When about a mile below Colnbrook he came up to two brakes, and blew his horn. He passed one of the brakes, the driver of which shouted, "Take the ——— thing away, or I'll smash it up." They were all going at a walking pace at the time. Suddenly the driver whipped up his horse, and one of the poles of the brake came "bash" into the back of the motor-car, forcing it against the brake in front. The back of the car was smashed in, and a fine lamp, valued at £7, was destroyed. The plaintiff went on to speak as to the identity of the driver of the brake. For the defence, Edward Rhymes, the driver of the vehicle in question, stated that the road at the spot where the accident occurred was very narrow, and the motor-car stopping dead right in front of the brake, it was quite impossible for him to prevent the accident. His Honour said he did not believe that the driver of the brake drove deliberately into the motor-car, as had been suggested; but he thought that the evidence pointed to contributory negligence on the part of the driver of the motor-car. There would accordingly be judgment for the defendant, with costs.

THE MOTOR POWER COMPANY, LIMITED, v. GILLING.

This was an action brought before the King's Bench last week by the plaintiff company to recover the sum of £320, the balance of the price of a motor-car supplied to the defendant, Mr. G. M. Gilling. The defendant admitted that the plaintiffs were entitled to credit for £320, but he said that it was a condition of the agreement to purchase the car in question that the plaintiffs should provide a competent driver. His case was that the plaintiffs, in breach of the condition, had negligently supplied an incompetent driver, with the result that an accident occurred and the car was rendered worthless. He counterclaimed £600 damages.

It appeared that in February last the defendant ordered a Gladiator light motor-carriage from the plaintiff company at the price of £320, and in addition to this the defendant was to hand over to the plaintiffs his old Locomobile. On February 15th the plaintiffs delivered the Gladiator to the defendant, who gave a cheque for £320, which was postdated February 18th. On the Sunday the defendant went in the motor-car to Croydon, and was driven by a man named Passmore, who, according to the plaintiffs, was engaged by the defendant. Unfortunately, the roads in Croydon were slippery and the car had a side-slip, with the result that the driver lost control of the vehicle, and it ran into a lamp-post. The driver was seriously injured and the car was damaged. Thereupon the defendant stopped the cheque which he had given to the plaintiffs, a course which

they contended he had no right to take. The defendant wrote complaining of the incompetence of the driver, who, he alleged, had been supplied by the plaintiffs, and he counterclaimed damages from them for an alleged breach of a condition to supply a competent driver. A good deal of evidence was given on both sides, but in the end the jury found a verdict for the plaintiffs for the amount claimed, and judgment was given accordingly.

A MOTOR-CAR CONTRACT.

In the King's Bench Division last week the Lord Chief Justice tried the case of "Ellis v. Keene." The plaintiff, Mr. Frank Ellis, of East Putney, sued Mr. L. Perry Keene, Putney Bridge, to recover £100 paid for a motor-car, the consideration of which had, he said, failed. Mr. Lincoln Reed stated that the plaintiff saw a petrol car at defendant's establishment. The price asked was £130, which was to include some painting and redecorating. Finally, £100 was agreed upon as the price without any redecorating. The car was, however, to be overhauled. Plaintiff was taken by the defendant for a run round Richmond Park, and after the return journey the balance of the purchase money (£95) was paid. Later the car was sent to plaintiff's house, but on that day it would not go at all. Subsequently it was agreed that the car should be exchanged for a steam vehicle, for which plaintiff was to pay another £10, and certain alterations were to be made. For the defence Mr. Mears said the car was chosen by plaintiff at defendant's works, and was all that it was represented to be. If the car did not behave properly after that it was because it was not treated properly. As to the steam car, no bargain was arrived at. In the result the Lord Chief Justice came to the conclusion that the original contract was determined by consent of the parties, and there was a bargain made that in consideration of Mr. Ellis allowing the £100 to remain on account of the steam car and paying another £10, Mr. Keene was to deliver the steam car within fourteen days. Judgment would, as the defendant had not fulfilled that contract, be entered for the plaintiff for £100 and costs.

PETROL STORAGE AT BRISTOL.

THE Bristol Motor-Car Company was summoned last week for selling two gallons of motor-spirit without a licence, contrary to the Petroleum Act of 1871. A fine of 10s. and costs was imposed, the Bench taking into consideration the statement for the defence that the spirit was sold by a lad not in the employ of the company, and contrary to the stringent rules laid down by the defendants. H. B. Lowe, of Redcliffe Street, Bristol, was also summoned for selling a gallon and a half of motor-spirit, in contravention of the above Act. The spirit was sold to Inspector Gotts by a servant of the defendant, the employee admitting that he had been instructed by his master not to sell the spirit. A fine of 10s. and costs was imposed.

A CLAIM FOR COMMISSION.

At the Brompton County Court on Friday week, before Judge Stonor Mr. T. H. Schultess Young, described as a motor-car maker, 149, Ebury Street, S.W., brought an action against the Speedwell Motor and Engineering Company, Limited, 50, Albert Gate, W., claiming £26 5s. as commission, said to be due in the introduction of business. Plaintiff's counsel explained that the Pall Mall Motor and Cycle Company, in which his client had been one of the two partners, had some business transactions, about May of last year, with a Dr. Fenton. This gentleman was desirous of disposing of a "Baby Peugeot" car, and purchasing a more expensive one, and he arranged with the Pall Mall Company that if they sold his car for £150, any other car he might purchase should be bought through them, so that they might get a commission in the usual way. Subsequently, having inspected various cars, and discussed with the members of the Pall Mall Company the merits, etc., of the different makes, Dr. Fenton agreed to buy a Renault car from the defendant company for £350. The doctor fully explained at the time of purchase that he was buying the car through the Pall Mall Company, and in a written agreement the defendant company agreed "to allow a trade discount of 7½ per cent." on the car in question. The defendants, however, failed to supply a car to time as agreed and of the colour stipulated, and Dr. Fenton in consequence cancelled the order. The learned counsel maintained that the commission had been earned, but the defendant company disputed the claim. In cross-examination, Dr. Fenton said that, beyond referring to the Renault cars, among others, in course of conversation, the Pall Mall Company did nothing towards finding him the car which he had agreed to purchase. When the defendant company asked for longer time in which to get the car from Paris he waited for more than a week, and when one ultimately arrived he understood from the company's communication that he would have to get it painted the colour he had ordered at his own expense. That was why he cancelled the order and claimed the return of £100 deposit. The judge said it appeared to him that if anyone was entitled to the commission it was Dr. Fenton, who, of course, could hand it over to the plaintiff if he so desired. A difficulty in the case also was whether the plaintiff could rightly claim the commission, seeing that the arrangement was that he and his partner—who had now disappeared—should receive it. The partnership had never been dissolved, and so it still subsisted. Counsel for the plaintiff: Will your Honour allow the claim to be amended to "Young, trading as the Pall Mall Motor and Cycle Company"? The Judge: As the action stands on the record there can be no doubt that it is in the wrong name. The case was then adjourned.

Where no alleged speed is given it is understood to be above the legal limit.
 * Motor-cycle case.

ON the authority of the solicitor of the Automobile Club, the announcement is made that a motorist has the right to appeal to Quarter Sessions against any verdict provided the fine exceeds £5.

At the Horsham Petty Sessions, last week, H. Coombs, of London, was summoned for driving a motor-car at an excessive speed at Crawley, on October 12th and October 17th. Defendant pleaded not guilty. Sergeant Beacher said defendant drove a motor-car on October 12th over a measured quarter of a mile in 36 secs., or at a rate of 24 miles an hour. Mr. Paul Nolke, defendant's employer, said they were not travelling at an excessive speed. The car was out of order, and it was not possible to go fast. In regard to the second offence, on October 17th, Sergeant Beacher said defendant covered the quarter of a mile in 41 secs., or 22 miles an hour. Defendant was fined 40s. and costs in each case.

In the case against J. Thomas, at Swansea, police-sergeant Hopkins said the car was going at eighteen miles an hour, but could not swear who was driving it. Defendant denied being the driver, and the magistrates dismissed the case.

At Cambridge Petty Sessions, Lionel de Rothschild, student, of Trinity College, was summoned for unlawfully driving a light locomotive, to wit, a motor-car, on the highway, at Trumpington, on October 12th, at a greater speed than was reasonable or proper, having regard to the traffic on the said highway. Police-constable Day stated that he was on the Trumpington road on Saturday, October 12th, at 2.15, with Sergeant Warren. He pointed out to witness a certain place where he stood and waited for motor-cars. Witness saw the defendant coming from the direction of Cambridge and driving his car at a very fast pace. Police-sergeant Warren, stationed at Chesterton, said, acting under the instructions of Superintendent Webb, he went to Trumpington, where he saw Police-constable Day. They compared watches, and at 2.15 p.m. witness placed him at a certain point in the village, and instructed him with regard to any motor-cars that might pass. Witness took up a position 600 yards away. At 2.51 the defendant passed witness at a rapid pace. Witness timed him exactly as he passed and found that defendant was driving at the rate of six hundred yards a minute. Twenty miles an hour in Trumpington was a dangerous speed. They had received a great number of complaints with regard to motor-cars. Defendant said he was the holder of a certificate of proficiency in motor-car driving in France. He could have stopped on the day in question before he reached any foot-passenger. Witness had never had an accident, and always stopped if he thought there was any danger. The Bench fined defendant £2 and costs.

IN the case against Mr. Claude Browne, police-constable Morris gave evidence that at 4.20 on October 16th defendant drove along Upperton Road towards the town at a furious rate—he should think quite twenty-four miles an hour. Defendant said it could not have been his car at all; he passed the spot earlier than was stated by the police, and he was not driving furiously. The Bench, however, considered the case proved, and imposed a fine of £2 and 12s. costs.

AT Norman Cross Police-court on Tuesday, J.W. Falmouth, who gave his address as the Automobile Club, Westminster, was summoned for driving a motor-car on the North road above the regulation speed. It was stated, however, that the defendant had given a name and address where he was unknown, and on the application of the police a warrant to arrest him was granted.

MEASURED DISTANCES.

A CORRESPONDENT kindly informs us that the police have a measured distance (200 yds.), in the Eltham Road, Lee, Kent, commencing from the Avenue towards the Weigall Road. It is the high road from

Lewisham to Eltham. A number of cars were stopped on Sunday last one old 6-h.p. Daimler standing charged with 30 miles an hour on its third speed.

In the furious driving case against H. Ward it transpired that the Epsom police have a measured furlong in the part of High Street commencing at the curve just after passing under the railway arch, near the Brighton Co.'s railway station.

Those taking part in the run to Oxford to-day (Saturday) would do well to note that the police have a measured quarter of a mile near Nuneham Courtenay.

MOTOR-CAR REPAIRS AT COVENTRY.

JUDGE INGHAM and a jury sat in Coventry County Court, on Tuesday, to hear the case brought by the Maudslay Motor Company against Mr. John Lindsay Scott, to recover the sum of £75 7s., for repairs to a motor-car belonging to defendant. The case did not go very far—not far enough to hear the defendant's version—but it was, briefly, that Mr. Scott, in the early part of this year, got into correspondence with Mr. Bamber about certain repairs needed to Mr. Scott's car. Mr. Maddocks, who appeared for the plaintiffs, said Mr. Scott set up two defences to the action (1) "I am liable to pay nothing, because I instructed Mr. Bamber to get the work done for me, and I am not the proper person to pay Messrs. Maudslay's account at all. (2) The price charged is too high for the work done." Mr. Bamber was, the solicitor said, a consulting engineer, and had no motor works of his own, as the note-heading he used clearly showed, and he was alleged to have stated that he should have to get the necessary work on Mr. Scott's car done by a firm. It was contended, for the plaintiff company, that Mr. Bamber had nothing to do with the account. The amount of the bill was £75 7s., including 5 per cent. commission to Mr. Bamber, and that, said the solicitor, would have to come off.

Mr. Maudslay and Mr. Bamber gave evidence, bearing out the agency of the latter. He said that having had a letter from Mr. Scott, he wrote to him, revealing his position as to the repairs. Mr. Wood called for a copy of this letter, saying his client knew nothing about it. Mr. Bamber said it was in his letter-book in London. The judge then said it was no good to go on with a case which would turn on the correspondence, and the correspondence not produced. There was no evidence of agency to go to the jury, and he therefore nonsuited the plaintiff company.

PETROL STORAGE.

At the Southwark Police Court on Tuesday, J. J. Fitzsimmons, of Westminster Bridge Road, S.E., appeared to two summonses for breaches of the Petroleum Acts. The defendant pleaded guilty. He said he was a bicycle and motor-car repairer, and the excessive quantity of petrol found on the premises had been drawn from a car which was under repair. Mr. Pidsley, who prosecuted on behalf of the County Council, pointed out that if the defendant was temporarily storing a quantity in excess of his licence, he should have given notice. Moreover, 30 lb. of india-rubber solution equivalent to 3½ gallons of explosive liquid, were found upon the premises. The defendant was fined £4 5s., including costs.

ACCIDENT AT SWANSEA.

At Swansea County Court, last week, Mrs. G. Mendellsohn, with her husband, of Swansea, brought an action against Mr. Pryce Trow, a motorist, for the recovery of £10 10s. damages for injuries, etc., through a collision on July 18th. Plaintiff said that on the day named she was proceeding towards Cwmdonkin Park, when defendant in his car, while turning into Walter Road, ran on to the footpath and collided with Mrs. Mendellsohn. Plaintiff had her dress torn, and sustained shock and injuries. The defence was that the machine on turning the corner struck a large stone, which caused the steering wheel to momentarily leave defendant's hand, and thus the car was brought on to the pavement. The car was going slowly, and there was no negligence. Judgment was given for plaintiff for £7 8s.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, NOVEMBER 15, 1902.

[No. 193.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WHEN we speak of "the Club" every motorist knows we refer to the institution in Whitehall Court, which held its annual dinner last week at the Trocadero Restaurant. As will be seen from the report on another page, the event was a repetition of former successes. The feature of the evening was the large number of members of Parliament present, the honours of the evening falling undoubtedly to Mr. T. P. O'Connor and Mr. Gibson Bowles. All the speakers recognised the absolute necessity of a change in the 1896 regulations, which have become antiquated hindrances to a promising industry, and when the time is ripe and opportune there should, with so many friends to automobilism in the ranks of members of Parliament, be no difficulty in getting a new Act, acceptable both to motorists and the general public, through the House of Commons.

The Oxford Run.

A NEW Act of some sort is much to be desired if only from the point of view of having an anniversary day in an earlier month than November, whose unsuitability for celebration tours has again proved itself. A year ago motorists enjoyed (?) a run through a dense fog as far as Staines; this year the way as far as Reading was made under climatic conditions of the most undesirable kind—blinding rain, the strong wind, and the sloshy roads almost making the most enthusiastic motorists wish for the comfort of the warm fire-side. About 230 cars entered for the run, of which 176 actually started. That 150 of these should have reached Reading is, under the circumstances, a matter of congratulation; indeed, so unkind were the elements, we should not have been surprised to have seen only half of this number at the biscuit town. While the motorists who continued the run showed a hardihood and enthusiasm worthy of all praise, we cannot blame those who, wet through almost to the skin, decided to retire from the tour.

November Too Late.

THE rain quickly converted the roads into lakes of mud, necessitating most careful driving to prevent side-slipping, and we are free to say that, with possibly one or two exceptions, no undue speeding was indulged in. So far as we can learn the only serious accident of the day was the collision between Mr. Atherley's car and a butcher's cart near Streatley, referred to elsewhere; the day was, however, full of minor incidents, the recounting of which, one to the other, made the dinner at Oxford a "noisy" event. While it cannot be denied that the tour was a great success, rain and mud notwithstanding, we feel that we are only voicing the opinion of the great majority of motorists when we say that November is too late in the year to hold anniversary runs, and that if we are to have another next year it should be held earlier, when the weather is more reliable.

Mud!

AFTER the experience of Saturday last the question of the proper encasing of the working parts of motor-cars again assumes importance. As regards the protection of ignition mechanism, driving chains, and gearing underneath the car a great many vehicles are lamentably deficient, and a run in weather such as was experienced on the journey to Oxford entails the covering of the whole of the vehicle, under and over, with mud, a considerable portion of which finds its way into the working parts. It should not be difficult to make the various moving parts of automobiles mud-proof, and the result would be not only a longer life, but a much sweeter and more economical running. Another point that may be mentioned as a result of Saturday's experience is that many makers have still much to learn in the way of providing suitable mudguards. Some of the American vehicles were minus guards of any kind, with the consequence that the passengers, not to speak of the cars, were a sight to behold. It was, however, not only the mud-guardless cars that carried mud-bespattered passengers; the same is true of many vehicles which were fitted with guards; hence our suggestion that more attention might be paid to the design and fitting of these necessary articles.

The Nottingham and District Automobile Club.

A REPRESENTATIVE gathering of this Club was to be seen at Hyde Park Corner on the occasion of the Anniversary run to Oxford, consisting of:—Mr. R. Millington Knowles, J.P., President, on his Serpollet, Mr. H. Belcher, on 12-h.p. Humber, who had as passengers Messrs. G. H. Kirk, W. Don Foster, and M. Ross Browne; Mr. Chas. Hardy on his new 12-h.p. Daimler, with whom were Mr. Lewis and Mr. P. Huskinson; Mr. Schwind and party on his famous and appropriately named Daimler "Redivivus." It is worthy of note that this car is one of the first turned out by the Daimler Company, and is still doing excellent work. At Oxford, Messrs. E. W. Wells and W. D. Wells, on Mr. E. W. Wells' 12-h.p. Daimler, joined the party, having driven from Nottingham via Coventry. To-night (Friday), a club smoking concert will be held at head-quarters, the "Black Boy" Hotel. During the evening the question of weekly runs through the winter will be discussed.

The Yorkshire Club's Anniversary.

THE most interesting run of the Y.A.C. of this year was held on Saturday last, picturesque Worksop being the venue. A start was made from Bradford at 3 p.m. amidst torrential rain. The actual meeting place of the various sections was at Red House on the Great North Road, about thirty miles from home, and at 4.30. After waiting for the laggards, the following cars started for Worksop via Doncaster and Tickhill:—Mr. Jackson and party, 28-h.p. Mercedes; Mr. Albert Farnell and party, 22-h.p. Daimler; Mr. Phoenix Jones and friends, 16-h.p. Panhard; Mr. A. W. Dougill (hon. sec.), 12-h.p. Loidis; Mr. Faiers and Mr. Broadbent, 11-h.p. Clement; and Mr. T. Cottage, 24-h.p. tricycle. Owing to the absence of signposts outside Tickhill, the usual errors of route were made in the darkness, and after traversing various by-roads and farmyards, experienc-

ing hair-breadth escapes from meres and ponds, the main road was gained and a speedy run to Worksop made. Owing to the greasy condition of the roads the tricycle entered one of the ponds, and was finally towed the remainder of the journey. The splendid accommodation of the Red Lion Hotel was taxed to its utmost, the stabling being full. An excellent dinner was presided over by the hon. treasurer, and after the usual loyal toasts, congratulating speeches were made as to the occasion of the run, and hopes were expressed that the present restrictions regarding speed would shortly be altered. Sunday morning was beautiful and bright, and after an interesting detour a start was made for the return journey at 11 a.m., and a delightful run was made back *via* Retford, Bawtrey, Pontefract and Leeds, Bradford being reached in the afternoon.

The Reading Automobile Club.

THE Reading Automobile Club held its annual dinner on Thursday last week, at the Queen's Hotel. The chair was occupied by the President (Dr. Truman). After the loyal toasts had been honoured, Mr. C. H. Dodd gave the toast of "Success to the Club." He expressed the hope that the members would

Another Surrey Resolution.

At the meeting of the Surrey County Council, at Kingston-on-Thames, on Tuesday, the chief-constable (Captain M. L. Sant) reported that owing to the rapid increase in the number of automobiles in the county the need of some means of identification had become a very pressing one. Sir William Vincent, Bart., moved "That in view of the widespread dissatisfaction with the provisions of the law as regards motor-cars, and of the difficulties attending its administration, this Council desires to urge upon the Government the importance of immediate attention thereto." The present state of the law, he said, cast an intolerable strain upon the police of the county, for there was scarcely a single motorist who used the roads of the county who paid the least regard to the law as to speed. They knew that motorists would never be content with such a low rate of speed as twelve miles an hour, and he thought they ought to meet them in some way or other. In France motorists were allowed to travel at 18½ miles an hour in open country roads, at 12½ miles in more populous places, but only at a walking pace in crowded and narrow thoroughfares. In this country a law to forbid a motorist driving to the common danger would, he thought, meet the

THE NANTWICH FIRE BRIGADE OFF TO A FIRE.

do all they could to enlarge the membership, there being plenty of people in Reading who took an interest in automobilism, who ought to be induced to join the Club and thus enhance its success. Mr. Paxton Petty, in response, remarked that for a young club they were doing exceedingly well. In time the Reading Automobile Club would perhaps attain to the position of being one of the leading provincial clubs in the kingdom. Mr. A. C. Major submitted "Our President," remarking upon Dr. Truman's thoroughness, enthusiasm and readiness to help in the cause of automobilism. The President, in acknowledgment, emphasised Mr. Petty's remarks respecting the social aspect of the Club. A good deal of correspondence had been going on lately respecting the formation of ladies' motoring clubs. He thought that in a few weeks' time a large and influential ladies' club would be started. Dr. Truman then proposed the health of the various officers. Mr. Major acknowledged the efforts of the Committee. Mr. Brigham, who also responded, spoke of the interest which attached to the Friday night meetings of the Club, when papers were read and discussions held, some of which were well worthy of a large audience. At present the Club had a membership of nearly seventy.

necessities of the case. But they ought also to have a means of identification such as a denoting number attached to every motor-car, with the number painted upon the lamp at night, and they ought also to have every driver properly certified. He urged that a strong representation to this effect should be laid before the Government. Major Kingsley Foster seconded the motion, which was carried.

Motor-Cars and Fire Brigades.

ON the occasion of a recent fire Mr. Henry Garner, of Nantwich, had an opportunity of demonstrating to the people of Nantwich and district the value of the motor-car in fire service. He had just come in from an eighty-mile run on his 1903-model Rex car when, five minutes after he had locked up the vehicle in his depot, the fire alarm sounded. Immediately he rushed off for the car and took the brigade of firemen, as depicted in the illustration, to the scene of the fire, six miles away, in seventeen minutes. Mr. Garner is the Cheshire and North Shropshire agent for these cars, and he tells us that the turnout proved a splendid advertisement, for he sold the identical car straight away, and has had a number of inquiries since. Being

a member of the Volunteer Fire Brigade he intends to put the cars to the same test on future occasions; his brother firemen seem to be looking forward to a similar experience, for these are, he adds, "the times when we are free from police restrictions."

Motor-Car and Electioneering Work.

DURING the recent municipal elections useful service was again rendered by motor-cars in several of the large provincial centres. At Bury St. Edmunds Mr. G. S. Cousins put his 6-h.p. Darracq to good use, the car being kept running continuously for over six hours. From Manchester, Mr. G. W. Ward sends us particulars of the work done in the Medlock Ward. He writes: "We started work at 8.30 a.m. bringing the voters to poll, myself driving the candidate's (Mr. W. B. Broadhead) 8-h.p. Progress, and Mr. Percy B. Broadhead driving a Darracq; we also had a big Daimler car. Others were promised, but, owing to the inclemency of the weather, they did not turn up. The morning was a trifle slow owing to the people not being home from work, but towards afternoon things began to be brisker, and the demand for the motor-car to take up the people became so great that we had to take as many as nine at a time in a car made to carry four. During the last three-quarters of an hour I myself took over a hundred people to the polling station. Notwithstanding the heavy loads we never had a breakdown of any kind, nor troubles with tyres. Had you been there to see the demand for rides and hear the remarks passed by those who rode, you would have been as delighted as we were at the good the cars did."

Inconsiderate Driving.

At the last meeting of the Executive Committee of the Automobile Club, Colonel Crompton drew attention to the fact that inconsiderate driving is on the increase, and that consequently the dislike for motor-cars is growing. He considered that unless inconsiderate and selfish driving be stopped the chances of securing the removal of the specific limit of speed will become more and more remote, and, on the contrary, automobilists would have to expect more severe restrictions than at present exist. Colonel Crompton stated that in his opinion the Club ought to do something to check the use of racing cars in this country, which are making the highways of the country almost unusable for other road users. He suggested that the Club should endeavour to identify the offenders, and, if they are members of the Club, to warn them that the continuance of that practice would end in their expulsion. A special committee, consisting of Sir John Thornycroft, Colonel Holden, Colonel Crompton, Mr. R. E. Phillips, Mr. Staplee Firth, Mr. Manville, and the Secretary, was appointed to consider what steps should be taken by the Club in this matter.

The impossibility of presenting one trophy to seventeen separate eligible competitors induced the Club to suggest to them that each be content with a gold medal and the honour of having his name inscribed on the cup, which would remain in possession of the Club itself. The suggestion met with ready acceptance, and that procedure will be followed.

Bells for Motor-Cars.

REALLY some of the motorists in Somerset will have to look to the worthy councillors of Yeovil, who have lately endeavoured to influence the rural and district councils of the country to reduce motor-cars to the level of steam trams and other antiquated and noisy means of conveyance. At the meeting of the Darlington Rural District Council a member moved a resolution—in terms suggested by the Yeovil Council—in favour of legislation prohibiting motor-cars from travelling at more than 10 miles per hour, or at more than 6 miles within 100 yards of a curve which cannot be seen round, and requiring a bell to be rung at 100 yards' distance from approaching animals or passengers. This was seconded and unanimously adopted. Elsewhere, at Steyning, Chesterton (Cambs.), Wirral (Chester)—to mention only a trio of prejudiced places—a similar resolution has been adopted, and it would seem that those who first suggested legislation are bringing a veritable avalanche upon motorists. It were far better to let well alone for a while—especially in view of the number of M.P.'s, County Councillors, Magistrates, and other leading men who are joining our ranks. As soon as they become a majority in public bodies the matter will right itself.

A LOCOMOBILE IN JAPAN.

Numbering Cars.

ANOTHER resolution passed by the Norfolk County Council is going the round of such bodies, and has received the endorsement of the Cambridge Council. It is to the following effect:—"That a petition be presented to the Local Government Board requesting them, either by legislation or otherwise, to secure, in the interest and for the protection of the public, that a registered number be so affixed on the back of every motor-car as to insure its identification in the event of any accident which may occur by reason of its improper use on the public highway." So that, what with bells and numbers, licences and other certificates, motorists will have to go forth on tours well armed.

In Scotland, too.

Now that the agitation has been revived in England, we are not surprised that it has extended over the Border, and the Lower Ward of the county of Lanark has confirmed the minutes of its Highway Committee urging the regulation of the speed of motor-cars, and compelling owners to affix distinctive numbers on their vehicles. Seeing that similar resolutions are

thus being adopted from one end of the country to the other, and that there seems an undesirable uniformity in the general view, it behoves motorists to be more than usually careful just now, not only with regard to their use of the road but also with regard to their public utterances. To label cars like hansoms, and to give them bells as though they were goats browsing on some mountain side, may appear advisable to some; but motorists will never tolerate such distinctions. They appear to be advocated for annoyance, certainly not for the protection of the public.

The Regulation of Air-Ships.

A GENERAL meeting of the Aeronautical Institute and Club was held on Friday last week, Dr. F. A. Barton presiding. Mr. O. C. Field, hon. secretary, read a paper on "Recent Disasters and the Factor of Safety." The chairman said the man who attempted to invent, make, and navigate an air-ship should have made many ascents in charge of an ordinary balloon, should be well equipped with a good knowledge of meteorology and of the general principles of motive power, as well as an ability to work out problems in the higher branches of mathematics, statics, and dynamics with absolute accuracy. Very few men had all the necessary qualifications. At the present time there were a very large number of people who were making or going to try flying machines. In the immediate future there would be a still larger number, and he foresaw the most appalling catastrophes unless something were done to prevent them, so far as was humanly possible. In the case of ships at sea various requirements of the Board of Trade had to be carried out.

Flying Certificates.

CONTINUING, Dr. Barton stated that the members of the Aero Club, the Aeronautical Society of Great Britain, and the Aeronautical Institute and Club would be asked to consider a scheme, of which the general outlines were that there should be constituted a central board of aerostation, which should have power to grant certificates to all aeronauts who had had sufficient experience and were able to take charge of an ordinary balloon, and to appoint a committee of experts who should examine every flying machine, navigable balloon, or air-ship before it left the ground. If every precaution had been taken the board would issue a certificate to the owner, who would then be empowered to send the machine up with a crew, provided that it had at least one certified aeronaut on board. If the board's certificate imposed certain limitations as to height and speed, and those conditions were infringed, thereby causing an accident, the owner would be liable to a criminal prosecution for neglect, refusal of examination also being penalized. If the experts reported that the machine was impracticable and was certain to come to grief, the board should notify the owner to that effect, and if he then attempted to make an ascent he would be treated like an ordinary homicidal or suicidal lunatic.

Motor-Car Imports and Exports.

THE returns now available relating to the British imports and exports of motor-cars and cycles during October last show an increase both as regards the imports and the exports. To deal first with the imports, 293 cars and cycles were imported into this country last month, the value of the same being returned at £92,320. The value of the "parts thereof" is given as £10,497, so that we get a combined total of £102,817, as compared with only £97,887 in September last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised twenty-one vehicles, amounting in value to £4,072, and £462 of parts, bringing down the net imports in October to £98,283. During the first nine months of the current year imports of foreign automobiles and parts into Great Britain have reached a net total of £901,114, representing over 3,200 cars and cycles. As regards the exports of automobiles of home

manufacture, the shipments during the past month amounted to thirty-eight vehicles of a value of £14,662. Of parts, the exports attained a value of £957, making a combined total for October of £15,619, as compared with £12,782 in September last. It is satisfactory to find that, so far as the year has gone—that is to say, during the ten months ending with October—282 British-built motor-cars and cycles have been exported, their value being roundly £123,000.

The 1903 Gordon Bennett Cup Race.

At the meeting of the Executive Committee of the A.C.G.B.I., on Monday, the question as to what action should be taken with reference to the selection of vehicles to represent the United Kingdom in the race for the Gordon Bennett Cup next year was considered. As a Napier car won the Cup, it was decided that one of the cars selected to defend it should be a Napier. As regards the other two defenders, it was agreed that constructors who desire to build vehicles for this race should be invited to send in their names not later than the 24th inst.

"Truth" and the Speed Question.

"TRUTH," in its current issue, deals very severely with the Yeovil proposal. In "Entre Nous" the editor remarks that, "now that every intelligent person recognises the absurdity and futility of the law restricting motor-cars to a maximum speed of twelve miles an hour, the Yeovil District Council have come forward with a proposal that the limit should be further reduced to ten miles an hour. They have asked District Councils throughout the country to support this egregious proposal, and some have eagerly done so, though the majority have declined to make such fools of themselves. While they were about it, these Yeovil yokels might as well have advocated a reversion to the old law requiring that a motor-car, like a traction engine, should be preceded by a man on foot carrying a red flag. There would be just as much likelihood of the adoption of this idea as there is of the success of the present movement for a ten-mile-an-hour limit of speed."

THERE is no alteration to report in the position of the petrol carriage question. One of the big suppliers, after the meeting last week, wrote asking the railway companies whether, pending the conference between them and the traders, they would carry petroleum spirit under the old terms. No reply having been received, the petrol distillers are still refusing to "ship" under the new consignment note.

AT their meeting last week, the Warwickshire County Council adopted a resolution in favour of levying additional excise duty upon motor-cars. The suggested increases are as follows:— (1) If the light locomotive unladen is less than 10 cwts., £1 1s.; (2) exceeding 10 cwts. but not exceeding 15 cwts., £1 11s. 6d.; (3) exceeding 15 cwts. but not exceeding two tons, £2 2s.; (4) two tons, £3 3s. These duties are proposed in addition to the fees for ordinary carriage licences but why motor-cars should be thus heavily taxed was not made clear at the meeting.

WE were sorry to notice that in the run to Oxford the new 10-h.p. Sandringham car, made by Mr. Frank Morris, of King's Lynn, met with a stroke of bad luck in Richmond Park, through a nut coming loose on the valve gear whilst climbing the hill. This car is interesting, inasmuch as the engine has cylinders and pistons identical with those he is now supplying to enable owners of old 6-h.p. Daimler type motors to attach them to their present base-chambers, and convert these useful old cars into 10-h.p. With the exception of the above slight stoppage the car ran through the tour without a single hitch, and on Sunday left Oxford at 10 a.m. for Lynn, which was reached at 8 p.m. the same night, the car having covered a distance of over 180 miles without a stoppage.

Anniversary Run to Oxford.

GENERAL VIEW OF OXFORD.

THE START.

AT the dinner at the Trocadero, on Friday evening last week, it was the subject of conversation that a number of cars had taken up their position at Grosvenor Place before seven o'clock that evening, ready for the run. Some doubt as to the accuracy of these rumours was expressed, and as a result, at midnight, several friends chartered a "four-wheeler" and drove to Hyde Park Corner, where sure enough the lights of a number of cars were seen. Mr. Johnson and several other members of the Club were on the spot, and it was soon perceived that the Baby Peugeot had secured premier honours; Mr. Lewin's 10-h.p. Peugeot was second; Mr. Friswell's "Dick," third; and then came Mr. Burford's Milnes "Silent"; Mr. Edge's 16-h.p. Napier "Australia"; Mr. Jarrott's 10-h.p. Napier, "Aaron"; a 12-h.p. Gladiator, an Oldsmobile, an 8-h.p. De Dion, a second De Dion, and a 10-h.p. Decauville. The rain was coming down pretty sharp and the prospect of spending a night in the "open" did not strike us as a very pleasant one. However, those in charge seemed happy and were contentedly eating their suppers.

Long before daybreak additional cars began to arrive, and at 9.20 a.m. we counted no less than 193 lined up at the starting point, the *queue* extending right down Grosvenor Place and round into Buckingham Palace Road; cars were still passing by with names on, and all around were numberless and nameless "cars" buzzing about, evidently having come to inspect the magnificent display. The opinion was somewhat freely expressed that the "tour" was a trade one, and disappointment was felt that there were not more privately owned vehicles present. However, be this as it may, the collection of cars was a very fine one, and the "anniversary" comes round once more to prove to the world that motorists are not "butterflies" and that, be the weather whatever it may, it will not deter users of cars from taking advantage of their favourite mode of travelling.

Never was such a variety of cars seen before, ranging as they did from a powerful 40-h.p. Mercedes down to the modest motor-bicycle. Pressure on our space this week prevents us giving

the full list of entries, but the appended table briefly gives the names of the varied types of vehicles.

The varied costumes of the motorists were a study in themselves—"umbrellas," fur coats, mackintoshes, and what not—and as the hour for departure approached engines were set in motion and the passengers made themselves as comfortable as possible,

ready for the run. The police arrangements at the start were of an excellent character, and punctually at 9.30 the "Sluggard," with Mr. C. Johnson, the Secretary of the A.C.G.B.I., headed off for Oxford. The scene at Hyde Park Corner for the next twenty minutes was one of great excitement. For some time after a number of cars lingered around the starting point, the lingering being probably due to the reluctance of their owners to start under such unpromising weather conditions, or perhaps, in a few cases, to a little temporary stupidity on the part of the cars themselves. No less than 176 vehicles bearing the name-cards issued by the Club were timed to have left Grosvenor Place at 10 a.m., this number comparing with 143 on the occasion of the run to Southsea a year ago.

AT READING.

At Reading the inhabitants had looked forward with great interest to the visit of the Automobile Club, on their anniversary run, and when in the morning it was seen that the weather would be unfavourable much disappointment was felt, as it was feared the strength of the muster would be impaired. The first car was expected about 12.30, and, notwithstanding the pouring rain, considerable crowds assembled to welcome the arrivals, some of those riding on vehicles innocent of mudguards causing

Most of the passengers on the cars were wet through, and very miserable and dirty some of them looked. After lunch the weather outlook was brighter. The sun shone, and, the inner man satisfied, pipes, etc., were lighted, and then began the "yarns"; several had experienced "side-slips," caused either by the grease or the swerving of cars in front. However, no real mishaps had happened, although several motorists had suffered from punctures, the causes being anything from a tin-tack to a four-inch nail.

Punctually at two o'clock a fresh start was made, and with promptitude and despatch the cars were sent on the last stage of the journey. At three o'clock there were still a number in the Station yard—in fact, some were still coming in—but as the proceedings had become desultory, we abandoned the scene and resumed our daily avocations.

BRAVING THE ELEMENTS.

BY PHANOMEN.

"THE Tour will take place irrespectively of weather."—So ran the head-line of the official programme of the anniversary run to Oxford, and, as events proved, it did take place "irrespectively of weather." In fact, for those who took part in the run on Saturday last there was altogether too much weather, or at least too much wet. The name of the car

Photo by]

THE CARS AT HYDE PARK CORNER.

[Argent Archer.

great hilarity at their mud-bespattered appearance. The police arrangements in the town were eminently satisfactory, and when at 12.15 "Aaron" (Messrs. Jarrott and Napier) arrived, with the name of their car almost undecipherable, a way was soon cleared and the car driven to its position, standing in the order in which it was to leave; "Australia" (Mr. and Mrs. Edge and Earl Russell) advanced next, while the third car was a 16-h.p. De Dietrich, said to be owned by Mr. Jarrott, but having only a *mecanicien* on board; then came "Old Blue," Mr. Lewin; "Dick," Mr. Friswell; "Corona," Mr. Abrahams; a Gardner-Serpollet, "Steadfast," Mr. Dew; "Silent," Mr. Burford; "Egalite," Mr. Moffat Ford; "Soupape," Mr. Overton; "Viking," a Gladiator; "Split Pin," Mr. Roger Fuller; "Achilles," Mr. W. Munn; "Cautious," Mr. Cappellen; "Albany," a Locomobile; "Attractive," Mr. W. Glass; "Chelmsford," Mr. Clarkson; "Hermes," Mr. E. Richardson; "Aboras," Mr. Stocks; "Waif," Mr. Maudslay Brooke; "Freedom," "Ripple," Mr. Staplee Firth; "Rustler," Mr. F. W. Leith; "Certiorari," Mr. E. de Wilton; "L'Orvet," Mr. A. F. Mulliner; "Safe," "Tourist," Mr. G. Iden; "Namur," Mr. F. M. Oppermann; etc., etc.

Ample accommodation had been provided at the various and excellent hotels, and there was ample time for due justice to be done to the good things provided. The cars were drawn up in the Great Western Railway Station yard, and it is no exaggeration to say they were standing in a sea of mud.

which was to convey us to the University City inspired confidence—a confidence, which as events showed, was not misplaced. We formed one of the passengers on the 12-h.p. M.M.C. driven by Mr. A. Burgess, and which for the nonce was given the name "British." Picking up the car at Holborn Viaduct, we were somewhat late in arriving at Grosvenor Place, so that we found ourselves at the Victoria Station end of the long line of cars. With unfavourable meteorological forecasts, and a threatening sky, we had prepared for rain, but certainly not for the deluge which vented its fury upon us. Gradually we worked our way up Grosvenor Place, preceded by Mr. Rhind-Tutt's 6-h.p. Hurst and Lloyd "Philo," and followed by the 12-h.p. Dennis "Albatross." As we neared the official starter, camera after camera was focussed upon us, but finally, at about 9.45 a.m., we were off, heading our way through the crowded traffic for Twickenham. Ere Hammersmith was reached the rain began to descend, and the further we got, the worse it pelted. Across Barnes Common, along Priory Lane and into Richmond Park we went, and here the full force of the storm was experienced, and what with the rain and the wind, the lot of the enthusiastic motorist was not a happy one. Careful driving was necessary down Richmond Hill, the rain having made the roads "tricky," but this and the sharp turn over the bridge were safely negotiated. Richmond, favourite spot as it is, had no charms on Saturday—the question of the moment being how to keep out the

wet. Twickenham and its Green next came into sight, and once again the timekeepers did their duty in notifying the time allowance to Staines (9 miles). Our rate of progression was not fast, but at least it was sure, which could not be said of the four or five cars we had seen pulled up on the roadside. On the way

a non-stop run. It was a sodden-looking party which partook of lunch at the Great Western Hotel. No one seemed in any great hurry to restart, and we took advantage of the luncheon hour to hand our great-coats over to the kind attentions of "boots," who got them dried in the kitchen.

MESSRS. JARROITT AND NAPIER ON THE NEW 10-H.P. NAPIER CAR.

Photo by]

[Argent Archer.

to Staines we passed Mr. Richardson on his 12-h.p. Daimler, with which he had been unsuccessfully trying to demolish a small bridge, owing to the sudden slowing up of a couple of cars in front; fortunately the impact was skilfully fended by the driver, and only a crumpled mudguard resulted.

The rain still came down pitilessly, and while wet and "clammy" ourselves, we thanked our stars we were not in the plight of the luckless wights on a light American runabout, minus mudguards, who were literally covered with mud from head to toe. As we passed through Staines, it was clear that several had given up all idea of non-stop certificates, and had decided to retire—not hurt, but dripping wet. Without stopping, a poll was rapidly taken as to whether "British" and its party should follow suit, but, wet as she was, our lady passenger showed an enthusiasm for motoring that encouraged us to proceed. The run from Egham Hill down to Virginia Water is, on a fine day, one we always enjoy, but, varied as were the autumn tints of the leaves, they had, on Saturday, no attraction for us. Indeed, we began to abhor them after the wind had kindly, or unkindly, blown a few of the wettest into our faces. Ascot, where the horsey element was very strong, and Bracknell were passed, and still the rain came down. Wet as we were and, consequently, in anything but an agreeable frame of mind, we could not help smiling at the Wokingham tradesman who had hung out a sign-board, "Motorists beware," below which was hanging a policeman's helmet. The next stage of seven miles was safely negotiated, and at 1.12 p.m. we pulled up in the Station Yard at Reading, after

A considerable improvement having taken place in the weather, and lunch having revived the spirits of our party, the restart was made under more favourable auspices. Our time at the Reading outward control was 2.48 p.m., and following close on the heels of "Waddler," Mr. M. H. Buckea's 10-h.p. M.M.C., we ran through Tilehurst and Purley. At Pangbourne the beautiful scenery of the upper Thames began to reveal itself, the river bearing us company as far as Shillingford Bridge. As we reached Basildon a stir of excitement among the inhabitants, all making their way in one direction, led us to suspect an accident, which unfortunately proved to be true, for as we neared Streatley we found the cart of a Wallingford butcher smashed up, and a wounded horse lying on the roadside. We learned afterwards that the cart was driven as to lay right across the road just as Mr. F. Atherley's 15-h.p. Pipe car was coming towards it. Although the motorist did all in his power to avoid a catastrophe, the car struck the horse, and so injured it that it had to be shot. The damage to the car was not so serious, but the owner withdrew from the run.

Moulsford, with its inn bearing the curious name of "The Beetle and Wedge," said to be derived from the implements used by stone-masons, and with its fourteenth-century church, gave way to Wallingford, another old, interesting place of historical renown. The many branches of trees strewn on the road bore

MR. W. GLASS ON THE 12-H.P. "FIREFLY."

evidence to the severity of the storm of the morning, but, fortunately, the mid-day improvement was maintained, enabling the last stages of the run to be made in comparative comfort. Crossing the river once more at Shillingford Bridge, we entered the county of Oxford and were soon in Dorchester, a straggling village, having

no interest nowadays beyond its church. Ere reaching Nuneham Courtenay a kindly-intentioned cyclist earned the thanks of all motorists by giving a warning by means of a notice board of a "police trap." We kept a sharp look-out, but, as we were almost an hour behind the leading cars, ne'er a policeman in uniform or in plain clothes did we see. Others, however, had not been so fortunate. A few minutes later we were at Rosehill, the last control, where our time was entered as 4.25 p.m., our driver being well pleased at having earned a non-stop certificate.

A SNAPSHOT EN ROUTE.

Little remains to be said of the run. Slowly we made our way through the crowded streets of Oxford, the townsfolk having turned out *en masse* to give us a right royal welcome. A little delay ensued in getting the cars into the large tents on Gloucester Green, which formed the garage, but eventually "British" was safely in position after its muddy seventy-mile journey. As already mentioned, we qualified for a non-stop certificate, which is evidence of the good behaviour of our engine and of the fact that the puncture demon for once did not favour us with his presence.

THE LOG OF "LE PETIT BLEU."

BY AJAX.

THE Meteorological Office, or whoever is responsible for our daily "weather," must be composed of gentlemen imbued with a strong antipathy to the automobile movement. Every succeeding year, upon the day chosen for the anniversary run, the climatic conditions appear to grow worse. So we were not at all surprised on the way to the "meet" last Saturday morning to read that we were to expect "gusty south-westerly to north-westerly winds, rain at times, etc., etc." It had rained considerably during the previous night, making the roads in a very wet and sloppy condition, but about eight o'clock things looked more promising, and we began to congratulate ourselves that once again the "prophets" were at fault. But, alas, they proved only too correct! Soon after we started at 9.30 the rain commenced, and by the time we reached Richmond Park it was blowing a gale. The driving rain was interspersed with hail, which made spiteful "digs" at one's features.

Under these trying conditions we considered ourselves fortunate in having a seat placed at our disposal by Mr. F. M. C. Instone, on his 22-h.p. Daimler, known for that day

only as "Le Petit Bleu." At various stages of the journey we passed some less fortunate than ourselves, stopping temporarily, the trouble generally being "electrical," caused by the excessive damp. "Le Petit Bleu" went through the whole run without any hitch or trouble whatever, under the skilful direction of its experienced driver.

Notwithstanding the threatening appearance of the sky there was quite a large crowd to see the cars start from Hyde Park Corner. Hammersmith Bridge was reached at 10.5, and the first official stop was made at Twickenham Green. We were particularly struck by the interest displayed by the general public along the whole of the route. Even in Richmond Park, where there was comparatively little shelter from the elements, numbers of cyclists and others, some of them ladies, were to be seen watching the long procession of cars. One lady we observed on the pavement at Richmond checking off the cars from the list given in the *Journal*, apparently quite oblivious of the fact that it was raining fast!

For some considerable distance the police appeared most friendly, and we had almost forgotten that such abominations as "traps" and "measured distances" had been invented. But, passing through Wokingham, we found a notice fixed on a string across the street advising, "Motorists, Beware of the Police." Underneath was hung, not a policeman but a helmet, which it may be presumed at one time adorned the head of a member of the force. Just before reaching Reading, the rain suddenly stopped, the clouds drifted quickly away, patches of blue sky began to appear, and lo! the sun was with us. It was a pleasant and agreeable sight after the experience of the previous three hours or so. The Great Western Hotel at Reading was reached at 12.50, where we stopped for lunch, to which most of us did full justice. It was amusing to hear a man draw the attention of his neighbour to the shocking state of his collar, and then to find that his own was just as bad! Never, we should imagine, was such an array of dilapidated monstrosities in the way of collars seen at an hotel luncheon—soft and squashy, and all colours of the rainbow, from contact with wet overcoats and mackintoshes.

A start was made soon after two o'clock to complete the day's journey. The streets of Reading were crowded by an

MR. W. B. KELLY'S 8-H.P. M.M.C. VOITURETTE WHICH MADE A NON-STOP RUN.

excited populace to whom the sight of so many cars at one time was apparently a novelty; quite as interesting, if not more so, than a travelling circus. The route from Reading to Oxford, via Pangbourne, Streatley, Wallingford, and Shillingford, is a lovely stretch of country. Occasional views of the river gave variety to the landscape, and in places where the trees still retained

their leaves the various autumnal tints were perfectly delightful. But, before long, our artistic studies were brought to an abrupt conclusion, and we were once more face to face with the stern realities of life. Near Dorchester, on a quiet and unfrequented part of the road, we observed in the distance two gentlemen cyclists dismounted. One of them held up to our view a notice containing only the two ominous words, "Police trap!" As we went slowly by, he kindly informed us that a little further along the road a measured distance had been prepared. Of course we

AT OXFORD.

OXONIANS boldly faced the slush and dirt, and patiently awaited the coming of the motor-cars. The fair sex were in the majority, but the mere males also made a brave show. The streets were lined with spectators, and the police so regulated the traffic that the procession was not interfered with—thus there was practically no break from the moment the cars left Rosehill. The hands of the clock had turned half-past four ere the first car passed—bearing the Israelitish name of "Aaron";

THE CARS IN THE STATION YARD AT READING.

[Argent Archer.

all thanked him for his trouble, and left him there to continue his kindly offices to others in the rear. We went slowly for some way, and there sure enough were two men in a gateway, and not far off a constable in uniform.

Soon after this incident occurred, and when about seven miles from Oxford, a gentleman in a dog-cart told us that the police were in hiding, and asked if someone would find room for him in one of the cars. Mr. Weigel gave him a seat, and he accompanied us to the "control" outside Oxford. Some con-

then came Mr. Moffatt Ford on a Decauville; Messrs. Edge, Friswell, Lewin, Burford, Overton, and others, in the order named. Some drew up at the hotels, depositing passengers and luggage, while others drove straight for the tents, coachhouses, or where else accommodation had been arranged. By far the largest number made for the tents, where more than one hundred and fifty cars were "housed" for the night, and we should like to "voice" the general opinion that the Oxford Automobile Agency, who were responsible for the arrangements, are to be congratulated

'I'VE GOT YOU.'

siderable delay was experienced at the last "control" waiting for the cars to assemble, and also to place them so that other traffic was not dislocated. We entered the city in procession at about ten minutes before five, the road being lined on either side by some thousands of interested citizens. We found that excellent "garage" accommodation had been prepared, large tents having been specially erected for the purpose. After seeing the car, which had carried us so well, safely housed, we made our way to the Clarendon to remove the stains of the plentiful supply of mud encountered on the run.

MR. R. E. PHILLIPS ON HIS NON-STOP 8 H.P. ROCHET SCHNEIDER.

upon their efficiency. No expense had been spared, not only in providing ample temporary storage tents, but these were provided with electric lighting and a plentiful water supply. There was no trouble either as regards petroleum spirit, for Mr. F. G. Barton, the manager of the Oxford Automobile Agency, had provided for all emergencies by having 10 tons of spirit conveyed by road from London to Oxford by means of a traction engine and three large furniture vans.

Besides the cars which bore legends, many came by Dashwood Hill and from other directions, while a strong contingent

journeyed from the Midlands. Cars continued to arrive all the evening, and by midnight it is computed there were not less than three hundred vehicles safely stabled in the good city of Oxford.

BIRMINGHAM TO OXFORD.

As stated in our last issue, the Midland Automobile Club decided to support the anniversary meeting at Oxford. A start was made from Birmingham at about 1.30 p.m., about ten cars braving the elements. The route followed was via Stratford-on-Avon and Banbury, and notwithstanding the rain practically all made non-stop runs. Among those who took part in the tour were Mr. Siddeley on the new Siddeley car, Messrs. H. Austin, Crowdy, A. Remington, Iliffe, and Duffin on Wolseleys, and Messrs. F. Lanchester, Millership, J. S. Taylor, and J. V. Pugh on Lanchesters.

THE SCENE AT ROSE HILL, NEAR OXFORD.

[Hill & Saunders.

AFTER THE RUN.

After the day's run an enjoyable reunion was held at the Clarendon Hotel, Oxford, Mr. Frank H. Butler presiding over the dinner. The company numbered 265, and was representative of every section of automobilism, including a large number of ladies, who, notwithstanding the shocking weather, had stuck to their cars in a way worthy of all praise.

After the repast the Chairman proposed the toasts of "The King," and "The Queen and the Royal Family." He referred to the deluge through which the motorists had passed, but which did not prevent the majority from making the journey. He announced that of the 176 cars which left London in the morning, no less than 148 had "reported" in Oxford by 7.45 p.m., the bulk of the absentees having given up the trip at Reading owing to the gale. Mr. Butler added that a number of telegrams and letters had been received, but contented himself by reading a telegram of greeting from the members of the Scottish Automobile Club, who that day had held their celebration at Luss, on the banks of Loch Lomond, and in which fifty-seven cars and 150 motorists had taken part.

The Royal toasts being duly honoured, Mr. E. Manville proposed "Success to Automobilism." He referred to the increased reliability of motor-cars, and considered the present speed regulations irksome. There was no harm in motor-cars running

at high speed on straight country roads, but he urged all motorists to have consideration for the other users of highways. He hoped that the run to Oxford would be the last in celebration of the 1896 Act, and that ere another year had gone by we should be celebrating the passing of a new Act.

Mr. R. J. Meeredy responded in a humorous speech, taking for his main point the question of running the 1903 Gordon Bennett Cup race in Ireland. He had suggested a circular route, sixty-two miles long, which the A.C.G.B.I. were sending a committee to inspect. He hoped it could be arranged to hold the race in Ireland, as it would encourage touring in that country. Ireland had both good and bad roads, but it was a fortunate coincidence that the good roads were amongst the most beautiful scenery. He was certain that motorists would receive a hearty welcome in the Green Isle.

Mr. Staplee Firth acquitted himself well in proposing the

toast of "The Ladies." After speaking a few minutes in a light vein, he came to the serious, and characterised the trapping of motorists by the police as disgraceful. At the same time, he, like Mr. Manville, urged motorists not to forget that others have an equal right to the road.

Mr. E. Shrapnell Smith responded for the ladies, and caused some amusement by speaking of "we ladies." On one or two occasions, however, he found it politic to become a mere man.

The Chairman next proposed "The Visitors," to which Superintendent Cole, the Chief Constable of Oxford, responded. He instantly met with a cheer by announcing that he had never had a measured quarter-mile. He had had a few rides on motor-cars which had made him acquainted with the great control motorists have over their vehicles. He pointed out, however, that the general public has, as yet, not got this knowledge, and urged automobilists to exercise more care and travel at a slackened speed when passing through towns and villages.

The health of the Chairman having been honoured, Mr. T. B. Browne gave the toast of "The Secretary," to whose energy in organisation the Club owed so much. The toast was drunk with great heartiness, but when called upon to respond Mr. Johnson was not to be found. And then, breaking up into small groups for petrol talk, the party gradually separated in good spirits, much satisfied with the results of the day's adventures, notwithstanding the pitiless rain and mud of the morning.

RESULTS OF THE RUN.

THE following applications for non-stop certificates have been received. Objections to them should be in the hands of the Club Secretary not later than Tuesday, November 18th, at noon. Other applications have been received, but in some cases the applicants have failed to have the times filled

SOME USEFUL NOTES.

IN changing speeds it is not necessary to completely depress the clutch pedal when coming from high to low; in fact, it will generally be found that a tap, just to release the strain on the gear wheels, is all that is required.

USERS of De Dion and De Dion type cars should notice that the trembler will usually require re-setting if accumulators are used in place of the dry batteries supplied with the car. If continual misfiring occurs after this change, couple up three of Peto and Radford's two-volt accumulators; the misfiring will then cease.

IF a steep hill is met with, and it is not known to the driver of the car, it is far better to start straight away from the bottom on the slow speed and go up slowly but surely.

IN a perfectly new car watch the nuts on the bolts that hold the back sprockets on to the wheels. These are liable to work loose, and should at once be tightened up.

NEVER leave a car with the engine running with only the hand-brake on (disengaging the clutch), the gear being in. A great many accidents have occurred in this way.

Do not leave a car with the clutch out when it is being

Photos by]

SCENES IN THE TEMPORARY GARAGES AT OXFORD.

[Argent Archer.

NEVER pour in petrol without a strainer; it may be done a hundred times without any harm resulting, but on the hundred and first occasion the carburettor may get choked, and if this takes place at night, the experience is not amusing.

IF the wheels of the timing gear of a car are not marked, mark them before taking them down, or there may be trouble about replacing them correctly. The exhaust valve should commence to open just before the end of the firing stroke, and should close exactly when the piston is at the top, previous to the suction stroke.

ALWAYS keep the hand-brake well adjusted, so that it may readily stop the car in an emergency. A foot-brake may often fail, or a chain may come off, and the hand-brake then is the only serviceable one.

washed, as the effect of water upon the leather of the clutch is detrimental.

ALWAYS turn off the petrol tap when the car is stopped, even if for a short time. Most carburettors flood, and consequently there may be some difficulty in re-starting the engine.

GREASE alone is not sufficient in a gear-box; heavy oil must be mixed with it, bringing the whole to the consistency of treacle.

THE question of lubrication of a new engine is very important. Be careful to set the lubricators to drip twice as fast as in a car of some eight or ten months' running.

LUBRICATION.

IN connection with the article on this subject by Mr. Buttemer in a recent issue, the following remarks by Mr. A. L. Clough in "The Horseless Age," on the same topic, are not without interest. The constant aim in the design of an automobile is, considers Mr. Clough, to secure, as nearly as possible, absolute positiveness of operation of each part, together with the maximum of convenience. Uncertain and variable agencies should be trusted to as little as practicable. This is true of that important function—lubrication. Winter operation is sure to bring to the mind of every user of a motor-car this important subject and to accentuate the ordinary difficulties of oiling.

It would appear that in order to secure the necessary positiveness in lubrication the gravity feed must be largely discarded and the mechanically forced feed system generally adopted. The fact that lubricating oils have a different degree of viscosity for every change of temperature must generally put an end to the uses of the gravity feed system, where regular results are demanded. As everyone knows, with the gravity feed, if one starts his vehicle

of [the viscous condition of the lubricant. The lubrication commences with the starting of the engine and ceases when it is shut down; thus there is nothing to be turned on or off. The amount of lubricant pumped is proportional to the engine speed. There is no danger of a loss of oil through forgetting to close feeds when stopping, and no likelihood of cut cylinders or hot bearings by failure to open oil feeds when starting up. There is only one reservoir of ample size to be filled, and, if the quality of oil be judiciously chosen, it will serve in both the cylinders and bearings. Oiling by gravity is dependent upon the weather, and requires watching. Lubrication by pump is independent of conditions and automatic.

One matter connected with the subject of lubrication which demands attention is the disposal of spent oil. Now, it is generally allowed to drip disagreeably on the road, as it runs out of crank case and bearings. This is nasty and wasteful. If your friend calls upon you with his vehicle he leaves a slippery visiting card in the shape of a puddle of oil on the asphalt, which results in an unsightly and permanent spot. Lubricating oil is expensive and good practice does not tolerate its waste. Used oil, after being

THE GRAND DUKE FRIEDRICH OF AUSTRIA TAKES PART IN THE TRIALS OF A DAIMLER HEAVY VEHICLE BY THE AUSTRIAN MILITARY AUTHORITIES.

[Allgemeine Automobil Zeitung.

cold or leaves it standing long in the winter, it is necessary to open the cups widely to secure any oil at all, with the result that everything becomes flooded after the mechanism becomes warmed up. The necessity of constantly tinkering with a multiplicity of oil cups, to regulate or demonstrate their feed, and then putting one's hands through a course of treatment with waste and a little petrol from the carburettor, has set many a spectator's mind against the motor-car. In some cases three or four separate cups of not too liberal size have to be filled before each run, and turned on and off every time the machine is stopped or started. These cups are too often located in ingeniously inaccessible places.

A forced feed lubricator consists simply of an oil pump mechanism, operated by a very slow motion derived from some moving part of the engine, drawing oil from a single large reservoir and forcing it through adjustable feeds to all parts of the mechanism requiring lubrication. By the use of such a lubricator the following advantages may be attained: A pre-determined volume of oil is positively pumped to each desired point, irrespective

filtered, is about as good as ever, and it is not visionary to hope that machines may soon be constructed with crank case overflow and bearings, piped to a common spent oil reservoir, from which the lubricant may be drawn occasionally and emptied into the oil filter in the *garage*, from which it may be again obtained in a clean condition.

OSMONT is leaving his old love—the De Dion motor-tricycle—in favour of the Darracq light car, which he will drive during the 1903 racing season.

ONLY one electric car participated in the run to Oxford, viz., the new Victoria of the Electromobile Company, Limited. Owing to the expense of charging at Reading and the courtesy of the Edmundson's Corporation men at High Wycombe, the direct route to Oxford was followed. Although the roads were very heavy the car proved itself quite equal to the ascent of Dashwood Hill.

THE SCOTTISH AUTOMOBILE CLUB.

THE members of the Western Section of the Scottish Automobile Club held their commemoration run to Luss, on the shores of Loch Lomond, on Saturday last. The meet was the concluding one of the season, and, notwithstanding the unpropitious weather, a record turnout of members and cars was achieved. The run to Luss is one of the finest in Scotland, the motorist being brought to the brink of the majestic scenery of Loch Lomond in little over an hour's run from Glasgow, the distance being 27½ miles. The morning opened beautiful and clear, a blue sky and a soft wind being more suggestive of an early day in June than the time of drear November. Everything favoured a large turnout, and if the estimate of a century was not fulfilled, the splendid muster of fifty-seven cars falls to be chronicled—a record gathering for Scotland.

Unfortunately, as the cars were assembling beneath the shadow of the Municipal Buildings, in Glasgow, the weather showed signs of breaking down. It was rather disappointing that just as everybody had primed themselves with the prospect of a day brimful of pleasure, the clouds should gather and

MR. JOHN ADAM, CHAIRMAN OF THE WESTERN SECTION OF THE SCOTTISH AUTOMOBILE CLUB, ON HIS "ALBION" CAR.

the rain come down. However, they made the best of it. The cars had all gathered at one o'clock, and the large assemblage naturally attracted a great crowd of the general public. The arrangements provided that cars should proceed in file through the leading streets *en route* to the Great Western Road. The president led the procession and no passing was permitted until the municipal boundary, when routes were optional. Mr. Adam gave the signal at one p.m. and the cars moved off, rain, as mentioned above, just beginning to fall.

Once outside of Glasgow the route lay by Yoker and Dalmuir. Here the river Clyde was struck and the party ran along its banks until after leaving Bowling. Through Alexandria way was made to Bullock and down a steep gradient and on to the shores of lovely Loch Lomond. Luss itself lies some seven miles up the Loch, and through the majestic scenery the motorists had a glorious run. The roads here were not quite so heavy as in the country near Glasgow, and a good speed was obtained.

The company all reached Luss safely a little after three, and on the invitation of Mr. William H. Kingsbury partook of tea

in the Colquhoun Arms Hotel, over one hundred and fifty members and friends enjoying the hospitality. At an interval Mr. John Adam, the president of the Western Section, after referring to the unavoidable absence of the president of the Scottish Automobile Club, Lord Kingsburgh, said it was pleasing to note the enthusiasm with which automobilism was being taken up in the West of Scotland. Their run that day was a record one, fifty-seven cars taking part as against twenty-three last year. He echoed the words of Lord Kingsburgh, "Go as fast as you can when there is no policeman about, but be cautious."

Mr. Smith, the honorary secretary, read a telegram from the parent Automobile Club, despatched from Reading, as follows:—"The members of the Automobile Club send hearty greetings to colleagues in Western Section of the Scottish Automobile Club. Journey here in pouring rain, but bright sunshine now."

Mr. Smith despatched to the London Club the following reply:—"One hundred and fifty members and friends of the Western Section of the Scottish Automobile Club at anniversary run, and now assembled on fifty-seven cars at Luss, on the banks of Loch Lomond, send greetings."

The light being very bad and the weather so threatening, the return journey was entered upon with as little delay as possible, and Glasgow in many cases was reached about six o'clock, no mishaps being chronicled.

The following cars were present:—

	h.p.	Car.
Mr. John Adam (President)	8	Albion.
Mr. Alexander	10	Arrol-Johnson.
Mr. Angus (Ochiltree)	12	Arrol-Johnson.
Mr. J. F. Bradford	—	Motor-Cycle.
Mr. N. P. Brown	—	Albion.
Mr. George Coats (Glen-Tana)	12	Arrol-Johnson.
Mr. Arch. Coats (Battleby)	12	Arrol-Johnson.
Mr. Walter Creber	—	Albion.
Mr. J. W. W. Drysdale	—	Albion.
Mr. P. Drummond	—	Tricycle.
Mr. A. J. Dixon	7½	Wolseley.
Mr. C. M. Farrow	—	Clement-Panhard.
Mr. J. J. Forgie	5	Wolseley.
Mr. Walter Graham	8	Albion.
Mr. Alex. Govan	—	Argyll.
Mr. G. Guest	—	Darracq.
Mr. Mather Gemmell	—	Clement.
Mr. W. Holms-Kerr	6	Daimler.
Mr. Laurence Harrison	—	R. and P. Progress.
Mr. Geo. Johnston	—	Johnston-Arrol.
Mr. David Johnston	8	Albion.
Mr. J. A. Johnston	12	Stirling.
Mr. L. Knoblauch (Leith)	12	Arrol-Johnson.
Mr. Wm. H. Kingsbury and Mr. R. J. Smith	12	Panhard.
Mr. Hugh Kennedy	9	Progress.
Mr. L. R. Lamont	—	Albion.
Mr. John Millar (Paisley)	10	Arrol-Johnson.
Mr. Miller (Renfrew)	10	Arrol-Johnson.
Mr. Menzies	12	Arrol-Johnson.
Mr. Murray (Galashiels)	12	Arrol-Johnson.
Mr. W. McLean	—	Clement.
Mr. John McLean	—	De Dion.
Mr. Napier (Denny)	12	Arrol-Johnson.
Mr. Henry Napier	4½	De Dion.
Mr. George Owen	9	Progress.
Mr. H. Prosser	7½	Wolseley.
Mr. H. Prosser	8	Clement.
Mr. Andrew Pearson	—	Stirling.
Mr. John A. Peacock	—	Peugeot.
Mr. Thomas Potter	—	Albion.
Mr. A. G. Rennie	—	Clement.
Mr. H. Reid	6	Gardner-Serpollet.
Mr. J. M. Ross	—	Albion.
Mr. A. T. Reid	—	Locomobile.
Mr. Thomas Symington	12	Arrol-Johnson.
Mr. W. B. Sayers (Milngavie)	10	Arrol-Johnson.
Mr. John Shaughnessy	—	De-Dion.
Mr. A. W. Steven	—	Argyll.
Mr. A. Sharp	—	Panhard.
Mr. L. C. Seligmann	7½	Wolseley.
Mr. E. J. Thomson	—	Stirling.
Mr. J. Watt-Torrance	—	Albion.
Mr. W. A. Verel	—	Albion.
Mr. R. A. Whytland, junr.	—	Arrol-Johnson.
Mr. Wm. Weir	10	Wolseley.
Mr. T. Nilson	12	Arrol-Johnson.

MOTOR-CYCLING NEWS.

A GOOD show of motor-cycles of all types was made in the anniversary run to Oxford. Amongst the bicycles were several Excelsiors, Ormondes, F.N., Rex, Mitchell, Phoenix, Singer, Westfield, and Morris. Amongst tricycles there were a Dennis, a Singer tandem tricycle, several De Dions, a Rochet, a Phoenix Trimco with Van Hooydonk at the helm, a De Dion quod, two Century tandems, a couple of tandem motor-bicycles, and a Minerva motor-bicycle and trailer. Amongst the early arrivals at Reading were the

MR. A. C. WRIGHT ON HIS ORMONDE, READY FOR THE RUN TO OXFORD.

Singer tandem tricycle, driven by Mr. E. B. Palmer; the "Oxford," Mr. Adams's Ormonde; the "Tempter," Mr. Martin's Excelsior; the "Spy" Mr. D'Esterre's Ormonde; the "Anglo-Saxon" Mr. Barnes's Mitchell, and others. So far as we can learn the machines all got through to Oxford safely, although Mr. Adams had a nasty side-slip on entering the University city. We were, in the hurry and scurry at the *garages* in Oxford, unable to get a full list of the motor-cycle arrivals, but up to 6 p.m. on Saturday evening the following had arrived:—Mr. D'Esterre (Ormonde), Mr. A. C. Wright (Ormonde), Mr. H. Martin (Excelsior), Mr. G. A. Barnes (Mitchell), Mr. E. B. Palmer (Singer tandem tricycle), Mr. E. R. Lowe (Excelsior), Mr. J. Adams (Ormonde), Mr. J. Van Hooydonk (Phoenix), and Mr. W. R. Morris (Morris). As we go to press we learn that all the three Ormondes went through successfully, making non-stop runs, which speaks well for the consistent behaviour of these machines.

THE Clyde motor-bicycle for 1903 will, we understand, have 2½ h.p. engines as standard. The Clyde Cycle and Motor-Car Company, Limited, of Leicester, will, however, supply a 2-h.p. motor if required. The 2½ h.p. machine will have a mechanically-operated inlet valve and new pattern carburettor. The release valve will be through a hole in the crank shaft, and any oil which may escape will be conducted into the operating gear connected with the magneto.

THE Liverpool Motor-Cycle Club held another successful run last Sunday. In spite of the inclement weather there was a good attendance, and at 10.30 a start was made from Liverpool landing

stage. After an enjoyable ride of fifteen miles Hindeston was reached. Several of the members continued the ride to Chester, but the majority turned back to Liverpool, which was reached at 1.30 p.m., after an enjoyable ride. The Sunday runs have proved so successful that it has been decided to continue them during the whole winter. Next Sunday's run is to Ormskirk.

THE formation of a motor-cycling club is under consideration at Bristol, a preliminary meeting having just been held.

THE members of the Motor-Cycling Club will hold a run to Stevenage on Sunday next, meeting at the Marble Arch, W., at 10.30 a.m.

ONE of the latest additions to the large number of machines competing for the public favour is the "Davison," of which an illustration is given herewith. One point which the designer and maker—Mr. A. C. Davison, of Camden Road, N.—considers of great utility is the glass gauge fitted to the petrol and oil tanks. These are let into the side of the tank so as to be secure from injury, and the difficulty of making a reliable joint is got over in a very simple manner. A new glass can be fitted in a minute or two, in case of breakage, and to make doubly sure a screw-down valve is provided, so that, should the glass be deliberately broken or the rider staying anywhere for the night, the petrol can be shut off completely from the gauge, the tank then becoming an ordinary one. The tank is graduated in miles by the side of the glass, so that a glance is sufficient to show the distance the remaining petrol will allow of covering. The oil-tank has a similar graduated gauge, and is fitted, in addition, with a glass sight feed-lubricator, regulated by a valve so that the supply to the engine is positive. The tank itself is not attached to the frame by clips and screws, but it slides into the space in the front frame, and is wedged forward by one screw. The position allows of an ample supply of petrol being carried, the standard tank, which is only 2½ inches wide, containing sufficient for 150 miles. The frame is of special design, the back part being especially trussed to take the engine pull, while the front part, being raised, allows the engine to be easily accessible or removed bodily. A Simms engine of 2-b.h.p., with magneto ignition, is fitted. The drive is by a Lincona belt, which passes round a jockey pulley mounted on a screwed stem, so that it can be raised or lowered by the fingers in the event of it being desired to wheel or pedal the bicycle. This pulley also causes the belt

to embrace more than half the circumference of the engine-pulley, which the designer claims allows one-third to one-half more power to be transmitted with any given tension than if the belt went direct to the larger pulley. The exhaust valve-lifter is connected by a Bowden wire to the left twisting handle, and the timing gear of the sparking to the right twisting handle, so that absolute control of the machine is obtained without removing the hands from the bar. A spray type of carburettor is employed to furnish the mixture. The weight of the machine complete with 2 in. motor tyres, two brakes, and tool bag is 101 lb.

THE COULTHARD 4-TON STEAM WAGON.

THE subject of the accompanying illustration is a steam vehicle, lately constructed by Messrs. T. Coulthard and Co., Limited, Preston, for Messrs. Wm. Whiteley, Limited, of Westbourne Grove, W. The vehicle is capable of carrying a load of four tons, and under favourable conditions an additional two tons, if need be, on a trailer, and has been designed to come within the tare-weight limit imposed by the Locomotives on Highways Act. The leading dimensions are:—Length over all, 17 feet 6 inches, width over all 6 feet 6 inches, height over chimney 8 feet 6 inches, platform 11 feet by 6 feet, fuel bunker capacity 4 cwts., sufficient for 35 miles, and water tank capacity 15 to 18 miles, according to the nature of the roads and grades. Two speeds are provided, three and seven miles per hour. The limit of grade which the makers guarantee the vehicle to ascend with four tons is ten per cent. The handles for steering, reversing, changing

the fire. The ashpan is also divided and hinged, a movement of a handle releasing the ashpan, and a further movement dropping the fire bars. The smoke box is of a conical shape acting as a receptacle for fuel. By lifting a lid on top of the central feeding tube the fuel drops in automatically, hence stoking is very simple. The fuel receptacle at the top of the boiler can be filled from the bunkers when stopping. Water is fed to the engine by a specially-designed pump directly connected with the engine, in which the ram is not exposed to dirt or grit. An independent steam pump is fitted as an emergency feed.

The engine is of the compound type, fitted with reversing gear, and capable of developing 20-h.p. The casing is oil tight, and extended to carry a simple two speed driving and compensating gear, all running in oil. The engine shaft carries two steel pinions sliding upon a square which can be made to engage with gear wheels carried on a sleeve, being an extension of the casing of the compensating gear carrying the two bevel pinions. Thus, both speeds drive through the compensating gear as if the gear wheels were directly on the crown thereof, and an inter-

THE 4 TON COULTHARD STEAM-WAGON.

speeds, also main steam valve and water feed regulator, are all within easy reach of the driver. The chassis of the vehicle is a rectangular frame of channel steel, strongly braced, carrying the whole of the machinery. Distortion of the frame (owing to the variations of the road and uneven roads) to injuriously affect the engine and gearing is guarded against by a special system of spherical bearings and flexible joints. By this elastic suspension it is claimed to be possible for the frame-work to be badly buckled without in any way affecting the working parts.

The boiler is of an improved vertical fire-tube type, centrally fed from the top, owing to which construction the makers have dispensed with the ordinary fire door, thereby obtaining a perfectly equal distribution of metal in the shell, and an equally perfect expansion and contraction, with the minimum of risks of leaky tubes. The fire bars are divided and hung on their diameters upon trunnions. They can be swung down to clean or discharge

mediate second motion shaft is obviated. The transmission-drive to the road wheels is by means of Renold chains. The wheels are of the gun-carriage pattern, the width of the tyres being 6 inches and 4 inches. The drive is taken direct to the wheel felloes by a triangular attachment thereto. Double-acting brakes are fitted, capable of holding the vehicle on any reasonable gradient, in either direction.

A PROPOSAL to organise a competition of motor-car silencers during the course of next year is under the consideration of the French Automobile Club.

MOTORISTS touring in Ireland will be glad to learn that the Great Southern and Western Railway Company's hotels at Kenmare, Parknasilla, Waterford, and Caragh are all keeping a stock of petroleum spirit.

CONTINENTAL NOTES.

By "AUTOMAN."

THE official track for the achievement of mile and kilometre records, which is situated at Dourdan, near the Paris-Bordeaux road, has received a very fitting baptism by the renowned Henri Fournier, who succeeded last week, in spite of the bad state of the roads, in lowering both the mile and the kilometre records. The machine on which these results were accomplished was a 80-h.p. Mors of the Paris-Vienna pattern. The time for the mile was 47 2-5 secs., and for the kilometre 29 1-5 secs. In saying that the records were broken, I do not forget Mr. Jarrott's performance at Welbeck, but as the course there is slightly downhill and that at Dourdan almost dead level, the two results cannot be fairly compared. I hear that Jarrott contemplates an early record run on the Dourdan course.

TALKING about records for short distances brings me to touch again on the controversial question of the best methods for timekeeping. After what occurred at Deauville confidence in timekeeping by hand has received a rude shock, but there is another reason why timekeeping by chronometers should be, and indeed must be, relegated to the past, as far as short distances are concerned. The reasons I am about to give are drawn from an interview with M. Hospitalier.

M. HOSPITALIER makes the statement in the *Velo* that under the best conditions, and with the best chronometer to be procured, it is possible to make an unavoidable error of four-fifths of a second in the difference of the times of two competing motor-cars racing for the kilometre record. This, at a speed of seventy-five miles an hour, would mean that although the chronometer would register the same speed for both cars, one of them might have been going at a rate capable of carrying it nearly twenty-five yards further in the same time.

FROM some calculations I have been making, I think that M. Hospitalier's principle is right, but his figures are wrong, the possible error in the difference of the times of two cars being two-fifths of a second instead of four-fifths.

THE explanation of this important possible error is as follows :—The chronometer has necessarily a wheel divided into fifths, which moves the second hand a fifth of a second at a time. But this toothed wheel may be just entering a new fifth, or just leaving one, as the case may be. Suppose, for the sake of example, that two cars, A and B, are being timed over a kilometre. When car A starts, suppose that the timekeeper's watch is just an infinitesimal fraction *over* halfway between 2.15 o'clock and 2.15 1-5 o'clock—say, for the sake of argument, that the actual time was 2.15 501-5000, and supposing that the timekeeper's watch at the further end of the kilometre was just an infinitesimal fraction *under* halfway between 2.15.28 3-5 and 2.15.28 4-5—say 2.15.28 3499-5000, the actual time taken by car A would be 28 2,998-5000 secs., or practically 28 3-5 secs., whereas the time records by the timekeepers would be: started at 2.15 1-5, arrived at 2.15 28 3-5; result, 28 2-5. The same calculation with car B, but with the car starting at 2.15 499-5000. and arriving at 2.15. 28 3501-5000, would give practically the same results in actual time passed, but in the timekeeper's records would give: started 2.15, arrived 2.15.28 4-5, result 28 4-5 secs, making a difference of practically two-fifths of a second between the real and the recorded result.

THE only way to get over this difficulty is by using a recording instrument such as that of M. Hospitalier, in which there is a tape unwound by clockwork at a fixed speed. The tape may be divided into any fraction of a second, and two electro-magnets may serve to mark the tape with ink when the car starts and when

it finishes the kilometre, and in such a manner not only will the exact time be recorded, but the record can be kept as proof. If a long, continuous tape be employed the records of a whole meeting might be kept on an unbroken tape and would, together with the list of the running order of the cars, constitute absolute proof of the results. Of course, an automatic means of working the electro-magnets at the start and finish would have to be provided, but this constitutes no difficulty, and can be easily performed.

AMONGST the many air-ships which are in course of construction, perhaps the most interesting, and the one with the greatest chances of success, is "Le Jaune," which is being prepared at the expense of the Brothers Lebaudy, the great French sugar refiners, by M. Surcouf, a distinguished aeronaut, from the plans of M. Julliot.

THE air-ship is of the Santos-Dumont style, and has a cigar-shaped balloon 68 yards long by 11 yards, and covered with a yellow substance called "balloneine," from the colour of which it has been nicknamed "Le Jaune." It cubes 2,284 metres. Suspended underneath the balloon is a large platform of steel tubing, on which is placed a motor of 40 h.p., working two side fans three metres diameter at a speed of 1,000 revolutions per minute.

THE air-ship made its maiden trip last week near Mantes, and achieved results which command the earnest attention of all those interested in aeronautics. To begin with, it had a complete crew of four, including Messrs. Surcouf and Julliot and two mecaniciens. The greatest prudence was exercised, and the first evolution made by the ship was at a height of only twenty yards above the ground, everything going well. The ship made evolutions successively at eighty yards and 100 yards above the ground, and circled round a large curve five times without the slightest hitch.

THE delivery wagon competition organised by the A.C.F. takes place on Thursday next, the 20th inst. It is not exciting very much attention in the French automobile world. There are only twenty-one entries, out of which fourteen are cars for town service, and only seven vehicles for use in the suburbs.

AFTER a lengthy discussion at the meeting of the racing committee of the A.C.F., the question of how the Paris-Madrid race should be run was put to the vote on Monday last, and it was decided by five to four that the race should be run entirely *par equipes*. The word *equipe* in the sense in which it is used in this case has no complete and appropriate equivalent in English. It is perhaps in this case best translated by the word "series." The exact meaning is that the winner of the race will be the firm which, when the aggregate times of all the cars it has entered in any one class are added together, shall have completed the race in the best total time.

THE cars will therefore be judged by "series" and be raced in "series," so that regularity of running as well as speed will be a factor in the result, and a factor just as important as speed. The object, of course, is to promote the manufacture of cars which are not only fast but also robust, and not liable to break down or get out of order. The new plan will also have a tendency to make drivers more careful on the roads, for should they have an accident they will not only lose the race for themselves individually, but will almost certainly prevent the maker whose car they are driving from winning.

MESSRS. A. P. WILLS AND COMPANY, 3, New Bedford Road, Luton, inform us that, being independent of the railway company for their supply, they can furnish petrol as usual.

HERE AND THERE.

WE hear that there is another proposal on foot for supplying the Metropolis with a public service of motor-cabs.

THE City Garage, Limited, of Queen Street, E.C., has now arranged to undertake the storage of motor-cycles. They also have special facilities for quickly recharging ignition batteries.

THE Prince of Wales and the Kaiser had a morning's duck shooting on Monday, going to and from the scene of operations in King Edward's motor-car.

MR. C. WALKER, the proprietor of the Pembroke Street Garage, Cambridge, writes that, notwithstanding the action of the railway companies, he is able to supply petrol promptly. His sale is never less than forty gallons per week, while last week it reached 104 gallons.

THE BRITISH GERMAIN MOTOR-CAR COMPANY, LIMITED, has been registered with a capital of £21,000, to import, export, manufacture, and deal in oil, gas, and electrical motors, machines, and engines. The registered office is at Hanover Court, Hanover Street, W.

MESSRS. THRUPP AND MABERLEY, the well-known carriage-builders of 425, Oxford Street, W., have established a charging station for electrical vehicles, where they can recharge three cars simultaneously. The firm are prepared to store, maintain, and insure electric carriages of any make at an all-round charge.

MESSRS. MARSHALL AND COMPANY, of Manchester, are at present building a motor-caravan for a gentleman who delights in spending his time in roaming round the byways and unfrequented parts of the country. The vehicle will be fitted with a four-cylinder motor capable of developing 30-h.p. Provision of bunks for five sleepers is to be made within the van, and a tent is also to be carried for sleeping in the open. The total weight, unloaded, is to be two tons, and the transmission mechanism is to be geared to a normal top speed of ten miles per hour.

WE learn that Messrs. Phillips Ormonde and Co., of Melbourne, recently approached the Australian Federal Customs authorities with the view of obtaining a list of all the motor-vehicles imported into the Colonies. Until this was done no special entries were made in any of the capitals of Australasia of motor-vehicles, they being entered up under the heading of "carriages." In the future, however, they are to be entered separately, so that records will soon be available of the automobiles imported into the Commonwealth of the southern seas.

THE foundation stone of the works connected with the new transporter bridge over the Usk, at Newport (Mon.) in order to provide means of connecting the eastern and western banks without interfering with the river traffic, was laid on Saturday last. At the point where the bridge is to be erected the Usk is 750 ft. wide, and from open lattice-work steel towers a girder suspended by steel cables will cross the river at a height of 177 ft. Upon this bridge, with girders for rails, will run a travelling frame, from which, by wire ropes, a car will be suspended at the ground level. This car is capable of carrying 66 tons, including vehicles and a large number of passengers. It will cross the river in one minute by means of electric motors.

At the opening of the proceedings, on Tuesday, at Ipswich, in connection with the Suffolk murder, Judge and Jury expressed a wish to see certain letters written by the prisoner since his incarceration. In order to obtain these it was necessary to send to Peasenhall—a distance of twenty-seven miles. Counsel for the defence promptly requisitioned a motor-car from Mr. A. F. Garnham, of St. Margarets, Ipswich, who, at a moment's notice, started with the messenger at 11.30 a.m., on his Clement car. The journey to Peasenhall (via Yoxford) and back to Ipswich was made under three hours, the return being accomplished in just over the hour. This speed was made possible by a special permit for urgency, and a tacit understanding that no penalties should attach to violation of the law as to the speed of motor-cars. The car arrived at Ipswich on its return just after the luncheon interval.

THE Cumberland County Council has adopted a resolution "in favour of more stringent regulations dealing with motor-cars."

THE municipal authorities of Bombay are considering the question of adopting a motor dust wagon.

MR. U. D. PALMER, Lynn Road, Wisbech, is keeping a stock of petrol, grease, &c., for motor-cars. He has also a well-equipped repair shop and an inspection pit.

A MEETING of the Scottish Automobile Club, Western Section, will be held on Monday evening next, when there will be a discussion on "Motor Troubles," the subject being introduced by Mr. H. Napier.

MESSRS. J. PORTER AND CO. have recently opened a motor-repair shop and garage at Crescent Lane, Clapham Common, S.W. A stock of petrol is kept on hand, while all classes of repairs can be dealt with.

MESSRS. CURRIE AND SANDERS have commenced business at 6, St. Luke's Yard, Bravington Road, Harrow Road, W., as motor-car repairers. They have also storage accommodation, and keep a stock of petrol and motor-car accessories.

THE Somerset Poor Law Association has been discussing the question of motor-cars and has adopted a resolution:—"That motor-carriages (including motor-cycles) should be obliged to carry a conspicuous number, and should pay an excise tax; and that no person should be permitted to drive them without a licence, such licence to be liable to suspension or forfeiture if the holder is convicted of furious driving."

At the last meeting of the Executive Committee of the United States National Association of Automobile Manufacturers a proposition to co-operate with the Automobile Club of America and the Automobile Club of Chicago in holding a run from New York to Chicago resulted in the adoption of a resolution directing the secretary to inquire into the feasibility of such a run being conducted.

OWING to the difficulty of getting prompt railway communication between the Cardiff stores and those of Newport and Barry, the Cardiff Pure Ice and Cold Storage Company, Limited, has lately purchased a steam motor-van. The saving in time to Newport (twelve miles) and to Barry (eight miles) effected by the van is of the greatest importance, while all expenses of transhipment are saved. In addition to this the vehicle has proved particularly useful in providing speedy delivery of considerable quantities of ice to the shops of various customers.

MESSRS. RICHARD LORD AND CO., of Blackburn, have sent us a small sample of the rubber amalgam they have recently introduced for filling up cuts in the outer covers of pneumatic tyres. The amalgam is a plastic rubber, vulcanising with exposure to the atmosphere. After cleaning the cut and injecting a small quantity of rubber solution, sufficient amalgam is inserted to fill the cut, vulcanisation taking place in about five hours. We have not yet tried the amalgam ourselves, but we understand that it has met with considerable success in the North.

THE Corporation of Eastbourne are inviting offers for the supply of motor-omnibuses to accommodate not less than sixteen passengers. Those tendering should state (1) the size of the omnibus which they are prepared to supply; (2) the number of passengers which it will carry; (3) the motive power; (4) the estimated working expenses (including repairs) at per car-mile; (5) the price of each omnibus and alternative prices for six or twelve omnibuses; and (6) the period (if any) for which they are prepared to guarantee the omnibus subject to ordinary wear and tear. The routes along which the Corporation has power to run motor-omnibuses cover a length of 8½ miles. Seven miles of this route are practically level, a short length of 190 yards has a gradient of 1 in 16, and for the remainder the gradients do not exceed 1 in 35. The offer should be accompanied by a complete specification, and also the time within which, say, six omnibuses can be supplied. Offers should be sent to the Town Clerk by Saturday, the 29th inst.

OIL MOTOR-CARS OF 1902.*

BY CAPTAIN C. C. LONGRIDGE.

(Continued from page 705.)

AN additional advantage is that the crosshead is kept constantly pressed against one guide, if the shaft is half stroke away from the axis of the cylinders, consequently there is no knock from bar to bar on turning centre. All that is needed to accomplish this is to set the crank-shaft in advance of the axis of the cylinder.

(b) *Fly-Wheel*.—There is little to be said on this detail. The inertia of the fly-wheel is one of the chief causes of vibration, the explosion energy imparted to the wheel reacting on the frame. A very radical elimination of this objectionable feature is the provision of two fly-wheels revolving in opposite directions. This method has been successfully worked out in the Lanchester car, and also in the French Crozet (Tourand) motor. A large, more especially large rimmed, and, therefore, preferably a built-up fly-wheel is by no means to be despised, since it conduces to steady running; facilitates easy change from low to high gear; helps starting on hills and heavy ground; extends the speed range, enabling the motor to run slower without pulling up; reduces fluctuations of rotative speed, and thus the stresses on all driven parts, gear, chains, and tyres. Naturally multiple-cylinder or high-speed, or low-compression motors, require less fly-wheel than single-cylinder, slow-running or high-compression engines.

(c) *Clutch*.—The function of the friction clutch is to transmit motion from the fly-wheel to the gear. A good deal of trouble used to be experienced with clutches getting out of alignment, slipping, acting too fiercely, etc. Nowadays these difficulties have mostly disappeared. One of the best methods of ensuring accurate alignment is to mount the internal part of the clutch on the engine-shaft, prolonged through the fly-wheel. In other cases provision against defective alignment is made by setting springs under the friction strip (leather, copper, etc.) with which the clutch is faced. In most cars the application of the foot-brake withdraws the clutch; and, in the Mercedes of the Canstatt Daimler Company, the withdrawal of the clutch automatically reduces the speed of the motor—a very neat arrangement. The latest form of clutch is that employed on the 40-h.p. Mercedes Simplex German Daimler car. Here the ordinary clutch is replaced by a spiral spring fastened at one end to the fly-wheel, which in this case serves as a fan. When in action the spring is caused to coil tightly round a small drum on the driving axle. The idea is in many respects excellent.

Transmission from Clutch to Gear.—The main point noticed is the increased use of universal joints at both ends of the transmission shaft, so as to prevent deflection strains reaching the gear. There is an indication, however, that these universal joints will be dispensed with, and greater rigidity obtained by tying all parts to a single frame. There is no objection to a single frame properly tied, but flexibility of drive, the author thinks, should be fully maintained, if not increased. To this end he suggests the trial of flexible transmission shafts, constructed on methods illustrated by the coiled spring, the bundle of steel rods, etc. Such shafts provide not only for want of alignment, but also, by reason of their initial twisting, absorb the heavy jars and strains when the clutch is too fierce or too suddenly applied. The same method of construction might perhaps be applied to the countershaft between the differential and the sprocket pinions.

Change-Speed Gear.—The various systems in use do not present much novelty. Four methods predominate: toothed wheels which are slid in and out of gear, the Panhard type, very generally used; gear-wheels always in mesh, but fixed, when required to drive, by interior expanding clutches, less common, but likely to become a great deal more so; belt-gear, as in the Benz cars, fast disappearing; epicyclic gear, running solid for the high speed, found chiefly in light cars; lastly a link motion, by which varying throw is imparted to rods which drive the differential, on the rear axle, through reciprocating clutches. Only one instance of the use of this method is known to the author, viz., in the 2½-ton lorries built by R. Hagen, of Cologne. With gears the general tendency is a direct drive for the highest speed; that is, without the use of intermediate pinions between the motor and the differential. The latest Mors car may serve as illustration of the method, Fig. 9. At the end of both primary and secondary shafts there are bevel pinions gearing into and driving the differential; the secondary shaft is in use for the first three speeds. The fourth speed is transmitted direct from the primary or driving shaft (that next to the motor) to the differential through a clutch connected with a spur wheel, out of gear for the first three speeds. Actuation is by a lever that, forcing back the driving shaft, leaves the intermediate shaft out of gear and engages the loose bevel wheel with the differential.

An ingenious idea has been realised by Mr. L. Megy, of Paris. Dispensing with the hand change-speed lever, he causes the speed to automatically vary according to the resistance to be overcome. The gear-wheels are always in mesh, and on each of the loose wheels is a large collar or drum, inside of which is a leather disc. These discs are operated by a rod inside the shaft and are displaced by the resistance met with by the car. Thus, when the car begins to slow down on one gear the rod moves forward and presses the leather disc on a lower speed wheel, and *vice versa*. Any one speed, however, can be fixed by a hand lever. The car thus regulates its speed to the road or can be regulated when required. It is quite possible that change-speed gears may be soon driven out of the market either by motors of sufficient flexibility or by some electric transmission of power from the motor to the driving-wheels, or, though far less likely, by hydraulic gear.

* Abstract of Paper read before the Institution of Mechanical Engineers

The Differential Gear.—In a few cases the differential has been replaced by other arrangements. Messrs. Brouhot et Cie., of France, are said to employ ratchet clutches inside the hubs of the driving wheels. In taking corners, the outside wheel runs free, and on dropping down again to the same speed as the inside wheel, the ratchet pawl falls into the teeth for forward driving. In the Swift voiturette also the road wheels are fitted with free-wheel clutches of the ratchet type, such, only on a larger scale, as are in use on bicycles. Neither arrangement would appear suitable for reversing. In designing a differential, the pins should be of the strongest material and ample proportions, and every precaution should be taken to keep the gear free from any defect in the countershaft alignment. Universal joints in the latter can be used, and the flexible shaft, as suggested, might be tried.

The weakness of the divided shaft is remedied in "the liner tube countershaft," or may be got over by placing the differential on the road wheel axle.

The defects of bevel differential gear are:—Natural tendency of bevel gear to force itself apart, end thrust of pinions against the collars, excessive wear and tear, cross strain on the bearings, loss of power by conversion at right angles. The same compensation is obtained by spur differential without the thrust and wear.

FIG. 9.—MORS CHANGE SPEED GEAR.

Systems of Driving.—The two systems of driving are the live axle and the double sprocket chain. The former seems the better mechanical job, but so far it is chiefly confined to light cars. No development of the central chain drive has taken place.

(To be continued.)

THE Bavarian Automobile Club proposes to organise an endurance tour of Germany for next year.

MR. FRANK BUTLER made a balloon ascent from the Crystal Palace on Wednesday last week, landing safely in the evening at Corby, in Lincolnshire, 115 miles away.

THE Cornwall County Council has adopted a resolution "to endeavour to secure, in the interest and for the protection of the public, that a registered number should be so affixed on the back of every motor-car as to ensure its identification."

ONE of the 1903 pattern 8-h.p. De Dion cars, with the new form of gear giving three speeds, has been in England about a month, and was promptly taken out for trial and testing by Mr. J. W. Stocks. In sixteen days he drove the car about 1,500 miles, including two non-stop runs of 185 miles each, the vehicle running consistently and sweetly throughout.

MRS. CLAUDE WATNEY, who has disposed of her 24-h.p. Panhard, "Frou-Frou," through the London Motor Garage Company, Limited, has bought from the same company a 60-h.p. Mercedes Simplex, for delivery in February next. This car will therefore be the first of the Cannstatt Daimler Company's 60-h.p. cars to be delivered to a private buyer; in fact, it will be the fourth car of that make and power to leave the works. The price paid was, we understand, a "tall" one, although it will probably turn out to be a good investment if the Mercedes Simplex of 1903 accomplishes all that the makers are sanguine of its doing in the races next season.

ANNUAL DINNER OF THE AUTOMOBILE CLUB.

CLOSE upon 250 gentlemen sat down to dinner at the 'Trocadero' Restaurant, London, W., on Friday evening of last week. It was the occasion of the annual dinner of the A.C.G.B.I., to celebrate the completion of the sixth year since the inauguration of the Locomotives on Highways Act of 1896; and under the chairmanship of Mr. Roger Wallace, K.C., a very pleasant evening was spent.

The toasts of the King, the Queen, the Prince and Princess of Wales and other Members of the Royal Family—having been drunk with enthusiasm—for the chairman reminded those present of the Royal interest in automobilism.

Mr. Gibson Bowles, M.P., proposed the toast of "The Imperial Forces." In the course of his speech he said that he conceived that the idea of speed, of going fast, of doing things rapidly, was a purely modern notion. All the old notions were contrary to that; the old mottoes were *festina lente*, slow and sure, *chi va piano va sano, chi va sano va lontano*. In that Club they believed in speed; many of them had an over-belief in speed, many went not more than eighty miles an hour; there were others whom no rate could hold. Had it ever occurred to them that the suggestion of speed had never yet been so much as conceived by the War Office? He thought they might learn a lesson in progression from the Automobile Club. Had our soldiers, he continued, amid much laughter, instead of marching up the hill against the Boers at two miles per hour, dashed up on motor vehicles at eighty miles an hour, the Boers would not have waited. The Navy had conceived the notion of speed, it had adopted it, and it had produced the destroyer.

Sir Howard Vincent, M.P., responded to the toast, and stated that the War Office had decided to purchase twenty-five cars for the use of generals. That, he suggested, rendered an alteration of the law more necessary than ever, so that the police might be able to identify a general when he went by at a speed in excess of the legal limit.

To Mr. T. P. O'Connor, M.P., fell the duty of proposing "The Success of the Automobile Movement of the Club and its affiliated Clubs," and this task he performed with dexterity and wit. He saw the fitness of choosing him, as being probably the only man in the room who did not own half a dozen cars. There were, he noticed, some manufacturers present, and by way of a gentle hint he might suggest that books were not the only things he was prepared to review. In 1830 there was already the beginning of automobilism in this country, there were already the germs of a great steam road traffic, but Parliament was extremely anxious to superintend, in the most grandmotherly fashion, the improvement of road traffic. That was the period, he believed, when a man with a red flag was compelled to go in front of the vehicle, and the result of that action of Parliament was that the industry was destroyed, that progress was brought to an end, that more than half a century was allowed to pass before automobilism was able to make any show in this country, and that, in the meantime, not only many precious years had been lost, but the honour of being the pioneer of the motor industry had passed to other countries. The opposition to automobilism was not yet at an end. A great deal of it was due to a certain type of automobilist. He thought that when people drove their automobiles without regard to the life and comfort of the humble pedestrian they were enemies of automobiles and were pests that no decent club ought to allow to remain on the roll of their membership. Automobilism had come to stay, and he believed it would bring about many useful changes in this country. It would assist in solving the great agricultural problem by bringing town and country nearer together. The means of carriage for commercial purposes by motor-car was the problem of the future, and he protested against any attempt on the part of rival interests to attempt to stifle automobilism, because it might affect other means of locomotion.

Mr. Roger Wallace, who responded to the toast, remarked that as this country had won the Gordon-Bennett Cup, the next race ought to be held on this side of the Channel. If that expectation was realised, he hoped the contest would be run in Ireland. They could only do this, however, through the influence of the Irish members, who must combine to pass a short Act allowing the race to be run. He was sure that if the contest took place in Ireland, the Cup would never go out of the country, because our cars were the stronger. With regard to the speed limit question, Mr. Long, the President of the Local Government Board, had declined to adopt the suggestion that the motor problem might be solved by the issue of certificates to drivers on the ground that it would be too great a business to undertake. He suggested that as the French Government had authorised the Automobile Club to examine English drivers and certify their fitness to drive in France, Mr. Long also might hand over the work to the Automobile Club. Certificates would have to deal not only with the skillfulness of drivers, but their consideration for the public, and they recognised that harm was done to the cause of automobilism by drivers who did not consider the convenience of other users of the roads. But now that Cabinet Ministers and Lords Justices regularly broke the law on motor-cars, some amendment was necessary. There could be no respect for a law which was broken by the highest people in the land, and the logical course was to put an end to that state of things.

Mr. G. H. Cox, J.P., also responded, and referred to the question of the tare limit for heavy motor-vehicles. At present a limit of three tons tare is fixed, but he was in hopes of an early alteration.

The Hon. J. Scott-Montagu, M.P., submitting the toast of "The Visitors," said that when he addressed the Club last year he had never been

caught by the police, but in that respect he had now lost his virginity. The circumstance had converted him to the conviction that some alteration must be made in the legislation of the country, and he believed that a distinct majority of the House of Commons was in favour of that view. Before he came to that dinner he met Mr. A. J. Balfour in the lobby of the House of Commons, and asked him if he had any message to send to the Club. Mr. Balfour desired him to say that he wished the Club all success, and that he hoped it would go on and prosper, and that now he was a member he should take great interest in its proceedings. The fact that they had the Prime Minister on their side was one they might well be proud of, and was one that would have its influence on future legislation.

Lord Farrer replied to the toast, and stated that, although he was a Surrey magistrate, the views recently expressed at Kingston did not represent those of the general public in that county. A special set was undoubtedly being made against motorists, but as twelve miles an hour was the law every effort must be made to get it modified.

"The Health of the Chairman" was proposed by Sir Lewis M'iver, M.P. He was greatly interested in the question of locomotion and traction in great cities, and believed the motor-car would have an important effect in this direction. He referred, however, to the question of excessive speed, and considered a reckless motorist worse than a Surrey magistrate.

The toast list at an end the party broke up, some to continue "petrol" talk, and others to hurry home in preparation of the annual run on the morrow.

CORRESPONDENCE.

FURRED BOILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter from Mr. Frank Thatcher on the above subject in your issue of the 25th ultimo, will that gentleman kindly inform me if he uses a special blow-off cock for cleansing his boiler? I have to blow my boiler off from a cock at the bottom of the water column; this makes a bad matter worse, and chokes the column up. The pipes of my water gauge lead from this column, so when the pipe is blocked between boiler and column, the water gauge fails to work, and the only way I can get scale out is to disconnect the pipes and clean them out. I should think most Locomobiles are fitted with a blow-off cock, for I have seldom heard of others in trouble this way. Mr. Thatcher mentions Vulite. I have been told that any fluid used for removing scale is injurious to the boiler tubes.—Yours truly,

STEAMER.

A MYSTERIOUS ACCIDENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reading an account of the fatal accident at Handcross in *The Motor-Car Journal*, in which the engineer was killed, I was struck by the similarity between this and a motor accident which happened to myself and a friend while driving a Benz some months ago. We were about to descend a hill, and were going about fifteen miles an hour, my

friend having charge of the helm at the time, when, without the slightest warning, the car shot off the road and turned completely over in the hedge, as the accompanying photograph will show. Luckily, we were both thrown clear of the car, and escaped with a few scratches, the result of coming in contact with the hedge. I was able to take the snapshot immediately after the occurrence, as fortunately I had my Kodak with me. But how or what caused the car to do as it did remains a mystery; perhaps it was through a swerve of the steering handle, as was the cause of the Handcross disaster, but my friend, who, as I before said, was at the helm, is an experienced driver, and he positively denies any knowledge of moving the handle, and we are still at a

loss to account for so sudden a movement. I may add we found one of the driving chains off when we pulled the car over. The vehicle was so badly damaged as to necessitate the use of a horse and trolley to convey it home.—Yours truly,

GEO. J. COOK.

MECHANICALLY-OPERATED INLET VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the question of mechanically-operated induction valves has been raised, we should like to give you the results of our experiments with such valves. We may say that from actual experience we thoroughly endorsed Captain C. C. Longridge's report as to their necessity and utility. The repairing of motors, cars, and cycles has been an extensive part of our work during the last three years. After thoroughly considering the matter we found that two-thirds of the troubles could be traced to the erratic working of the suction-operated induction valves; this led us to experiment with small motors having the inlet and exhaust both operated mechanically. The results have been a complete success. We are about to introduce a chain-driven motor-cycle, fitted with our mechanically-operated inlet valves. We have been putting one of these machines through some very severe tests; the one we have now on the road experimenting with has completed a mileage of just over 3,000, over some of the most hilly roads in Yorkshire, Derbyshire, and the Lake District, and has never given the slightest trouble in any way. We have, up to the present, not experienced any of the back blowing through carburettor, which M. H. J. Wimshurst so strongly complained of in his letter; in fact, one cannot understand how this occurred if the valves were properly fitted. We contend that the mechanically-operated inlet valve is an absolute necessity, and it is imperative that it should be used in all motors which have two or more cylinders. If Mr. Wimshurst had seen some of the motors we have had through our hands, and seen the havoc caused in the two or more cylinder engines through the sticking of inlet valves and suction working of same, he would not speak quite so favourably of the suction induction valve. In conclusion, we, in actual experience, have found the induction valve operated mechanically to give the following advantages:—Great increase in power, power kept more constant, steady running, freedom from vibration, and great increase in general efficiency.—Yours truly,

THE ENDURANCE MOTOR AND CYCLE COMPANY.

Scarborough.

WATER CIRCULATION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent, "Puzzled," re water circulation, my experience may be of use to him. I have just had a similar trouble, and had an expert for three days, who left, declaring he could not solve the difficulty, but that all pipes were perfectly free. Notwithstanding this, he could not make the vehicle go more than four miles before the motor would overheat. On examining it again myself, I found the rubber hose connecting the pipes together at fault; they had swollen inwardly, allowing a small quantity of water through, until the water in the jacket developed steam. The swelling in the rubber hose then expanded, and allowed no water to pass. The steam, however, would work its way back into the tank, and make the water appear as if it were boiling.

I might mention that my motor was of 7-h.p., and only carried 2½ gallons of water. Since putting on new rubber piping I have run the car over sixty miles with the loss of only half a gallon of water.—Yours truly,

"NIL DESPERANDUM."

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Thirsk	Mrs. Basil Hoare, Morpeth	20 m. p. h.	£2.
Manchester...	J. Prestwich, Oldham	18 m. p. h.	£2, etc.
Chester-le-Street	C. Gaulaur	31 m. p. h.	£1, etc.
London	R. Browne, South Kensington	—	£2.
"	A. Fletcher, Windsor	—	£5.
Horsham	C. F. Hill, Haywards Heath	—	£2, etc.
"	A. Ellis, London	—	"
"	E. W. Makowski, Redhill	—	"
"	J. Goodie, Sydenham	—	"
"	W. Batt, Oxford	—	"
"	G. Baker, Horsley	—	"
"	S. Waller, Crawley	—	"
"	Miss B. Church, Horley	—	£4, etc.
"	D. Emile, Maidenhead	—	£4, etc.
Carlisle	F. Lipop, Wiseton	—	£10, etc.
Stirling	W. Graham, Greenock	20 m. p. h.	£2, etc.
"	W. Drysdale, Glasgow	20 m. p. h.	"

Where no alleged speed is given it is understood to be above the legal limit.

WHEN charged at Marlborough Street Police Court with driving a motor-car at Piccadilly Circus to the common danger, Mr. Roland Browne said that an omnibus wrongly pulled out and damaged his car to the extent of £40 or £50. The magistrate imposed a fine of £2.

CHARLES GAULAU, a motor-car driver, was charged at Chester-le-Street, last week, with driving a motor-car at a furious pace at Birtley, on October 3rd. P.C. Martin said that he saw the motor-car driven by the defendant travel a distance of 1,400 yards in a little over 3 minutes, a rate equalling about 31 miles an hour. He held up his hand, and defendant stopped. The Chairman said they would take into consideration the fact that the defendant stopped when called upon and gave his address, and as it was the first case they had had in Durham, they would only inflict a penalty of £1 and costs.

AT Carlisle, on Saturday, Frank Lipop, of Wiseton, Notts, was fined the full penalty for furious driving and for not sounding a bell or other instrument when overtaking a grocer's van. Superintendent Graham stated that the defendant covered three-quarters of a mile in two minutes. When stopped by the police he gave a false name and address.

A BIG batch of motorists were hauled up at Horsham Police Court on Saturday last for driving at excessive speed. Miss Bertha Church, of Horley, who did not appear and had sent no letter, was fined £4. Dunjil Emile, Maidenhead, who failed to stop when called on to do so, and who did not put in an appearance, was mulcted in a like amount. Those who responded to the summons had to pay £2 and costs.

THERE was a strange conflict of evidence at the Marlborough Street Police Court on Saturday in a case in which Mr. Andrew Fletcher, of the 2nd Life Guards, stationed at Windsor, was charged with driving a motor-car to the common danger in Piccadilly Circus. Constable Whittington deposed that about 5 p.m. on October 31st Mr. Fletcher drove across Piccadilly Circus at a very fast rate while the traffic was "held up." The constable said he put up his hand, but the defendant took no notice. He had to jump out of the way, and he had a narrow "squeak" of being crushed between the car and a van. He therefore caught hold of the car and asked Mr. Fletcher to stop, but he laughed and put on a speed of about 20 to 25 miles an hour. Several constables gave corroborative evidence, most of them putting the speed at 20, and one at 19 miles an hour. Mr. Fletcher denied the constable's story on oath. He said that when approaching the spot he was "cutting the engine out," and going only about two miles an hour. Mr. Kennedy said the defendant had been guilty of wanton driving and must pay a fine of £5. Mr. Newton, who appeared for Mr. Fletcher, protested strongly at the action of the police, who marched the defendant through the streets like a common felon to the police station, where he was searched, instead of issuing a summons against him.

DAMAGES AGAINST A MOTORIST.

AT the Penrith County Court, last week, his Honour Judge Steavenson heard a case in which Robert Holliday, veterinary surgeon, Kirkoswald, sued William Marsten, manufacturer, Honley, Huddersfield, for £45 6s., damages arising out of a collision between defendant's motor-car and plaintiff's horse and trap. The evidence of the plaintiff and a number of other witnesses was to the effect that on the afternoon of August 15th he was driving on the Carlisle Road, when he saw defendant's motor-car coming towards him, 220 yards away. He lifted his hand for the driver to stop, as he had a nervous mare, but no notice was taken of it, and the car ran into the conveyance, throwing both trap and horse. The vehicle was badly damaged, and plaintiff was much injured.

Defendant said he was only travelling at six miles an hour, and plaintiff made no signal to stop. When he got nearly opposite to the trap the horse became so restive that a collision was inevitable. He pulled on to the grass at the roadside, and when the horse backed he put both foot and hand brakes on. When the accident happened plaintiff said, "You are the chaps we were waiting for to make a case of."

In giving his decision, the Judge said the witnesses for the defence had contradicted one another on most material points, so that he could not rely on their evidence. He gave judgment for £45, but he could not allow costs on the higher scale.

REPAIRING A MOTOR-CAR.

IN the Lord Mayor's Court last week the Streatham Motor-Car Company sued Mr. B. M. Kilby, stockbroker, for the cost of repairing a motor-car. Mr. Lionel Bennett, who carries on business in partnership with Mr. Arthur Bennett as the Streatham Motor-Car Company, said the defendant was his cousin, and owned a motor-car. He wished it to be done up for the purpose of being disposed of. The car was taken to their place and examined, and the defendant was informed that the repairs necessary would cost £50. They were instructed to do the work. It was afterwards discovered that other parts required repairing. Being enclosed, they were not visible upon a casual inspection. They informed the defendant that the work, if done, would have to be charged as an extra. The extra work was not done. The work they had agreed to do was completed, and the car was taken on a trial run in the neighbourhood. Upon the defendant's man calling for the car, it broke down through the differential gear going wrong. This had not been included in their work. They had received £25 on account, and now sued for the balance. The defendant now sought to deduct from the balance due the expense he had been put to in repairing

the gear. The price charged for the work done was reasonable. The defendant said the arrangement made with the plaintiffs was that the car was to be overhauled for the purpose of putting it into thorough working order. The plaintiffs were to charge the sum of £50. The work had not been thoroughly carried out by the plaintiffs, and as a result the car broke down. The jury found for the plaintiffs on the claim, and judgment was entered accordingly for the sum of £26 6s.

MEASURED DISTANCES.

In the case at Thirsk against Mrs. Basil Hoare, it transpired that the police have a measured quarter-mile on the road between South Otterington and Newby Wiske.

FOR some time past there have been complaints from residents in West Stirlingshire about the furious driving of motor-cars. The long brae between Aucheneck House, Drymen, and Finnoch Glen is a favourite spot for motorists to put on a high speed, and here the police have measured a half-mile, and stationed constables at each end of it with watches to take the time occupied by the cars to cover the distance. As a result two motorists were trapped and fined a few days ago.

A MEASURED furlong at Southwick, near Brighton, is being actively made use of by the police.

SEQUELS TO MOTOR-CAR ACCIDENTS.

In the Perth Sheriff Court last week a case was called at the instance of Alexander Stewart, farmer, Chamber Bain, Pitlochry, against Jay Shaffer Phipps, Beaufort Castle, Beaulieu, for £12, in respect of loss and damage sustained by pursuer in consequence of defender having refused to stop his motor-car when called upon to do so, whereby pursuer's horse took fright and bolted, and was injured, and his cart smashed. Proof was fixed for the 7th inst., but the pursuer's agent stated that the defender's agent had expected to have paid the sum before now, but as they had not done so, he moved for decree, with £1 13s. 9d. of expenses. This Sheriff Sym granted.

At Yarmouth County Court last week, W. Weavers, milkman, sued Mr. Briggs, Yarmouth, to recover £11 for damages sustained by reason of defendant negligently and unskillfully driving a motor-car. Plaintiff said that on Wednesday, October 1st, he was delivering milk at Gorleston. His cart was standing quite in the gutter, so that the trams could pass. His lad was getting off the cart with the milk when a motor-car came into them behind. Defendant said he was following plaintiff's cart. Plaintiff pulled up suddenly, but gave no sign by holding up his whip or his hand. Had he done so there would have been no collision. The wing of the motor-car caught the back of the cart.

"BUYING" A MOTOR-CAR.

At Bow Street last week, before Mr. Fenwick, Nicholas J. Wood was summoned for obtaining a motor-car, value £1,600, by false pretences, from D. M. Weigel, manager of the British Automobile and Commercial Syndicate. Mr. A. Osborn appeared in support of the summons; Mr. Charles Mathews and Sir George Lewis defended. Mr. Osborn said that on October 4th the defendant, accompanied by Sir Robert Peel, went to the complainant's premises in Long Acre and asked to be shown some motor-cars. He selected a Panhard, value £1,600, and it was arranged that he should pay £1,200 down, and the balance by two acceptances at one and two months after date. At a subsequent interview he drew out a cheque for £1,200, and the complainant, having learnt that the defendant was a minor, asked him if there was sufficient money at his bank to meet it. He replied in the affirmative. The complainant allowed them to take the car away, but when, on the following Monday, he presented the cheque at the bank it was returned. On the Tuesday the defendant came to have some petrol put in the car, and Mr. Weigel then told him that his cheque had not been paid. He replied that that would be all right, and promised to bring the cash next day. He did call on the Wednesday, but it was for more oil, and he did not bring the money with him. On Thursday he again called for some petrol, and the complainant directed one of his men to remove part of the machinery so that the car could not be taken away. After some discussion the defendant promised to bring the money on the following day. He called on the Friday, and told the complainant that he had not got the money; that he was an infant, and that he could do anything he liked with him. Mr. Weigel afterwards learnt that the defendant was in receipt of an allowance of £62 10s. a quarter, and that he had never had £1,200 at his bank. Further inquiries also elicited that since April of this year eleven other cheques of the defendant's had been dishonoured. Mr. Osborn added that the car had been badly damaged by the defendant, and it had been depreciated in value to the extent of £300 or £400. The complainant then went into the witness-box, and had not concluded his evidence when the summons was adjourned.

THE LONDON MOTOR GARAGE COMPANY, LIMITED, have secured space at the Paris Automobile Exhibition in December, at which they will be showing the "Pipe" and the new "Magnet" cars.

A BALLOON chase is to be held to-day (Saturday), under the auspices of the Aero Club. A start will be made from the Crystal Palace at 12 o'clock.

It has been decided to hold the annual banquet of the Automobile Club of America at the Waldorf-Astoria, New York, on January 24th.

THE COLONIAL MOTOR COMPANY, LIMITED, has been registered with a capital of £2,000 to carry on the business of transport and traction agents, tourist agents, carriers, manufacturers of and owners of appliances for and means of transport, etc.

ACTING upon complaints that have been made regarding the excessive driving of motor-cars, the police authorities at Utica, N.Y., have announced that they will in future arrest any violators of the State law.

THE Worcester Chamber of Commerce has adopted a resolution in favour of reducing the speed of motor-cars from twelve to ten miles an hour, and six miles an hour round dangerous corners. General Davies characterised the proposition as absurd. It was not, he argued, in the least necessary. Anyone who had travelled on motor-cars knew that it was perfectly safe to travel at a speed of twenty-five miles an hour.

THE old District Council offices in Victoria Road, Kingston, have been taken over by Mr. G. W. Rice, who has transferred his business there from Brighton Road. The Surbiton Cycle and Motor Company, under which style the business will in future be known, undertakes the storage, repair, cleaning, etc., of motor-cars and cycles. Accommodation is afforded on the premises for fifty motor-cars and 100 cycles.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, NOVEMBER 22, 1902.

[No, 194.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE first of a series of meetings and discussions under the auspices of the Western section of the Scottish Automobile Club took place in Glasgow on Monday last, when Mr. H. M. Napier read a paper on "Motor Troubles and how to get over them." He began with the trouble of selecting a car. When so many manufacturers and agents were advertising in the most glowing terms, only experience taught one that the cheapest in first cost might not be the best bargain. The advantages and disadvantages of steam, petrol, and electric cars were dealt with, more particularly petrol cars. Much trouble arose from adjusting screws of brakes, grease cups, clearing taps, and generally the working parts that wanted adjustment were, in the lecturer's opinion, inaccessible or too small. Chain and gear driven cars were also dealt with. Pressure in the petrol tank and also circulating pumps were condemned, as with a proper arrangement of tanks and pipes gravity would do everything necessary, and it was well known that the motor would run better if the water was kept fairly hot. The necessity of having all spare gear tried in place beforehand was pointed out, and a list of suitable tools and spare parts put forward. The tyre question, he thought, was far from settled, and he proposed a thick semi-solid outer cover with small inner tube just sufficient to make the rim grip the cover. The large pneumatic tyre was responsible for much side-slipping and throwing up of dust. To sum up, every motorist was bound to meet troubles, but the time lost through these could be greatly minimised by knowing the car, and being able at once to put the finger on the defective spot. An interesting discussion followed the reading of the paper.

Proper Police Work.

MANY of the chief constables are acting wisely with regard to motorists. The chief of the police in Huntingdonshire has declared that twenty miles an hour is a comfortable speed at which to travel, and now Colonel Daniel, who is at the head of the police force in Hertfordshire, has placed constables at various dangerous corners of the highway to take action against motorists who take no heed of the public safety. This is far better than the policy adopted elsewhere of entrapping those who drive rapidly on straight and level roads. Sensible and reasonable motorists would welcome prosecutions against the foolish people who, by disregarding the ordinary courtesy of the road, have been responsible for much of the prejudice with which those who own motor-cars have been assailed of late.

The Sheffield and District Automobile Club.

TO-DAY (Saturday) the members of this newly-formed club will hold an inaugural run to Worksop. The cars and cycles will line up the Surrey Street and Norfolk Street sides of the Town Hall, with Mr. B. H. Foster, the President, as marshal, in his Wolseley car. The start will take place at 2.30 p.m., the cars running in procession as far as Tinsley, after which point the members will "go as they please" to Worksop. The President will entertain the party to dinner at the Red Lion Hotel, Worksop. Mr. Foster has also offered two challenge cups for a hill-climbing competition—one cup for cars and another for

cycles—to be held twice a year; any member winning three consecutive times will become the owner of the cup.

Motor-Cars at Delhi.

WE regret to learn from the "Times of India" that a notification has been received in Bombay stating that motor-cars are, after all, not to be permitted at the Delhi Durbar. An excellent opportunity to popularise the motor-car in India has thus been spoilt. It may be hoped that even now the authorities will be induced to reconsider their decision, and to permit motor-cars to be sent to Delhi. A restricted use of them will be better than their complete banishment. The motor-car ought to solve the problem of rapid locomotion in those districts of India where railways are not likely to pay. Railways are costly, but the outlay necessary upon a road over which motor-cars can run is comparatively small. The Durbar promises to afford a chance of impressing all the most prominent men in India with the possibilities of automobiles.

Dangerous Roads.

AUTOMOBILISTS are beginning to help themselves so far as the roads of the country are concerned, and through the agency of the A.C.G.B.I. are now advising each other as to dangerous stretches of highway, etc. The Executive Committee have agreed that roads made of such material as is likely to render travelling on them, on pneumatic tyres, dangerous shall be marked on a large map displayed in the club-room for the benefit of motorists. The idea is a good one, and is, moreover, capable of localisation by the various provincial clubs. Thus the headquarters of the Liverpool Self-Propelled Traffic Association might contain a similar map showing dangerous stretches in that locality, and at Reading, Leeds, Nottingham, and elsewhere local automobilists might be able to find equally good advice at their local centres.

Air Ship Disasters.

At the last monthly meeting of the Aeronautical Institute and Club, a paper was read by Mr. C. C. Field, entitled "Airship Disasters and the Factor of Safety." Mr. Field pointed out that very few, perhaps only 2 per cent., of inventors paid any attention to providing their apparatus with means of breaking the fall consequent upon any accident which might overtake them. He called attention to the fact that parachute surfaces could be automatically brought into position as a direct result of a fall at great speed, and that cushioning should be provided to break the shock upon contact with the ground, mentioning the jumping-sheet in use by the Fire Brigade as an instance of what could be done in this respect, and as an example which would indicate the amount of compression or "take up" necessary in the springs or pneumatic cylinders which may be provided. The lecturer inquired as to how many of the airships now building included in their design means of detaching the car in case of emergency. This could doubtless be arranged by some modification of the lever. In the course of his paper Mr. Field suggested that the Institute should organise a series of parachute contests at the Exhibition which the Aeronautical Institute and Club propose holding in 1903, the slowest in descent to be declared

the winner. He remarked that a great deal of useful information would thus be obtained. Mr. E. C. Dwyer afterwards read a paper entitled "The Inventor and the Flying Machine," in which he called attention to the great amount of money wasted in patenting useless inventions. This was a matter very much to be deplored, as specially in view of the amount of valuable data which might have been obtained had this money been spent in perfecting useful experiments. He then detailed some very useful experiments which might be made with a view of designing a machine on the lines of bird flight.

Balloon v. Motor-Cars.

THE second of the series of competitions between a balloon and a number of motor-cars took place on Saturday at the Crystal Palace; the automobile which succeeded in keeping the balloon in sight and arriving at the point of its descent within half an hour of its return to earth being regarded as having captured the balloon and its despatches. The balloon was a new one—the "Graphic"—owned by Messrs. Spencer Brothers, this

being its maiden trip. Its capacity is 45,000 cubic feet. Mr. Frank Butler, who was in charge of the balloon, was accompanied by Miss Vera Butler, Mr. C. F. Pollock, and the Hon. C. S. Rolls. The balloon envelope is of white oiled silk, designed to make it as nearly as possible invisible against the sky. There were nine competing cars, including Mr. Mark Mayhew on his new 24-h.p. Pascal car. A start was made at one o'clock, the balloon at once rising to an altitude of 400 ft., where a breeze was found which took it in a south-westerly direction. The cars started simultaneously, and following the course of the balloon as it drifted over Lower Sydenham, Mr. Warren Smith, on his Argyll, early took a foremost place in the pursuit. In the neighbourhood of Epsom the balloon took a south-western course, and the pursuit lay by the road to Oxshott. The conditions were now beginning to favour the aeronauts. A thick mist was forming about 300 feet above the earth, and through this the balloon could only be seen dimly, when fairly close at hand. Near Oxshott a stag, hunted by the Surrey staghounds, suddenly crossed the road with the field in full cry. Mr. Warren Smith would not cross the scent, but waited for the hounds and horsemen, and the balloon was out of sight before the field had passed. At Leatherhead the balloon was reported to have sailed towards Bookham, and at Bookham it was alleged to have travelled towards Guildford, for which town the motorists made. About nine o'clock on Saturday night Mr. Butler

telegraphed:—"Descent 4.50 near Basingstoke. Car kept with us till Guildford." The balloon on this occasion, favoured by the mist, thus succeeded in eluding its pursuers.

Motor-Cars in South Africa.

IN previous issues we have referred at some length to the increasing use to which motor-cars are being put in South Africa, their efficiency as aids to business now being generally recognised by merchants. In addition to the several public services which have already been established at Cape Town, Johannesburg, Pretoria, and other centres in South Africa, a company has lately been formed at Bloemfontein under the style or title of the Orange River Colony Motor Bus Co., Ltd. Mr. E. Hoehne, the manager, informs us that he has already imported the first three cars, each of 6, 8, and 12-h.p. respectively, thus enabling the town service to be started early this month. Other services to outlying districts are to be established from time to time as occasion requires. Messrs. Winch and Co., another Bloemfontein firm, have, according to the "South African Export Gazette," lately imported two cars of 6 and 12-h.p. respectively, and a further two, each of 20-h.p., are now on the water.

Numbering.

A THOUGHTFUL contribution lately made to the discussion now progressing with regard to the proposed legislation concerning motor cars comes from Mr. J. S. V. Bickford, of Camborne. He says:—"The proposed alteration has been suggested by users of high-powered, fast cars, and if they want the twelve-mile limit abolished at the cost of carrying a number, I would suggest that they arrange the alteration so as not to include small, light-powered cars. All car owners would like to see the ordinary furious driving clause substituted for the twelve mile limit, but certainly not at the cost of a number. I have heard it stated that the motor man objects to the number because he wants to drive fast. This is untrue. Were I the user of a 40-h.p. Panhard and desirous of travelling at fifty miles per hour, I should not care in the least for a number. All I should have to do would be to clean it with a little oil before starting out, and in five minutes it would be as easy to read the name of a street in a London fog as to read the car number through the layer of dust. It is not the users of high-speed cars that this alteration is going to affect, but the users of small cars for business purposes. A man who drives at very high speeds as a general rule does not care much for appearances, and in consequence I do not suppose that numbering would prejudice the sale of such cars at all, but I am really afraid that it will be a very serious matter for cars like the light Benz, the Locomobile, etc., which are used by professional men in business, etc.; and it is for these cars that the Legislature should cater most carefully, because in a few years' time, in the nature of things, there will be fifty such cars to one really fast car."

Automobiles for Electrical Engineers' Use.

ONE of our electrical contemporaries considers a motor-vehicle will be in the near future a necessary part of the equipment of every up-to-date central electric lighting station. The uses to which a car could be put are so numerous—to say nothing of the saving of time effected by its employment—that the engineer would wonder how he previously could have got along without one, or with only a bicycle. Where an electric supply area is scattered over a large district, journeys of inspection take up a considerable portion of valuable time, and as the station man is invariably wanted in a hurry, some mechanical means of transport would not only save time and fatigue, but would enable a closer watch to be kept upon works being carried out in outlying portions of the district, and permit calls to be made with greater frequency and promptitude. Here and there the advantage of the motor-vehicle is being grasped by electrical engineers. Mr. Edmund Hill, general manager of the South Wales Electrical Power Distribution Company, is using a steam car,

and finds it of great service in making calls in the electric supply area, comprising 1,034 square miles, under his control. In America the Hartford Electric Light Company, of Hartford, has had an electrical runabout in use for over two years. It was found that the vehicle greatly increased the scope of personal inspection of the company's work going on in different parts of the town. More recently the company has purchased an additional runabout for the use of the foreman of line construction, an electric delivery wagon, and a large electric emergency wagon for general utility and "trouble business."

A New Suggestion.

ORIGINAL, and yet supported by pointed arguments, is the theory of Dr. Lee H. Smith, the retiring president of the Buffalo Automobile Club. He considers that it is the slow speed at which horse-drawn vehicles are permitted to go that makes the streets of a city dangerous. He believes that the law and the coachman should, in a way, be whipped up. A bicycle or motor-vehicle that has to tarry because of an obstructing cab

built by him at that time for experimental purposes, and which is still doing regular work. In this motor the clearance space was cut down very considerably below that calculated for sea level conditions, with a marked increase of power. The same gentleman also raises an interesting question with regard to electric ignition. Since the spark ignites the mass of mixture immediately surrounding it first, and the resultant flame must be propagated throughout the entire mass before complete ignition takes place, he considers that several sparks occurring simultaneously at different points in the explosion chamber would be more effective than anything yet devised, especially in high speed motors. This idea occurred to him over a year ago, and is the foundation of some experiments at present being carried out.

The Starley Memorial.

THE negotiations which the J. K. Starley Memorial Fund Committee have had under their consideration for some time back have now taken a definite shape, and the form of the memorial has been settled. Firstly, a small bust of J. K. Starley will be erected in a Coventry institution. Secondly,

SIR JOHN THURSBY, BART., THE PRESIDENT OF THE BURNLEY AND DISTRICT AUTOMOBILE CLUB, ON HIS 7-H.P. TURRELL VIBRATIONLESS CAR.

or brougham becomes a danger not because bicycles and motor-cars go fast, but because the other vehicles move so slowly that there is congestion of traffic when the faster ones catch up. Dr. Smith's theory is that the regulations should not only fix a speed that is compulsory with regard to limit, but also a minimum speed that must be maintained, due regard being had, of course, to street crossings.

Effect of Altitude on Petrol Motors.

AN American motorist, whose scene of operations is several thousand feet above sea level, furnishes some interesting particulars with regard to the effect of altitude on the power of petrol motors. In the first place he points out that a motor which shows a certain compression at sea level will not, if carried to a higher altitude, show so high a compression, and the loss will increase with the height above sea level to which it is carried. The cause of this is obvious. Since the piston displacement is constant, a full charge of rarefied air, when compressed, will not register as high a gauge pressure as would air of greater density. The remedy for this loss of power was provided by the motorist in question nearly five years ago in a motor

a technical scholarship for "Road Locomotion" at Birmingham University will be founded. About £1,600 is required, and already the Committee have about half that amount. The scholarship will cover all the University fees, and the University authorities guarantee that while the study of matters pertaining to cycles will have a most prominent place in the Road Locomotion course, the studies will be so arranged that the scholar will receive a thorough training in mechanical engineering.

Ten Miles an Hour!

THE proposals of the Yeovil Rural Council are still engaging attention up and down the country. St. Asaph Rural District Council have discussed the proposal, and have decided to support it, notwithstanding that one member drew attention to the fact that the imposition of unreasonable regulations would have a tendency to drive the motor-car industry out of the country. The Gainsboro' Rural Council have also decided to support Yeovil, but not without some discussion. One member, Mr. Bradshaw, who is also a motorist, considered the motion ridiculous, and remarked that when George Stevenson invented

locomotives to go twenty-five miles an hour people thought the same about them as was thought about motor-cars to-day. Whatever the Council did, it would, in his opinion, be useless, for the time was coming when the speed limit would be done away with altogether. To this Mr. Wells, an anti-motorist member, is reported to have retorted, "If they come round here I'll do what I can to see that the surveyor gives them a bit of road here and there that will stop their flying." We would suggest that Mr. Bradshaw takes Mr. Wells a trip on his car ere carrying his terrible threat into execution. It only needs a brief demonstration to prove to him that motor-cars and motorists are not the terrible beings that he imagines.

Bells Again.

THE Dover Rural District Council is another body which is following the Yeovil example, but only by the casting vote of the Chairman. The Council also decided to support the advocacy of the enforcement of a clause for compelling the sounding of a bell by light locomotives when within one hundred yards of a person on the highway, and also rendering it necessary to carry a distinguishing mark. The voting on the subject was close, the opposition wisely urging the authority not to assist in nipping in the bud an important industry. The Chairman's vote, however, closed a heated debate with the passing of the resolution.

An Absurd Proposal.

AT a meeting of the Settle Rural District Council last week, the circular from the Yeovil Rural District Council suggesting a reduction of speed limit of motor-cars from twelve to ten miles an hour was discussed. Mr. H. M. White said he was surprised that a District Council in the twentieth century should draw up such a circular. Compared with many other countries, England was twenty or thirty years behind in the matter of legislation relating to traffic. The idea of decreasing the speed was absurd. He supported the idea of numbering the cars, however. It was ultimately decided to support the numbering of cars only, and not a diminution of speed.

Parcels Delivery.

THE Manchester Tramways Committee is about to consider the adoption of a system of interchangeable parcels traffic, in connection with their trams. At present a similar system of parcel carrying is in operation in North Staffordshire. This was started about nine months ago, two hundred parcels being the weekly freight for the first month. Now five thousand parcels are carried every week, and the business is developing at a very rapid rate. It has occurred to us that this system of parcels carrying by trams might be more usefully extended where automobiles have been utilised by the tramway companies as feeders, not only for parcels, but also for passengers. In London, for instance, there are many important streets, leading on to the main thoroughfares where are the great tramway lines, from which passengers could be drawn away by a rapid service of motor-cars run in connection with the trams. In fact, the idea has no limitations when once it is considered, and we look forward to the day when the motor-car and the tramcar will often run in conjunction.

"No Prejudice."

IN the King's Bench Division, Mr. L. Reed has applied, on behalf of Mr. George Wilder, for a rule calling on Lieutenant - Colonel Wisden, chairman of the Worthing Petty Sessional Bench, to show cause why a writ of "certiorari" should not be issued to bring up a conviction by that Bench under the Light Locomotives Act, 1896, in order that it might be quashed. The matter arose out of a recent prosecution for alleged furious driving, and counsel alleged that

Lieutenant - Colonel Wisden had, in similar cases which had been brought before him, exhibited bias and prejudice against motor-cars and motor car drivers. In support of that view he read affidavits by Mr. Staplee Firth and Mr. E. M. Iliffe. After hearing counsel, Mr. Justice Wills said he did not think there was any ground for a rule. The chairman might entertain strong views, but there was nothing disclosed in the affidavits which indicated that he violated his judicial oath and decided contrary to the evidence, or which established that kind of prejudice which would interfere with a man administering justice. Mr. Justice Channell concurred, and the rule was refused.

New Political Questions.

A CORRESPONDENCE between the Secretary of the Automobile Club and Mr. E. Beckett Faber, M.P., enlivened the proceedings at a political meeting at Andover a few evenings ago; and it was evident, from the reception it met, that when ordinary controversies fail to entertain, the introduction of the motor-car to the political platform will prove a boon to the jaded legislator. Mr. Faber advocates that motorists should be licensed and their cars numbered. After three convictions offenders against the law should be imprisoned. The questions addressed to Mr. Faber received very explicit answers, and may serve as a guide to automobile hecklers in the constituencies. They were as follows:—(1) Whether you are correctly reported? (2) What foundation you have for the statement that a motor, if properly driven, is a dangerous machine? (3) How far you have been driven on a motor? To the second question the M.P. pointed out that motor-cars often negotiate sharp corners at high speed, and the third query brought a counter question, "Is it material how far I have been driven on a motor?"

ON Monday last, Augieres, on a 70-h.p. Mors car, succeeded in making a new kilometre record, doing that distance in 29 sec. dead.

IN our last issue the old address of the A.C.G.B.I. was inadvertently mentioned. The present club-house is of course at 119, Piccadilly, W.

BARON DE FOREST has become a member of the German Automobile Club, a step which is reported to be preliminary to his driving a Mercedes car in next year's Gordon Bennett Cup race.

WE regret to learn that Sir Francis Jeune, President of the Probate, Divorce, and Admiralty Court, and an enthusiastic motorist, has, in consequence of ill-health, been ordered to take a rest from his judicial duties. He is not expected to sit in court again until January.

MOTORISTS will be interested to learn that H.R.H. the Prince of Wales has now become an automobilist like his Royal father, having acquired an electric four-seated phaeton, which he has been using daily at Sandringham to attend the shoots. The carriage will travel ninety miles on one charge, and has a top speed of twenty-five miles per hour.

THE Imperial Tyre and Rubber Company, Limited, of Brooke Street, Holborn, E.C., who make a speciality of the repair of motor tyres, have just issued a price list for vulcanising new treads on worn tyres, etc. From the list we note that they return all tyres sent to them for repair that in their opinion do not justify, by reason of their condition, any further expenditure.

IN addition to the list given in our last issue, non-stop certificates are to be granted, if no protests are received, to the following cars which took part in the anniversary run to Oxford:—Mr. W. Acton's Renault, "Acme"; Mr. S. F. Edge's 16-h.p. Napier, "Australia," and Gladiator, "Viking"; Mr. A. Burgess's 12-h.p. M.M.C., "British"; Mr. C. Cross's 8-h.p. Humber, "Magician"; Mr. W. Maplebeck's Renault, "Mercote"; Mr. Instone's Daimler, "Petit Bleu"; Mr. Schwind's Daimler, "Redivivus"; and Mr. T. Gillett's Serpollet, "York."

BRITISH AND FOREIGN CARS IN THE RELIABILITY TRIALS.

THE mass of data included in the report of the recent Reliability Trials, gathered together at an expenditure of time and money only realised by those who took part therein, has now been for some weeks in the hands of those interested in automobilism, and will doubtless be used as a work of reference for some time (at least as time is counted in automobile progress) with regard to cars in which they are, prospectively or not, interested. Before, however, it becomes too ancient history, it may be worth while to extract a few general conclusions from the figures available, which, boiled down in this way, will appeal more to the casual reader than will the more undigested list of individual performances.

It is, of course, open to question how far the system of marking adopted adequately expresses the relative merits of the various cars, though there is substantial agreement among unbiassed critics as to the order of merit being fairly represented thereby, the inevitable element of chance being recognised. Experience, no doubt, will admit of this ideal being more nearly approached in future. Without, however, demanding this perfection in the data, some useful, if only approximately correct, deductions may be made from the figures given, and without making invidious comparisons between competing cars, the general averages of performance shown by home and foreign productions will be of interest, the more so as the differences, though slight, are to some extent in favour of English cars; while a summary of the time lost from different causes goes far to show the reliability of the modern motor. The only factors used for Table I. are the marks lost on the six running days; while for Table II. the h.p. as shown by performance on the hills, together with nominal h.p. and price, are employed. The steam car and the bicycle performances, we may add, are not considered in this article, in which petrol vehicles alone are compared, the forty-nine cars which completed, or nearly completed, the trials, and the thirty-five of which the hill-climbing data are complete, being used for the two tables. And here a word as to the rather unfortunate total of eleven breakdowns—eighteen per cent. of the petrol cars running. Of these the causes of three were not particularised, while four were due to broken gears or differentials, and two, if not three, to undetected flaws in important parts; three, also, were in new and not yet widely popular cars. The failure of gears—which are often made too light—and of differentials, which in addition are sometimes defectively provided for in the matter of lubrication, are the only points on which stress is necessary.

TABLE I.

Marks lost for	English Cars.	Foreign Cars.	Total.	Per Cent. of total cost by English Cars.
Ignition	328	283	611	54%
Hills	147	75	222	66%
Brakes	282	—	282	100%
Valves	10	22	32	31%
Clutch	49	75	124	39%
Pump	39	31	70	56%
Other Causes	381	260	641	58%
Tyres	60	30	90	66%

Referring to Table I. it will be seen that the causes of stops on the road other than those for filling up, lubricating, etc., have been divided into various heads, and the delays due to them tabulated under their causes. The cars available for this tabulation included twenty-four of British and eighteen of foreign (or chiefly foreign) make, fifty-seven per cent. being thus of home manufacture; nevertheless, in only three heads have they more than their share of misfortune, namely in stoppages on hills, brake trouble on the road (the brake tests are not here considered),

and tyre troubles. They are freer than the foreigners from ignition troubles, and very much above their rivals in the matter of valves and clutches.

The average cost of the cars respectively per h.p., both nominal and as calculated from the hill-climb, is shown in Table II., and though the formula for the latter is probably not very near the actual h.p. at the road wheels, it will serve for purposes of comparison, any error affecting all the figures alike. It must be remembered, however, that a heavy car is thereby credited with pulling up its own weight, and—in default of racing—it is somewhat desirable that the rules of road competitions should in some way or other put a sufficient premium on lightness; if the other conditions are sufficiently severe, durability will take care of itself.

TABLE II.
COMPARISON OF NOMINAL HORSE-POWER; AND ACTUAL HORSE-POWER AT ROAD WHEELS AS SHOWN BY PERFORMANCE AND COST.

From the performance of nineteen English and sixteen foreign cars.

ENGLISH CARS.			
Total value of English cars	£10,115	Ditto up to £500 value, 11 cars	£4,025
Total nominal h.p. ..	234	Ditto. nom. h.p.	108
Total actual h.p. as shown	101.5	Ditto actual h.p.	46.1
Efficiency	43%	Ditto efficiency	42.7
Average cost per nom. h.p.	£43.2	Cost per nom. h.p.	£37.1
Cost per actual h.p. at road wheels	£99.6		
FOREIGN CARS.			
Total value of foreign cars	£8,268	Ditto up to £500 value, 10 cars	£3,398
Total nominal h.p. ..	181	Ditto nom. h.p.	81
Total actual h.p. as shown	87.1	Ditto actual h.p.	34.81
Efficiency	48%	Ditto efficiency	43%
Average cost per nom. h.p.	£45.6	Cost per nom. h.p.	£41.9
Average cost per actual h.p.	£94.9		

From this table it appears that the foreign cars show forty-eight per cent. efficiency to the British forty-three (note that here no correction for number of cars engaged is necessary), while they cost £45.6 per h.p. as against £43.2; though when the actual h.p.'s are considered, the foreign vehicle costs but £94.9 to the British £99.6.

As a set-off to this, however, when the cars costing £500 or less are alone taken into consideration, the efficiencies of the rival products are nearly equal, 42.7 and 43 per cent., and the cost of the British car is only £37.1 against £41.9 per nominal h.p. It is true that if "cost of production" could have been substituted for selling prices, the figures would be less acceptable to the British maker; but, on the other hand, a much larger proportion of the English cars were comparatively new and untried productions, and the results are, on the whole, a credit to the strides which the industry has made at home, but which it must continue, and accelerate, if it hopes to improve, or at least maintain, its position. It is worth noting, as a proof of the reliability of the modern car, that the average of delays from the causes tabulated above, stops for filling and oiling excluded, amounts to less than forty-one minutes per car for the week, or less than seven minutes per day's run, and a stop for tyre troubles every other week.

MOTORISTS passing through Basingstoke will be able to obtain petrol from Mr. W. W. Webber, cycle and motor agent, he having arranged for a supply to be delivered by road.

DURING a debate on the Yeovil proposals at the last meeting of the Stansted Rural District Council Mr. Fane stated that he thought the suggested proposition was so reactionary that there was no chance of its being passed. As an owner of horses he did not like motor cars, but they must remember the great industry that they were opening up. He could not agree to reduce the limit to ten miles an hour.

MOTOR-CYCLING NEWS.

THE run on Sunday next of the Motor Cycling Club will be to Goring, meeting at the Marble Arch at 10.30 a.m.

HEREWITH is illustrated a new motor-bicycle stand, which is being put on the market by Messrs. Lake and Elliott, of Braintree, and which has been specially designed for testing and repairing. Motor-bicycles provided with two steps are held in the forks of the stand, while the hooks enable any motor-bicycle or bicycle, without a gear-case, to be firmly supported by the chain stays. The width is easily adjusted, and when folded up the stand occupies but little space. It is made of malleable iron and steel, and finished in aluminium bronze.

STARTING at ten o'clock on Tuesday morning, in bitterly cold weather, at the Crystal Palace track, F. W. Chase essayed the task of beating the world's record for six hours (212 miles 586 yards). Chase was successful in his attempt, and steering his Bat 2½-h.p. motor-bicycle splendidly from the outset, commenced establishing new records at 44 miles. From this point to the finish he continued to beat previous records, and at the completion of the six hours had ridden 228 miles 250 yards, with only having once left the track for about ten minutes. Continuing, he finished up his ride at 233 miles in 6hr. 7min. 31 1-5sec., to secure a hundred miles record. In this he was again successful, beating the previous best "century" by 7min. 14 35sec.

MR. A. LAVELLY, of Smethwick, Birmingham, sends us particulars of an ingenious driving arrangement he has devised for motor-bicycle propulsion. Instead of driving on to a light metal pulley attached to one of the road wheels, he drives directly on to the tyre of one of the wheels from the pulley of the motor by means of an endless band or chain which runs in a groove in the tyre. He has adapted his system to both front and rear driven machines. In the case of front wheel drivers he makes the front or steering wheel considerably smaller than usual, and lengthens the front forks to suit. The motor and driving gear are carried by the front fork immediately above the steering wheel. He prefers to drive directly on to the pneumatic tyre, and to enable him to do this and at the same time to keep the motor central with the front fork, the driving pulley on the crank shaft of the motor is arranged at the centre of the motor, the crank disc being a little at one side, with the connecting rod cranked to suit. The patent covers a number of variations of the idea. Mr. Lavelly is anxious to arrange with some firm to take up his new system.

A NEW motor-cycle belt has just been put upon the market by Messrs. E. and J. Richardson, of Newcastle-on-Tyne. The new belt is V-shaped, and not only are the tiers of chrome leather cemented firmly together, but an extra security is obtained by means of copper rivets.

It will be remembered that the allotment of the prizes in connection with the 5-miles motor handicap at Canning Town, on the 23rd August last, was withheld, pending the consideration of the claims of the various competitors by the Automobile Club. The delay in assigning the prizes in question had reference to Mr. Wright's disqualification as the winner, by reason of the erroneous description of the machine ridden by him. Mr. Wright's disqualification has been confirmed by that

body, and consequently the prize falls to Mr. W. Parry, who rode a 2½-h.p. Minerva. The minute also contains the following observation:—"The Committee were of opinion that competitors should understand from this example that the greatest accuracy must be observed in stating on the entry forms the measurements of their entries, and that no excuse for misstatements could be considered."

THE Ormonde Motor Company inform us that the 1903 "Kelecom" motors comprise an engine for single bicycles of 2½-h.p. with a bore of 70 mm. and a stroke of 75 mm.; one for tandems of 2½-h.p., having a bore of 77 mm. and a stroke of 80 mm., and a special light engine for use upon racing machines. The old form of exhaust lifter has been replaced by an improved system of lifting exhaust valve, at the same time automatically breaking the electric circuit. The valves are much larger, proportionately, than hitherto, and the exhaust port is also greatly increased in size to ensure a perfectly free passage for inert gases. Among the new fittings of the "Ormonde" motor-bicycle are a new design of tank, having a dial indicating the exact quantity of petrol contained in the reservoir, and longer levers for the control of the machine.

THE meet of the Liverpool Motor Cycle Club on Sunday last was at Walton Church. The day was fine but cold, so cold that one machine fitted with a surface carburettor caught a chill, and refused to go after a mile or so, until given a reviver in the shape of a bucket of hot water, externally applied. The roads past Aintree were very muddy, so it was decided to make for Formby, instead of Ormskirk, the run home being made without incident.

THE Princes Autocar Company, of Northampton, inform us that for the coming season the power of both their single and double-cylinder motor-bicycles has been increased. Their smallest motor is a single cylinder of 2½-h.p., made in two types, one with flywheels contained in the crank chamber, and the other with an outside fly-wheel. To secure smooth running and manageability they prefer two cylinders for motors over 2½-h.p., and for next year are introducing a 4-h.p. double-cylinder engine. The inlet valve, as well as the exhaust valve, is mechanically operated. Power is thereby increased and kept constant, as the volume of the carburetted gas taken in is always

THE PRINCES DOUBLE-CYLINDER MOTOR-BICYCLE.

in proportion to the desired speed of the engine. The carburettor, made almost entirely of aluminium and fitted with a throttle-valve for varying the supply to the engine, is of a new design. Its efficiency is proved by the fact that one carburettor will supply the two-cylinder engine equally well as the single cylinder. A neat exhaust-valve lifter, controlled from the handle-bar, is provided, and a double-chamber silencer effectually minimises the noise of the exhaust. Either belt or chain drive is provided as desired. The exhaust-valve lifter, current breaker, free engine clutch, and front and back rim brakes are operated from the handle-bar, all top-tube levers and rods or wires outside the tank having been dispensed with.

THE OLDSMOBILE CAR.

WE have already published a brief description of the car which has recently been introduced into this country by the Oldsmobile Company of Great Britain. As the vehicle comprises a number of novel features, a more detailed account of some of the latter will, no doubt, be of interest. The 4-h.p. engine is of the single-cylinder horizontal type, as indicated

FIG. 1.—PLAN OF THE OLDSMOBILE.

A, flywheel.	G, inspection lid.	M, brake and clutch pedal
C, crank chamber.	H, rotary pump.	shaft.
D, two to one gear wheel.	J, radiators.	S, epicyclic gear.
E, controller shaft.	K, starting handle shaft.	R, hand brake.
F, crankshaft.		Y, Motor.

in the general plan (Fig. 1). The whole of the engine and transmission gear is secured to a rectangular channel steel frame, which is carried on the two longitudinal leaf springs which form the side members of the frame. The usual high-tension electric ignition provides the firing spark. In Fig. 2 is shown a section of the carburettor employed on the car. The air enters the chamber through the pipe on the right and passes straight through it and out of the opening on the left. The petrol arrives by a small tube connecting on top of the device, and is fed into a conical tube of fine-mesh wire gauze. The flow of petrol can be regulated by means of a needle valve N. The air in passing around the gauze tube becomes saturated with petrol vapour and is then caused to flow through a throttle valve V operated by means of a foot lever through the intermediary of the bell crank B. The main petrol supply tank is fixed at a lower level than the carburettor, and any surplus petrol from the carburettor returns to the tank by gravity, as may be seen from Fig. 3, which illustrates the method of feeding the petrol.

Referring to Fig. 3, A is a diaphragm pump, one compartment of the diaphragm chamber of which is in communication

FIG. 2.—SECTION OF CARBURETTOR.

with the closed crank case of the motor. The other compartment communicates with a fitting in the petrol tank containing two ball valves. When the motor is in operation the diaphragm is vibrated in unison with the strokes of the piston by the suction in the crank chamber, and petrol is thereby pumped from the

main tank into an auxiliary tank B located higher than the carburettor. From this tank the petrol flows to the carburettor by gravity. The auxiliary tank B forms the upper part of a vertical cylinder extending down into the main petrol tank. A piston provided with a stem and handle is arranged in this cylinder, and the object of this arrangement is to allow the operator to pump petrol into the auxiliary tank by hand when starting.

FIG. 3.—PETROL FEEDING DEVICE.

From Fig. 4 it will be seen that both the inlet and exhaust valves of the Oldsmobile motor are mechanically operated. The cam shaft, which is operated by means of spiral gear-wheels, runs longitudinally with the engine on the exhaust valve side. Both valves are located in the head of the motor. The exhaust valve is operated by means of a single-armed lever, which is forked to

FIG. 4.—SECTION THROUGH VALVE CHAMBERS.

pass the admission valve. The latter is operated by means of a double-armed lever pivoted below the exhaust-valve.

The exhaust box (Fig. 5) is of special construction and singularly effective in eliminating the noise of the exhaust. The latter is delivered into the free space of the exhaust box, which is of ample dimensions, and it percolates gradually and slowly to

FIG. 5.—SECTION OF SILENCER.

the outside air through the two bent pipes which are perforated towards their ends on the left. The exhaust as delivered from the engine has adequate space to expand, and its passage to the atmosphere is slow and continuous. The cylinder of the engine is water-cooled and the water is pumped through a plain tube

radiator arranged in front of the car. The tubing of the radiator is arranged in two layers, and the connections to it are made by flexible piping, the water being pumped back from the rear end of the upper layer to the water tank. Two speeds forward and

FIG. 6.—AN OLDSMOBILE CLIMBING THE TEST HILL IN RICHMOND PARK.

reverse motion are fitted, working through epicyclic gears, the latter being brought into action by tightening band-brakes surrounding them.

THE annual dinner of the Aero Club of the United Kingdom will take place at the Carlton Hotel, London, on the 25th inst., at 7.30 p.m.

MESSRS. C. H. HAGUE AND COMPANY, of Ashton-under-Lyne, inform us that they are supplying Pratt's motor spirit in sealed cases, carriage paid, per rail, at their own risk.

A MOST enjoyable smoking concert was held by the Nottingham and District Automobile Club on Friday last week, when upwards of fifty members and friends were present. During the evening it was decided to make weekly club runs to Newark on each Saturday during the winter, the headquarters there being at the Ram Hotel.

THE Silent Motor-Car Syndicate, Limited, has been registered with a capital of £3,000 to adopt an agreement with Gearings, Limited, F. W. Dunlap, M. Crawford, and H. Brooks, and to carry on the business of engineers, motor, mechanically-propelled vehicle and engine builders, etc. The registered office is at 5, Warwick Court, Holborn, W.C.

THE Peerless Manufacturing Company, of Cleveland, Ohio, whose cars are being introduced into this country by the Petrol Motor Power Company, showed for the first time last week to the members of the Cleveland Automobile Club the 40-h.p. racing car of the type they propose entering for the Gordon Bennett Cup race next year. In design and construction the car is said to be very similar to the Mercedes.

IN connection with the torchlight procession at Birmingham, on Monday last, organised in honour of the Right Hon. J. Chamberlain, on the occasion of his departure for South Africa, the Wolseley Tool and Motor Car Company supplied one of their 7½-h.p. cars for the use of Mr. Jenkins, the chief marshal of the procession, to enable him to visit the various points along the route. The car started work at 5 p.m., and went on till 12.30 a.m. the following morning without the slightest trouble; in fact, the motor was kept running throughout the whole of this time. In addition to aiding the chief marshal in his task, the car also proved its usefulness for ambulance work. During the crush at Cannon Hill Park, a woman was badly trampled on; the car was promptly requisitioned, and conveyed the injured woman to the hospital.

KNOWLEDGE IS POWER.

ONE of the most disagreeable features of a motor trip through a new country away from any large town or city is a breakdown where there is no one in the neighbourhood who seems to understand the first principles about mechanics. The amount of dense ignorance shown even by some workmen in country repair shops is appalling. A trifling accident to an automobile may often be repaired by a skilful workman within half an hour, while a bungling mechanic will work hours at the job and do no good. The driver of a horse-drawn conveyance has any number of repair shops and horse-shoeing establishments scattered all along his route where he can apply for assistance if anything happens to either horse or equipage; but the automobilist is much like the mariner who starts out on an ocean voyage. He must depend upon himself for all repairs, and if he cannot do this he may be stranded at any moment without hope of immediate help. Until adequate repair shops are scattered over the country, it should be the purpose of every owner of an automobile to thoroughly familiarize himself with every part of the mechanism of his vehicle, so that he can make ordinary repairs on the road himself. It is for this purpose that a kit of tools should always be carried with the vehicle, and if one understands how to use them he will be as independent as the aforesaid mariner on the high seas.

The average bicycle rider who makes a long tour through the country carries with him a full knowledge of the construction of his machine, and with the few simple tools in his bag he can make almost all ordinary repairs to the machine or tyres. There is no good reason why a motorist should not be equally well equipped with a knowledge of the working mechanism of his conveyance. A few instructions from an intelligent motor mechanic, considers the "Automobile Magazine," will enable an ordinary man to do his own repairing in an emergency. There would be fewer accidents and breakdowns on the road, and far less troublesome experiences in isolated regions, if every owner learned the lessons of handling his vehicle thoroughly. More than this, a mechanical knowledge of the driving and operating part of a car would prove a distinct advantage to any owner who wished to get the best out of his purchase with the least possible amount of wear and tear. There is such an important relationship existing between the life of an automobile and its daily handling that the question should be considered by every owner of a motor-car. If one trusts the driving of his car entirely to a servant it should be ascertained beyond doubt that the man is thoroughly competent not only to drive the vehicle skilfully, but to take it apart and put it together again.

There are only a few levers and wheels to manipulate in driving an automobile, and one can in a short time easily become quite expert in handling these. The vehicle can be made to go slow or fast, and to turn sharp corners with comparative ease. One may even become expert in dodging vehicles and pedestrians while proceeding at a fair speed. But such efficiency should not constitute the full lessons of the motorist who intends to drive the car himself. There should be a comprehensive understanding of the nature of the whole mechanism.

MESSRS. F. BERNARD AND COMPANY, of Paris, have just published a bulky treatise on electricity from the pen of M. C. Sarazin. It is the second edition of this gentleman's "Cours d'Electricite, Theorie et Pratique," and deals with the subject in a most exhaustive manner.

M. ARCHDEACON, a well-known French motorist, has raised in a Paris court the question whether identification by number, taken while a car was in rapid motion, according to the accusation, was sufficient proof to justify a conviction. What is more, he has won his case, as the judge held that there was too great a chance of error. This admission will support the views of those who object to the numbering of motor-cars.

FROM NORTH TO SOUTH.

B EING a medical man, and concluding, after much deliberation and calculation, that a motor-car would answer my purpose much better than two horses and carriages, I determined to set about getting one. I need not say that I was quite ignorant on the subject. First I consulted my friends who motored as to the best kind of car to get, and found myself let in for long lectures on the merits and demerits of petrol, steam, electricity, belts, chains, gear, one cylinder, several cylinders, and hundreds of other things, including flying machines. I was lectured on the enormity of motorists and inundated with papers containing accounts of serious motor accidents—that they were all relating to the same accident mattered not—marked in thick red ink.

My hair grew white and I was told I wore a worried expression, so I gave up my friends and in a weak moment bought a book of horrors—I will mention no name—but the diseases of motor-cars are tabulated. Alas! I had indeed wandered from purgatory to Hades. I could not sleep and I was rapidly getting bald—I shunned society because I felt sure my expression was becoming idiotic. I went to the Show at the Agricultural Hall, and felt that an asylum was the only fit place for me. But relief came at last, for I found the *Motor-Car Journal* and read the advertisements, sat down, and wrote for particulars of all the British-made cars. It was the postman now who wore an overworked look. I was improving.

I waded steadily through the mass of literature that poured into the letter-box, and finally decided to get a gear-driven machine, and as funds were somewhat limited, a one-cylinder engine. Living, as I do, in a very hilly place, it was necessary to get a good and fast hill-climber. In the end I decided to purchase an Argyll 8-h.p. one-cylinder car, and gave the order. Owing to the courtesy of the manager of the Bexhill Motor Company, I was able to get four lessons in driving, and to study the anatomy and physiology of the machine. In a very short time I considered I knew something about it.

The Argyll cars being made in Glasgow, I imagined I could arrange for a nice holiday in Scotland by going to fetch the car and driving home to Hastings. I wrote to a friend asking him to accompany me and fixed it all up in no time. Unfortunately my friend knew less about motors than I; he had never driven one, and had only once set foot in a car. We reached Glasgow, went to the works and arranged with Mr. Govan, the manager, for one of his men to drive us to Helensburgh the next day. At Helensburgh we arrived all right, although it makes my hair stand up now when I think of the way we pushed and wriggled through the thick of the Glasgow traffic at its most busy time.

The man returned by the next train and we felt very much alone in the world. The next morning two tired, weary men, with a haunted look on their faces, might have been seen cautiously steering a motor-car along the main street of Helensburgh. Had they been questioned they would have said they hoped to go to Arrochar along the side of Loch Lomond and back by Gareloch Head. Unfortunately we missed the turn, and found ourselves confronted by the well-known Whistlefield Hill. We stopped "just to ponder and think," and having smoked our pipes, decided to go on; the car was quite of the same mind but refused to go up the hill on its third speed; it just jerked the lever out of the driver's hand, stopped and commenced to run back. A speedy application of the brake stopped its downward and backward career.

Again we pondered and thought, this time with the boards out of the bottom of the car; we soon found that the clutch, driven out by the pedal, had stuck. Once more what we are pleased to call our brains began to work to find out the cause, the effect we kenn'd right well. Oil—did someone say oil?—good idea, let's try; we filled the oil cup. The day seemed to have suddenly become very sultry. We started the engine with the lever in the "off" notch and watched; slowly the clutch returned, we put down the pedal, and, joy, the thing worked perfectly.

Having once more reduced the car to a proper frame of mind we went for the hill and got up gaily, down the other side, and along by Loch Long—an "awesome and fearful" road for a beginner—a narrow road like a twisted switchback, cliffs on one side and a drop into the lake on the other; to the driver there seemed to be at most six inches on either side. However, we reached Arrochar all right, and came back by Loch Lomond, and mighty proud we were of ourselves! I took the opportunity of giving my friend a lesson in driving. The next day we did another successful little run round the south of Loch Lomond and decided to start for home on the morrow. In the morning we started with the intention of keeping on the west side of Loch Lomond, and hoped to reach Callander. At Crianlarich Hotel we stopped for tea, and the rain began gently at first; but ere long it just rained and rained, so we went to a place with an appropriate name—to wit, Killin—and stayed the night there to dry.

Next day we went to Callander and the Trossachs, intending to get round to Aberfoyle, but the Duke of Montrose intervened. After twelve miles of the worst possible road and the worst possible rain we found his Grace would not allow motor-cars through, because a horse of his had once been frightened by one, so we sadly retraced our wheel marks and put up for the night at Callander. In the morning we started, still rather moist, passing through Stirling, reached Lanark, where we decided to

MR. H. G. L. ALLFORD ON HIS ARGYLL.

stop to dry ourselves, we having driven all day through a deluge. I have never seen the like out of the tropics. Waterfalls down one's back are pleasant for a short time, but five or six hours is too much. The next day we reached Penrith, having spent a few hours in Carlisle.

From Penrith we journeyed by Ullswater along another twisted switchback to Patterdale, and on over the Kirkstone Pass, up a hill about four or five miles long having an average gradient of one in eight, and down another about six miles long, to Windermere, thence through Kendal to Settle, where we put up for the night. From Settle we went to York, York to Grantham, and Grantham through Deeping and Peterborough to London, making that day's run about 120 miles. In London my friend left me, and I went to Oxford on the following day, alone, climbing Dashwood Hill on the way. At Oxford my wife joined me and we went on to Shipton-on-Stour, and stayed with friends at a pretty little village called Honnington. The following day four of us drove in the car to Warwick and back by Stratford. The day after we started for home through Oxford, reaching Hastings on the third day, having stayed at Wallingford and Reigate. The machine had done about 900 miles, and, excepting the clutch trouble, we had no breakdown of any sort, not even a puncture. I cleaned the valves when I reached home and the car has gone perfectly ever since. I use dry cells for the electric ignition.

H. GEORGE L. ALLFORD.

THE BAKER ELECTRICAL CAR.

THE accompanying illustration shows the little electrical runabout, the latest production of the Baker Motor Vehicle Company, which is being introduced into this country by Mr. Samson Parsons, of Darlington. The vehicle is not intended for touring purposes, but for making social or business calls, and general runabout purposes, instead of using horses, in large towns. The battery consists of twelve cells of 2 volts each, which are charged to 2·65, giving a total, roundly, of 32 volts and 100 ampère hours, which is stated to be sufficient to run a distance of forty miles on good level roads. The motor is of the modern multi-polar type with special windings adapted to the Baker exclusive system of control, which will, it is claimed, stand any load the battery will furnish without burning out. It is ball bearing throughout, as is also the countershaft by which the power is transmitted. The controller is situated at the operator's right hand, and gives three speeds of 6, 11, and 14 miles per hour, both forward and backward. It also acts as a brake, and has a push button in the end of the grip for ringing the bell. The frame is of tubular construction, the motor being supported

THE BAKER ELECTRICAL CAR.

at about the centre and driving directly a countershaft connected with the rear axle by a centrally-located chain. In addition to the hand brake which is used in ordinary traffic, there is a foot-brake which is claimed to be powerful enough to lock the car on any gradient; both brakes are effective both forward and backward. The wheels are of the cycle type, shod with Palmer single-tube tyres. Mr. Parsons has had one of the Baker vehicles in use for some time in Darlington, where, by reason of its quiet and easy running, it has attracted considerable attention.

MESSRS. ROOTS AND VENABLES have concluded arrangements with Messrs. Sir W. G. Armstrong, Whitworth and Company, Limited, Newcastle-on-Tyne, whereby the latter will in future build the Roots heavy oil cars.

At the last meeting of the Executive Committee of the A.C.G.B.I., it was agreed that the association of the names of official timekeepers of the Automobile Club with events which are not approved by the Club is very undesirable, and that the official timekeepers should be informed that their appointment can only hold good in the event of their agreeing not to act in connection with automobile events which are not held under the auspices of the Automobile Club or of affiliated clubs.

CONTINENTAL NOTES.

BY AUTOMAN.

THE "ballon Jaune," or in other words the flying machine, of the Brothers Lebaudy, cut its moorings and started its first free manoeuvres at Moissons, on the banks of the Seine, last week. Altogether four ascents were made, and in each one there was a crew of three aboard. The success was even greater than that of the week before, when it manoeuvred with the guide ropes held continuously from the ground. The most notable feature of the flight of this new "steerable balloon" is the fact of the total absence of rolling or pitching. It is said that a speed of twenty-five miles per hour was attained with only one of the fans working, that is to say with half the power of the motor. During the last flight the steering gear gave way through too sharp a curve being taken, but notwithstanding this slight accident the air-ship was able to come back to the Aerodrome and land without any difficulty.

THE Lebaudys have placed at the disposition of the engineers in charge of the construction of the machine such ample means that no experiment is neglected and no effort spared to advance the science of aeronautics, and it may be easily foreseen that most interesting developments will be the result of this venture. It is intended to make a trip from Moissons to Mantes, and then the balloon will be housed for the winter. In the spring time the Parisians may expect to see it appearing over their heads, and it will no doubt be entered for the Santos Dumont prize, which still remains unchallenged.

THE rain of records still continues on the Dourdan track, and in almost every official category there is a new record holder. In the voiturette class under 400 kilos. (7 cwt. 3 qrs. 14 lbs.) Thellier on a four-cylinder Passy-Thellier last week covered the kilometre in 36 1·5 seconds, and the mile in 58 seconds. Deryn on a four-cylinder Clement motor-bicycle did the kilometre in 33 1·5 seconds, and the mile in 1 minute 52·5 seconds. In the heavy car class Fournier's mile record did not last a week, for Augieres on a 70-h.p. Mors car did the mile in 46 seconds, attaining a speed of 125 kilometres 874 metres per hour, the highest rate attained (a little over 78 miles per hour). Strange to say, however, in attacking the kilometre record, the best Augieres could do was 29 2·5 seconds, or 1·5 of a second longer than Fournier. In the light car class, Thery on a Decauville did the kilometre in 30 seconds, and the mile in 48 2·5 seconds, establishing two new records.

In the issue of the *Journal* of November 1st, I quoted from the *Chronique de Bruxelles* a circular letter said to have been sent by the A.C.G.B.I. to all the Continental clubs except the A.C.F., proposing a united action to revise the international racing rules by the introduction of six alterations. I am informed that this proposition was brought directly before the notice of the Committee of the A.C.F. in a letter from the A.C.G.B.I. at its last meeting, and that the A.C.F. have decided not to introduce the proposed alterations.

THE author of the new proposition with regard to the Paris-Madrid race is the Marquis de Dion, who in bringing it forward proposed the following rules:—(1) For the Paris-Madrid race there shall be established a commercial classification, the basis of which shall be no longer the speed of any individual car. (2) In order to obtain a commercial classification of types of vehicles entered the results shall be judged by the behaviour of all the cars of one type entered. (3) That five cars shall constitute a series. (4) That the speed of the series over the whole distance shall alone count in the final result. (5) That the commercial classi-

fication shall, therefore, be established as follows:—(a) For cars covering the whole distance the total time shall be calculated as herebefore. (b) That for cars which break down their time shall be taken from the last control passed before they break down, and that after that they shall be penalised by a time representing 10 or 6 kilometres per hour to the end of the race.

THE following is the translation of an advertisement which appeared on the fourth page of the *Temps* (the largest Paris daily) on November 14th last:—

“IMPORTANT NOTICE.

“Doctors, stockbrokers, people in a hurry, don't buy automobiles whose pace is limited to twelve kilometres an hour by municipal bye-laws. Buy good horses that can trot the kilometre in two minutes. The speed of animal traction is not limited. A big arrival of trotters will be announced shortly.”

BEFORE the Federal Chamber of Switzerland there is at present a project of a rather drastic measure to be taken against offending *chauffeurs* guilty of furious driving. The idea is to treat them in the same manner as assassins or robbers, and lock them up “on sight” pending an examination and trial. Needless to say the Automobile Club of Switzerland is taking steps to oppose this insane proposition.

THE Paris Automobile Exhibition in the Grand Palais opens on Wednesday, December 10th, and lasts until Christmas Day. There has been such a big demand for space this year that all the stands have had to be cut down in size. The principal spaces have been balloted for and arranged, and the minor spaces are now being divided. There will be many novel attractions provided to interest visitors, and conferences and lectures will be delivered on automobile topics.

RYDE MOTORS, LIMITED, has been registered with a capital of £6,000, to adopt two agreements with F. W. E. Ryde and an agreement with R. W. Vining, and to carry on the business of engineers, etc.

MOTORISTS should note that they are not welcomed at hunting meets—at least not unless they leave their cars at home. Such an intimation is now given on the fixture cards of the Essex Hounds.

THE Executive Committee of the A.C.G.B.I. have decided that in the new motor storage of the Club in Down Street, W., there shall be erected a weighbridge, on which motor-vehicles may be weighed.

THE Albion Motor-Car Company, Limited, are erecting large new works at Scotstoun, near Glasgow. The ground is three acres in extent, and the buildings are being erected on the one-storey principle. The new works are expected to be ready for occupation in April next.

A SUGGESTION from the Yeovil Rural District Council that the speed of motor-cars should be limited to 10 miles an hour was received with laughter at the meeting of the Rural District Council at Lincoln. The chairman remarked he understood one Council had gone further than Yeovil and recommended (perhaps ironically) that each motor-car should be preceded by a steam roller and the steam roller by a man carrying a flag. The letter from Yeovil was allowed to lie on the table.

ON Friday last week, the Great Central Garage, Limited, submitted one of their 9½-h.p. double-cylinder “Earl” cars, recently illustrated in these columns, to the 100-mile non-stop trial on the Oxford road of the A.C.G.B.I. Notwithstanding the bad condition of the roads, the 100 miles was made without a stop. We are informed that the speed up Dashwood Hill was at the rate of twelve miles an hour, and up Aston Hill, on the return journey, eleven miles. The consumption of petrol for the whole run was 4 gallons 1 pint, and of water only 1½ pint. Having in view the fact of the conditions under which the test was made, the performance is undoubtedly a noteworthy one.

THE BROWN ELASTIC WHEEL.

THE illustrations show two views of a new elastic wheel invented by Mr. J. Brown, F.R.S., of Belfast, and described by him at the recent meeting of the British Association in that city. Mr. Brown pointed out that in most forms of elastic wheels previously suggested the connections of the spring spokes to the hub and rim were made by some jointed arrangement expensive to make and maintain, and with the fatal drawback of entailing much friction on these joints every time the wheel revolved. As much as ¼-h.p. per wheel was found to be absorbed by this friction, in one case, at quite a moderate speed. If, to avoid all this, the ends of the spring spokes were rigidly attached to hub and rim, in the hope that their elasticity would answer the purpose of joints, it was found that, in the displacement of the hub relatively to the rim at every revolution, the bending stress was chiefly concentrated at the points of attachment and very soon caused fracture at those points.

In the new wheel, while the spring spokes are bolted rigidly to the hub and rim, thus avoiding joints, fracture at the points

of attachment is also avoided by a gradual widening towards the ends of the steel strip from which the spring is made. In this way the stress is spread over a foot or more of the steel. The outer ends of the springs are bolted to castings fixed on the steel rim (one of the Buffer tyre rims is used). Their inner ends are passed between a dished ring and the hub. In case there be any slight difference in the strengths of the springs the small split wedges in the slots in their inner ends are used to true up the wheel on an axle. After trueing up, these inner ends are clamped under the dished ring. Sideway stability of the wheel is obtained by the alternate diagonal placing of the springs. A load of 11 cwt. depresses the centre about 1½ in., and under this load it has been tested at speeds up to about twenty miles per hour without any sign of giving way.

The advantages of the wheel are cheapness of construction, no loss of power from friction, as in the ordinary leaf springs or in jointed spring wheels, with strength and durability.

AMONGST the latest purchasers of the 20-h.p. Georges Richard light cars are Count Zborowski and Mr. William Younger, M.P. Mr. Younger's car is of the Lonsdale type, to seat four. It is fitted with a four-cylinder engine with a special throttle for each cylinder, making the car very silent for its power. Magneto ignition only is fitted, following the latest practice.

HERE AND THERE.

MR. C. F. ENNIS has started business on his own account at 47, Chancery Lane, W.C., as a registered patent agent.

THE Automobile Club has decided to erect danger boards at Wansford, on the main North Road between Oundle and Peterborough, and at each side of Brixworth Corner, Northamptonshire.

THOSE motorists using the Great North Road will find a plentiful supply of petroleum spirit at the Ivel Works, Biggleswade, Mr. Dan Albone having arranged to convey spirit down by

road until the difficulty with the railway companies is settled. The accompanying illustration shows the Ivel agricultural motor with van and lorry attached, loaded with cases of motor spirit.

THE Belsize cars of Messrs. Marshall and Company can be seen and tried in London by arrangement with Messrs. Rawlings Brothers, Limited, 165, Sloane Street, S.W.

THE Executive Committee of the A.C.G.B.I. has decided that no motor vehicle records shall be taken by the official timekeepers appointed by the A.C.G.B.I., unless notice be given at least ten days previous to the date, and giving the place and time at which the run is to be made.

ON Sunday last the new 10-h.p. Sandringham car with solid rubber tyres, built by Mr. Frank Morris, of King's Lynn, successfully mounted the famous Gass House Hill, near Norwich, from a standing start. The hill in question is well known in the Eastern Counties for its steepness, and so far as we remember has only hitherto been scaled by the 70-h.p. Napier and a Locomobile.

To overcome the difficulties experienced with the condensation type of lubricator as applied to steam carriages, Weston Motors, Limited, are introducing a new type of positive feed lubricator, which is claimed to ensure absolute lubrication to the cylinders at all times, and under all circumstances. The lubricator, which is now being fitted to all Weston steam cars, consists of an oil reservoir directly connected to a small feed pump, the flow of which can be graduated to a nicety; this small pump works directly off the engine. The advantages of this system will be apparent, for, when the engine is at rest, the lubricator does not work, and the faster the engine runs, the more oil is fed to the cylinders. Apart from the increased smoothness and running efficiency of the engine, Messrs. Weston claim to obtain a saving of 50 per cent. in lubricating oil, owing to the entire elimination of waste. The lubricator holds sufficient oil for a run of more than fifty miles, and an advantage which will be appreciated by drivers is the fact that it has a 3-inch opening for filling, and that not being under pressure it is perfectly cold. It may be mentioned that the new lubricator can be fitted to existing Weston cars without trouble, and at a very small cost.

AN automobile club has just been formed at Wurzburg, Germany.

THE Mors Company has already entered four cars for the Nice week.

THE members of the Yorkshire Automobile Club will hold a run to Harrogate to-day (Saturday).

THE Works Committee of the Hull Corporation are discussing the question of adopting an electric motor fire engine.

AT the Newbury County Police Court, Thomas Homyer was fined £1 for driving a motor-car without exhibiting a red light in the rear.

To enable the police to check the speed of motor-cars the East Sussex County Council has decided to purchase, at a cost of £14, a battery and other telephone appliances.

MR. W. WORBY BEAUMONT is to give a series of four lectures on Mechanical Road Carriages to the Society of Arts, in April and May next.

THE Gainsborough and Hoole Rural District Councils have decided to support the Yeovil Council's proposals to reduce the speed limit of motor-cars from twelve to ten miles per hour. On the other hand, the Pershore and Grantham Rural District Councils have decided to let the communication lie on the table.

THE Irish Motor Company, Limited, has been registered with a capital of £2,000, for the purpose of establishing, acquiring, and carrying on in the United Kingdom the business of manufacturers and dealers in all sorts of cycles and motors, and to acquire by purchase the business of John R. Evans, 12, South Avenue Street, Dublin, and the goodwill thereof.

THE great increase in the number of automobiles in New York has brought about a condition of affairs which has an interesting and important bearing on the industry. Automobile storage stations, as a rule, have all the vehicles they can care for, and still the number of cars increases rapidly every day. To meet this demand a number of new garages are about to be opened. It is difficult, however, to find properties that answer all the requirements for a successful garage.

A 20-H.P. DECAUVILLE AT THE RECENT FRENCH MANŒUVRES.
(Le Chauffeur.)

AUTOMOBILE COMPONENTS, LIMITED, have sent us a copy of the new catalogue they have just issued, in which considerable space is devoted to the set of components of which they are making a speciality, and which enables small motor-car makers to turn out a little two-seated vehicle at the low price of 105 guineas. The engine is of 3½-h.p., and alternative designs of motor at the front or rear are supplied. The list gives illustrations and particulars of the various parts which form the set, as also details of a 6 to 9-h.p. set, change-speed gears, bodies, motor-bicycles, launch motors, carburetors, etc.

MESSRS. W. E. CLARK AND COMPANY ask us to mention that they can supply petrol to tourists at the usual price at their North Road and Station Road Depots, Doncaster.

AMONGST the most recent applications to the Turkish Government is one by the Ottoman Vice-Consul at Genoa, who proposes establishing a service of motor-omnibuses at Mitylene.

MESSRS. SALSURY AND SON, LIMITED, have just issued a very complete retail catalogue, in which particulars and illustrations are given of the many forms of motor lamps, horns, and other accessories they manufacture.

MESSRS. RICHARD LORD AND COMPANY, of Sudell Works, Blackburn, who appear to be laying themselves out to cater for the wants of motorists in their district, have just issued a very handy little list of motor-car accessories.

MESSRS. SCAIFE AND PEARSON inform us that they are making arrangements to shortly open a motor garage and repairing depot in York, under the title of the York City and County Garage and Motor Agency. The premises will be situated near the market place in the centre of the city.

FOR the 1903 season the Speedwell Motor and Engineering Company, Limited, are introducing the new 9-h.p. car shown in the accompanying illustration. The vehicle is being manufactured to their order in France, and is fitted with a 9-h.p. De Dion engine located under a bonnet in the front of the car. It is provided with water circulation by syphon, radiators round the bonnet, De Dion carburettor, and electric ignition. The power from the engine is conveyed through a cone clutch to a speed-change gear of the Panhard type, except that the top speed drives direct. This gear gives three speeds forward and one reverse, operated by a single lever. From the gear box the power is conveyed to bevel pinions situated on the back axle, by means of a universally-jointed shaft. The car has artillery wheels of equal size, shod with Clipper-Michelin heavy 750 by 85 tyres. Two foot pedals, controlling clutch, and brake and clutch respectively, are fitted within convenient reach of the driver; the foot brake operates upon a drum fixed outside the case of the bevel gear on the longitudinal shaft. The usual hand brake is also provided, and acts upon drums attached to the artillery wheels. Fitted to the dash-board is a three-way lubricator, by means of which oil can be forced either to the engine, speed-change gear, or the bevel gear, as desired. To the inclined steering pillar is fitted the usual De Dion exhaust throttle. The car is to be put on the market at a popular price, which will include a complete outfit of tools, a pair of brass Ducellier lamps, and a few spare parts.

THE Kitto Automobile Company, Limited, has been registered with a capital of £6,000, to acquire from W. H. Kitto the business of a motor-car and cycle builder, repairer, agent and dealer, etc., and to adopt an agreement with W. H. Kitto, S. B. Saunders, and G. S. Hunter. The registered office is at Bush Lane House, Cannon Street, E.C.

THE newly-formed British Germain Motor-Car Company inform us that they have been appointed sole agents for Great Britain and the Colonies for the Germain car. Large showrooms in Hanover Court, Hanover Square, W., have been taken, and the alteration of the premises will be completed within a fortnight or so. In addition to the present types of Germain, they also intend to introduce a 7-h.p. voiturette, to sell at a popular price,

A LANCHESTER car built to the order of Lord Milner was despatched to South Africa last week.

THE Ware Rural District Council (Herts) has decided to have nothing to do with the Yeovil suggestion that the maximum speed should be reduced from 12 miles an hour to 10 miles.

THE Elswick Motor and Accessories, Limited, has been registered with a capital of £500, to carry on the business of manufacturers of cycles, motors, carriages, and accessories, etc.

THE Dechamps Car entered by the Graphic Motor and Engineering Company, Limited, for the run to Oxford, did a good day's work on the 8th inst., as it was driven back to London without a stop the same evening, reaching home about 11 p.m.

WE learn that Mr. Eric Stuart Bruce, M.A., Oxon., Fellow of the Royal Meteorological Society, honorary secretary of the Aeronautical Society of Great Britain, and member d'honneur of the Paris Aero Club, has also accepted the secretaryship of the Aero Club of the United Kingdom.

LORD PIRBRIGHT'S 12-h.p. Dennis car was among those which earned a non-stop certificate in the run to Oxford. The car has a special double tonneau body seating six persons. It will form one of Messrs. Dennis' standard patterns for 1903, and will be known as the "Pirbright."

A WELL-ATTENDED meeting of the general committee of the Automobile Mutual Protection Association was held on the 7th inst. Mr. J. J. Mann, A.M.I.C.E., was in the chair. The secretary (Mr. George R. Helmore) reported the steps he had taken on ascertaining the restrictions placed by the railway companies upon the carriage of petrol, and read the correspondence he had had with the various companies on the subject. Sir Edgar C. Boehm, Bart., F.R.G.S., and Mr. J. Ernest Hutton, J.P., were elected members of the Association. A large amount of general business was transacted and

an expert's opinion as to the validity of certain patents considered.

THE petrol and electrical motor-cars built by Messrs. Stoeber Brothers, at Stettin, which have already earned a reputation in North Germany, are about to be introduced into England, Messrs. Salmon and Sons, the well-known carriage and motor body builders, having acquired the sole agency for Great Britain. Large showrooms have been opened at 27 and 29, Laystall Street, Rosebery Avenue, E.C., for the sale of the new cars. We may add that Messrs. Stoeber are at present building a special petrol car for the Sultan of Morocco.

THE new features in the 1903 Werner motorcycles comprise an improved form of float-feed spray carburettor and throttle device combined, and a new design of self-adjusting contact breaker, in which there are no platinum points, trembler, or screw. The contact is visible without removing any covering or fitting. The tank contains lubricating oil and pump, accumulator and petrol reservoir. The accumulator case is between petrol and oil reservoirs, so that in the event of an accident causing one or other of the reservoirs to leak it can be easily repaired, and there is no possible danger of the oil leaking into the petrol or vice versa. A new silencer with double chamber; non-slipping belt pulley for flat belt; extra wide belt, but without increasing width of tread for pedalling; and a new compression release are other new points. Two models will be made next season: the "Tourist," with 2-h.p. engine (66 by 72 mm.), and the "Paris-Vienna" machine with 2½-h.p. motor (76 by 76 mm.).

THE "SPEEDWELL" 9-H.P. PETROL CAR.

GERMAN AUTOMOBILE CLUB BADGES.

OIL MOTOR-CARS OF 1902.*

At Filey last week, Norman Shubotham, a motor-car driver, of Cricklewood, London, pleaded guilty to having obtained food and lodgings by false pretences at the Crescent Hotel, Filey, on September 15th. The chairman said prisoner could not be allowed to go about the country cheating people, and he must go to prison for three weeks, with hard labour.

Steering.—All first-class cars are fitted with irreversible steering gear, mostly of the worm and worm-wheel section, or preferably the square thread shank and sleeve or nut on account of the reduced wear, which in the former arrangement may soon produce backlash. Fig. 10. In the future, efforts should be made to embody resilient or absorbent members in the locked or irreversible controls, which at present transmit in their full force all shocks and blows from the front wheels.

Brakes.—Invention is still busy with this important detail of car construction, and there is yet room for an improved brake, perhaps hydraulic, pneumatic, or magnetic. Several makers are abandoning hand brakes on the driving wheels; and, in the author's opinion, the step is a wise one. The substitute mostly takes the form of an inside expanding brake acting on the inside of a special sprocket ring. Messrs. Charron, Girardot et Voigt have introduced an expanding collar inside a drum on the wheel. The Canstatt Daimler Co. use a powerfully-built, expandable ring clutch, acting within an annular flange, secured to the road wheel, as part of the sprocket. Messrs. James and Browne employ a double-acting brake, having two cast-iron slippers acting on the inside faces of the sprockets. Another form of brake is the French Rassiner, which substitutes the grip of rollers (rolling friction) for blocks (sliding friction) on an annular ring affixed to the rear wheels. It is said to be impossible to fire the brake or affect its grip by grease. The water-cooled hand-brake on the differential, and occasionally on the countershaft as well, shows no alteration. Neither of these positions are commendable.

Axles.—It is a strange thing that no English firm appears capable of turning out motor-car axles of quality and accuracy equal to the production of French and Belgian firms. An enquiry to one of our large forging firms for an explanation of this fact elicited the reply that there appeared to be nothing in the material itself to differentiate it from the steel of this country, and that if any superiority existed it must be due to a method of hammering which was more or less a lost art in England. The author, after visiting the French factory and seeing their methods of manufacture, advised a firm of English manufacturers to import a few leading hands and start home manufacture; but the advice was not followed, and so far the trade is allowed to remain in the hands of the foreigner. The employment of weldless steel-tube or hollow-bored axles, which is the latest development, ought to suit British makers, and if this type of axle proves successful British-made axles ought to be found on every car.

Springs.—The same remark as to the superiority of the foreign made article applies to motor-car springs. The firm of Lemoine et Cie. have a special reputation for such goods. For the purpose of more closely studying their process, the author visited their works, as also the Paris establishment of Messrs. Rothschild. Although naturally reticent, Messrs. Lemoine stated that the spring steel they used was a special brand made exclusively for their use by Messrs. Holtzer, of Unieux, Dept. Loire, the metal containing manganese and a certain percentage of silica. Every spring was tested before delivery, and the tests witnessed by the author showed excellency both as to quality and make. By far the majority of the springs used by French makers are of the Grasshopper type, fairly broad, flat, and long. The choice of spring dimensions naturally depends on several factors:—The horse-power of the car, the weight of the car, the length of the car, the speed of the car, and the elasticity desired.

Generally speaking, springs should not be less than one metre in length, preferably more. For light cars they should show when loaded a deflection of 15 to 30 mm. for every 100 kilos of dead weight. In heavy cars the deflection may be as low as 12 to 13 mm. per 100 kilos of dead load.

The customary method of application is to support the frame on springs. In a few cars a cross spring is added to the side springs, and this no doubt tends to break the periodicity or rhythm, which, occurring in any one system of springs, may accumulate to a disagreeable swaying. Though not in use, numerous patents describe spiral springs for automobiles, and there seems no particular reason why they should not be employed, especially for heavy drays, etc. With the object of saving the springs and preventing the wheels from jumping from the road at high speeds, pneumatic buffers form a new feature in the 80 h.p. Mors racer. A pneumatic cylinder is fixed to the frame, above each front spring, while the piston rod is attached to the axle. Fig. 11. Above each rear spring two pneumatic cylinders or dash-pots are similarly fixed. Endeavours have been made to save the motor also from jar by rubber suspension buffers, as illustrated in Fig. 12. With a flexible drive and flexible pipe connections, the plan might be serviceable.

Frames.—Most makers are now using a longer wheel base and a broader frame, giving greater space for large roomy bodies. Whereas until very recently the engine and mechanism were usually carried on an under frame, and deflection provided for by universal joints on the shafts, etc., the most recent practice, illustrated in the 40-h.p. Mercedes Simplex car, dispenses with the underframe and universal joints, and carries engine, bearings, gear, etc., on the main frame, which is braced and stiffened for the purpose. Fig. 13.

As regards material, car frames are mostly of armoured wood, then stiffened or backed by girder-shaped steel plates. For the recent Paris-Vienna race, Messrs. Charron, Girardot et Voigt forced the square section

* Abstract of Paper read before the Institution of Mechanical Engineers.

wood into thin weldless steel tubing, which takes the same shape, and, fitting tightly to the wood, is stated to give, as it is likely to do, greater rigidity than the other method. In a few cases a tubular frame is used.

Lubrication.—In this respect there is nothing very new or noteworthy. The innumerable toy grease-cups that used to adorn the mechanism of cars have been replaced mostly by sight drop-feed oil lubrication. In a few cases the preferable forced or circulating pump lubrication is employed. In the Wilson and Pilcher car this excellent system is used throughout.

FIG. 10.—Steering Gears (Daimler). Worm and wheel sections.
Screw and nut steering gears.

the oil being drained back, filtered and re-used. In the 35-h.p. Mercedes car, lubrication of the engine, engine bearings, and change-speed gear is provided by an oil pump, chain driven off the half-time shaft. In the 20-h.p. Maudslay car the engine shaft is extended forward, and, by means of worm gear, drives two barrel pumps fixed on the frame. In both cases the oil returns to a reservoir and is filtered for re-use. All pumps, whether for

FIG. 11.—Pneumatic Buffer (Mors).

oil or water circulation, should be gear driven. Change-speed gears are generally run in oil, and crank-shaft lubrication is of the splash, collecting cup or ring type.

A very usual method of crank lubrication in modern high-speed steam engines is to fill the crank chamber with water to a depth covering half the crank-pin on the down stroke, floating oil on the top. This plan has two advantages. The churned oil and water furnish better and more ample lubrication than oil alone, while the gradual evaporation of the water prevents the temperature rising over 212 deg. Fahr. It would be worth

trying the same plan for motor cranks. Provided, which with the piston fit and temperature does not seem likely, that water did not find its way into the combustion chamber, and that evaporation was not too rapid, the addition of water would not only improve lubrication, but very considerably cool the piston and cylinder walls, whilst at the same time providing a volume of lubricant enabling the engine to run safely should the oil-supply temporarily fail. It is unnecessary to add that the crank chamber must communicate with the atmosphere by pipe or otherwise.

There is another interesting point that so far appears to have escaped the attention of the chemist and the engineer—the effect of lubrication on charge-firing. At certain temperatures and pressures trouble is experienced by premature so-called automatic firing of the petrol mixture. It has been stated, and by authorities of standing, that petrol charges cannot be compressed to much over five atmospheres without risk of premature firing. What this represents in temperature is difficult to say with accuracy, since one factor—the working temperature of the cylinder wall—has not

FIG. 12 —Method of attaching Motor to an Angle Frame by Rubber Buffers.

been determined. Owing, however, to the thinness of the metal and the steepness of the heat gradient, it is probable that no great difference exists between the mean temperature of the inner and the outer skin, and that the mean temperature of the whole consequently is not greatly in excess of that of the jacket water. Although no temperature measurements seem to have been taken, certain considerations would appear to fix this temperature at from 200 deg. to 250 deg. Fahr. Assuming, therefore, the incoming charge to attain this temperature, and then by further compression to 75 lbs. to receive an additional rise of 374 deg. Fahr., its final temperature will be from 574 deg. to 624 deg. Fahr., which would stand as the critical point of automatic ignition. The principle and fact of ignition by compression is so well established in the minds of engineers that, for example, Messrs. De Dion and Bouton have patented a self-igniter, consisting of a small cylinder in communication with the main cylinder. The point raised by the author is this : Is the automatic ignition of a petrol mixture possible under any temperature attainable in a water-cooled motor ? He doubts the possibility. With a view to testing it, he recently took a $3\frac{1}{2}$ in. by $4\frac{1}{2}$ in. tin case, with tightly fitting cover, and successively introduced two, four, and six drops of petrol, then placing the case over a Bunsen burner. At each attempt the heat was increased until the solder melted. In no case did ignition take place. He then took a jointless stamped tin case, $3\frac{1}{2}$ in.

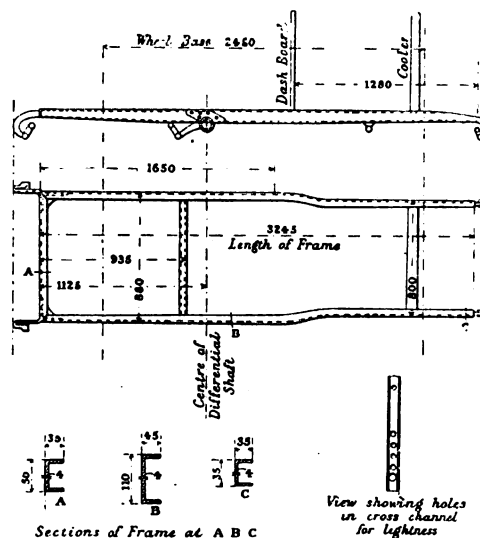

FIG. 13.—The new 40-h.p. Mercedes Simplex Frame.

by 1 in., and tried unsuccessfully with four and six drops of petrol to obtain explosion at partial red heat. Repeating the tests, using instead of petrol a cylinder lubricating oil of 410 deg.-430 deg. Fahr. flash point, 440 deg.-460 deg. Fahr. fire test, 910-915 density, ignition was readily obtained.
(To be continued.)

CORRESPONDENCE.

MOTOR-VEHICLES FOR CORPORATION WORK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Alderman Larard, Chairman of the Hull Tramways Committee, is reported to have said at Hull that he hoped motors would soon be used to take firemen to the scene of conflagration, that another improvement to be expected was the use of motor traction for scavenging, and that where the horse had been supplanted by the motor the change had been entirely acceptable to all. May I venture to add, on behalf of the Church Society for the Promotion of Kindness to Animals, that the substitution in certain cases of motor traction for horse traction would be a means of eliminating the strain, suffering, and weariness which are at present the daily lot of so many horses.—Yours truly,

F. LAWRENCE.
Hon. Secretary.

A GRUMBLE RE MOTOR REPAIRERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Cannot something be done to prevent owners of motor-cars, when requiring repairs away from home, falling into the hands of bunglers? One often sees "Cycle and Motor Works," "Cycle and Motor Engineer," etc.; after inquiries, you are told, probably by some friend of the "motor engineer," that "you will be all right there." Oh, yes, he is a very clever fellow, etc. In you go, and, after enjoying your lunch, find the man has either broken something or made your engine worse than before. I have been in this fix twice to-day at two different towns, and at last had to send to London for a man. A friend of mine last week had his 20-h.p. car completely ruined by one of these "motor engineers." In this town within the last three months two cycle firms have done the same thing, and I have reason to be sorry that my car ever went into their yard. One spoiled a splendid De Dion tricycle, and the other kept my car six weeks, messed it about, and then I had to take it elsewhere, and the firm put it right in an hour. Could not a list of reliable motor experts be compiled? I am sure it would sell.—Yours truly,

J. DARLINGTON.

THE ANNUAL ANNIVERSARY RUN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is it not a great pity that on the occasion of an annual automobile run the same town is not fixed upon for the different automobile clubs to drive to? I feel certain that a pleasant result would be obtained by the A.C.G.B.I. meeting with the Scottish, Liverpool, Yorkshire, and other automobile clubs. The place of meeting would have to be farther north than it is at present, so as to diminish the difference in the respective distances. Knowing well the widespread popularity of the *Journal*, I thought it best to put the suggestion in your hands.—Yours truly,

S. McKENNA.

A MYSTERIOUS ACCIDENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A friend nearly had an accident similar to that described by Mr. G. J. Cook—viz., a sudden swerve without apparent cause and nearly running into a wall. On investigation a stone was found under driving chain on back wheel, evidently thrown up by front wheel. A remedy appears to be to have the front splashers very low.—Yours truly,

T. CROSSINGHAM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read the letter of your correspondent, Mr. Geo. J. Cook, and also having read the account of the fatal accident at Handcross in the *Motor-Car Journal*, perhaps I may be able to explain what was undoubtedly the cause of the accident in each case, and the same theory will apply to other accidents of a similar nature.

It has been suggested that the steering is at fault. This is true to a certain extent, but to my mind the steering is upset by the differential gear seizing or locking on one half; this in many instances would throw one chain off and the drive would be taken on the opposite wheel, causing the car to career in a circle, if nothing was in the way; if otherwise, the result would be obvious.

At high speeds a tyre suddenly bursting on the rear wheel will cause the steering to be upset. If the differential gear works too tight it will not respond quickly. It would be wise for all owners of cars to occasionally take their chains off and turn one sprocket by hand; if the centre gear pinion is held slightly, the opposite sprocket should rotate freely in the opposite direction; where the differential is on the back axle the car should be jacked up, and by turning one road wheel the same test will apply; should all not be right, it should be seen to by a competent man. Many types of gears are so constructed that it is possible for them to be put together in such a manner as to give trouble and sometimes cause disaster.—Yours truly,

DAVID DOYLE.

Where no alleged speed is given it is understood to be above the legal limit.
* Motor-cycle cases.

AT the Hatfield petty sessions, Paul Deneler did not appear in answer to summons for driving a motor-car furiously at North Mimms on November 1st. A Frenchman who was with him at the time appeared and said defendant was now in Paris. The Bench decided to issue a warrant for the defendant's arrest.

BEFORE the county magistrates, at Tewkesbury, last week, A. C. Glantworth was summoned for furiously driving a motor-car. The evidence of the police and their witnesses was that defendant drove a car belonging to his employer, Mrs. Martin, of Bredon's Norton, at the rate of twelve miles an hour through the village of Kemerton. Mrs. Martin expressed her regret at the occurrence, and offered to place the motor-car and driver at the service of the Bench if they cared to have a ride. The Chairman remarked that he hoped the driver would go at a more moderate pace if he took him. A fine of £1 and 14s. 8d. costs was inflicted.

AT the Woolwich Police Court, last week, J. Dottridge, of Bickley, was summoned, before Mr. d'Eyncourt, for driving a motor-car at a speed exceeding 12 miles an hour. The constable said he saw the defendant driving his car along the Eltham Road at a speed of 24 miles an hour. The defendant said his machine was geared up to 12 miles an hour, and it was quite impossible to get 24 miles out of it. The summons was dismissed.

BEFORE a King's Bench Divisional Court, composed of Justices Wills and Channell, on Friday last week, Mr. Lincoln Reed applied for a rule nisi for a writ of certiorari to bring up a conviction at Worthing on October 15th, when it appeared that Mr. George Wilder, of Emsworth, Hants, was fined for driving a motor-car at more than 12 miles an hour. The applicant alleged that the chairman showed that he was a prejudiced person, and should not have sat on the Bench. Mr. Justice Wills said there was nothing to indicate that the chairman of the Bench would violate his judicial oath and decide contrary to the evidence. The application was therefore refused.

AT Horsham, Charles Homewood, of Balcombe, who was summoned for exceeding the legal limit at Ifield, on November 2nd, pleaded not guilty, and was defended. Police-constable A. H. Farrow timed defendant close to the Sun Inn, and said he covered the measured quarter of a mile in 42 secs., or at the rate of 21 miles an hour. Defendant said he was 62, and had had the motor-car six months. The clock was striking ten as he left Balcombe, and a dog accompanied him. The police stopped him at five minutes to eleven—it was barely eight miles covered in 55 minutes. He pulled up at once when the policeman signalled. His dog, a little Scotch terrier (shown to the magistrates), kept up with him all the way. After a consultation, the Bench thought there was a possibility of a doubt, and dismissed the case. In regard to this case, Mr. Homewood writes:—"The action of the police was most unjust; evidently speed has nothing to do with it, they are stopping us all, and it does not matter at what rate we travel, I am quite convinced by my own case that it is not safe to go on the roads, and it is high time that there was something done to protect those who do not even travel the limit. This kind of thing is doing a great injury, and while it lasts I personally know many will not buy cars, who, like myself, would not wish to be constantly hauled up to a police-court."

SERGEANT JARRETT is still on the war-path, having secured another batch of motorists by means of his measured 176 yards at Ripley. The Guildford magistrates imposed a fine of £3 in each case.

TRADE DEVELOPMENTS IN LONDON.

We are this week able to give an illustration of the new premises which Messrs. Friswell, Ltd., have acquired, reference to which was made in a recent issue. They are situated in Albany Street, N.W., within a stone's throw of Portland Road Station, and have hitherto been known as the Albany Repository. On Monday last we had an opportunity of going over the whole premises from basement to roof, and were simply astonished at their extent. Including the basement, there are no less than five floors, on each of which motor-cars may be stored. There is a lift in the centre of the building, on to which cars can be driven from the road and conveyed to any part of the building. Some idea of the size of the lift may be gathered from the fact that at the time of our visit it contained a big pantehnicon, which was being loaded with furniture, on the top floor. The premises are undoubtedly well-adapted as a motor garage, for not only are they fire proof—each floor being made of solid concrete and the ceiling and girders covered in asbestos—but they are heated by hot water, and lighted throughout by electricity. Altogether the building is capable of holding no less than 700 cars. As mentioned in our issue of the 1st inst., it is intended to arrange the premises in three different sections. Block A will be used entirely for offices and show-rooms for Peugeot and other cars. In Block B large repairing shops, carriage building and painting departments will be established and the auctioneering business carried on. The most novel departure in connection with the new premises is the decision to set apart a large portion, to be known as Block C, as a garage for the use of clients absolutely free of charge. The idea of a free

carrying a lighted lamp through a yard, the vapour given off by the petroleum spirit became ignited, and if the efforts which were made to extinguish the fire had not been successful the result would have been disastrous. The magistrates commented upon the serious nature of the offence, but as the defendant pleaded ignorance of the regulations, only a small fine of 20s. and costs was inflicted.

WHEN DOES COMMISSION BECOME PAYABLE?

THE case of *Schultess Young v. The Speedwell Motor and Engineering Manufacturing Company*—a report relating to which appeared in these columns a week or two ago—came again before Judge Stonor last week at the Brompton County Court.

The plaintiff, it may be recollected, had formerly been in partnership with a Mr. Sadgrove, trading as the Pall Mall Motor and Cycle Company, Ebury Street, S.W., and claimed commission from the defendants in respect of alleged introduction of business. Plaintiff's case, briefly, was to the effect that a Dr. Fenton, for whom he and his partner had sold a motor-car, agreed that any other car which he might purchase should be bought through them. The doctor subsequently agreed to buy a car from the defendant company, and was said to have explained at the time that he was purchasing through the Pall Mall Company. The car appeared not to have been delivered to time specified, and was not painted the colour stipulated, and the doctor cancelled the order. At the last hearing the Judge pointed out

FRISWELL'S NEW "PORTLAND ROAD MOTOR STATION."

garage is a radical departure, and its result will be watched with interest. This decision has not been arrived at by Messrs. Friswell without full consideration, as it is estimated that they will receive compensation for the accommodation they are able to offer by supplying oil, petrol, and grease to their clients, and also by carrying out any necessary repairs on the spot. Some little time will elapse before the whole of the building will be available, a large amount of furniture having to be cleared out and alterations made to suit the new business, but the free garage portion is already in operation, having been opened on Friday last week. The situation is a good one, as, while close to Regent's Park, where intending purchasers of cars may be given a trial run, the premises are within a three-minutes' run of Regent Street, W. We have not space to refer to all the many schemes Mr. Friswell has in hand in connection with his "Portland Road Station," but those who wish to take advantage of the free garage would do well to make early application.

RAILWAY COMPANIES AND PETROLEUM SPIRIT.

A CASE was heard before the Oxford magistrates last week, in which the chemist of the Christ Church laboratory was charged with having handed to the Great Western Railway Company for conveyance a consignment falsely declared as ordinary petroleum, but which really consisted of petroleum spirit; also with not having observed the Government regulations in regard to packing liquids of such a dangerous character. It appears that during transit, when a member of the company's staff was

that there was some difficulty in regard to the plaintiff proceeding without his former partner, who is said to have disappeared. Mr. Schultess Young, senior counsel appearing for the plaintiff, now produced a large number of documents to show that Sadgrove was a consenting party to the action; and other papers to show that on May 17th last the partnership between plaintiff and Sadgrove was dissolved. Mr. St. Gerrans, counsel for the defendant, argued that the commission was not due until the purchase was completed, and that, as Dr. Fenton did not really purchase the car, no commission was payable by the defendants. The agreement to pay commission, however, was still in force with regard to any car which Dr. Fenton might purchase from the defendant company in the future. The point was argued at great length, but his Honour ultimately non-suited the plaintiff on the ground that the only person who could sue for the commission was Dr. Fenton, and that he was only entitled to recover commission in the event of his completing a purchase through the defendant company. His Honour allowed the defendant's costs.

A CASE OF MISTAKEN IDENTITY.

THE Monmouthshire police have made a singular mistake in reference to a summons which they caused to be issued against Mr. George H. Lanchester, of Birmingham, who had been proceeded against for driving a motor-car along the Usk Road at improper speed. At the previous court, held at Caerleon, Mr. Lanchester's brother stated that defendant was not

within miles of the distance at the time. Acting-Sergeant Smith alleged that the car passed him. At Caerleon Petty Sessions, on Thursday last week, Superintendent James stated that since the adjournment a month ago he had discovered that some mistake had been made in regard to the identity of the defendant, to whom he had written stating that it was his intention to apply for the withdrawal of the summons. The Bench, without any remark, consented to this course.

MOTOR AND VAN IN COLLISION.

At the Brompton County Court (London), last week, before Judge Stonor and a jury, Mr. Francis L. Merritt, motor-car builder, Loftus Road, Shepherd's Bush, W., brought an action against Messrs. Coomber Brothers, furniture removers, Notting Hill, W., claiming £23 12s. in respect of damage to a motor-car, alleged to have been caused through negligence on the part of one of the defendant's drivers. The plaintiff stated that on July 12th last he and his two sons were driving a motor-car in Devonshire Street, Hammersmith Road. On returning along the same road they found it impossible to turn, owing to the road being narrow, and they backed slowly—at about two miles an hour—into the Hammersmith main road. As they were crossing the road they saw defendant's van coming eastward rapidly towards them. He and a constable shouted to the driver of the van, who, however, appeared to take no notice. They had got the car almost across the road, and were near the farther kerb, when the pole of the van "lashed" obliquely into the side of the car.

The defence, briefly, was to the effect that the motor-car coming into the main road backwards was not properly managed, and that the accident occurred in consequence. The Judge said that the main question was whether those driving the motor-car were doing right in coming into the main road backwards as they had done. The jury returned a verdict in favour of the defendants. His Honour gave judgment accordingly, but allowed no costs.

MEASURED DISTANCES.

DURING the cases at the Steyning Petty Sessions last week it transpired that the police have a measured half-mile on the road skirting Henfield Common, and a measured quarter of a mile near the "Rock," at Washington.

As already announced, the police have a measured 200 yards on the Eltham Road, Eltham. As a result, three motorists were summoned at Woolwich last week.

THE Bridgwater police have a measured distance just outside the town on the Bristol road.

A CORRESPONDENT kindly informs us that a police trap is in operation on the Eastbourne Road, on the level stretch between East Hoathly and Horsebridge. A wire electrically connected with the police-station is fitted at each end of a measured furlong, whilst some distance farther on the police, in hiding, are also in telephonic communication with the station.

MR. A. F. PEMSEL, of the Hemel Hempstead Motor-Car Co., writes:—"Last week I watched two sergeants from the local police force measuring off the road outside Boxmoor Station (the main road from Watford to Aylesbury). I can only guess at their object in doing so. I should like, however, to state that motorists are in the habit of 'rushing' this level piece of good road past the station entrance, to the danger of vehicles entering or leaving the station yard from the said main road. I have occasion to notice this repeatedly, and wish there were some recognised means of warning automobile drivers of dangerous parts of the road where speed should be slackened."

A HONOR OAK PARK correspondent writes:—"Police trap between here and Eltham last Sunday afternoon."

A QUESTION OF ARREARS.

At Chelmsford County Court, last week, before his Honour Judge Tindal Atkinson, Messrs. Knight Bros., motor engineers, of Chelmsford, sued R. J. Vynar, of Chelsea, for £39 7s. 6d., arrears of instalments on the purchase of a motor-car.

Mr. F. P. Suthery, who appeared for plaintiffs, said the case was adjourned at the last Court for defendant to put in a defence. His wife now wrote to say he had gone abroad to see his sick father. Defendant himself wired from Prague, Bohemia, saying he had intended coming home, but had met with an accident. He also sent a medical certificate in German. His Honour said he should give judgment for plaintiffs, with stay of execution till after the next Court, which would give defendant leave to be heard. Defendant would have to pay the costs.

"BUYING" A MOTOR-CAR.

NICHOLAS J. WOOD appeared before Mr. Fenwick at Bow Street Police Court on Thursday last week to an adjourned summons charging him with obtaining a motor-car, value £1,600, by false pretences from D. M. Weigel, manager to the British Automobile and Commercial Syndicate, Ltd. Mr. A. Osborn appeared in support of the summons; Mr. Chas. Mathews, instructed by Sir G. Lewis, defended. It was alleged that on October 4th the defendant purchased from the complainant a Panhard motor-car value £1,600, in payment for which he gave a worthless cheque. The complainant, in reply to Mr. Mathews, said that no request was made to him by the defendant to hold back the cheque. After purchasing the car the defendant called at the company's premises almost every evening for petrol until October 9th. After a number of witnesses for both sides were heard,

the defendant then went into the witness-box and said that under the provisions of his father's will he did not come into his property until he was twenty-five years of age. When he purchased the motor from the complainant he certainly asked him to hold over the cheque for a few days, and he promised to do so. The case was again adjourned, Mr. Fenwick saying he wished to hear the witnesses for the defence as fully as he had those for the prosecution.

The case was further heard on Tuesday last, and in giving his decision Mr. Fenwick said it was one of those cases which ought to be fully investigated. The case depended upon how far the accuracy of Mr. Weigel's recollection as to what took place at the various interviews could be depended upon. He (Mr. Fenwick) was on the point of dismissing the case at the close of the evidence for the prosecution, but he thought it would be fairer to hear all that could be said. He did not say there was not a tittle of evidence against the defendant, but he did not think any judge would allow a jury to convict on such evidence, and the case would be dismissed, and he declined to commit the defendant for trial on the other charges brought against him. Mr. Osborn: On the part of the prosecution, I must ask you to bind Mr. Weigel over to appear at the Sessions with respect to these charges. Mr. Fenwick: Certainly; himself in £200 and two sureties in £100 each.

ACCIDENT AT MARKET HARBOROUGH.

AN inquest on the body of John Wilson, aged 26, a labourer, who was run over and killed on the Leicester road, just outside Market Harborough, was held last week. George Randall, of Debdale, said he was returning home from Market Harborough in a heavy cart. Before reaching the Workhouse Wilson came up, and asked for a ride. Deceased jumped on the cart, and all went well until they were near the Foxton cross-roads, when a motor-car passed them. He heard no warning of any kind. The horse was frightened by the "buzzing" noise, and started to gallop. Witness tried to pull him up, and then found that Wilson had slipped down, and was hanging on to the shafts. As soon as he had pulled up the horse he went back to the deceased, who had fallen on the roadway. Harry L. Stevens, coach builder, deposed that on the day in question he was riding on a motor-car from Market Harborough to Leicester. He had repaired the car for a Mr. Stainman, who had asked him to accompany him a little way, as he was doubtful about it working. Before reaching Foxton cross-roads they passed two or three carts, but he did not recollect passing Randall's cart. The driver sounded the horn before reaching the carts. The car was not going at more than ten miles an hour. The coroner, in summing up, commented on the variation in the evidence as to the speed of the motor-car, and the jury returned a verdict of accidental death, adding that they did not consider the motor-car was travelling at an unreasonable pace when it passed Randall's cart.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, NOVEMBER 29, 1902.

[No. 195.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

INTEREST in the Gordon Bennett Cup contest for next year has been revived by the visit of a deputation from the Automobile Club to Ireland. Various routes have been traversed and conferences have taken place with some of the most enthusiastic Irish motorists. It is thought possible that a circular route may be found most acceptable, and certainly from

a spectacular point of view such a course would be popular. But, before any definite proposal can be made, the consent of the French Club to the variation from a straight to a circular course will have to be obtained. Should the race eventually take place in the Emerald Isle the support of the Lord Lieutenant, the Earl of Dudley, may be confidently anticipated.

Numbering Cars.

THERE seems little doubt that many of the local authorities have taken their cue from what is known as the Montagu Bill, and are passing resolutions in favour of numbering with an unanimity that is almost alarming. At the invitation of the Yeovil Council, the local authorities of many rural districts are declaring that motor-cars should be regarded in a similar light to hansom and other vehicles, and, labelled with a number, go through the streets as though their owners were under "police supervision"—as well as amenable to the ordinary street regulations. This is a state of things never contemplated by motorists when the present agitation was inaugurated. And the pity of it is that it was practically begun in our own ranks.

The Logical Sequence.

SOME Councils are wiser than the promoters of the Bill, and at the meetings of the Welton District Council at Lincoln, the Kesteven County Council at Sleaford, and the St. Asaph Parish Council decisions to take no action in the matter have been arrived at. Unfortunately, however, a large number of approving resolutions have been passed, and the Branston (Lincoln) Rural District Council has attained distinction by deciding in favour of the numbering of automobiles, adding that the number should be placed "on the car near the lamps, so as to be visible by night as well as by day." And this is but a logical sequence of the unpopular numbering notion. This is a matter of supreme importance to the automobile movement, and having published the text of the Bill in our present issue we propose to return to the subject next week.

Poachers and Motorists.

"Truth" has not been unmindful of the treatment to which motorists have been subjected at the hands of county magistrates, although our contemporary slyly doubts if the owners of automobiles will find consolation in the reflection that "after all they are only experiencing the treatment to which poachers have been accustomed for generations"—a quaint

connection which finds illustration in the well-known Pillory of our contemporary as follows:—

Hawarden Petty Sessions.
Before Mr. W. C. Jones and other magistrates. George Wm. Bower, farmer, charged with cruelty to a bullock. The animal, which was suffering from consumption, was turned into a field and left there. An inspector found it in a dying condition, and on his intervention it was destroyed. Fined 20s. and costs.

Hawarden Petty Sessions.
Before same magistrates. Frank Bright Summers, charged with driving a motor-car at a greater speed than twelve miles an hour. The police-sergeant who pressed the case admitted that the road on which the offence occurred was quite clear of other traffic at the time. Fined £5 and costs.

Chelmsford County Police-court. Before Mr. T. Kemble and other magistrates. Charles Turner, charged with driving a horse and cart furiously. He was under the influence of drink, and his furious driving endangered a number of children in the road. Fined 15s., including costs.

Arundel Petty Sessions. Before Captain W. Kemp, Captain E. H. Hills, and Messrs. J. Harvey, and E. Henty. Allan Francis Fletcher, charged with driving a motor-car at a speed in excess of the legal limit of twelve miles an hour. Fined £7 16s.

The American Reliability Trials.

SCARCELY less astonishing than was the enormous number of perfect scores is the showing of the cars qualifying for first-class certificates in the recent New York to Boston and return reliability contest. Instead of about fifty winners of first-class certificates, as was generally expected, it turns out that there are sixty-five. That is to say, all the sixty-eight finishing cars except three averaged between twelve and fourteen miles an hour for the entire 488 miles of the distance between New York and Boston and return. Furthermore, one of these three cars was awarded a second class certificate, while another vehicle was given a third class one. In addition to the seventeen cars which tied for the President's Cup, there were twenty-five cars that averaged exactly fourteen miles an hour. Other cars to the number of thirteen averaged thirteen or more miles per hour, leaving a comparatively insignificant minority to fall below thirteen miles. Equally remarkable is the showing of points. Turning from the seventeen cars with 2,092 marks to their credit—the highest possible—it is found that four cars fell but one mark each short of this number. Then came two with 2,090, one with 2,089, four with 2,088, two with 2,087, one with 2,086, and two with 2,085. Thus it is seen that thirty-two cars—roughly just one half of those which finished—came through the ordeal with a loss of but seven or less marks.

Litigation in Ireland.

OUR pages this week contain a summary of a case which has occupied one of the Dublin law courts four days, providing some very entertaining "copy" for the Irish newspapers. In opening the case the Solicitor-General for Ireland gave a dissertation on motoring. The motor-car, he said, seemed to possess a great many attractions. In the first place one was almost certain to come to grief in some shape or other, either by colliding with a tramcar or a lamp-post, or a foot passenger, or other obstacle. Then, again, one had his whole internal

organisation shaken out, and he had also the delightful prospect of knowing that at any moment the whole thing might explode, and polish off both himself and his machine. These were some of the attractions of motor riding as he understood it, and he mentioned them for the purpose of impressing upon the jury that in any transactions between two gentlemen involving the sale or purchase of a motor-car, there was a strong duty cast upon the vendor of making a correct representation of its state and condition, and not conceal the defects which it would be necessary the purchaser should have in his knowledge. In reading the full report of the case, we have been struck by the strength of the language used in the case. In fact, the Judge had to ask the jury to leave out of mind the effect of the bad language, which had been as bad on one side as the other. There was little law in the case, and "the whole thing had been just tossed to the jury." In the end they disagreed—after a four days' hearing and evidence from two English witnesses, one on each side.

An Enthusiastic Yorkshire Motorist. THERE are few more enthusiastic motorists than Mr. H. R. Kirk, of Castle Grove, Headingley, and fewer still, perhaps, who can so successfully inspire enthusiasm in other folk. Until a year or so ago, all Mr. Kirk's energies were devoted to running a stud farm, which he owned and worked, and from

Photo by]

[Green Brooks.

which he turned out annually some very valuable Hackneys. He is a keen sportsman, and a life member of the Hackney Horse Society and of the Yorkshire Agricultural Society. An invitation from a friend to go a-motoring resulted in Mr. Kirk, like Oliver Twist, asking for more, and so irresistible did the delights of these excursions become that it was not long before he placed an order for his first motor-car. The first ride on the new vehicle was from Paris to Leeds, since which time he has covered many thousands of miles in this country and on the Continent. This ride was followed in a week or two by the local papers announcing the fact that the whole of a valuable stud of horses was to go to the hammer, "owing to the owner investing in motor-cars." Mr. Kirk is now

a member of the A.C.G.B.I., and also of the Yorkshire Automobile Club. As might be expected, he has had many interesting and exciting experiences since he took to the King's highway, and it is very gratifying to be able to chronicle the fact that, under all conditions of road and weather, he has never met with an accident, and, what is perhaps more important in some people's eyes, has avoided hurting the susceptibilities of the "gentlemen in blue." The first garden party to the members of the Yorkshire Automobile Club was given by Mr. Kirk in the grounds of Castle Grove, when, among other features, he organised a hill-climbing competition, awarding three prizes to the successful competitors. Mr. Kirk's present stud consists of an 8-h.p. De Dion, a 7-h.p. Panhard, a 12-h.p. Gladiator, and a 16-h.p. Panhard.

"A Motor-Car Accident."

JOSEPH BURNHAM, a hotel omnibus driver, has died at Stamford, from injuries received in an accident. Deceased's horse was startled by the Marquis of Exeter's motor-car, and, swerving suddenly round, threw the driver from the seat on to the road. At the inquest a verdict of "accidental death" was returned. Although the regrettable accident was in no way due to the motor-car but to the restiveness of the horse, which would probably have acted in a similar way had any other apparently unfamiliar object come that way, the newspapers have not hesitated to describe the affair as "a motor-car accident," and some have gone so far as to head their reports, "Killed by Lord Exeter's motor-car."

The Sheffield Club's Run.

ON Saturday, the Sheffield and District Automobile Club held its inaugural run to Worksop. The Club has already seventy-six members, and more than half of these formed into procession by the Town Hall on Saturday afternoon. At the head of the line was the president of the Club (Mr. B. Harvey Foster), on his 10-h.p. Wolseley car. A 24-h.p. Napier, owned by Mr. E. P. Reynolds, one of the vice-presidents of the Club, attracted much attention. Mr. J. R. Wade (hon. sec. of the Club) had a 12-h.p. Belsize, and the company included Mr. Herbert Barber, on a Mabley car; Mr. D. H. Bookless, 5-h.p. Marshall; Mr. E. F. Coupe, 8-h.p. Daimler; Mr. John Ellis, 8-h.p. M.M.C.; Mr. Gerald Flather, 1½-h.p. Werner; Mr. Harold Hill, 10-h.p. Benz; Mr. Benjamin Hind, 6-h.p. Darracq; Mr. W. James, quadricycle; Mr. F. Mellowes, 9-h.p. Napier; Dr. Parsons, Rochet car; Mr. J. H. Pickford (Rotherham), Kimberley Daimler; Mr. J. Robson, 4½-h.p. Locomobile; Mr. S. J. Robson, 4½-h.p. Locomobile; Mr. F. G. Smith, 4½-h.p. Locomobile; Mr. J. Truelove, 12-h.p. Belsize; Mr. W. Watts, 6½-h.p. Humber; Mr. Brook Shaw, 5 h.p. Decauville; and Mr. A. J. Blyde, 4½-h.p. voiturette. About half-past two the procession moved off down High Street, headed by the president in his car, and marshalled by Messrs. F. B. Cawood and Jas. Barber.

To Worksop.

AFTER passing through Darnall and out into the country districts speed was increased. Mufflers and overcoats were adjusted, rugs tucked tightly in, and masks put on to protect the face from wind and dust. There was little time for contemplation, but the mind received an infinity of fleeting impressions. Woodhouse Mills was soon passed through, and a few minutes later Swallownest came in sight. At Aston, a little further on, a brief halt was necessitated. Passing along the main road to the cemetery was a funeral, and the cars drew up and waited until the mourners had entered the church-yard. Several short steep hills tried the powers of some of the smaller cars and cycles somewhat severely, but they were all successfully negotiated. South Anston and Lindrick were reached soon after, Gateford was skirted, and a little after four o'clock Worksop came in view. Incidents were few on the journey, and all the cars and cycles reached their destination safely. About half way on the

journey of 19½ miles a little knot of policemen, accompanied by a constable with a bicycle, were observed on the look-out for motorists exceeding the legal limit of speed, but the members of the Club were proceeding at a reasonable rate, and the services of the "men in blue" were not called for.

The Future of the Club.

THROUGH the hospitality of the president of the Club the members were entertained to dinner at the Red Lion Hotel, Worksop, and the refreshment was heartily welcomed. Mr. Foster presided over the company, numbering about sixty, and there was a short toast list. The health of the President was proposed by Mr. Barber, and very cordially honoured. He announced that Mr. Foster had presented two cups for hill-climbing competitions. Mr. Foster, in responding, said that their run had been a most successful one, and if supported by their members they would be able to make their Club the first out of London. They had more members than, he understood, any Club out of the metropolis. No less than thirty-seven cars had assembled that day, and he did not think that any other provincial Club had mustered so largely on the occasion of their first run. Mr. J. R. Wade (hon. sec.), responding to the toast of "The Club," pointed out that they had seventy-six members on their books, and he did not think that any other Club had enrolled so large a number in such a short time as they had done. The Committee, he added, had made arrangements for the storage of cars in Sheffield either for one night or for a period at special rates. The party then broke up, and the majority of the company returned home, the journey in the evening twilight being a novel and exceedingly pleasant experience.

Motor-Omnibuses.

MOTOR-OMNIBUSES are likely to be a prominent factor in the traffic of London streets next summer. At the present time such a vehicle, to ply between Oxford Circus and Cricklewood, is being constructed by Stirling's Motor Works, Limited, for the London Motor Omnibus Syndicate, and there has been quite an outbreak of paragraphs in the London press with regard to the enterprise of the London General Omnibus Company in a similar direction. Meanwhile it is interesting to know that satisfactory reports continue to come to hand with regard to several motor-vehicle services that have been established in various places.

The Question of "Goggles."

THIS question will naturally appeal to all motorists, and no doubt many have heard, as we have, as motor-cars pass in town, with passengers all "begoggled," the remark made, "How ridiculous!" And so, at first sight, it would seem; but our experience is that the eyes need more protection in town than in country. In town the dust is unwholesome and chemically injurious, and this dust is kept in perpetual circulation by the traffic; but in the country the dust (when there is any) is left behind, and a journey from Brighton to near London can be made without the use of glasses, until almost in town, when it is found that the eyes begin to "smart." Should the writer have his glasses on when nearing town he would not take them off; but, again, if he was not wearing them, would put up with the inconvenience rather than wear them, for the sake of appearances.

"Goggles" and "Goggles."

CONCERNING the subject generally, we should like the opinion of our readers whether it is best to ride entirely without glasses, except, of course, in a dust storm, or whether it is best to use them, especially when travelling at speeds exceeding the legal limit. Without them, the eyes "run" continuously, and at the close of a long ride, and for several days

afterwards, grit is found exuding from the corners of the eyes, especially in the mornings, on awakening from sleep. The wearing of the glasses a portion of the day and then omitting to put them on, we are afraid, would cause neuralgia, and therefore if one can travel safely without their absence causing inconvenience it would certainly be an advantage.

Motor Matters Generally.

ALTHOUGH common in France, the Limousine body has only recently become popular in this country, and the appearance of the covering on the car generally evokes admiration from the onlookers.

The idea of having a glass shield and curtains to be drawn or otherwise, as desired, seems splendid, but in regard to the glass front extreme care should be taken as to its use. Perhaps when starting on a journey the screen will be down, and after going some distance it will be raised, and then the passengers may for certain expect a chill or influenza. In extremely cold weather, when going a distance the glass will be found most comfortable, sheltering and shielding the passengers from the chilly blast; but if a storm arises, then the glass has to go up again through the impossibility of the driver seeing through an opaque mass caused by the mud.

MR. J. V. KINSLEY, OF BRIDLINGTON, GIVES A STRANDED CYCLIST A LIFT ON HIS "LOCOMOBILE."

Maidenhead Bridges Tolls.

MR. G. S. D. MURRAY has held an inquiry (on behalf of the Charity Commissioners) at the Town Hall, Maidenhead, "in the matter of Maidenhead Bridge and of the endowments thereof or attached thereto, and in the matter of the Charity Trust Acts, 1835 to 1894." It will well be within the recollection of our readers that Mr. Joseph Taylor, of Eton, was the first to bring to the public notice the alleged illegalities as to the levying and appropriation of tolls for passage over Maidenhead Bridge. In the latter stages of the agitation, Mr. Taylor has had associated with him Mr. Fullbrooke, of Slough, and Mr. C. Howlett, of Eton. To the petition which Mr. Taylor addressed to the Charity Commissioners, and which resulted in the present inquiry, there were no less than forty-six signatures of representative public men in the counties of Berks and Bucks. At the inquiry amongst those present were the Town Clerk, Mr. Battelley (solicitor for Mr. Joseph Taylor), and Mr. Staplee Firth, who appeared for the Automobile Club.

**Illegal
Tolls
Levied.**

IN the inquiry the case of Mr. Fullbrook, who in April, 1900, was stopped when driving a motor-car and eightpence was demanded of him, came into considerable prominence. Subsequently, in September of the same year the Town Council passed a resolution that the toll for motor-cars should be 6d. per day, and for motor-cycles 3d. per day. Mr. Firth referred at length to this matter, and argued that if the Corporation had a right to levy toll, the charge in Mr. Fullbrook's case could only have been 2d. Mr. Stuchbery said that frankly he thought 2d. to be the proper toll, but he had not the authority of the Corporation on that point. The Commissioner asked what would be the best way of bringing this before the Corporation, for if it was a public grievance, and a fair grievance, the sooner it was remedied the better. Mr. Kick, the Town Clerk, promised to bring it before the Council, so that another grievance is on a fair way to settlement. The Commissioner intimated that the Commission would probably be disinclined to say much about the errors of the past in consideration of the whole matter being put on a proper footing in the future. Efforts will now be made to free the bridge. In this connection we would remind our readers of the Maidenhead Bridge Legal Expenses Fund, subscriptions to which can be sent to Mr. J. Taylor, Mr. Cecil Hewlett, Eton, or to Mr. J. Fullbrook, of Slough.

**The Lincolnshire
Automobile
Club.**

THE Lincolnshire Club's final run of the season took place on Saturday, when Newark was the rendezvous. Owing to the bitterly cold weather only a limited number made the journey, but the roads were in fine condition. The Chairman, Mr. C. W. Pennell (Lincoln), was present. Mr. Hole drove his 16-h.p. Panhard, and there were also present—Mr. J. R. Richardson, Mr. W. Pennell, Mr. Combes, Mr. T. E. Foster, Captain Newsum, all of Lincoln; and Captain and Mrs. Lyall, Grantham. The types of machines included 8½-h.p. Buchet, 8-h.p. De Dion, 3½-h.p. Star, 6½-h.p. Darracq, and others. It was the smallest meet of the season, the record being that to Bawtry, when eighty cars turned out. Tea was served at the Ram Hotel, and afterwards the return journey to Lincoln was made.

**American
"Justice."**

THE anti-automobile fever seems to be an international complaint affecting all armed with a little brief authority. Recently a motor-car and tramcar collided in the streets of New York, and as the latter got the worst of the encounter vengeance was wreaked on the driver of the other vehicle. Twenty persons were hurt, and the luckless driver was sentenced to six months' imprisonment. With a celerity that is not usually associated with legal procedure, the victim's hair was clipped, his moustache razored clean away, and he was accoutred as a convict. Notice of appeal was given, and the disfigured motorist is now out on bail. This method should suggest new forms of punishment for motorists to many of the prejudiced persons who sit on our magisterial benches in this country. Upon hearing her husband fined for exceeding the automobile limit in New York Mrs. Foxhall Keene is reported to have said, "We will go to England to live; there is no justice here." Apparently there is little to choose between America and this country in this respect.

Club Discussions.

EVIDENTLY the Executive Committee of the Automobile Club recognises the necessity for the provision of standing orders in connection with the reading of papers and the discussions thereon. Based on the experience gained in the forum at Whitehall Court, it has been officially suggested that the opening paper should occupy twenty minutes in reading, thus making an effort at uniformity which might well be developed into

limitation of the length of speeches in the discussions. If the latter suggestion were adopted it would always be possible for the time allowed any specially interesting speaker to be extended; but, if the popularity of the discussions develops, the adoption of rules of debate will become necessary. Mr. C. Jarrott is to be asked to read a paper on Motor-Car Racing after Christmas, and if the Committee will arrange the remainder of the programme in good time, busy men will be able to keep the evenings of the Club discussions free from other engagements.

Local Debates.

IN addition to the discussions at the leading organisation of the automobile movement, papers are being read before many of the provincial Clubs, and the leading local organisations of engineers in the country. In this way much is being done to popularise automobilism, and we shall be pleased to receive early intimation of meetings at which the motor-car will form the subject of discussion. At the Rochdale Technical School, Mr. McNeil, of Manchester, recently lectured on the subject under the auspices of the Rochdale Engineers' Improvement Association, and at Bath we notice a local debating society has had quite an exciting evening in discussing the manners and behaviour of motorists on the King's highway.

**The Gordon Bennett
Cup Race, 1903.**

THE Executive and Races Committees of the A.C.G.B.I. have agreed that the Motor Power Company should be nominated to enter two Napier cars for the Gordon Bennett Cup Race, 1903, the decision as to the third car to be arrived at by an eliminating test. A cheque for £120 has been received from the Automobile Club of France in respect of three cars entered by the Club as challengers for the Gordon Bennett Cup race.

UNDER the auspices of the Aero Club there will be a balloon meet at Prospect Park, Reading, on Saturday, the 6th Dec. Several prizes are being offered in connection with the event.

WE understand that another meeting has this week been held between the railway companies and the petroleum spirit traders on the carriage question, but that no tangible result can yet be reported.

IN a speech at Belfast on Tuesday, Lord Dudley said that the establishment of motor-car services would be more satisfactory in many parts of Ireland than the establishment of light railways. It was a matter that Mr. Wyndham, the Chief Secretary, had very much in mind.

THE MOTOR MANUFACTURING COMPANY, LIMITED, are now in occupation of their new show-rooms at 95, New Bond Street, W., which it is expected will be more central and found more convenient to their clients. They are not able to carry out repairs at the new depot, but have made arrangements for them to be done in the vicinity by workmen well experienced in this class of work.

ON Saturday week a meeting of local automobilists took place at Market Deeping, Lincolnshire. Amongst those present were Mr. Huntley Gordon, on a 10-h.p. Pick, Dr. Benson, Dr. Gilpin, Messrs. Carter, Densham, Tryon, and Greenfield, all on their cars. After an exhibition, showing how easily the large cars could be manipulated, the party adjourned to the New Inn for dinner. A discussion followed on the merits of the respective cars.

A COMMITTEE of the Breconshire County Council has made a tour of inspection of roads in the county by motor-car, traversing in all a distance of about 200 miles. The cars which carried the Committee were a 10-h.p. Wolseley, lent and driven by Capt. D. Hughes Morgan, of Brecon; a M.M.C. car, lent and driven by Col. Thomas Wood; a four-seated Locomobile, also lent by Col. Wood; and a 3½-h.p. Benz Victoria, owned and driven by the County Surveyor, Mr. C. W. Best, who was accompanied throughout the trip by the Chairman of the Main Roads and Bridges Committee of Breconshire.

"LET WELL ALONE."

BELOW we reprint the text of the Registration of Motor Vehicles Bill, introduced by Mr. Scott Montagu, M.P. This proposed legislation is the outcome of that gentleman's own work and that of the Legislative Committee of the Automobile Club. Our readers can now judge for themselves what effect the passing of such a proposal will have upon the motor industry of the country. Our own opinion, and we are fain to think it is the view of the majority of automobilists throughout the United Kingdom, is that, should the above Bill pass through Parliament, motorists will labour under greater disabilities than they do at the present time.

The memorandum states that: "The object of this Bill is to prohibit the use on public highways of motor-cars, light locomotives, and such-like vehicles unless the owners are duly registered and the cars numbered, and unless proper means are taken under regulations of the Local Govern-

2. In addition to the powers conferred by the Locomotives on Highways Act, 1896 (herein-after called the principal Act), and notwithstanding anything in the said Act contained, the Local Government Board may make regulations.

(1.) Prescribing the conditions under which and the mode in which and the places where the registration and numbering of such vehicles may be effected and the persons (residing in the United Kingdom) also may be registered as owners of such vehicles.

(2.) Fixing a sum not exceeding *five shillings* per annum for each vehicle, which shall be charged and paid to the County Council in whose district the licence is granted as duty or licence in respect of such registration, and which duty shall be levied and dealt with as the additional duty imposed by the principal Act, such licence money to be applied in aid of the Highway Fund of such County Council.

3. The person proceeded against for breach of any byelaw or regulation made under this or the principal Act or of any provision of such Acts may appeal to the Court of Quarter Sessions.

4. "Vehicle" shall mean and include any vehicle referred to as light locomotives in the principal Act as well as any vehicle propelled by

LORD STANLEY'S 10-H.P. WOLSELEY CAR—MR. H. AUSTIN AT THE WHEEL.

ment Board for ensuring the identification of the persons owning or unlawfully using them, and their punishment for breaches of such regulations.

"The restrictions on this mode of transit are made more elastic and more suitable to the varying conditions of traffic in different places and at different times.

"Aggrieved persons are given a right of appeal in the usual way against convictions by justices.

"The powers conferred upon the Local Government Board are extended so as to include vehicles of a somewhat greater weight and capacity than were provided for under the principal Act."

A BILL TO PROVIDE FOR THE REGISTRATION OF MOTOR VEHICLES, AND TO AMEND THE LOCOMOTIVES ON HIGHWAYS ACT, 1896.

Be it enacted by the King's most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows:—

1. After the commencement of this Act any person driving or assisting to drive a vehicle as herein defined on a public highway shall, unless some person is registered as owner thereof, and unless such vehicle bears thereon a number or such other mark of identification as may be prescribed, be guilty of an offence punishable summarily.

mechanical power if it is designed to carry its load upon its own platform, and does not exceed, including such load, a total moving weight of *fourteen tons*, or when used for the purpose of drawing one vehicle does not exceed a joint total moving weight of *twenty tons*, and which is so constructed that no smoke or visible vapour is emitted therefrom, except from any temporary or accidental cause.

5. The Locomotives on Highways Act, 1896, is to be read as one with this Act, except section four, which is hereby repealed.

6. This Act may be cited as the Locomotives on Highways Act, 1902, and shall come into operation on the *first day of January, nineteen hundred and three*.

THE Automobile Club of America has resumed the regular weekly talks, which proved so popular last winter. On the first night the subject was the recent reliability run to Boston and back.

THE Baldwin Chain and Manufacturing Company, of Worcester, Mass., U.S.A., have sent us a chart giving illustrations and sizes of the various types of chains they manufacture for use on motor-cars.

CONTINENTAL NOTES.

BY AUTOMAN.

ONE of the most interesting problems in connection with motor-cars has always been the question of the most suitable ignition. Incandescent platinum tubes held their sway for years, and some of the best manufacturers of automobiles would not hear of any other system, and ridiculed electricity as a means of igniting the explosive mixture in the cylinders. Notwithstanding all opposition, however, electric ignition made its way steadily and finished by entirely supplanting tubes, which are now a thing of the past. They have been banished for two reasons, first on account of bother with the burners and the attendant risk of fire, and, second, on account of the fact that tube ignition cannot be retarded or advanced. The only defect of the

THE "AUTO-VELO" TROPHY,

Awarded to Messrs. Werner Frères for the best average motor-cycle performances in the Paris-Vienna Race, the points being allotted for reliability, speed, and regularity.

electrical ignition is, perhaps, the attention required to the batteries and the recharging or renewing of the same. In order to overcome this trouble dynamos and magnetos have begun to replace batteries. With the first there is the danger of burning out the armature, if too high a speed be reached, and the difficulty of getting a spark at a slow speed for starting purposes. The magneto, on the other hand, gives a current at a low speed, and for all practical purposes cannot be burnt out. Hitherto with the magneto the spark has been produced by means of a sudden rupture of the circuit in the cylinder. This necessitates a mechanism more or less complicated, worked by the cam shaft, and requiring several small springs; the method of retarding or advancing the ignition has to be applied to this mechanism, which needs also provision to prevent an accident, should the motor back-fire. All of this constitutes a certain difficulty, and adds to the cost and care of a motor. It is, however, or was until a few weeks ago, perhaps the most satisfactory form of ignition, and as such was adopted in most high-class cars on the Continent.

HERR EISEMANN, of Stuttgart, has, however, invented and perfected a new form of ignition, which is, I think, destined to become universal, and which is actually creating a sensation here in automobile circles. It has been adopted for the new Mercedes cars, and I had the good fortune to be able to examine the other day the first that has been imported into France, and which had just completed a trip of 1,000 kilometres on a 40-h.p. Panhard. It is a magneto of the ordinary type, but with two commutators, which form part of the machine itself. One of these collects the alternating current and converts it into a continuous current; the other distributes the current to the four cylinders. The continuous current from the magneto passes into a transformer coil in the secondary circuit, which gives a high-tension current, capable of flying across the terminals and creating a very long spark. I actually saw a spark of nearly half an inch when the machine was revolved by turning the driving shaft by hand. The armature of the magneto is carried on a sleeve on the driving shaft, and its position can be changed with regard to the driving shaft in such a manner as to advance or retard the ignition by cutting the lines of force earlier or later. The whole apparatus takes up very little more room than the ordinary magneto, and can be placed close by the cylinders, so that the high-tension wires will be very short, and will not be in proximity to other parts of the metal work. The only difficulty I can foresee in this new ignition is the question of the insulation of the high-tension wires, but they will be so short and direct that I think a little care in the placing of the apparatus will entirely obviate this danger.

A SPECTATOR of the kilometre trials on the Dourdan road informs me that a Wolseley car turned up for trial the other day with a Buchet four-cylinder vertical engine replacing the horizontal type which has been for so long one of the distinguishing features of this car. The car was, I believe, of the 30-h.p. type, but the trials were not successful this time, as it seemed difficult to get all the cylinders to work together, and little over forty miles an hour was accomplished. The car was then taken to the workshops of Buchet to have the difficulty remedied, and finally, as I am informed, it was decided to put off further trials until a more powerful machine arrived.

THE Dourdan trials are, however, suspended for the time being, as there is a little difficulty between the police and the A.C.F., owing to the latter having neglected to obtain the necessary permission or authorisation for the holding of these trials. It is quite likely that these difficulties will be satisfactorily arranged in the near future, for the Government is watching over the automobile industry in France, and does not intend to allow any "motorphobe" mania to seriously endanger its progress. The inroads in the French trade already made by the Cannstatt Daimler Company with the Mercedes car, which is being imported into France very largely, is giving the trade food for reflection, and showing them that they must look to their laurels.

THE other day I happened to be at the Hotel du Lion d'Or at Rheims, in the Champagne district of France, and I met Baron Pierre de Crawhez, chairman of the Racing Committee of the A.C.B., and president of the Automobile Club of Namur and Luxembourg, who organised the Circuit des Ardennes last summer. I had not seen the Baron since I met him on the Bastogne road, when his 70-h.p. Panhard was lying in the ditch as a result of a collision with Coppee. Rheims seems to be the half-way house between Brussels and Paris, and the Lion d'Or has a large garage for motor-cars. The Baron spoke to me about the Gordon Bennett Race for 1903, and made the following suggestion, which will no doubt interest English readers. Should it be found impossible to run the cup on British soil, the most natural country to run it in would be Belgium, where the Circuit des Ardennes presents a suitable course, provided the A.C.F. would accept it. There are many reasons in favour of this plan, for Belgium is in the centre of the competing countries, Germany, France, and England,

and consent would be given without any difficulty by the local authorities, who have full powers over the roads. The cost would be very small (about £40 would be required for communal authorities). The roads are, as it will be remembered by those who took part in the last race, excellent, and the means of transport and accommodation for visitors can be easily and comfortably managed by special trains with sleeping and dining cars. It is likely that a Belgian car will compete next year, for I understand one is being specially built by M. H. P. Dechamps, who has left the works which bear his name, and who has commenced manufacturing automobiles in partnership with the Baron de Caters, in the Avenue van Volxem, at Bruxelles-Forest.

ON Thursday morning last week, at the Place de la Concorde, Paris, the trials of delivery wagons, light and heavy, began, and on Wednesday evening last they came to an end. The trials were divided into two distinct sections, namely, "town service" and "suburban service." The first section was divided into five different categories, namely: (1) Cars for two or four people, without luggage, with arrangements for making them open or closed. (2) Cars for four people, with a gallery to carry 66 lbs. luggage per passenger. (3) Cars for six people, with gallery to carry 66 lbs. luggage per passenger. (4) Delivery wagons carrying 10 to 14 cwt., and with a seat for a porter. (5) Delivery wagons carrying 6 to 10 cwt., and with a seat for a porter. The second section consists of two classes, namely, cars carrying at least 15 cwt. of goods, and with a seat for a porter, and cars carrying at least one ton.

THE weather was abominable; it had been snowing all the night before the trials began, and snow was still falling fast at 8 a.m., when the first car left the Hotel Pastoret on Thursday morning. Out of twenty-one entries, twenty cars came up to the scratch. Out of the starters there were fifteen arrivals, who had braved the intense cold of the morning's frost and the difficulties and dangers of the return through the mud and slush of the thaw which began during the morning. On Friday the frost came on again keener than ever, and the drivers and observers were literally covered with icicles when they returned. There were eighteen starters, and seventeen arrived in good time, one heavy delivery wagon remaining with its radiator frozen up at Versailles, two hours being lost in getting it thawed. On Saturday the same eighteen set off again, and the weather was still keen, the roads being in splendid condition, dry and hard. Seventeen of the competitors returned in good time, but the eighteenth, a Huber limousine, had a collision with another vehicle, and did not complete the day's run. On Sunday there was a day of rest, save for those who had repairs to execute, and

the committee of the Club examined the cars and took notes of the repairs effected, in order that they might count in the ultimate results. Amongst the competitors, there are no cars using alcohol, but this is due to a defect in the programme, for the consumption is taken in litres of either fuel, and no allowance is made for alcohol, which is always slightly in excess in consumption over benzine.

THE Compagnie Generale des Cycles et Automobiles Rochet, of Paris, has acquired the patent rights in the Chapelle motor-bicycle. M. Chapelle has joined the Rochet Company, and will superintend the manufacture of the machines.

It is not only English motorists who are suffering at the hands of the police in the way of traps and measured distances. It is the same in the Liege district of Belgium. A meeting of the Liege Automobile Club has just been held to protest against the rigour with which the police are prosecuting *chauffeurs*. It was stated at the meeting that during a single year no less than 1,500 charges had been brought against motorists, the bulk being of a trivial character, secured by policemen hiding in hedges and among groups of farm labourers. It was decided to bring the matter before all the other automobile clubs in Belgium, with the view of taking the matter to Parliament.

ON my last visit to England I was much struck to see and hear that there are still British advocates of the system of numbering of automobiles, in

spite of the fact that it has been proved a failure wherever it has been adopted on the Continent. It has either resulted in indiscriminate fines without a fair hearing, as has been the case in some parts of Belgium; or in protracted legal proceedings ending in the discomfiture of the police, as in France. In the first place it does irreparable harm to the trade, and in the second, whilst putting individuals to great trouble and expense, it makes a mockery of the law and encourages evil-doers to defy it. What a strange thing it is that we always insist on learning our lessons by bitter experience of our own, instead of profiting by the experience of others. In the case in question it would be so easy to avoid taking the wrong course, and it seems to be flying in the face of Providence to neglect to take the advice of our neighbours across the Channel.

THE Wirral Motor and Cycle Company, Limited, has been registered with a capital of £3,000 to take over the Wirral Cycle Company as now carried on at Seacombe, and to develop and extend the same. The registered office is at 22, Brighton Street, Egremont.

MODERN EXCURSIONISTS AT THE LION MOUND ON THE BATTLEFIELD OF WATERLOO.

[L'Automobile Illustrée.]

MOTOR-CYCLING NEWS.

THE advance of the motor-cycle has been very marked within the last few months. This application, which the production of the light internal combustion motor has rendered possible, offers a self-propelled vehicle to the multitude at a price befitting their pockets, both in original outlay and cost of operation. The outlay on petrol is almost infinitesimal and the performance of these machines excellent. If one may judge from the activity in this department noticeable at the Cycle Shows this week, the cyclist has taken up, or is expected to take up during the coming season, the motor-bicycle with enthusiasm.

GROUP TAKEN AFTER THE RECORD RIDE BY F. W. CHASE LAST WEEK ON THE "BAT" MOTOR-BICYCLE.

WE regret to note a tendency to build motor-bicycles with motors of high horse power. While this may meet the requirements of the few, we consider that for ordinary use a machine fitted with a motor of not more than 2-h.p., carefully designed to reduce weight to the lowest possible point without sacrificing strength and durability, will best meet the demands of the average motor-cyclist. The modest powered machine can attain a fair speed, but yet can be pedalled home in case of motor troubles. It is possible that the two-speed gear may come into general use on motor-bicycles, so that, even with a moderately-powered engine, the stiffest gradient can be surmounted without resorting to the use of the pedals.

IN the details of modern motor-bicycles many ingenious devices are to be found, a proof of the great attention which is at present being centred on these machines. Notwithstanding the introduction of several chain-driven motor-bicycles, the belt drive appears to be holding its own. The Minerva position of the motor is still to be found on a large number of machines, but the favourite location seems to be vertically in the frame just forward of the bottom bracket. Spray carburettors are displacing those of the surface type, exhaust valve lifters are becoming general, and altogether the motor-bicycle of to-day shows a marked advance on that of a year ago.

A MONTH or so ago we illustrated and described the new bicycle motor which is being introduced by Messrs. De Dion and Bouton. Since that time a number of further improvements have been incorporated, and in the latest form radiating fins are again provided on the full length of the cylinder. The arrangement of the exhaust valve and contact breaker at right angles to the plane of the fly wheels is retained, but the contact maker itself has been re-designed, and is now on the positive make and break principle. The width over the crank case is four inches, which enables the motor to be fitted within a narrow tread width. With the motor a simple form of float feed spray carburettor is being supplied.

THE members of the Motor Cycling Club will hold a run to Dunstable on Sunday next, meeting at the Marble Arch at 10.30 a.m.

THE HUMBER COMPANY's novelty for 1903 is the adaptation of their chain-driven motor-bicycle to the Olympia, which cyclists will remember as a most comfortable machine for two. There are three wheels, the passenger sits in front and has the full benefit of the scenery whilst being right out of all discomfort from dust or the exhaust gases. The back part is the same as the bicycle, all the control being in the hands of the rear rider. A Humber motor-tricycle, weighing under 170 lbs., is also being made, as well as a strong trailer for attachment to a motor-bicycle.

A MEETING is to be held at the Lion Hotel, Clumber Street, Nottingham, at 8 p.m. on the 2nd December, to consider the question of forming a motor-cycle club for Nottingham and district. Mr. E. G. Young, of 26, Radcliffe Road, West Bridgford, is the active spirit of the movement.

MESSRS. BAYLISS, THOMAS, AND COMPANY have found the 2½-h.p. Excelsior motor-bicycle so satisfactory during the past season that they have decided to make it their standard for the 1903 season. At the same time they will also market a 2-h.p. and 2½-h.p. for those who prefer lighter machines with smaller engines. The bicycle itself has been in many respects remodelled and improved. For example, duplex forks will be used; the hubs, too, have been made stronger and wider. The bottom bracket has been widened, and there is no necessity to bend the cranks in order to clear the engine. The surface carburettor has been retained, but the size of both the induction and exhaust pipes has been increased. A new lubricating pump is fitted, which enables the operator to see that the oil is finding its way to the crank chamber. The belt-drive is retained, and experiments are being made with a new driving pulley, which is said to give satisfactory results.

THE Palmer Tyre, Limited, have just brought out a new tyre specially designed for use on motor-cycles. The outer covers are made with a specially strong grade of the Palmer "Fabric," in which every thread is separated and cushioned in vulcanised india-rubber. The tread of the tyre is very thick, but contains no canvas or other materials that affect resiliency. The tyre is moulded and vulcanised to a special shape, so that, when inflated, the rubber is under compression. It is stated that a

two-inch tyre only makes a track about one inch wide, so that it does not throw mud wide of the mud-guards when travelling at high speed. It is claimed for the new tyre that ordinary 3-8 inch tacks driven into the tread up to their heads will not puncture the air tube. The liability of puncturing by thorns, etc., is thus considerably reduced.

THE British Westinghouse Electric and Manufacturing Company, Limited, is reported to have secured an order for a complete plant, comprising a gas engine, dynamo and switch-gear, to be erected at Sandringham for charging the batteries of electric automobiles.

HERE AND THERE.

LADY YARBOROUGH drove through Hyde Park on Sunday in her electrical brougham.

LORD AND LADY DUDLEY are having a motor-car tour through the north of Ireland.

A SERIES of "smoke talks" is to be held during the winter by the Rhode Island Automobile Club.

AMONG the objects of the Hunslet Engine Company, Limited, recently registered, is the building of motor-cars.

FOR not stopping at once when signalled to do by the driver of a horse-drawn vehicle, Mr. George Croxford, a Lincolnshire motorist, has been fined £1 and 4s. 6d. costs at Lincoln.

AT a general meeting of the shareholders of the New Grappler Tyre Company, last week, it was unanimously resolved to supply the additional capital asked for by the directors.

THE municipal authorities of Aberdeen have just invited tenders for the supply of an electrically-propelled tower wagon for use in connection with the Corporation electric tramways.

MR. GRANGER, in asking at the last meeting of the Isle of Ely County Council for a return of all prosecutions in the Isle of Ely for driving motor-cars, said that in the neighbouring county of Huntingdon between £400 and £500 had been received in fines from automobilists.

ON another page we reproduce a photograph of the 10-h.p. Siamese phaeton lately completed by the Wolseley Tool and Motor-Car Company for Lord Stanley. The car, which is painted dark brown and upholstered in red, is fitted with a canopy and specially-designed glass screen at the rear.

THE Roadway Autocar Company, Limited, ask us to mention that they have received a letter from a lady who informs them that she found on the Maidstone Road, near Ashford, on Sunday, November 2nd, a brown leather case about twelve inches long, containing motor tools, some of which are marked R. C.

A GOVERNMENT expert has made an inquiry at Kingussie as to the cause of an explosion that occurred by which a cottage was practically wrecked. It was found that the explosion was due to a rather remarkable combination of circumstances. A merchant had been left with a stock of petrol at the end of

THE PARTICIPANTS IN THE AUTOMOBILE PAPER CHASE ORGANISED BY COUNT SCHONEBORN-BUCHHEIM, PRESIDENT OF THE AUSTRIAN AUTOMOBILE CLUB. [Allgemeine Automobil Zeitung.]

MESSRS. CASTLE AND SONS, carriage makers, of Worksop, have decided to be of assistance to motorists passing that way. They have arranged to have a regular supply of petrol by water.

THE Watford Engineering Company are now keeping a stock of petrol and heavy oils at their works at the lower end of High Street, Watford. They also undertake repairs to motor-cars of all kinds.

REFERRING to the ascent of Gas House Hill by the Sandringham car, reported last week, Messrs. J. W. Brooke and Company, Limited, remind us that one of their 10-h.p. cars has also performed the feat.

THE Bristol and District Motor Club, open for all classes of motorists, was formed at a meeting last week. Mr. Charles Franklin, Ash Lodge, Chesterfield Road, St. Andrew's, Bristol, is the secretary of the new club. A run was held to Almondsbury on Saturday last.

As mentioned in a recent issue. Messrs. T. Cook and Son are now conveying tourists between Brussels and the battlefield of Waterloo by motor-car. On another page we are able to reproduce a photograph of a party of motoring tourists at the Mound of the Belgic Lion.

the season, and he emptied the contents of some of the tins into a sewer which runs into the river Spey. The river, however, being in flood, caused a backwater in the sewer, the result being that the oil was not allowed exit. As a result the vapour therefrom appears to have percolated back through the sewer to the house, where it became ignited in some way, with the disastrous consequence stated.

THE motor-omnibus service started by the Hemel Hempstead Motor Car Company in February, 1901, has run without interruption ever since. Two well-appointed Daimler omnibuses are employed, and the fare charged between Hemel Hempstead and Boxmoor Station on the London and North-Western main line is threepence. Up to last month the railway company ran a service with two omnibuses, making the same number of double journeys with two conveyances as the motor-car company did with one car. Their fare was 6d. per passenger. Shortly after the motor-omnibuses appeared on the scene the large two-horsed omnibus which ran to the chief trains disappeared, and since then two one-horsed conveyances have been used. Now the railway company has reduced its fare to fourpence, and instituted a reduced service, which is kept up by a one-horsed omnibus.

OIL MOTOR-CARS OF 1902.*

By CAPTAIN C. C. LONGRIDGE.

(Concluded from page 745.)

Not satisfied with the sufficiency of these results, the author questioned Messrs. Carless, Capel and Leonard as to the temperature at which petrol vapour and air would ignite. On August 29th they replied: "From our experience we should have thought it would be impossible for a mixture of petrol vapour and air to ignite, except on the application of a light." He then addressed an inquiry to Mr. A. Phillips, of Reading, as to the temperature of premature ignition in air-cooled motors. The answer was: "From practical experience with air-cooled motors I find that explosion usually takes place when the walls of the explosion chamber are just below red heat."

There are, therefore, the following phenomena:—1st. Failure of petrol vapour and air to ignite at even partial red heat. 2nd. Ignition of lubricating oil under similar conditions. 3rd. Automatic ignition of petrol charges in water-cooled motors at comparatively low temperatures. 4th. Similar ignition in air-cooled motors at higher temperatures. The conclusion to which these phenomena point is, that the automatic ignition of petrol charges is due, not to compression or temperatures attainable under running conditions, but solely and directly to the ignition of the lubricant employed. It takes place at a fairly low temperature in water-cooled motors because the oil used has a comparatively low flash point; and it occurs in air-cooled motors at a higher temperature because the lubricant employed has a higher flash point.

Turning for a moment to the lubricating oils in common use with water-cooled motors, the following figures are typical:—

Flashing Point.	Burning Point.
410 deg. to 450 deg. Fahr.	460 deg. to 550 deg. Fahr.

If the author's suggestion be correct, it might be supposed that three results would be noticeable:—1st. Premature ignition would be more frequent when excessive lubrication is employed. 2nd. It would be continually occurring with lubricants of which the flash point is below 600 deg. Fahr. 3rd. It should leave evidence of its occurrence in the form of carbon deposit. The first result is distinctly noticeable. The second and third results would not necessarily follow. As Mr. H. B. Case, Managing Director of the Vacuum Oil Company, recently observed to the author: "The assumption that decomposition begins at burning point may be accurate, but practice seems to show that decomposition does not go far enough up to a considerably higher point than the burning point to cause deposit of consequence. This seems reasonable in view of the fact that the flash and burning points are determined by an accumulation, during a considerable period of heating, of enough vapour to flash or ignite; and, in practice, the vapour escapes, as it is driven out of the oil. After one flash an oil will go to a higher temperature before another flash occurs; and, if at the burning point the flame is blown out after ignition, the oil will go to a higher temperature before it will ignite again. The period of time which will elapse before another flash or a re-ignition occurs varies with the character of the crude petroleum from which the oil was made, and the processes of refining. The wide variation in these two things makes it impossible to deduce accurately from what one oil does, under given conditions of service, what another oil, even though similar in tests, will do under the same conditions." From this it will be seen that to produce the results in question three conditions must be fulfilled:—There must be sufficient time for decomposition; sufficient oil to generate enough vapour to flash; and sufficient continuous burning to cause any deposit of consequence. In practice these conditions are not so frequently present. Excluding the suction stroke, when the temperature is too low for the purpose, the duration of oil exposure to vaporisation or decomposition in the presence of air is confined to the compression stroke. The time factor, is, therefore, very short, unless indeed oil vaporisation is continuously proceeding between the hot surface of the piston and the cylinder wall. On the other hand, continuous burning is or should be confined to the working stroke; very little carbon, therefore, should be formed. On this point Mr. Veitch Wilson, Chief of the Lubricating Oil Department, Price's Patent Candle Company, wrote to the author on September 9th: "The question as to what we may attribute the tendency of gas-engine oil to carbonise is an exceedingly difficult one, and suggests a prior question, viz., whether the carbon found in gas-engines proceeds from the fuel (gas, oil or petrol) or from the lubricant. From data before me, supplied by the authorities already referred to, I think that I am correct in saying that, in the case of a gas-engine, the relations of gas and of lubricating oil used, gas being reduced to actual weight in accordance with its known specific gravity, are about 96 to 97 per cent. of gas against the balance in lubricating oil. Analysis shows that the composition of town gas, or of gases from mineral oil or from spirit, closely approximate one another, viz., hydrogen, say 84 per cent., carbon about 16 per cent.; and, on this assumption, it seems not unfair to suppose that the bulk of the carbonaceous deposits which are found in gas and oil-engines is due to the fuel rather than to the lubricant." If this view is correct, lubricating oil, as it undoubtedly flashes during the explosion stroke, might also occasionally do so during the compression stroke, without betraying the fact by any material increase of carbon deposit.

The arguments that ascribe premature ignition to the flashing or burning of the lubricant, might be countered by ascribing it to incandescent

carbon in the cylinder or ports. It is quite possible that this also may be a cause of pre-ignition. But it does not fully meet the case. As incandescence would be continuous, it should also lead to continuous pre-ignition; it should make pre-ignition independent of the amount of lubricant used, but the reverse is the case; it should confine premature explosion to cases where such deposit is present, but this is not in accordance with fact.

Speaking with the reserve due to imperfect study of the problem, the author inclines to think that low-flash lubricants are a cause of premature charge-firing. The easiest way out of the difficulty, therefore, would be to use only oils of the highest obtainable flash point. Unfortunately, the oils of this description now on the market are extremely viscid. This gives rise to two fresh difficulties: one, the feeding of such oils into the cylinder; the other, the spreading or dispersion of the lubricant within the cylinder. The first difficulty could be overcome by a mechanically-operated lubricator, such as Messrs. Snowdon use for their "Sinol," a graphitic lubricant of high viscosity. The second is thus described by Mr. Case: "An oil fed into steam is blown, by the velocity of the steam, into minute particles, which are carried through all the steam and deposited on all surfaces with which it comes in contact. In a petrol engine a drop of oil entering the cylinder remains almost intact, and oils of as high flash point (585 deg. and 640 deg. F.) and viscosity (234" @ 210° and 320" @ 210°) as 'Hecla' and 'Extra Hecla' will not spread over the surfaces." Both Messrs. Bluman and Stern and Messrs. Snowdon are inclined to differ from this view; the managing director of the former writing: "I am of opinion that by the combustion in the cylinder, the lubricating oil is spread in somewhat similar manner to the process going on in a steam cylinder"; that of the latter stating: "Any good oil, as 'Sinol,' is diffused or sprayed all over the cylinder." The fact, however, that inventions have been patented with a view to overcoming the difficulty mentioned by Mr. Case, rather points to its recognised existence, at least in the case of the more viscid oils.

As the author would, no doubt, be asked why in gas-engines oils with 400 deg. to 450 deg. Fahr. flash point do not cause premature ignition of the charge, he may at once say that he has not studied the question. Very possibly, the cylinder temperature being kept lower and the quantity of the lubricant used being much more accurately determined, decomposition is sufficiently impeded. Again, it would appear as if hydro-carbon vapour exerted an influence on lubricants which a gas mixture does not. On August 28th, Messrs. Crossley Brothers wrote to the author: "Some short time after we had commenced manufacturing oil-engines, it was brought home to us that the class of oil suitable for lubricating a gas-engine piston would not do so for an oil-engine, as there appeared to be more tendency for the oil to carbonise and to cause the rings in the piston to stick."

The practical conclusions to which the author arrives are, first, petrol motors should be fitted with positive feed-lubricators, ensuring a sufficient, and no more than sufficient, oil supply; second, that with such lubricators high flash point oils should be used in preference to the oils now commonly employed. The high viscosity of such oils is favourable to the retention of compression; on the other hand, it tends to increase friction and thus also the temperature of the rubbing surfaces.

Nickel Steel for Automobile Work.—The author advocates nickel steel, in automobile work, for rivets, pins, exhaust valves, rods, shafts, axles, and springs. Its chief merits are:—(a) Stiffness or resistance to deflection under impact, and toughness or resistance to fracture under repeated impact.—Steel with 3 per cent. nickel shows 48 per cent. greater stiffness, and 45 per cent. greater toughness, than similar carbon steel. With 5 per cent. nickel the difference is even greater. (b) Elastic limit.—The elastic limit of mild and medium hard steel is usually taken as 46 to 50 per cent. of the ultimate strength. With 3 per cent. nickel steel it is stated to be 63 to 74 per cent. (c) Tenacity.—In simple carbon steel, a crack once formed quickly develops, and the material breaks short. In nickel steel the rend is gradual. The latter gives warning, the former does not. (d) Temper.—Nickel allows a reduction of carbon, makes the steel more sensitive to temper, and facilitates the tempering of irregular shapes. Where a forging is too complicated for oil tempering, the requirement may be met by using a somewhat softer and tougher steel and introducing from 3 to 4 per cent. nickel. (e) Resistance to oxidation and heat.—An 18 per cent. nickel alloy is said to be practically incorrodible. A high nickel alloy also withstands well the action of heat. (f) Anti-frictional properties.—The American Sullivan Machine Company state:—"We believe that the nickel renders the wearing parts of machines which run on other parts less liable to cut, the nickel apparently having the property of making the surfaces smooth with wear, even though not always properly oiled."

Conclusion.—The author has endeavoured to bring the present technique of motor-car manufacture briefly before the members of the Institution, because the industry is undoubtedly one of growing importance, and because there are so many features that admit of improvement, and so many points that require the elucidation which the members are pre-eminently qualified to give. But it is not only to the members individually but to the Institution as such this subject is presented. From the former opinions and information are solicited; to the latter is submitted the question, whether considering the magnitude of the industry, the Council of this Institution might not, in accordance with the practice and scope of the association, afford the same assistance as they have given to the gas-engine industry. A Gas-Engine Research Committee has been formed; could not the scope of this Committee be extended to the investigation of the many problems surrounding and impeding the progress of the petrol engine?

* Abstract of Paper read before the Institution of Mechanical Engineers

The discussion on Captain Longridge's paper on "Oil Motor-Cars" was concluded on Friday evening last. Those who took part in it mostly confined their attention to such technical details as the construction of valves, arrangement of cylinders, heating of explosive charges, transmission gear, and other matters of this nature. The opinion was expressed that the chief matter needing attention was not so much the motor as the transmission gear and the details of sparking mechanism by means of which the charge in the cylinders of internal combustion engines is exploded.

In the course of a long reply, in which he met many of the criticisms on his paper, Captain Longridge stated he had avoided mere description, because it was fully and regularly given in the automobile press. Mr. Holroyd Smith complained of the absence of details. He (Captain Longridge) had sought to give illustrations of principles and lines of improvement, but avoided mere details, such as figures, dimensions, materials, etc. Mr. Holroyd Smith thought all the illustrations were old ideas, and defective. That only proved that most inventions were evolutions or perfected repetitions of former crude ideas. If they were defective, why did not the speaker follow the more practical line of suggesting improvements? It was evident from the teaching, and suggestions and prophecies, attributed to the author, that Mr. Holroyd Smith had really not read the paper, and therefore he would not follow his remarks in detail. With Mr. Iden, Mr. Beaumont, and Mr. Austin's opinion that the two-piston, one-cylinder engine was complicated, he could not quite agree. It was certain that this type had done good work, and had distinguished itself in the late 500-mile Reliability Trials in America. As regards the horizontal and vertical position for engines, he drew attention to the importance of the facility of the horizontal motor for obtaining the same power with a longer stroke and slower speed, and therefore as he would at another time show, with probably lower fuel consumption. He thought it a grave mistake to subordinate the choice or evolution of the motor in any way to that of transmission. This was an inversion of the right principle, which was to develop the motor so as to reduce transmission, including change speed gear, to an irreducible minimum. Mr. Lucas had embarked on a distinctly progressive course by eliminating change speed gear; and this would be, he understood, the great feature of the new Charron, Girardot and Voigt 1903 car. Mr. Beaumont and Mr. Sennett were confounding his (Captain Longridge's) proposed impulse every revolution motor with a fairly common type, in which, as in the Butler engine, the charge was received on one side of the piston, transferred to a receiver, and then expanded into the combustion chamber. This cycle was open to objections, from which, as also from that attributed by Professor Burstall, his proposed engine was entirely free. Piston speed was more vital than Mr. Beaumont appeared to think, because a certain speed was required for efficiency, but an excess seriously affected explosion and combustion. He apologised to Professor Hiorns for not having more fully stated the conditions under which hematite had been suggested, and he agreed as to the excellent running surface of this material. At the conclusion of his reply he would give the further promised information on steel cylinders, and try to confute the metallurgical superstitions. He differed from Mr. Beaumont and Mr. Austin, and thought that, when the internal troubles, due to the erratic working of the automatic inlet valve and jet carburettor, were considered, neither device could be called simple. He heartily approved of mechanically-operated valves, and agreed with Professor Burstall that the magneto was a better system than accumulators, and mentioned its adoption for large Continental commercial engines. He upheld and quoted evidence for the correctness of the proposition, that exhaust governing was more economical than volume throttling, and thought that Mr. Iden's objection as to cylinder fouling probably arose from over-lubrication or imperfect combustion. He advised the trial of water and oil for the base chamber lubrication, and did not think that either Mr. Rainey's or Professor Robinson's experiments proved that lubricant vapour could not be a cause of premature ignition. To the professional body, so ably represented at the discussion, he conveyed the thanks of all present, and trusted they would continue their practical interest in the industry; and to the President and Council of the Institution he again very earnestly submitted the desire that the Gas Engine Research Committee should also embrace the petrol motor.

Captain Longridge next explained the analysis for steel cylinders submitted by the Weldless Steel Tube Company and by Messrs. Krupp, and then, as follows, explained that there was no reason to say that steel cylinders would not wear well or would prove troublesome to lubricate. Continuing, he said, "I come to two points that I must accentuate, because they have been mentioned in the discussion. I think they are superstitions rather than facts, and as such I feel bound to contest them at every occasion. I do not deny that *certain* steels may have proved bad to wear and difficult to lubricate; but I do deny, or, at least, I cannot see any grounds to admit, the general assertion that steel cylinders will not wear and cannot be easily lubricated. The question of lubrication resolves itself into that of wear, because, given a smooth surface with immunity from wear, there could be no difficulty with lubrication. It is the wear, the abrasion, the roughening of the surface that leads to lubrication troubles. What, then, are the factors that resist abrasion? First, there is hardness, or resistance to scratching. A hard polished surface, offering the maximum resistance to scratching, presents also the minimum frictional resistance—and the least wear. As steel can be made with any degree of hardness, it follows that in this respect it can be endowed with exceptionally perfect anti-frictional and wearing properties—quite as good as cast iron. In course of time, however, whatever be the material, it must wear; but if that wear be uniform over the whole

area, then the quality of hardness reduces the amount of abrasion to a minimum, and maintains the surface in its original excellent condition; but if, from some want of homogeneity, or from the presence of some hard foreign substance between the rubbing surfaces, irregular wear, scratches, or grooves are produced on the metal, then the very factor of hardness, which was in the first instance a merit, becomes a defect, because it impedes the levelling down and the filling up of the abraded surface; and thus increased friction, leading to further abrasion, and, finally, perhaps, seizing. It is clear, then, that in addition to hardness, something else is needed to improve the wearing capacity, to increase the resistance to abrasion. This second factor is tenacity. In former days, hardness and tenacity were if not essentially, at least casually identified. About 1843, Wertheim experimentally concluded that the tenacity of a metal was proportional to the $\frac{\text{specific gravity}}{\text{atomic weight}}$; and some thirty years later Bottone stated that the hardness of a metal varied in the same ratio. Hence it was surmised that both properties, varying inversely as the atomic volume, or directly as the number of molecules in the unit space, were at least one in cause. This gave rise to or fostered another superstition: That strength and hardness in cast iron go together! I believe the credit of proving the fallacy of this conclusion belongs to Professor Turner. In 1885-87, by an ingenious experiment, he showed that while hardness and tenacity doubtless mutually depend on cohesion, and thus on the number of molecules in a given space, yet the two properties are physically distinct. We may have cast iron or steel high in the scale of hardness, yet low in that of tenacity, and *vice versa*. This is a very important distinction. To resist the gradual uniform wear of normal friction, the attrition or grinding away of the material in fine impalpable powder, hardness is the essential property; but to resist an irregular pressure, tending to strip off shavings or cuttings, to furrow

MOTOR TROUBLES ON THE ROAD.

(Automobile Topics.)

and plough the material, tenacity is the important factor. Hardness is manifest by the resistance to the force required to separate the smallest particles or molecules of the substance; tenacity is displayed by the resistance to the force needed to separate the aggregated molecules of the mass as a whole. Hence the best material for wear and lubrication is that in which hardness and tenacity are duly combined; but in steel we are able to vary the two properties within very wide and very close limits, consequently there is no reason to contend that steel is deficient in wearing properties, or consequently troublesome to lubricate. The difficulty that exists is purely experimental, it is the testing which has already taken place in the case of cast iron required to find the best ratio of hardness to tenacity for cylinder steel. Here it is that the peculiar effect of nickel on hardness and tenacity may stand in good stead, and in this lies the interest of the communication made by Mr. Lloyd on this subject.

I do not attach much importance to the supposed spongy, absorbent nature of cast iron, nor to what might also have been suggested, the presence of graphitic carbon; but I believe with Professor Turner that we need not look for any further reasons than the abrasion hardness and the tenacity. I trust I have made my meaning clear, and that other gentlemen will follow up the subject until the metallurgical superstition of bad wear and troublesome lubrication, that frightens would-be users of steel cylinders, is finally laid to rest."

ONE of the Societe Electromotion's electrical vehicles was last week driven from Paris to Vernon and back, a distance of ninety-four miles, on one charge of the battery, which comprised ninety-six cells of the Phoenix type.

MOTORISTS in Derby are about to form a local automobile club, and on Monday a meeting will be held at the Royal Hotel to consider the matter.

THE NATIONAL SHOW.

As at the Stanley, the exhibits at the National Show, which is this week being held at the Crystal Palace, comprise a large proportion of motor-bicycles, the principal displays being those of the Singer and Quadrant Companies, and Messrs. Bayliss, Thomas and Co., Limited.

Considerable interest has been shown during the week in the 7-h.p. chassis and car exhibited by the "Union" Nurnberger Motorfahrzeug Fabrik, of Nuremberg, Germany, and from the point of view of novelty and attraction they have been the *clou* of the exhibition. The feature of the "Maurer Union" system is the transmission mechanism. The vertical motor is situated in the fore part of a tubular frame, and carries on its shaft, formed with the fly-wheel, a large disc, so mounted that it can be brought into contact with a friction wheel carried on a screw-threaded counter-shaft. A single side chain connects the latter with the rear road wheels. Any desired speed can be obtained by varying the point of contact

FIG. 1. —PLAN OF THE MAURER UNION CAR.

of the friction wheel with the disc, by means of a hand wheel at the side of the steering column. The further the friction wheel is moved from the centre of the disc towards the periphery, the faster the speed of the car, while if the friction wheel is moved over the centre of the disc, a reverse motion is obtained. The idea of a friction drive for motor-cars is by no means new, but the experiments hitherto made have not proved successful. In view of the fact that a large number of the Maurer Union cars are running in Germany, it cannot be said that there is nothing in the idea. The impression the gear leaves on our mind is, from a brief inspection, not a very favourable one, but probably a lengthy trial might bring forward results of such a satisfactory nature as to cause a change in our views.

A new car which made its first public appearance in the Anniversary run to Oxford is the 12-h.p. Sunbeam, built by Messrs. John Marston, Ltd., of Wolverhampton, and, judging from a brief inspection, it is one of which much should be heard in the near future. The main frame is strengthened with steel plates, and in the interior a second frame of angle steel carries the motor and transmission gear, the general arrangement being on Panhard lines. The dimensions are 6 ft. 3 in. wheel base, and 3 ft. 11 in. wheel gauge. The 12-h.p. four-cylinder vertical motor, the pairs of cylinders of which are cast in one piece without joints, is placed in the front of the frame, and is remarkable for its smoothness of running. The valves are easily accessible, the unscrewing of a single plug allowing of their removal. A ball governor is placed on the large gear wheel fixed to the cam shaft. Its action consists in closing more or less an admission valve above the carburettor, an arrangement which the makers have adopted as the system of regulator which puts the least strain on the motor, at the same time reducing the consumption of petrol to a minimum. The working of the regulator is modified by a spring worked by the accelerator pedal, and is set by a hand lever on the steering column. Four speeds are provided, these being divided into two groups, each held, as well as the reverse, by a fork, the whole being actuated by a single lever. All the gear wheels are machine cut; they are all independent, being mounted on squares or bolted together, and are automatically lubricated. Inclined non-reversible steering and three powerful brakes are provided. The foot brake is composed of a steel band working round a drum fixed to the differential box. This brake is applied by a toggle lever worked by a pedal, holding firmly in both directions. The rear wheel brakes are composed of steel bands covered on the inside with camel's hair belting. There is also the usual sprag to avoid running backwards. The wheels are of the artillery pattern, with 32 in. x 3½ in. pneumatic tyres. The lubricators, which are automatic, are placed in sight of the driver. The body is of the tonneau type, and, judging from the care bestowed upon every detail, the car should prove not only reliable, but comfortable and easy to drive. On the same stand are shown two of the curious-looking "Mabley" cars, to carry two persons, one being fitted with a detachable box over the front seat, making a most handy vehicle for tradesman's use. They are fitted with genuine De Dion engines, and have transmission by means of leather belt from engine to second shaft, and then by chains to driving shaft.

The General Motor-Car Company, Limited, of Norbury, is one of the newest concerns to enter the automobile industry, and, judging from the rapid progress made is likely to attain a good position. Foremost

among the exhibits is a special 40-h.p. racing car, which has been built by the company for Mr. W. G. Crombie who, we understand, intends to enter it for the Nice races next year. The four-cylinder motor is provided with a governor acting on the inlet, and by means of an "accelerator" the engine will run up to a speed of 2,000 revolutions per minute. Four speeds forward and a reverse motion are provided, these being controlled by a single lever. The change-speed gear and transmission is on the lines of the Mors, that is to say, the power is transmitted through a clutch to the gear-box, and thence from the differential shaft by two side chains to the rear road wheels. The car has a very long wheel base—7 ft. 6 in.—and the seat is placed much further back than usual. A feature of the car, which equipped for racing only weighs 700 kilog., is the wind cutter with which it is provided; this extends from a point and is brought well up to the driver's seat. We shall look with interest to the doings of the new "General" car when the 1903 racing season opens. On this stand is also to be seen a neat little tradesman's delivery motor-car, with 4-h.p. motor, belt and chain drive; this will carry over 200 lbs. and two people at a speed of twelve miles an hour easily. A 2-h.p. motor-bicycle is shown; this is fitted with a free engine, chain drive, and magneto ignition. The motor is mounted vertically in the lower angle of frame, and in such way that the latter is strengthened considerably. A special feature is the ease with which the machine can be started. The speed of the motor is reduced by enclosed spur-gearing, the power being then transmitted through a chain and clutch to the rear wheel. The engine can thus be kept running, although disconnected from the machine, just the same as in a motor-car.

We have already illustrated and described the 1903 model of the motor-bicycles built by the Quadrant Cycle Company, which are being made in two sizes—2-h.p. and 3-h.p. In Fig. 2 we illustrate the Quadrant motor-tricycle, which is exactly the same as the bicycle in every detail except the front fork. In the place of the front fork and wheel of the bicycle the steering socket is elongated and stayed to the frame. This elongated socket has a cross bridge fixed rigidly at the lower end, each end of this bridge terminating in a short pillar about 6 in. high. A corresponding pillar working parallel with it and joined to it by four links is arranged to carry each side wheel. Steering is done by the handle in the usual manner, and by means of light rods running parallel with the fixed cross bridge, the gear causing one end of the fixed bridge to fall, with a corresponding rise at the other end. The principal alteration in the Quadrant machines for 1903 is in connection with the contact-breaker. This device is formed of a bell-crank lever, pivoted loosely on a stud from the plate of the commutator; the latter carries a second stud holding the contact screw. The end of the bell-crank nearest this is provided with a platinum contact, while the other is hardened to resist wearing by the cam upon which it rests. The bell crank is pulled by means of a spring towards the contact screw, against which it presses when the other end drops into a deep notch in the cam. When, however, this end is raised from this notch the contacts are separated. The device has the great advantage that it is practically

FIG. 2. —THE QUADRANT MOTOR-TRICYCLE.

self-adjusting, and it is impossible for the motor to misfire owing to faulty contacts.

The Benz cars exhibited by Messrs. Hewetsons, Limited, are of a type that has already been illustrated and described in the *Journal*. Three of the cars are of 10-h.p., with two-cylinder motors, comfortable tonneau bodies, and four speeds and reverse, the transmission being by means of a single belt, gear, and chains. Three 16-h.p. cars and a couple of the well-known Benz 6-h.p. tonneaux are also staged. For business purposes the firm are showing a couple of light vans of respectively 5 and 10 h.p., and a 10-h.p. lorry to carry 30 cwt., built for the Corporation of Huddersfield.

The Rochet voiturette, described in connection with the 1902 Automobile Exhibition at the Agricultural Hall, is to be seen at the stand of the British and Foreign Motor Car Company, Limited, who also stage a 10-h.p. Rochet chassis and a complete 10-h.p. touring car. The novel feature of this vehicle is the speed change gear, which has already been illustrated in our columns. Four speeds forward and a reverse motion, controlled

by one lever, are provided, the makers claiming to be the first to adopt this improvement.

The new record of 228 miles 250 yards in six hours, established by F. W. Chase last week on his Bat motor-bicycle, has caused considerable attention to be centred this week on the exhibit of the Bat Motor Manufacturing Company, Penge. The Bat bicycle has only been on the market a few months, but it has already made an excellent name for itself. The machine is designed with the idea of making a thoroughly reliable, strong, and powerful motor-bicycle. It has a close, compact frame, firmly stayed. In the No. 1 pattern a $2\frac{3}{4}$ -h.p. De Dion air-cooled motor is employed, and

FIG. 3.—THE BAT DRIVING PULLEY.

in the No. 2 one of $2\frac{1}{2}$ -h.p. The motor is placed vertically in the frame, and a stay runs from the bottom of the motor casing to the rear axle. The power is transmitted through the Bat patent pulley, and a Chicago raw hide belt to the rear wheel. Reference to Fig. 3, which gives an elevation, plan, and section of the pulley, will show that the grooved periphery is recessed in eight places equidistant from each other for the purpose of accommodating a similar number of "clutches." The latter are each free to move about a pin on which they rock, so that the shaped portion of their bases, when coming under the stress of the belt, is thereby pressed down to and aligned with the solid portion of the grooved path in the pulley. The effect of this is to force the upper inner face of the clutch inwards on to the belt, clutching or gripping it, and as these clutches are set alternately on each side of the groove, it will readily be seen that the belt is gripped by them in a very effective manner. A neat and effective form of belt fastener is used, and the switch, operated from the Bowden brake lever, renders the breaking of the current instantaneous. A spray carburettor is used, and a petrol tank of a capacity of $1\frac{1}{2}$ gallons is provided. Another novelty, so far as the roadster "Bat" is concerned, is the spring frame (Fig. 4), which can be fitted if desired. The saddle is carried on a second diagonal which is retained by a guide and links to the main frame, and is supported on two strong spiral springs, which can be adjusted to suit riders of various weights. This same sliding portion carries the rests for the feet—for it should be noticed that the "Bat" has no pedals, as the power of the engine is stated to be sufficient to take it up any hill; pedals can, however, be fitted.

The Duryea Company have on view five of the Duryea power carriages, ranging from a little phaetonette to carry two up to a comfortable wagonette holding eight. The same 10-h.p. engine is used in each, but a different ratio of gearing is employed. The smallest car, with a normal rate of progression of about 22 miles an hour, and can attain, if needed, a rate of 45 miles, whilst the largest vehicle progresses at a modest 16, which can, when required, be increased up to 32. A unique feature of these cars is the "one-hand control." A slight side movement of the single lever directs the course of the car, a slight rotary movement of the handle opens or closes the throttle; whilst a tap with the other hand on the top instantly puts the motor out of gear, and a further depression of the handle brings the low gear into play for emergencies.

The Progress Cycle Company, Limited, exhibit five of their neatly-finished 9-h.p. Progress cars, with tonneau and double-phaeton bodies. The well-known De Dion-Bouton motor, with water-jacketed cylinder and combustion chamber, furnishes the motive power. It is placed in a vertical position, under a bonnet. An exhaust valve regulator is applied by means of a lever, working on a serrated quadrant, just underneath the steering wheel, and within easy reach of the driver. It is used for reducing the noise of the engine, when the full power is not required. The speed of the car can also be varied by using this means instead of the ignition lever. Two speeds and a reverse are provided. The slow and fast gears are always in mesh, each being connected to an independent friction clutch. Between the motor and speed gears is placed a clutch worked by a pedal. As the speeds of the car are changed by friction clutches, it is not necessary to use this in changing speeds, except in reversing. The power from the speed gears is transmitted to the back axle by a shaft fitted with universal joints

at both ends, and bevel pinions. Wheel steering is fitted, while the frame is constructed of steel tubing. The motor and the whole of the mechanism are fitted upon two lengths of channel steel, securely bolted to hangers, carried by the tubular frame—thus forming a double frame.

One of the new De Dietrich (Turcat-Mery) cars is shown on the stand of the Burlington Carriage Company, Limited. Although combining many of the best points of the latest Panhard and Mercedes practice, the new car exhibits much originality in detail. Broadly, it follows the standard arrangement of vertical motor in the fore part of the frame, friction clutch, change-speed gear, and two side chains. The motor comprises four cylinders and develops 16-h.p. The governor runs in an oil bath case, and magneto ignition is employed. The pump for ensuring the circulation of water around the cylinder jackets is of large dimensions, and is chain driven. The cooling system, however, is so arranged that should the pump fail, natural circulation proceeds in a manner sufficient to allow the motor to be still driven. The carburettor is fitted with a regulator or throttle, by means of which, and the firing control, the motor is claimed to be as flexible as a steam engine. A powerful brake applied by a pedal is fitted on the differential shaft. Powerful band brakes, applied by side lever, are also fitted to the chain sprockets on the road driving wheels. There are a number of special features in the car to which we hope to refer in a later issue.

Mr. E. W. Hart, of Luton, is present with an interesting array of cars, including an attractive electric runabout, used by Miss Hart to drive to and from school. The vehicle is fitted with a small battery permitting a distance of about 25 miles to be run on one charge. A 9-h.p. Renault car of the latest type is also staged, this being provided with a special tonneau body. An attractive vehicle is to be seen in the 12-h.p. Hart car. This follows the modern practice, the engine having two cylinders set in the fore part of the frame. Three speeds ahead and one reverse are available. The tonneau body is finished in heliotrope, and has a comfortable appearance. The next car we inspected was one of the so-called 20-h.p. Paris-Vienna Darracq "flyers," converted into a touring car, with a tonneau body of the Roi des Belges type. The car on the stand which has probably attracted most attention during the week is the 8 to 12 h.p. genuine Mercedes car, fitted with a Roi des Belges tonneau body, in white and gold. So far as concerns the motor and mechanism of this kind, it is practically a replica of the 40-h.p. Mercedes, the four-cylinder motor having mechanically-operated inlet valves, magneto ignition, the Mercedes radiator, etc.

A large display of Beaufort cars is made by the Beaufort Motor Company, of Baker Street, W., ranging from a 6-h.p. phaeton to an 18-h.p. six-seated tonneau. The 6-h.p. car has a single-cylinder motor, and two speeds, the power being transmitted to the rear axle by a single belt and gear wheels. The 8-h.p. cars have a single-cylinder engine and three speeds ahead and one reverse. In these cars the transmission of the power is through, a clutch gear-box, jointed longitudinal shaft, and bevel gear to the rear live axle. We next examined the 12-h.p. Beaufort cars, which

FIG. 4.—THE BAT SPRING FRAME.

have a double-cylinder motor, the two cylinders with the water jackets being cast in one piece. In other respects the vehicles follow the arrangement adopted in the 8-h.p. Of the 12-h.p. cars, a tonneau is being exhibited as well as a well-finished brougham, with a body specially built by Mr. G. Page, of Camden Town. Finally, we come to the 18-h.p. Beaufort car, with special "Alexandra" body, seating six persons. This vehicle has a two-cylinder motor, four speeds ahead and one reverse. The governor, which works on the inlet, runs in an oil bath. Automatic lubrication of the various parts is maintained by the pressure of the exhaust. We may add that in all the Beaufort cars a special form of rotary magneto ignition is

employed, and by means of which the sparking can be advanced and retarded as desired.

Messrs. Bayliss, Thomas and Co., Limited, exhibit no less than forty of the Excelsior belt-driven motor-bicycles, which is probably the largest collection of motor-bicycles ever shown by any firm. The machines are made in three different patterns, with motors of 2, 2½, and 2¾ h.p. respectively. They are suspended below the bottom tube of the frame, but in the case of the larger sizes the frame is modified to allow space for the larger cylinder and bigger combustion-chamber. It is worthy of note that the engines are manufactured entirely by the firm, and the larger sizes are fitted with carburettors sufficiently large to permit of an ample supply of mixture, no matter how fast the engine may be running. The mudguards are wide and substantially fitted, and the front one is carried well forward in advance of the steering socket.

Messrs. Hobart Bird and Co., Coventry, show a specially designed motor-bicycle. It has a 2½-h.p. vertical motor of British make, spray carburettor, and a large petrol capacity. The Wearwell Motor Carriage Co., Ltd., display two motor-bicycles having the 2½-h.p. engine supported within the frame, on the lower cross tube and driving the rear wheel by a belt. One of the engines is fitted with spray carburettor and the other with a surface carburettor, both having an exhaust valve lift. The motor-bicycle shown by the Centaur Cycle Co. is a chain-driven machine, with the Humber motor and the Humber drive. It has, however, some modifications especially in the arrangement of the front fork, which follows the lines of the well-known Centaur pattern, and is still further strengthened by a brace in front.

Although the Raleigh Cycle Co.'s motor-bicycle, as made this year with the engine over the front wheel, has given satisfaction as regards its power and pace, yet the company have had to bow to the popular prejudice against front-driven motor-cycles, and is introducing a rear-driven machine of special design, in which an adaptation of their X frame is used. The engine, which is hung perpendicularly in front of the crank bracket, develops 2-h.p., and all the controlling levers may be manipulated without removing the hands from the handle-bar. A spray carburettor is used. The Imperial Motor Co., of Brixton Hill, S.W., are making their P.D.C. motor-bicycle in two sizes—2-h.p. and 2½-h.p. In both, the motor is located vertically in a special frame and drives the rear wheel by a twisted belt. A spray type of carburettor is employed. On this stand is also to be seen one of the "bi-carriages" made by Mr. L. Straker, of Farnborough, Kent. It consists of a comfortable seat attached by C springs to a tubular axle, so arranged that the wheels turn on their hubs as on a car. The axle is attached to the frame by three tubes. The carriage enables a motor-bicycle to be quickly converted into a tricycle for two persons.

The Whippet Motor and Cycle Manufacturing Co. show a motor-bicycle with F.N. motor and the Whippet two-speed gear, enabling the rider to assist the engine uphill, by means of the high gear, without exhausting himself, the low gear being retained for pedalling the machine in case of derangement of the motor. Four motor-bicycles are shown by the Star Cycle Co., Ltd., all fitted with 2-h.p. vertical engines. One has magneto ignition and spray carburettor, and the three others ordinary electric ignition and surface carburettors. In all, the frames are designed to give long wheel base, and are especially strengthened, the front forks being fitted with a forward pair of forks so as to make this vital part of the machine doubly secure. The transmission is by means of the Lincona belt, and all machines are controlled by the usual switch-handle. The large belt pulley rim is built into the wheel by means of spokes and nipples, thereby preventing strain on the wheel spokes. The Ilford Motor Car and Cycle Co., Ilford, display their Regina motor-bicycle, which is fitted with a 2½-h.p. genuine De Dion motor in vertical position just in advance of the bracket. The valve lifter is operated by Bowden twist handle, a switch handle being provided on opposite side, thus giving complete control of the machine without removing the hands from the bar. The machine is driven by a Lincona belt, and a method of adjusting this is afforded by a small jockey pulley depending from the bottom stay and moving vertically in a slot.

For the 1903 season the motor-bicycle of the Rex Motor Manufacturing Company, Limited, is being fitted with a 2¾-h.p. (75 mm. by 75 mm.) engine, mounted vertically, near the crank bracket. It is slung in a kind of cage, and is well stayed. It drives by a belt to the back rim. A surface carburettor is fitted on the top rail. There are three control levers, the throttle lever, the air lever, and the lever which combines the functions of spark advancer and retarder, and exhaust valve lifter. A compression tap has been added to the top of the cylinder. Perhaps the most unique feature about the Rex motor is the method of carrying away the exhaust. The usual exhaust pipe and box are dispensed with, and instead the exhaust box is ingeniously designed so as to be part of the motor itself (see Fig. 5). It works on the following principle:—A chamber of good capacity is cast just below the exhaust valve chamber, and the gases pass direct into this and expand; before they can pass into the atmosphere they strike up against a series of baffle plates, which form the cover of the exhaust box. These baffle plates are made in one casting and are drilled with small holes, and the gas issues out from them with practically no pressure. The device is claimed to be most effective as a silencer, and puts practically no back pressure on the motor. It also gives a distinctly neat and finished appearance to the motor.

A big display of the 1903 Model Rex cars is shown by the Rex Motor Manufacturing Company, Limited, all having the engine in front under a bonnet, and driving the rear axle through a clutch gear box, and bevel

gear. The first car we examined was a two-seated touring car, fitted with an 8-h.p. single-cylinder motor, and provided with three speeds forward and one reverse, the power of the motor being transmitted direct on the top speed. Of the Rex 10-h.p. cars there are three or four well-finished specimens. The majority have tonneau bodies, but one is fitted up as a brougham. The vertical single-cylinder motor has a diameter of 115 mm., and a stroke of 115 mm., and runs at a maximum speed of 1,200 revolutions per minute. It is fitted with a governor acting on the exhaust. The road wheels are of the artillery type, shod with 32 by 3½ in. tyres. For the first time the Rex Company show a two-cylinder car—a 14-h.p. tonneau, having three speeds and reverse. This company appears to be making rapid strides in motor construction, for it is only a couple of years ago that their exhibit consisted of a 4½-h.p. voiturette.

The 1903 model of the Singer motor-bicycle has already been illustrated and described in the *Journal*. At the Palace the stand of the Singer Cycle Company, Limited, is naturally attracting much attention, for in addition to the motor-bicycles, there are motor-tricycles, tandem tricycles, and tri-voiturettes; a new variation of the latter, consisting of a governess cart, in which the usual single seat at the rear of the axle is replaced by a double-seated, coach-built body, with a door behind, giving easy access, is a distinct novelty. The tandem tricycle arranged for lady at back is a splendid piece of workmanship, and of fine appearance. By detaching the rear portion it is converted into a single tricycle. The single lever control is retained in all these motor-cycles. We may add that the Singer chain-driven motor-bicycle has not been designed to supersede the gear-driven machine, but is made to meet the demand for a chain driver. The spokes on one side of the rear wheel are entirely dispensed with, so that the engine is perfectly accessible. The motor pinion drives a larger wheel on a hollow axle, which serves as a countershaft running through the bottom bracket; at the other end of this shaft another chain pinion drives back to the road wheel. The hollow shaft is mounted upon roller bearings. Through this hollow shaft, upon another set of roller bearings, the crank axle proper passes, and is provided with a gear on the Crypto principle for pedalling

FIG. 5.—CYLINDER OF REX BICYCLE MOTOR, SHOWING NEW EXHAUST DEVICE.

A cylinder; B, exhaust chamber; C, exhaust valve stem; D, silencer baffle plates.

purposes, upon the left side. To reduce the strain upon the chains caused by the impulses of the engine, a special spring buffer chain wheel is fitted to the road wheel.

The Dorman Engineering Company, Limited, show no less than five patterns of their motor-cycles, fitted with the "Whirlwind" engines, as well as samples of the motors themselves, with all the necessary fittings. The motors vary in power from 2 to 3 h.p., and are fitted in both in inclined and vertical positions. The 3-h.p. machine is fitted with a water-cooled engine in a vertical position. This machine carries sufficient oil and water for a run of 150 miles, and is suitable for hilly districts, and for drawing a trailer. The D.E.C. 2-h.p. engine, with complete set of fittings ready for attaching to cycle, has been considerably improved in several details, and comprises specially-designed crank and fly-wheels, by which is obtained a firm crank shaft and long bearings, thereby securing long life. Another special feature is the accessibility of the valves; by unscrewing a set screw half a turn, a special swing-over bridge exposes the inlet valve dome. The inlet valve and its seating can then be taken bodily out, and the exhaust valve removed. Motor-bicycles with the 1903 Minerva engine are shown by Mr. Harry S. Roberts, of Deanshanger, and Messrs. Frank H. Parkyn, Limited, Wolverhampton.

Mr. E. Blundell, of Wem, Shropshire, is showing his liquid patching tyre cement, "Patcho," a new composition for repairing inner tubes or outer covers of bicycle or motor tyres, without the aid of rubber or chalk. To repair a puncture or burst, the neighbourhood of the puncture is cleaned and roughened with sandpaper or emery, and the cement is applied. After two minutes allowed for drying, the repair is described as complete. A Yorkshire motorist, who has tried "Patcho," reports that it has proved most successful in repairing an old motor outer cover full of holes and cuts.

[There are a number of other exhibits which we hope to deal with later.]

THE STANLEY SHOW.

As might be expected, the display of motor-bicycles is the dominant note of the Stanley Show at the Agricultural Hall, Islington, N.—that convenient and accessible home of so many popular trade exhibitions.

The latest American petrol car to appeal for the favour of British motorists is the "Rambler," which is being introduced into this country by the Petrol Motor Power Company, and of which an illustration is given in Fig. 1. The motive power is supplied by a 6½-h.p. horizontal single-cylinder motor. The water circulation is on the gravity system, a special arrangement being fitted for causing cool air to rush through holes

FIG. 1.—THE RAMBLER CAR.

provided for the purpose through the water-tank. Two speeds forward and a reverse motion are provided; the change speed gear is of the Crypto type, the drive being direct through a single chain on the high speed. The car is equipped with Goodyear tyres, and on the level can attain a speed of twenty-five miles. It may here be mentioned that one of the "Rambler" cars made a non-stop run in the recent Anniversary run to Oxford.

Two new American petrol cars are to be seen on the stand of the Kitto Automobile Company—the Cleveland, and the Waltham. The former has a 8-h.p. single-cylinder, horizontal motor in the rear of the frame. The throttle is worked by a foot button. A float feed carburettor of the Longuemare type furnishes the mixture. One notable feature is the automatic check release for starting the engine. The valve is opened and the engine is started by the usual ratchet crank. At the first kick of the engine the compression release valve closes automatically. The cylinder is water-cooled, the circulation being maintained by a small circulating pump. An automatic multiple feed lubricator keeps the various bearings and cylinder well oiled. Two speeds and one reverse are obtained by a Crypto-type gear, the power being transmitted to the rear axle by a single chain. The Waltham Runabout has a frame of steel tubing. The axles are strongly trussed to support the heavy lateral springs which are mounted upon them and carry all the weight of the frame and machinery. The motive power is supplied by an 8-h.p. De Dion motor. The speed of the motor is controlled by pressing the foot on a button or throttle on the floor of the carriage. The throttle and carburettor are so well adjusted that, by this means alone, the speed of the motor can, it is claimed, be governed at will from 250 to 2,000 revolutions per minute, giving a speed to the carriage of from 3 to 20 miles an hour. The transmission gear is mounted on the direct shaft from the motor; it operates on the band brake principle, giving two speeds forward and one reverse. On the high speed the power of the engine is conveyed direct to the rear axle by a single chain without the operation of any gears. The controlling mechanism consists of a lever located on the left-hand side of the carriage.—To start the carriage, it is pushed forward a few inches, which causes the slow-speed gear to operate. A further movement of the lever forward will engage the direct gear, and the car will then take a speed according to the pressure given by the foot on the throttle. To stop the car the foot is simply lifted from the throttle and the lever pulled quickly back as far as possible against the reverse, which acts as a powerful brake until the vehicle stops, and then if still held back will cause the car to move slowly backward until the lever is allowed to take its natural upright position. The car is further provided with a powerful emergency brake acting upon the rear axle. The new Kitto motor-bicycles are fitted with 3½-h.p. air-cooled engines, built in the frame in such a way as to constitute part of the seat tube. The top tube of the machine is used as a lubricating oil-tank. Belt-driving is adopted, while the "mixture" is furnished by a special combined mixing valve and throttle.

Messrs. Brown Bros., Limited, show the new pattern of Brown motor-bicycle. The 2-h.p. motor is vertical, and is placed in the popular position in front of the crank-bracket, a couple of plates on the frame and bracket holding the crank-case secure. A spray carburettor is fitted, and the machine is controlled by two levers only. In addition to this, the firm show the type with the engine inclined on the lower cross tube, a position which finds favour with a good many motorists. Both the patterns are of the belt-driving class. Car motors of various powers and an 8-h.p. Brown

car are also to be seen. In addition to these Messrs. Brown display a most complete collection of parts and accessories, including coils, accumulators, lamps, jacks, lubricators, gear wheels, chains, etc.

Messrs. Davis, Allen and Co., in addition to exhibiting a number of Mitchell 2-h.p. motor-bicycles, have on view one of the "Indian" 2-h.p. chain-driven machines, of which an illustrated description was given in our issue of November 30th, 1901. The East London Rubber Company are introducing a new motor-bicycle, which they have named the "Kerry"; it is carried inside a special loop frame, and drives the rear wheel by a belt. The engine has a cylinder 70 mm. bore by 80 mm. stroke, and develops 2½-h.p. at 1,400 revolutions per minute. A float feed type of carburettor is employed, and a neat form of exhaust valve lift is fitted.

No less than three types of motor-bicycles are shown by Messrs. Bradbury and Co., Limited, of Oldham. The new one has a motor of 2 or 2½-h.p., placed vertically in the frame; the case of the engine is a malleable casting in which the whole of the lugs and the crank bracket shell are included. Consequently the crank case of the engine can, without any fear of fracture, be used as part of the frame. The cylinder is cast in one piece with the head, and the silencer is placed close to the exhaust outlet. The first movement of the exhaust valve lifting lever breaks the electric circuit. Lubrication is provided by a pump placed conveniently at the fore part of the tank, where the oil reservoir is situated. The drive is through a Lincona belt. Fig. 2 shows the Bradbury 2½-h.p. motor-cycle provided with an extra rear seat, which may be readily attached and detached. The machine is provided with an extra tank, with compartments for both oil and petrol. A well-designed trailer is exhibited, and a chain-driven motor-bicycle driven by a Clement-Garrard engine is also shown.

Tyres naturally form an imposing collection—could they be brought together—and are now numerous enough to puzzle the novice anxious to make the best selection. All the well-known makes are represented. The Collier Twin Tyre Company, Limited, show the tubes of the tyres which went through the 4,000 miles test of the Automobile Club, while prominence is naturally given to the fact that these tyres lost least marks in the daily runs. The "Radax" motor-tyres are shown on various sections of rims. These are made in certain sizes, moulded and vulcanised throughout, and the strain being distributed, elasticity and easy running are secured. Stand 1 is occupied with specimens of the Camel motor-cycle tyres, and other goods of Messrs. F. Reddway and Company, Limited. Messrs. Toni and Company take occasion to call attention to their new form of motor tyre in which the thickened edges of the cover are clamped one on each side of the metal rings, thus holding them with absolute firmness. The clamp itself prevents creeping, and automobilists will regard with interest a practical trial of this idea. The Grappler motor tyres are shown in weights suitable for cars of all sizes, nuts and bolts being adopted at intervals round the rims. The Continental Caoutchouc and Gutta-percha Company have a representative display of the "Clipper Continental" motor-tyres, the features of which are universally known. A novelty is shown by the Ducasable Automatic Tyre Syndicate. A string of strong indiarubber balls containing atmospheric pressure only, is placed within the tyre in place of the usual inner tube. In each ball is a small aperture to allow the free passage of air where the ball receives the load. According to the claims of the Syndicate the tyre can be punctured without any interference with the running of the car, and motorists will look for the future performances of this innovation.

FIG. 2.—THE BRADBURY MOTOR TANDEM.

Considerable interest is being shown in the 1903 models of the Minerva Company's bicycle-motors, exhibited by Mr. D. Citroen. As we have already announced, three sizes are being made—the 1½-h.p. Romania, arranged to be fitted in a vertical position, a 2½-h.p. Minerva of the old type for use on high-powered machines, and a 2-h.p. Minerva, which is attracting great attention by the fact that it is fitted with mechanically-operated inlet valves. We give two views of this motor in Figs. 3 and 4. In the motor the inlet valve mechanically opens the moment that the piston begins to descend, and is not closed until the piston has arrived at the end of its stroke. The fresh gases occupy, therefore, the whole of the volume of the cylinder. The compression has been greatly increased, the combustion chamber and the cylinder being cast in one piece. The sparking plug is placed just above the inlet valve. The exhaust is quite free, the angular bends of the

tubes having been eliminated and a silencer constructed which, whilst being small, avoids back pressure upon the motor. Referring to the illustrations, it will be seen that the cylinder does not possess any radiators on its lower part; only the top part, the combustion chamber, and the valve boxes being so provided. D is the combustion chamber, cast in one piece

FIG. 3.—SIDE VIEW OF THE NEW MINERVA MOTOR.

with the cylinder. An interior partition almost completely separates the two valve chambers. H is the inlet by which the gas prepared by the carburettor is sucked in by the motor. I is the outlet for the burnt gas. This outlet inclines at 45 degrees, and considerably facilitates the escape of the gases, as these do not encounter sharp angles. Both valves are opened

FIG. 4.—SECTIONAL VIEW OF NEW MINERVA MOTOR, SHEWING VALVE-OPERATING MECHANISM.

by being lifted by rods raised by the action of the cam seen in Figure 4. The cam M is keyed upon the shaft N, which is operated from the interior of the crank case by a two-to-one spur wheel keyed upon the shaft O. This cam M operates the inlet valve S through a lifting rod V sliding vertically

in a guide-socket W, the cam M turning in the direction of the arrow indicated in the illustration. After having operated the inlet, it operates the exhaust valve P through the medium of a bell crank T turning round a pivot U, and lifting the rod Q sliding in the guide R. Half of the thickness of the cam M is cut away, so that although the cam is made in one piece it has two distinct profiles, of which the larger controls the exhaust valve P, and the smaller the inlet valve S, in order to hold the exhaust valve open for a longer period than the inlet. The small cam X turns freely on its pivot when actuated by an external rod connected to the operating lever on the bicycle top-bar, and when so turned the cam raises the arm Y of the bell-crank and so holds the exhaust valve open.

Other features of interest to automobilists will be described in our next issue.

CORRESPONDENCE.

THE AUTOMOBILE CLUB BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the owner of a $3\frac{1}{2}$ -h.p. car which I have had in use for nearly four years, and during that time I have ridden many thousands of miles with great advantage to my health and at little expense to my pockets. With the police, until recently, I have never had any difficulty; but during the last three months I have been stopped twice, although my car will not travel, at its best, more than fourteen miles an hour. This, Sir, I consider is a shame, and I can only suppose that the police have recently had special instructions to stop all motorists.

Whether this is so or not I do not know positively, but it certainly seems to me that the activity of the police is being caused by the ill-judged action of those motorists—in Parliament and out of it—who want to alter the present law. Why should Mr. Montagu want to alter the existing law; or, why should he seek to interfere with other people's pleasures? It appears to me a very injudicious act on his part, and I trust other Members of Parliament will take care to block any Bill seeking in any way to alter a condition of progress which has been so eminently satisfactory.

Thinking as I do I beg to append a signature suggesting to sensible folks the advisability of not seeking to alter present conditions.—Yours truly,

LETTING SLEEPING DOGS LIE.

GRADIENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In Mr. Alford's article, "From North to South," in your last issue, he states that the Kirkstone Pass, approached from the Patterdale side, "is a hill about four or five miles long, having an average gradient of one in eight"! Assuming four and a half miles to be the length, this gives a rise (not from sea level, be it remarked) of about 2,970 feet from the foot of the hill. I do not know the length of the foot of the hill above sea level, but it is considerable, and even supposing it is only 200 feet, then, according to Mr. Alford, the summit of the Kirkstone Pass must be about on a level with the top of Helvellyn!

Motorists' statements are as a rule very loose as regards grades, but Mr. Alford's estimate pales into insignificance compared with a statement I saw a few weeks back of a motorist on a small-powered petrol car, who "frequently encountered hills of one in five, and sometimes of one in four and a-half, on main roads." Can any of your readers tell me of a main road with a slope of one in five. Personally, I doubt there being one, when subjected to the test of clinometer or, better still, theodolite. Another point in connection with statements as to hill slopes is the use of the word "about." One often hears a hill described as "about one in seven or seven and a-half at its steepest part," the speaker being, apparently, under the delusion that the extra half is of small value; well, so it may be with a hill of one in fifty, where half only makes a difference of one per cent., but at one in seven and a-half makes a difference of, approximately, 7 per cent.—Yours faithfully,

T.

FURRED BOILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 8th inst. Mr. J. G. Kirsten, and in yours of the 15th inst. "Steamer," ask for full particulars of "Vulite," which I recommended for the boilers of steam motor-cars. Being acquainted with the constituents of Vulite, and knowing that it contains neither acid nor alkaline matter, after giving it a severe trial, I am able to thoroughly recommend it as a prevention of incrustation. I use it myself and, therefore, can speak from experience. It is manufactured by the Vulite Syndicate, Ltd., 40, Wilson Street, Finsbury, E.C., to whom I suggested they should advertise their preparation in the *Journal* so that others may also benefit by its use. I know only too well the harmful effects which result from the majority of boiler compositions, therefore should not recommend this one did I not find it advantageous. As I reside at Burton-on-Trent, where the well waters are so extremely hard, I found it absolutely necessary to look around me for something to prevent my pipes and boiler furring. I shall be only too glad to be of service to any inquirers on this matter.

In reply to "Steamer," the blow cock is fixed at the top of my boiler for blowing off the steam, but I have a special blow-off cock from the bottom of the boiler for blowing off water and also any sedimentary matter, but my principle is to blow off the boiler every day after the steam has run down to

20 lbs. pressure. I also open all steam pipes as far as possible so as to get rid of any sedimentary matter that may be in them. "Steamer" will not have any further difficulty with his pipes or water-gauge when he employs the compound above referred to. I shall be glad to know how he succeeds with its use.—Yours truly,

FRANK THATCHER.

HOW TO DRIVE MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be interesting to have the opinions of your readers concerning the best methods of driving a motor-car. Few people are able to spare the time necessary for a course of lessons from competent teachers, and the majority have to rely upon themselves, or the advice of friends, who possibly were in a similar position a few months previous, but have worked out their own salvation in what seems a satisfactory manner.

Their method of driving may, however, be far from the best. One will drive with the spark advancing lever only; while another will use the throttle lever. In running down hill there are more ways than one of arranging matters. One driver goes at it on the top speed, with motor running out of gear, relying solely on his brakes; while another stops his engine and uses it as a brake. Yet another will use the middle or low speed gear, with engines either working or switched off, or in or out of gear. Which is best? Other problems might suggest themselves, answers to which would make interesting reading and greatly assist those who are anxious to drive well.—Yours truly,

"GEAR BOX."

ANTI-FREEZING SOLUTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers suggest an easy method of guarding against fracture of the cylinder of water-cooled motors owing to frost? The present would be an opportune time. We are not all fortunate enough to have a properly-equipped motor-house, and there is always an element of danger attached to lamps and stoves, to say nothing of the trouble of stoking. One does not feel disposed to empty and fill eight or ten gallons of water two or three times a week, and the emptying may not be a sure safeguard, as there is always a possibility of water remaining in the jacket owing to air-lock. Equal parts of glycerine and water have been suggested, but that would be somewhat expensive. Is there any cheap compound that may be added to the water and that will serve the purpose without being detrimental?—Yours faithfully,

J. G. HUGHES.

"J. W. G." writes:—Where or from whom can spare parts for a "Jackson Doctor's" car be purchased?

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-cycle cases.

SAMUEL TIMMINS, who was fined at Birmingham, is an employee of the Midland Motor Company, and was testing a new motor-cycle. The police alleged a speed of 17 to 20 miles an hour uphill.

EIGHT cases came before the Bullingdon Petty Sessions, at Oxford, on Saturday, in which the drivers of motor-cars, on the occasion of the run of the Automobile Club from London to Oxford, on the 8th inst., were summoned for driving at a faster rate of speed than the law allows. The police alleged that the pace varied from twenty-nine miles an hour downwards. Seven defendants were fined £1 and costs. One, who, it was

stated, refused his name and address, and was followed by a constable on a bicycle, was fined £5 and costs.

In the case against Mr. Renton at Tavistock, Dr. Marshall, who prosecuted, stated that the car came round the corner at such a furious pace that had his pony not shied on to the grass by the side of the road there would have been a collision. He shouted to the defendant and his companion, but they did not stop, and he informed the Tavistock police, who had them stopped at Okehampton by telegram, and their names and addresses taken.

THE DAIMLER MOTOR COMPANY, LIMITED.

THE directors of the Daimler Motor Company have issued the balance-sheet and accounts for the year ending September 30th, 1902. The accounts show a loss on the year of £19,751 8s. 6d. This loss is attributable to four causes: First, re-arrangement and re-organisation of the shops and stores with a view to more economical production; second, loss on the sale and in the value of cars of the old type and of stock for such cars, which had been accumulated in former years; third, cost of designing and manufacturing new types of cars; fourth, increased cost of management and establishment. The report says that when the present Board took charge of the business, the Company had no up-to-date cars able to compete with the English and foreign cars then in the market. Only cars of the old type were being constructed, and a large quantity of finished parts of the old type were in stock. The Board decided to stop the manufacture of these cars, to dispose of them at the best possible price, and to design and construct cars which could compete with any car in the market, and in this they have succeeded, as shown by recent results. Sales show about the same result as in the previous year. More orders for cars were received than in any previous year, and at the close of the year there were in hand orders from customers for eighty-four cars, the net value of which was £62,000, or three times as much as on the 30th September, 1901. This is in a great measure due to the high merits of the new types of cars which are now being manufactured, and is a proof of the wisdom of the policy adopted by the Board. In the report for the year 1900-1901 the shareholders were informed that the Board proposed to make an issue of debentures. In March, 1902, an issue of £60,000 five per cent. debentures was made, the whole of which was underwritten through the North of England Industrial Trust, Limited. By the end of the year £43,050 had been received, and £16,950 had to be paid up. This operation involved the paying off of the £13,000 loan mortgage. It has in consequence now disappeared from the balance-sheet. Mr. E. Manville retires by rotation from the office of director, and, being eligible, offers himself for re-election. The auditors, Messrs. Monkhouse, Stoneham and Co., retire, and offer themselves for re-appointment.

ALLEGED BREACH OF WARRANT.

In the Nisi Prius Court, No. 1 (Dublin), before Mr. Justice Johnson and a city common jury, Major Harold B. Sykes has sought to recover £210 damages against Captain H. R. Langrishe, of Knocktopher Castle, co. Kilkenny, for alleged breach of warranty in the sale of a motor-car, and also for misrepresentation. The defence was a denial of the breach and also that there were any misrepresentations of fact. Counsel for the plaintiff were the Solicitor-General, Mr. O'Shaughnessy, K.C., and Mr. Wm. Gibson; for the defence there were Serjeant Dodd, Mr. R. F. Harrison, K.C., and Mr. Gerald Fitzgibbon.

The Solicitor-General said that on the 1st January there appeared in the "Irish Times" the following advertisement:—"Motor-car for sale, 8 horse power, Peugeot; one-third of original cost; perfect order; twenty miles an hour over any road; mount any hill; trial allowed.—Apply to owner, Knocktopher Abbey, co. Kilkenny." Then, on the 13th March the following appeared:—"Motor-car for sale, in splendid order throughout; guaranteed to climb any hill with full load." Counsel went on to open correspondence which had arisen out of the advertisement, and had passed between plaintiff and defendant, complaining at the beginning of what he called the deliberate attempt on the part of the defendant, in his affidavit of discovery, to suppress plaintiff's letters. Mr. Harrison, K.C., admitted that the defendant had destroyed these letters. Continuing, the Solicitor-General said the defendant asked £210 for the car, stating that it had cost him £650. As a matter of fact, the car was bought secondhand for £300. The car being represented as absolutely reliable, was purchased by the plaintiff for £210. When it reached the plaintiff the wheels had to be tied up to keep the thing together. At last Major Sykes decided to take it to Messrs. Hutton and Co., at Dublin, at whose premises it had remained. Counsel concluded by reviewing the offers which plaintiff had made to get defendant to agree to a reasonable settlement. He was willing to hand over the machine if he got back £150, but that and all other offers had been refused, and plaintiff had no alternative but to come before a jury.

Evidence for the plaintiff was given by himself, Mr. H. E. Wells, a motor engineer, Mr. J. R. Evans, instructor in practical engineering to the Board of Technical Education in Ireland, who said £100 would have to be spent on the car to bring it into a proper condition, Mr. H. Tooms, head of the engineering department of Messrs. Hutton and Co., and Mr. E. Instone, of Coventry, who said in April, 1900, he examined the car for Captain Langrishe, and a cheque for £300 for it passed through his (witness's) hands. He did not know that the purchaser gave up another car worth £200.

Serjeant Dodd then opened the case for the defendant, who, in his evidence, said he arranged for the purchase of the car with a Mr. Scarborough through correspondence, and paid for it by a cheque down for £300, another cheque for £50 in six months, and also handing over a six h.p. Vallec car, for which he was allowed £200. The car was a second-hand one, and cost new £650. Witness used it for the first season of 1900 in England, and then brought it over to Kilkenny for 1901. In February of this year he had it overhauled by an expert local mechanic who spent a fortnight on it. W. Simpkins, who was employed by the defendant as driver, Mr. F. Browne, Mr. Douglas, Captain Skeffington Smyth, and Colonel Chaloner Knox then gave evidence, the latter saying he was present when defendant bought the car at the Automobile Exhibition in London in April, 1900, and could corroborate him as to price and terms of purchase.

Mr. Claude Johnson, secretary of the Automobile Club of Great Britain and Ireland, was a witness on the concluding day of the trial. He said he had four cars of his own, and had had a good deal of experience with motors. He had been on the car, the subject of this action, when a prize was won for readiness in starting. That was in July last. On one occasion he went on the car, in England, sixty-four miles at night. Mr. Harrison, K.C., and Mr. O'Shaughnessy having addressed the jury, they, after two hours, returned to court, stating that they were not able to agree. They were then sent back, and with explanations of the questions submitted by the Judge. Half-an-hour later they came in again. They were not long in consultation this time. Some further progress had then been made, and the issue appeared to have been narrowed. But they had again to go back. They had, however, found that the car on delivery was in perfect working order, and that it was capable of mounting the steepest hill. Once more they returned to their room to find answer to an issue not yet decided, and, finally, his Lordship announced that the result of their findings appeared to him to amount to a disagreement of the jury.

MEASURED DISTANCES.

THERE is a measured quarter of a mile at Dringhouses, near York. At Headington (Oxon) the police have a "quarter of a mile 'trap,'"—to quote from evidence in the case at Bullington—commencing at the Barton turn and ending just before the Quarry.

MOTOR-CAR OBSTRUCTION.

At the Durham County Police Court, William Greenwell, of Sunderland, has been summoned under the Highway Act for obstructing the roadway by laying a 2-inch pipe across the road and footpath, from his motor-car to the river Browney, near Langley Moor. Constable Bruce gave evidence, and said the defendant's car stopped at this place twice a day to take water, and caused an obstruction to the roadway and footpath for ten minutes at a time. For the defence, it was pointed out that it was necessary for the car to pick up water at intervals. In the present case every care had been taken, and he urged that there was no wilful obstruction. The Bench dismissed the case.

POLICEMAN AS TRADER.

At the Mistley (Essex) Petty Sessions, Frank Youngs was summoned for having ridden on a motor-bicycle without a light on the night of November 3rd, at Ramsey. Police-constable Gardiner stated that just after midnight he saw the defendant riding a motor-bicycle, to which a trailer was attached. There was no light. The defendant said that the policeman offered to sell him a lamp for 4s. 6d. Replying to the Chairman, the constable said that defendant's statement as to the lamp was correct. Witness gave 3s. 6d. for the lamp. The Bench fined defendant 2s. 6d. and costs, the Chairman remarking that the constable ought to be on his guard against selling lamps at a profit.

MESSRS. CASTLE AND SONS, of Victoria Square, Workson, have arranged for a regular supply of petrol by water.

THE Bakewell (Derbyshire) Rural Council has expressed its approval of the Yecovil proposals with regard to motor-cars.

THE yachtsmen of the country have formed a Marine Motor Association with the object of encouraging motor-launch racing.

A CONFERENCE of those interested in light motor delivery vans will be held at the Automobile Club on Thursday, the 4th prox., at 4 p.m.

AN American inventor has devised a simple attachment which can be applied to any petrol car, which, it is claimed, absolutely destroys the odour of the petrol, or of any burning oil coming from the cylinder. "It is automatic and consists of a fluid which mixes with the exhaust, from the exhaust pipe or muffler, leaving only a very slight and pleasant odour."

THE War Office have issued instructions with regard to the enlistment of recruits for the Mechanical Transport Companies of the Army Service Corps. Recruits are to be attested for the Army Service Corps for three years with the colours and nine in

the Reserve. The limits of age and standard of physique will be those laid down for drivers of the Army Service Corps. On enlistment the recruits are to be sent to Aldershot for final approval, and for posting to Mechanical Companies if found suitable. Mechanics only are to be enlisted, and the trades mentioned as suitable are engine drivers, engine erectors, fitters, gas fitters, metal turners, moulders, plumbers, riveters, metal shipwrights, tinsmiths, and whitesmiths.

ON the 14th inst. two cars underwent the 100-mile non-stop test of the Automobile Club. The Firefly Motor and Engineering Company's two-cylinder 12-h.p. car, seating four persons, successfully went through the run without a stop. The speed up Dashwood Hill with full load was 8.71 miles per hour, and up Aston Hill 8.75 miles per hour. The consumption of petrol for the 100 miles was 5 gals. $\frac{3}{4}$ pt., and of water 2 gals. 1 pt. As mentioned in our last issue, the 9-h.p. Earl car of the Great Central Garage, Limited, also made a non-stop run. The hill-climbing speeds given last week need a little revision. The car took its four passengers up Dashwood Hill at the rate of 10.45 miles per hour, and up Aston Hill at 10.2 miles. The consumption of petrol for the 100 miles was 4 gals. 2 qt. 1 pt.

AT the meeting of Kensington Borough Council, on Tuesday, a discussion took place with respect to the motor street-cleansing machine which has been at work since December last, and about which complaints have been made. The Works Committee brought up a report, with the following conclusions:—That the machine is a valuable adjunct to the working plant of the borough, and that although the noise made by the machine at night is less than an ordinary heavy vehicle, the regular repetition of the sound disturbs the rest of residents. It was therefore recommended that the machine be withdrawn from its present night work, and fitted with a removable tank body with tipping gear, so that the same could be used for ordinary cartage purposes, when not engaged in street-cleansing and watering. The Council agreed with this recommendation.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, DECEMBER 6, 1902.

[No. 196.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

A LREADY the French Automobile Club has issued a challenge to the British Club to contest the ownership of the international trophy in 1903, and the A.C.G.B.I. Committee has held a meeting to consider the selection of the British champions. They have agreed that the Motor Power Company should be nominated to enter two Napier cars—but in doing so have recorded that they do not wish it to be taken as a precedent by which the winner of the Gordon Bennett race in one year should claim the right to enter two cars in the following year. Some will probably ask why this intimation is made, and why the dual nomination should have taken place on the first occasion.

The Eliminating Test.

HAVING thus decided as to two of the three cars, the Committee have laid down conditions as to an Eliminating Test for the third car, which will probably cause some discussion among the manufacturers who are looking forward with something more than an academic interest to next year's event. Constructors will have to contribute at the rate of £50 per car towards the cost of organising the race, which will be run on a mile track and on a hill—the location of both to be announced later. The Eliminating Test on the Welbeck or similar course will consist of three runs *down* (the time to be taken over the flying kilometre); three runs *up* (the time to be taken over the flying kilometre); three runs *up* (time to be taken over the standing mile); three runs *up* (time to be taken over the standing mile), and three times up the hill. To arrive at the results there will be ascertained (1) the mean speed made over the six journeys over the flying kilometre, and from this will be calculated how long the car would take, travelling at that mean speed, to complete twelve miles. (2) There will also be ascertained the average speed made by the car on the six journeys over the standing mile, and from this will be calculated how long the car would have taken in covering three miles at that average speed. (3) From the records made in the three ascents of the hill it will be ascertained what was the average speed, and from this will be calculated what would be the time occupied, when travelling at this average speed, in covering one mile. The total time which would be occupied in covering the sixteen miles above referred to will thus be ascertained, and the car which proves to have been the fastest over the sixteen miles will be the winner.

Last Day of Entry.

ENTRIES for the Eliminating Race must be made before noon on Monday next, the 8th inst.—each entry to be accompanied by a cheque for £500. If a car entered is not at the appointed place by an hour to be stated on April 10th, or any subsequent date which may be fixed by the Committee, the £500 will be forfeited. Surely the Committee should be allowed to exercise a discretion with regard to this matter; if the failure to arrive be due to any unforeseen accident. The absolute forfeiture, without any qualification whatever, seems somewhat severe. Unless the car presented for the Elimination Test conforms in

all respects with the requirements of the Gordon Bennett Rules and unless the car is, in the opinion of the Committee of the Club, a *bona fide* racing car suitable to compete in the Gordon Bennett Race, the £500 will be forfeited.

A Criticism.

OF course it is necessary that stringent rules should be made, but we would have preferred that the Committee should have reserved the right of returning the money if substantial reason were shown for any deviation from clause j. The other point, as to the entry of two cars of one maker without trial, is of great importance to the industry. Of course, last year's winner is entitled to again enter a car without reference to any preliminary contest, but the right to two out of the three entries may be disputed. In fact, by asking that this course should not be made a precedent, the Committee would seem to be doubtful as to the wisdom of their own decision. Certainly it would have given more general satisfaction had the one car been nominated without contest, and both the second and third representatives made the subject of competition. In view of this it is rather a pity that so short a period elapses between the date of publication of the conditions of selection and the date of the entry of cars.

Balloon Chase at Reading.

As briefly announced in our last issue a balloon hunt will be held at Reading to-day (Saturday). The balloon engaged in the contest is a new one, Vivienne II., belonging to Mr. Leslie Bucknall, who with the Hon. C. S. Rolls and Mr. Frank Butler will make the ascent. The chase will be sustained by the Volunteer Automobile Corps, and among the prizes offered is one by Mr. Charles Cordingley. He has offered an award to the value of £10 to the automobilist or volunteer cyclist who, starting from the place of ascent in the public park, captures the despatches on the descent of Vivienne II. Weather permitting, it is hoped the balloon will leave the ground at noon, and, circumstances permitting, it should return to earth again between three and four p.m. We trust Mr. Leslie Bucknall's enterprise will be well supported and have the much-to-be-desired assistance from the clerk of the weather.

Automobiles at the Durbur.

IN view of the many motor-cars that have been sent out to India lately, the owners of which had hoped to use them when seeing the Durbur at Delhi, we are pleased to hear that Lord Curzon has decided against the recent prohibition of their use. The decision of the Committee not to allow automobiles on the camp-roads was unnecessary, and, to local firms that had invested largely in motor-cars, unjust. The matter having been brought to the attention of Lord Curzon, he has decided to permit the running of motor-cars subject to approval of the design of proposed vehicles, to guarantees as to the competency of the driver, to the use of particular roads, and to prohibitions which may be notified on special occasions. In view of the special character of the proceedings these regulations appear wise and necessary, provided

the "approval of the design of proposed vehicles" is given in a proper spirit.

Automobiles in India.

It would be well if the Government of India would relax its very stringent regulations with regard to petrol. At present it is practically classified as an explosive and subjected to almost as many precautions as nitro-glycerine—a needless severity in the face of the experience of Cairo and other places where motor-cars are becoming recognised as familiar means of locomotion. The Bombay Boiler Act is also adversely affecting the introduction of steam cars, and we are glad to see that several leading Indian papers are urging that rules unnecessarily tending to limit the general use of the automobile should be rescinded. As we have recently observed, the automobile will do much for the development of our great Dependency, and those motorists who are attending the Durbar at Delhi can render useful service by impressing this fact upon all in authority with whom they come in contact.

Maidenhead Bridge Tolls.

In our last issue we referred to the movement which has been started to free Maidenhead Bridge from toll. This is the only toll-gate now remaining to obstruct the great Bath Road, and, according to the prime movers of the agitation, the Maidenhead Corporation since 1836 have had no

Riker's Novel Device.

MR. A. L. RIKER, the well-known American motor-car designer, has recently taken out a patent for a safety device intended to stop a motor-vehicle in case the driver should accidentally be thrown from his seat or in case the car is started by anyone not in the seat. The motor is connected to the gearing by a friction clutch, and a system of levers is provided, by means of which the driver can put the motor in and out of gear. The motion of one of the intermediate parts in this lever system is limited by two movable stops on a sliding rod connected by a lever to the hinged front seat of the vehicle. Normally, when no one is seated in the vehicle, the seat is raised on the hinges by a coiled spring, and this puts the movable stops in such a position that the clutch cannot be engaged. In case the driver should be thrown from the seat the action of the spring would disengage the clutch, and so bring the car to a stand.

A Case for Inquiry.

PROSECUTIONS by the police, and subsequent attempts to secure reversals of the convictions they secure, are always unsatisfactory. Evidence of this comes in the case of Mr. Samuel Harvey, a member of the Committee of the Nottingham Automobile Club, who was convicted at Grantham for driving a motor-car at a speed beyond the legal limit. He subsequently made two applications to the magistrates for summonses

THE MAIDENHEAD BRIDGE TOLL-GATE—THE LAST REMAINING TOLL-GATE ON THE BATH ROAD.

Photo by]

[Lug, Slough.

right whatever to levy any toll, and they have therefore since that date been acting illegally. Our illustration shows the toll-gate at Maidenhead which it is now being endeavoured to remove. In the picture are seen the three gentlemen who have taken the matter up seriously—Mr. J. Fullbrook, of Slough, being at the wheel, Mr. Howlett in the car, and Mr. Taylor, of Eton, at the side. On Monday next an interesting development of the situation will take place, as Mr. Joseph Taylor has informed the Mayor and Corporation of Maidenhead, as well as the Chief Constable of the county, that he intends to attend at Maidenhead Bridge to exercise his right as a member of the public to pass over the bridge in a vehicle, and to resist payment of toll, in order that the legal right of the Corporation to levy toll may be challenged, as he is of opinion that their attempting to do so is wholly illegal. We are glad to learn, that as a result of recent proceedings, the Bridge Committee have recommended the reduction of the toll for motor-cars from 8d. to 2d., and that on Monday night the Corporation agreed to the reduction.

for perjury against some of the witnesses in the trial. The later employment of a detective brought out new evidence, but again the magistrates refused to grant a summons. Surely the interests of justice require the sifting of evidence, and the magistrates should have been willing to have caused further investigation, even though such may not have been palatable to the police.

The Halifax Automobile Club.

AT the annual dinner of the Halifax Automobile Club, Mr. J. T. Simpson, the President, proposed the toast of the Club, and testified to the pluck and energy of the members of the Halifax Club in taking to the sport of automobilism—considering the geographical conditions of the district. Several members gave interesting reminiscences of early trips on motor-cars. The menu of the dinner commenced with "Savourie à l'Automobile" as a "starting handle," and ended with dessert and coffee as "lubrication."

The Charm of Motoring.

PRACTICALLY all motorists agree that as a vehicle for pleasure driving the automobile has no equal—its uniform, yet perfectly controllable motion, the sense of security experienced in driving it, and the independence, both as regards time and route, as compared with railway travel, give motoring a charm of its own and constitute it a form of exhilaration that is greatly relished by all who know it by experience. The sustained speed and comfort of touring cars has revived interest in country touring. With horse-drawn vehicles this would be a hardship. Thirty to forty miles a day would be the limit of travel with a good team of horses, and at the end of the day's trip the tourists would be tired and worn out, while with the motor-car twice this distance can easily be covered in less actual running time and with less tiring effect upon driver and passengers.

The Practical Side.

FOR a number of practical purposes also the motor-car has already proved eminently suitable, notably as a doctor's carriage. Physicians whose practice extends over a large district find that they can attend to their patients more promptly. take charge of a larger practice, and find more time for recreation by the use of the automobile. The various advantages of automobilism have not yet attained their climax; the motor-vehicle has not yet reached the height of its development. Anything like finality cannot be reached in such a comparatively short period, but the progress made not only in the construction but in the adoption of motor-cars since the abolition of the red flag in 1896, augurs well for further rapid developments in the future.

Road Inspection in Wales.

LAST week we briefly chronicled the inspection of roads in Breconshire by a committee of the County Council. The tour was a great success, giving the various members of the committee such a thorough idea of the state of the roads all over the county as they could have obtained in no other way, and also affording them the opportunity of comparing the roads in Breconshire with those in the adjoining counties of Carmarthenshire, Glamorganshire, and Monmouthshire. Considering the very rough nature of the roads traversed, the gradients, and the load carried (many of the cars having at times more than their proper complement of passengers, some of whom were heavy weights), the cars behaved exceedingly well. It is worthy of note that among the party there were as many as six J.P.s, and they may congratulate themselves on the fact that Sergeant—or is it Chief-Inspector?—Jarrett was not brought up from Surrey to watch their cars on that particular occasion. The distances travelled on each of the three days of the tour were 69½, 64, and 63½ miles respectively; and the average rate of speed indulged in was—but, after all, it is hardly a matter of public importance.

Universities and Motor-Cars.

AN automobile department has been added to the curriculum of the Columbia University, New York. Dr. C. E. Lucke, under whose supervision this branch of instruction will be maintained, speaks of it as follows:—"With the growth of the automobile, not merely as a car for pleasure or as a touring machine, the demand for skilled and scientific builders will increase. Of course, it is intended to fit men for other work than merely the building of motors for automobiles. The electric car, as a traction machine, is closely allied to the automobile, and the skilled builder of machinery for such cars is a man who will be in great demand. The generation of power, fuel consumption, etc., will be one of the most important of the subjects to be handled. The engineer who designs motor-cars must be in a position to design any style of motor, or carriage, he may be called upon to

build. For instance, if a brewer should say, 'I want a truck with a propelling capacity for five tons of beer barrels,' one must be able to sit down and plan a motor of sufficient power to propel such a load over such roads as the proposed truck would have to run. This can be done with scientific accuracy, and it is only science that is capable of making such plans." All styles of motors will be thoroughly explained. A motor-car will be set up in the laboratory, and the generation of power, fuel combustion, and every feature will be made the subject of practical demonstration.

Motor Tractors for the Fire Brigade.

IN the equipment of the Metropolitan Fire Brigade the London County Council is taking renewed interest, and, on the suggestion of Commander Wells, the Fire Brigade Committee has recommended the acceptance of an offer of the Wolseley Tool and Motor Car Company to build an experimental 10-h.p. tractor which will be used to draw either an engine or a ladder mounted on a van. We are glad to see the fire-brigade authorities recognise the importance of superseding horse by motor power, and also to record that British firms are in a position to help them in giving their views practical form.

MR. CHAS. HOMEWOOD, OF BALCOMBE, ON HIS DE DION VOITURETTE. (See page 779).

Illicit Commissions.

IN common with those engaged in other industries, the motor-car trade is interested in legislative efforts to secure purity in business. The difficulties are great, but we would suggest that they are not insurmountable if motorists are determined. We are afraid some employees—both of firms and private owners of cars—have not preserved an attitude that is above suspicion in the matter; they should remember that anything which savours of undue preference for special goods simply because of favours received is, morally, indefensible and may shortly be rendered legally actionable. There are a few industries which are said to have a low code of honour, and where illicit commissions are the order of the day; it is to be hoped that those concerned with the driving of cars will not allow such a taint to rest upon the progress of automobilism.

The Electrification of the Railroad.

COMPETITION among themselves, the extension of tramways, and the threatened rivalry of automobile road-carrying services have combined to create a watchfulness on the part of railway companies, which will eventually prove to the advantage of the public. Ere long the densely-populated towns in the industrial centres will be connected with the speedy electric

tram, and anticipation of this fact is partially responsible for the electrification of the railways, which has already commenced. There is no doubt that great changes are imminent, and the greater utilisation of the highways of the country will reveal how distant from the main arteries of traffic are many of the railway stations that have done duty in the past.

The National Maintenance of Roads.

It is not only the growing traffic of our great towns with which the authorities of the future will have to deal, but also the development of the main roads. In fact the Government might well direct an inquiry into the whole subject, so that some universal scheme may be devised for the maintenance of the roads. This is a matter of national concern, and the sooner the nation recognises that fact—as well as the changes that are coming over our methods of locomotion—the better will it be for the prosperity of the country.

The Numbering Question.

THAT the rural councils are passing resolutions in favour of the numbering of motor-cars with such unanimity should make motorists suspicious as to the merits of the Registration Bill which Mr. Montagu has brought forward. The chief advocates of the proposal are anti-automobilists; and we feel that had the suggested discussion on the subject taken place at the Automobile Club considerable hostility would have been shown by many of those interested in the matter. In order to silence opposition some sort of compromise may have been necessary; but the proposal to number cars is asking motorists to concede too much.

Middlesex and Numbering.

THE Middlesex County Council has adopted the following resolution:—"That representation be made to the Local Government Board requesting them, either by legislation or otherwise, to secure, in the interest and for the protection of the public, that a registered number be so affixed on the back of every motor-car as to ensure its identification. That the present provisions as to speed limit should be revised." Surely motorists will recognise what we have so often urged, viz., that the eagerness of county and other bodies to pass such resolutions is proof of the unwisdom of any advocacy of numbering from our own ranks. These authorities are displaying prejudice against the motor-car.

Motor-Cars for Public Institutions.

DOCTORS are showing increased interest in automobilism, and a suggestion lately thrown out in the medical press is added proof of the influence of motor-cars on the health of the people. We venture to think it will not be long before many of our large hospitals, and especially such institutions as sanatoria for consumptives, realise that in the automobile they have a ready means of providing health-restoring measures for their patients. At the present time in connection with many asylums and establishments for the crippled, blind, or otherwise deficient, occasional drives are provided at considerable expense, and necessarily very limited in application. The Boards of Management of such places should consider the opportunities which the automobile places at their disposal.

Business Methods.

THE old complaint made by British consuls abroad as to the lackadaisical methods of many English business houses is now arising in connection with the automobile industry. A well-known motorist writes to say that four years ago he had a car made by an English firm, "and that she is reliable," continues our correspondent, "is proved by the fact that she runs better than ever after having travelled at least 50,000 miles

Recently, however, the clutch leather required renewing, so I wrote to the firm in question for a new one; this was sent, but without the rivets for fixing. I then wrote for the rivets, asking for them to be sent by post. They were sent by 'rail,' and as I was at an out of the way place in Scotland, I got them about a week later; when they arrived they were the wrong kind. I then wired and received by return the proper rivets. I also wrote to the firm, complaining and asking them if they had not already sent the rivets on receipt of my telegram to do so. The result was a further consignment of the same sort as I was sent at first—viz., the wrong ones. Altogether I could not use my car for a fortnight. I also have a French car, and, whenever I want a new part, all I have to do is to wire, and the correct parts are sent at once." Carelessness on the part of some subordinate was probably the cause of the trouble in this case—as in many others—but the incident demonstrates the necessity for principals and managers to keep an eye on all transactions.

A MOTOR-CYCLE club is being formed at Nottingham.

BARON HENRI DE ROTHSCHILD has promised to read a paper at a meeting of the Automobile Club in January.

H.R.H. THE PRINCESS OF WALES has been graciously pleased to accept, for the children of the Royal Household, a copy of Mr. Thomas Stevens' illustrated juvenile book, the "Babes of the Empire."

ON Sunday morning last His Majesty the King of Portugal drove in King Edward's new 22-h.p. Daimler from Sandringham to the Roman Catholic Church at King's Lynn. During the time His Majesty was at his devotions the car remained in Mr. Frank Morris's new garage on London Road.

ON Tuesday afternoon a successful balloon ascent was made from the Crystal Palace by Mrs. Miles, Mr. Leslie Bucknall, and Mr. Frank Butler with M. Gauldron as aeronaut. The party made a difficult descent about twelve miles from Folkestone, having occupied one hour seven minutes in the journey.

MESSRS. DE DION BOUTON, LIMITED, ask as to point out that their coils are not made to take more than a 4-volt current, and that if a 6-volt accumulator is used there will be great risk of "shorting" the coils. They themselves recommend the use of dry batteries. We may add that one of the new 6-h.p. De Dion light cars, recently described in our columns, may now be seen at their depot in Brook Street, W.

FOR the coming season, Messrs. Dennis Bros., Ltd., of Guildford, have decided to manufacture as their standard productions the improved 9-h.p. car with De Dion engine; a 12-h.p. car fitted with Aster or De Dion fast running double-cylinder engine and long body, and a car fitted with a new 12-h.p. Aster slow-running engine with four speeds forward and reverse motion. The latter car will have a wood fitch-plate frame.

ALTHOUGH very little is heard of the Arrol-Johnston cars in the South, a large number of them are being turned out by the Motor-Car Syndicate, Limited, from their large works at Underwood, Paisley. Two vehicles have been supplied to the Duke of Portland, who has now ordered a third. The Arrol-Johnston cars are also used, among others, by Lord Charles Montague, Lord Elcho, Sir C. B. Renshaw, M.P.; Sir Charles Cayzer, M.P.; Sir Edward Carbutt, the Rt. Hon. R. W. Hanbury, M.P., Minister of Agriculture; and the Hon. Thomas Cochrane.

IN addition to the cars mentioned in previous issues, the following, which took part in the Anniversary Run to Oxford, are to be awarded non-stop certificates unless protests are received:—Mr. W. Munn's 8-h.p. De Dion, "Achilles"; Mr. G. D. Barnes' 10-h.p. Dennis, "Buzzer"; the 9-h.p. Earl, "Cautious"; Mr. W. B. Kelly's 8-h.p. M.M.C., "Freedom"; Mr. E. K. Lowe's 2½-h.p. Excelsior, "Good Luck"; the 12-h.p. Beaufort, "Inferno"; Mr. C. F. Wahl's 8-h.p. De Dion, "Loreley"; Mr. J. M. Gorham's 22-h.p. Daimler, "Paratus"; and Mr. C. R. D'Este's 2½-h.p. Ormonde, "Spy."

THE CHELMSFORD STEAM-CAR.

A DESCRIPTION of the new steam car lately completed by the Clarkson and Capel Steam Car Syndicate, Ltd., of Chelmsford, will no doubt be of interest to our readers. The vehicle, of which a general view is given in Fig. 1, took part in the recent anniversary run to Oxford, and attracted a considerable amount of attention. In Figs. 2 and 3 are illustrated an elevation and plan of the chassis, showing the arrangement adopted. It will be seen that the main frame is rectangular in shape, and is constructed of channel steel. The boiler, A, which is of the multitubular type, with vertical fire tubes, is fixed in front. The burner, A¹, is carried immediately beneath it, and the lamp, P, for initially heating the vaporising coil, is so arranged as to be easily accessible beneath the floor of the front seat. The funnel, A², projects up vertically from the bonnet; it is given an oval shape in order to prevent it from obscuring the view of the driver and passengers. The boiler

the vapourising coil of the main burner. It enables the same fuel to be used for this purpose, and entirely avoids the use of methylated spirits or petrol.

The engine, illustrated in section in Fig. 6, consists of two horizontal double-acting cylinders having a bore and a stroke of 4 ins. It develops 12-h.p. at a normal speed of 500 revolutions per minute, and is fixed centrally beneath the floor, with its cylinders projecting to the rear. The crank chamber is entirely enclosed and the differential gear on the countershaft is also arranged inside it. The slide valves are placed beneath the cylinders and are operated by Joy valve gear. By placing the valve-box underneath the cylinders any condensed steam in starting from cold automatically drains away. Separate exhaust pipes, E, are led from each cylinder, one on each side of the car. They convey the exhaust steam through feed-water heaters C², to the upper tube of a V-shaped (in plan) cooler E¹, which forms the front of the bonnet. The steam is thus led into both ends of this tube, and some of it is condensed in this first cooler. The bulk

FIG. 1.—GENERAL VIEW OF CHELMSFORD STEAM CAR.

is tested to a pressure of 750 lbs. to the square inch, and its normal working pressure is 250 lbs. The boiler itself is shown in vertical and horizontal sections in Figs. 4 and 5. The shell is made of steel and is in one piece with the top plate. The bottom plate is flanged around its edge and is riveted in place, as seen in the illustration. Altogether it contains 512 weldless steel tubes, $\frac{9}{16}$ in. diameter. The boiler is provided with all the usual fittings, the water gauge being fixed on the dialboard, as also a duplicate pressure gauge. Twin safety valves are provided. It is fired by one of the well-known Clarkson burners, the fuel feed being automatically regulated by the boiler pressure. It is constructed for burning ordinary paraffin or kerosene oil; its full calorific properties being obtained with natural draught, no steam jet or other means of forced draught being required, whilst at the same time it is entirely unaffected by the direction or force of the wind, "blowing back" being unknown. A neat burner is fitted beneath the front footboard for initially heating

of the steam, however, passes through from the centre of this tube to a large S-shaped condenser, E⁴, which is carried in front of the car. Here the greater part of the steam is condensed, and the water finds its way to a drum placed beneath. A small pipe also lets any condensed water from the V-shaped cooler go to the same drum, and a pump on the countershaft forces this water back through two filters into the water tank. The filters remove the greater part of any oil that may find its way into the condensers, but a sponge-box is also provided in the water tank itself, and the sponges appear to effectually remove or absorb any traces of oil which may be left. The feed heaters are covered externally with wire wound into spiral form in order to assist in cooling the exhaust steam. Any uncondensed steam is led into the flue above the boiler so that it passes invisibly away through the funnel.

The oil-tank, B, holds twenty-four gallons, and is fixed at the rear beneath the frame, a gauge enabling the level of oil to be seen

D

at a glance. The oil is pumped from this tank to a pressure receiver, B', in the front of the car. From the latter the oil flows direct to the burner through a stop cock, immediately in front of the driver. A relief valve on the oil delivery pipe is set to come into operation at the desired pressure and to thus return any surplus oil back to the suction side of the pump. The automatic device, N, which regulates the burner contains a small plunger, operated upon by the steam pressure, against the action of a spring. It closes down the fire to a minimum when the pressure reaches 250 lbs. per square inch and it opens it up full at about 180 lbs. per square inch. Provision is made by which air can be pumped into the chamber B' by hand when

capacity of thirty-four gallons, sufficient for a run of 120 miles. A large gauge glass on the left of the dash-board shows the level of the water in the tanks. The water is forced by a pump through the feed water heaters into the boiler, and the driver regulates the quantity delivered to it by a by-pass. All the steam pipes are made of weldless steel. A neat pressure gauge is mounted in the centre of the dash-board; it has duplicate scales and needles for recording the steam pressure, and a needle and scale for indicating the pressure of the fuel feed. The speed of the car is for the most part controlled by the throttle valve near the water gauge, while, close by, is a shut-off cock, which enables the driver to cut off the fuel feed to the burner. A large side lever, fitted to

desired, and two try-cocks are fitted in order to enable the driver to ascertain the level of the oil in it. The relative space occupied by the air at a certain pressure is so calculated as to maintain a sufficiently high pressure for feeding the oil into the burner when the car is at rest, and when the oil pump is consequently not working. An auxiliary pump permits the oil to be fed into the pressure tank by hand, and so replenish the supply, if the car has at any time been left standing for an unusually long period with the burner alight.

The water is carried in two long tanks, C, placed beneath the seats in the main portion of the body. They have a combined

the right of the driver, is connected with the valve gear. It carries a quadrant with notches, and operates the reversing gear, besides enabling the driver to vary the cut-off in a forward direction of travel. A vertical hand lever projecting upwardly through the floor is connected with the fuel and water pumps. Either of these can be brought into play when required, so that when the lever is given a few strokes by hand oil can be forced into the pressure tank, or water forced into the boiler when the car is at rest.

The power is transmitted by spur gearing to a differential countershaft, connected by two side chains with the rear road

wheels. The countershaft drives no less than four pumps—one for the feed water, one for forcing the lubricating oil, one for the fuel feed, and a fourth to pump the condensed water back to the main tanks. The steering is either by wheel or lever, the latter being adopted in the car illustrated. The lever is hinged to an upright side pillar, the lower end of which carries a crank connected by the usual system of rods to the hubs of the steering wheels.

The brake power is most satisfactory, consisting as it does of two independent brakes, both of which act directly on the road wheels, whilst on an emergency the engine itself can be used as a powerful auxiliary. Two foot-pedals, I and J, projecting from the floor-board in front of the driver's seat, are connected respec-

FIGS. 4 AND 5.—VERTICAL AND HORIZONTAL SECTIONS OF BOILER.

tively with side brakes of the shoe pattern, and of the band type. The shoe brakes press upon the inside face of rims bolted to the wheels, and the band brakes operate upon drums which are rigid with the large chain wheels. In both cases the brakes on each side of the vehicle are inter-connected by steel cables in such a way that the pressure is equalised. Solid rubber tyres have been adopted, and by a careful consideration of length and flexibility of the springs, and spring cushions, most satisfactory results have been attained, for at the moderate speed of sixteen miles an hour at which the car travels one may almost imagine that pneumatics are fitted.

This vehicle is fitted as a private omnibus or long distance touring car, the driver's seat being protected from the weather, and seats for four other passengers being provided inside the closed portion of the body. All available space has been fitted up as a cupboard or lockers. Above the boiler and on each side

of the funnel small leather lids are found, these, when lifted, disclosing handy receptacles within easy reach of the driver and his companion on the front seat. Although passengers travelling

in it under ordinary circumstances would not recognise the fact, it is provided with all necessary conveniences for making it serve the purpose of a dressing-room and lavatory. The car can be prepared for service in twelve minutes, and when once steam is up it may be kept for hours ready to start instantly. The weight of the steam car exclusive of fuel and water is 28 cwt. The capacity of the steam car will go a long way towards popularising it, for it carries enough water for 100 miles without a stop, fuel for 120 miles, and lubricating oil for 1,000 miles. As a result of a 1,000 mile trial, extending over nine days, on a circular up and down route, it has been found that 5.86 miles can be run on one gallon of fuel, or, in other words, about a penny per car mile, with six people on board.

THE EISEMANN HIGH-TENSION MAGNETO IGNITER.

WE are now able to give two illustrations of the new high-tension magneto ignition device recently introduced by Herr Eisemann, of Stuttgart, and described by our Continental correspondent in the last issue

FIG. 1.—THE EISEMANN HIGH-TENSION MAGNETO IGNITER.

of the *Journal*. This machine takes the place of the accumulator and contact breaker, and, whatever the number of cylinders used, requires only one coil without trembler, the ordinary form of sparking plug being used. It is claimed to give a spark at any rate, slow and fast, and can be adapted to any make of engine or car with a minimum of difficulty. The igniter creates an alternating current by the rotation of an armature in a magnetic field; this alternating current becomes transformed into a continuous current strong enough to produce an igniting spark between the points of the sparking plug. The inter-

FIG. 2.—DIAGRAM OF MAGNETO AND COIL CONNECTIONS.

mittent transmission of the sparks to the different cylinders (if more than one) is caused by a distributor disc provided on the inductor and running synchronously with the same; the firing can be advanced and retarded as usual. We may add that the Eisemann device is being introduced into this country by Messrs. G. T. Riches and Co.

Amongst the foreign exhibits there will be the Wolseley, the Napier, and the Mercedes. Honeycomb radiators and mechanically-worked induction valves are now classic, and I hear that Colonel Krebs, the managing director of Panhards, has a new motor with these improvements.

SPEAKING of mechanically-worked induction valves, I notice a peculiar error into which Mr. S. F. Edge has inadvertently fallen in upholding the superiority of suction induction valves as against mechanically-worked ones, and no one seems to have remarked it. Mr. Edge says that in order to gain the same initial pressure and volume as would be gained by mechanically-operated valves he makes the crank throw of the Napier car one-sixteenth of an inch longer. This, of course, could be done just as well with the engine which has mechanically-worked valves. It means increasing the horse-power of the motor, and has nothing whatever to do with the question as to the superiority of one system or the other. This refers, of course, to the opening of the valve, but with regard to the closing Mr. Edge claims that the automatic suction valve closes quicker than the mechanically-worked valve; here, however, I think that this entirely depends on the shape of the cam which opens the latter, and the strength of the spring which closes it, for although the mechanically-worked valve is opened by a cam it, of course, closes in the same manner as the automatic suction valve, that is to say, by means of a spring.

IN my notes last week, on the authority of a spectator at the Dourdan kilometre track, I mentioned that the Wolseley car with a four-cylinder Buchet vertical motor had been making trials. Had my informant not been an official connected with the trials and familiar with the cars, and one who followed the Paris-Vienna Race in an important official capacity, I should not have credited his assertion. As it was I questioned it, and suggested that he might be mistaken, remembering that the Wolseley had horizontal cylinders. In reply he told me it was not only the same car, but that he had seen the letter applying for the trial. The following day the *Auto-Velo* confirmed my information. On hearing from London some doubts as to the matter, I went to see Georges Prade, of *l'Auto-Velo*, who had been present on the day in question, and I found him suffering from the same inexplicable error. It seems that the car in question was a new racing car made by the General Motor-Car Company, though how it came to be confounded with the Wolseley car I cannot tell.

THERE was a stormy scene at the meeting of the Municipal Council in Paris with regard to the absurd regulations as to the speed of motor-cars in Paris, in the Bois de Boulogne and in the Bois de Vincennes. Paris and its two great parks are under two different jurisdictions, the former being the Prefet de Police, and the latter the Prefet de la Seine. The same police carry out the regulations in each case, so that it happens that policeman X, whilst in the Bois de Boulogne, must stop any car that exceeds 12 kilometres ($7\frac{1}{2}$ miles) per hour, and whilst in Paris, where there is no limit of speed except the legal 30 kilometres ($18\frac{1}{2}$ miles), he must use his own discretion as to what is furious driving. Monsieur Joussetin, the councillor for the "Ternes" ward, where the greater part of the motor garages are situated, urged the town council to brush away and dispose of the absurd persecution to which motorists are subjected, for the simple reason that they have the misfortune to be using a new means of locomotion, which is much less dangerous and productive of accident than the existing systems. During the course of his discourse Monsieur Joussetin pointed out that an ordinary cab horse trots at 16 kilometres an hour, a carriage horse at 20 kilometres an hour; whilst the Government imposes an average speed of 20 kilometres per hour for the postal vans in level parts of Paris, and 16 kilometres in hilly parts like Belleville or Montmartre. In conclusion the question was referred to a special commission.

THE use of motor-cars is making but slow progress in Sweden. A few motor-lorries are employed in Stockholm to carry parcels

and heavy goods, and a few may also be seen on the country roads. A very limited number of motor-carriages is employed, but it is hoped that the exhibition to be held in the capital next year will give an impetus to the movement. The duty in Sweden on motor-carriages is 15 per cent. ad valorem, as per amount of invoice, or if the Customs authorities should not consider that true and correct, the value is fixed by a survey. The duty on motor-parts of machinery is 10 per cent. ad valorem.

A STUDY of what is happening daily in France under the numbering system, together with a little reflection on the attitude of some English local benches with reference to the motor-car question, will be productive, I feel sure, of wiser counsels. Let me state a few supposititious cases. Mr. A. and Mr. Z. are owners of motor-cars. The former is a quiet law-respecting individual with a $3\frac{1}{2}$ -h.p. Benz; the latter a motor fiend. Mr. A. has number 1826 and Mr. Z. number 1026, but a streak of black grease out of an axle box has *accidentally* converted the 0 into an 8. Mr. A. may find himself confronted with five or six summonses from five or six different towns along the Great North Road, and obliged, willy nilly, to attend at each and defend himself or else pay as many fines. Even should he be able to prove an *alibi*, it is doubtful, in the present state of mind of some of the local benches, whether it would get him off a fine, and in any case he would have all the expense and worry.

SUPPOSE, again, the case of a car that is in the maker's hands for repairs and is out on trial. The owner's number must still be on the car, for it would be impracticable to keep changing numbers. If the car passes over a police trap, or even past an over-zealous officer of the law, it is the owner who will be summoned, not the offender, and the same thing will happen when

THE A.C.F. RECORD-BREAKING COURSE ON THE DOURDAN ROAD.
THE TIMEKEEPER'S TENT IN THE FOREGROUND.
[*La France Automobile*.]

one's mechanic takes the car out with or without permission. The result will be that people who do not want to see their names in the papers in connection with police proceedings will be absolutely precluded from buying motor-cars, and the trade will suffer for it.

MESSRS. SHIPPEY BROTHERS, LIMITED, have been appointed sole British agents for the Janney Steinmetz Company, of Philadelphia, U.S.A., whose specialities are high-pressure steel petrol tanks, boiler shells, and other appliances connected with the steam car industry.

OCCASIONAL NOTES.

WHEN will automobilists be protected by law against the risks presented through the wandering of cattle on the highway? Mr. C. H. Oliverson, of Kendal, was recently riding his motor-tricycle at night near Southport when collision with a sauntering quadruped laid him insensible on the road, and his machine a wreck some yards away. The cow, doubtlessly, was somewhat damaged, and allowance must be made for the feelings of its owner, or his deputy in charge, on the sudden impact. He, however, afforded no opportunity to Mr. Oliverson to protest or explain, but left the unconscious and "iniquitous" motorist to recover as might be. And now for the moral. Does not the red light require its counterpart in the enforced carrying of a lamp, of the hurricane or other improved pattern, by every person in charge of cattle on the highway?

THEN there is the cyclist who has no legal injunction to carry a tail lamp or its equivalent, whose ordinary lamp, when he is being overtaken, shines but dimly on the ground, and who is not discernible until some lamp like the Blieriot picks out his moving form and saves a shave. For the next few months there is the dismal outlook of heavy roads, fogs, and snow, when night driving loses its charms unless that of rendering the senses more

these can be spared for a few hours and held sacred to the motor cult thereof. Mr. Leonard Williamson, and other local motorists, have inspected two of the suggested courses. The one most favoured is on the front, where a down-hill start of 800 yards can be secured before reaching the flying kilometre, and after that ample length for stopping. A decision by the Town Council will need to be arrived at soon, and, in the event of its being favourable, a representative local committee should take up the organisation in conjunction with the A.C.G.B.I., the Liverpool Self-Propelled Traffic Association, and other automobile clubs in the district.

SURREY has pleasant inns, with good fare and cheery landlords, but the powers that be, or some of them, do not like to see fresh customers flocking into the county, judging from the attitude of the police to motorists—too sleepy, too stick-in-the-mud, conservative, these Surrey magistrates. They do not concern themselves with the fact that seventy years ago stage coaches averaged fully sixteen miles an hour, point to point, for if they did such an old, genuinely crusted fact would surely appeal to their sense of reasoning. And motorists do not spend their money in Surrey now. I have myself taken special pains to go elsewhere and enjoyed myself immensely by a run through Epping, Ongar, Chelmsford, Braintree and Colchester to Wyvenhoe, calling on friends *en route*, last week-end. It is a Sunday run

THE CITY OF WESTMINSTER'S "MOTOR TRAINS." (See page 779.)

acute; and several long night runs] have brought home to me the value of white posts. Expressed in miles gained, their work has to be contemplated rather than gauged, and it is only a plunge from one county where frequency is marked to one where their absence is monumental that teaches the lesson. A sufficiency of these posts to mark all the curves and narrow ways is a scheme to be supported heartily by all who know the bad points of our otherwise beautiful country lanes with their innumerable twistings. Every waggoner on the road will testify to the service done him by these outposts of the track, how they mark the banks, the bridges, the dykes and the ponds. Be his day never so long, be his cups never so deep, these white stakes are proof against all. Let our County Councils be urged to develop and maintain a branch of road equipment sadly lacking in parts known to many of us, the same being one equally beneficial to the tired-out teamster or the speed-loving *chauffeur*.

WHICH brings me to the subject of speed trials. These are, apparently, occupying the attention of more than one watering-place in Lancashire. A brisk competition, in fact, threatens between Southport and her less fashionable *vis-a-vis* Blackpool. Whether the A.C.G.B.I. will have room for a speed trial next year, other than the Eliminating and Gordon Bennett Races, will probably decide the matter in any case. With her fine promenade and the magnificent wood pavement of Lord Street to choose between, Southport has undoubted advantages, if one or other of

to be recommended, and those who make it might do worse than have an oyster feast direct from the beds facing the house with big bow windows and yellow front, at the bottom of the hill at Wyvenhoe. Mr. Barrett is the gentleman to ask for.

By the courtesy of Mr. Shrapnell Smith, of the Road Carrying Company, Limited, I am to have an all-night trip on a motor-lorry next week. My impressions, unless too severe, shall be related. P. A. M.

A NEW company has been formed to acquire and carry on the German Daimler Motor Works at Cannstatt and Marienfelde, Berlin, as a result of the taking over of the latter. The capital is £158,300.

MADAME LOCKERT, of our French contemporary "Le Chauffeur," has sent us a copy of "L'Agenda Buvard du Chauffeur et de l'Alcool, 1903, which she has just issued. The "Agenda Buvard" in English means a diary, four days to a page, each page being interleaved with blotting paper. A feature of the book are the pen and ink full-page caricature sketches by Galop, of well-known personages in the French motor world. A number of short useful articles are comprised in the work, including one by M. Brillié on the alcohol motor, one by M. Rutishauer, of the Gardner-Serpollet Company, on steam cars, and one by M. R. Stern on the testing of automobiles. The diary is published at the low price of 50 centimes (5d.), and if only for the caricatures is well worth the money.

MOTOR-CYCLING NEWS.

THE Motor Cycling Club run on Sunday next (the 7th inst.) is to Hatfield. The two meeting-places will be the Marble Arch at 10.30 a.m. and Barnet between 11.15 and 11.30 a.m. The Committee of the Club is now considering the programme for next season, and Mr. G. E. Roberts, the assistant hon. sec., 17, Fieldhouse Road, Hyde Farm, Balham, S.W., will be glad to hear from motor-cyclists who have suggestions to make.

OUR illustration shows a novel form of tandem motor-tricycle which has lately been put on the market by Messrs. A. Jean and Company, of Paris. As will be seen, the power is transmitted to a pulley on the rear wheel by a leather band, in the same way as is done on motor-bicycles.

The motor, which develops 2-h.p., is of the air-cooled type; the cylinder has a diameter of $2\frac{3}{4}$ inch by $2\frac{3}{4}$ inch stroke. A heavy external flywheel is adopted, while a special device is fitted to permit the engine to draw in a large amount of cool air when running free down hill. The machine complete weighs about $1\frac{1}{2}$ cwt.

"All about the Minerva and Romania Motors for Bicycles" is the name of a booklet which has just been issued by Mr. D. Citroen. It contains a minute and lucid description of the well-known engine, and gives instructions for driving, hints on the care of the motor, and other particulars of value to everyone interested in the motor-bicycle. As much attention is just now being given to the Minerva motor with mechanically-operated inlet valve, motor-cyclists would do well to procure a copy of the pamphlet.

AN Australian correspondent writes:—The progress of the motor in the Commonwealth is slow, but, it may be said, sure. Most of the interest is centred in the motor-cycle, it being the only practical type of motor suitable for our roads, and, it should be added, to the purchasing power of this community, which, in a young country, is necessarily limited. With a view to popularising this type of motor, the Dunlop Tyre Company of Australasia, intend to organise a road race for motor-cycles next year.

A NUMBER of motor-cyclists in the Brockley district have just formed a club. It is known as the Kentish Auto Club, the headquarters being at the "Brockley Jack," Crofton Park, S.E. During the winter the members will meet on Sunday mornings for short impromptu runs.

At the Crystal Palace on Wednesday evening last week a meeting of members and friends of the Cyclists' Touring Club was held in the Concert Hall, part of the time being devoted to descriptions of standard types of motor-bicycles. The attendance, however, was very meagre. Mr. Rees Jeffreys was in the chair. The machines described were the Singer, by Mr. Birt; Quadrant, by Mr. Priest; and the new chain-driven machine of the General Motor Car Company.

THE Motor-Cycle Advisory Committee of the A.C.G.B.I. is to be called to advise as to what steps should be taken to encourage motor-cycles during the forthcoming season, and also to consider the question of the inclusion of a paper and discussion on motor-cycles in the programme of the winter season.

At the Crystal Palace on Tuesday a Belgian rider named Gommers made an attempt on the ten-mile record on a $3\frac{1}{2}$ -h.p. Gamage motor-bicycle. After covering several miles at the rate of 1 min. 20 secs. per mile, the rider had a nasty fall owing to a tyre bursting. Dr. W. G. Grace, the well-known cricketer, was one of the spectators, and immediately ran to the rider's assistance. A brief examination fortunately showed that no bones had been broken.

MR. HERBERT J. CROFT, of the Victory Motor Works, Kendal, has just brought out an ingenious stand for motor-bicycles, illustrated herewith. The method of mounting the machine in the stand is as follows:—First fix the stand as shown in Fig. 1;

FIG. 1.—Stand ready for receiving bicycle.

then run the machine backwards up the board, keeping the foot on the end of the latter. When the steps on the machine strike the back stays of stand, the foot is removed from the board, the

FIG. 2.—Position of board clear of tyre for running purposes.

machine dropping into position. To use the stand for trying the motor, the board is pushed back to the position shown in Fig. 2, it being then clear of the tyre. When it is desired to remove the

FIG. 3.—Stand folded up for fixing on luggage carrier.

machine from the stand, it is only necessary to draw the board forward, put the foot on the end, when the machine will run down the board itself. The stand is called "The Leva," and is provisionally protected. It folds up into a small space, as shown in Fig. 3, and has the advantage that no lifting is required to fix the machine in the stand.

LAST week the Duchess of Marlborough drove to Stratford in her motor-carriage to open a bazaar. It is a pity that the road connecting the City and the Eastern suburbs is so bad; otherwise it would be popular with motorists as the highway to Epping Forest.

A HUNTSMAN ON MOTOR-BICYCLES.

MAY I, through the medium of the *Motor-Car Journal*, endeavour to enlist the attention of brother automobilists towards the joys to be found in motor-cycling. As tenders to our big cars they will prove invaluable in certain disaffected districts by timely discovering sneaking police traps, set by magisterial malevolence. Our recent South African experiences have taught us the value of careful scouting. A speedy vidette preceding a 40-h.p. Mercedes might save the owner much loss of cash and complacency.

MR. AND MRS. E. KENNARD AND THEIR MOTOR-BICYCLES.

It is curious what a large amount of craven fear a motor-bike seems to engender even in the minds of would-be beginners. Having experienced in the hunting field three broken collar-bones, two dislocations of the same member, besides the fracture of numerous ribs, and a broken nose, I pronounce unhesitatingly that the pleasures of rapid locomotion far outweigh all the discomforts of temporary disablement.

THE FALLS OF THE CLYDE.

The troubles of stored electricity have caused cautious tyros to hesitate before committing themselves to an actual purchase. The magneto ignition, adapted to bicycle use by the Clyde Cycle Company, of Leicester, has rendered these former terrors to be now regarded only as nightmares of the past. Those who have never mounted "the magic wheel" can have no conception

with what extreme ease a good machine can be manipulated, and how seldom it gets out of order. A trailer behind enables you to share your joys with the wife of your bosom, provided she has a partiality for dust and ignores discomfort. My wiser better half set me a most spirited example by being first in the field as a motor-cyclist! She, too, knows what broken bones mean, having twice smashed her forearm while pursuing the fox across Leicester-shire pastures. The accompanying illustrations show the handy toys we both possess. In publishing these pictures, the *Journal* may perchance be the means of making many homes supremely happy in the future, as ours has become, by the introduction into their midst of one of these wonderful roadsters. The only drawback to motor-cycling that I know of is the difficulty experienced in getting on up hill. Active young men running beside their engines, vault into the saddle while their machines are in rapid motion. If we old men do take a little longer mounting, I for one do not grudge the time, when the great pleasure of the ride is seriously considered.

[A duplicate of my bicycle, in which I can find absolutely no fault after two months' constant use, may be seen in the windows in Regent Street of the Stereoscopic Company, who have become the London Agents of the Clyde Company. No one who has ever given magneto ignition the smallest trial would ever revert again to all the annoyances of secondary batteries.

EDW. KENNARD.

SOME USEFUL NOTES.

IF a car is fitted with tube and electric ignition, use the tube occasionally, for if it is left alone for a long time it may not be in thorough working order when called upon.

AFTER using tube ignition run some petrol through the burners after the flame is blown out, as otherwise they may get choked.

IT will be found most useful to have drain-off taps fitted to the petrol tank, water tank and gear box. Nearly all cars have one on the engine base chamber.

IN a four-cylindred engine try and keep the four cylinders running evenly. Keep all the valve springs of the same strength, and see that the tremblers on the coils are evenly adjusted.

ON any car, if oil gets up on to the sparking plugs, either the wrong oil is being employed or too much is being used; in either case the remedy is obvious.

SHOULD a chain break and it cannot be repaired, it is always possible to get home on one chain. The free countershaft sprocket must be prevented from revolving (this can usually be done by winding the broken chain round it and fixing it to the frame), and the car can then be driven, but it must be noted that holding one side of the differential nearly doubles the speed, so the car must be driven very carefully, or damage may be done to the differential.

IF the compression of the engine, with a slow speed in, is being used as a brake, take care not to switch the spark on again suddenly, as great strain will be put upon the engine and gear. Crankshafts have been broken in this way.

ALWAYS use brakes alternately going down a long hill, thus giving each one time for cooling.

IF a sprag is fitted to a car, be sure to use it properly. Never drop it when a run back has commenced. It should always be trailed up a hill.

SHOULD an engine prove refractory in starting in cold weather, petrol squirted into the cylinders very often overcomes the difficulty; or, if the mixing chamber has a removable top with a cone, warming up the cone will nearly always effect a ready start.

HERE AND THERE.

AMONG the several municipal bodies in the London district that have adopted heavy motor-vehicles, is that of Westminster whose "motor-trains" are now a familiar sight in the Strand and the Covent Garden district. By the courtesy of Mr. J. W. Bradley, the Westminster City Engineer, we are able to reproduce a photo on page 776 of the motor-trains drawn up outside Charing Cross Underground Railway Station

THE accompanying illustration shows Mr. W. A. Entwistle, of Mirfield, Yorks, on his 9-h.p. Pitt car. This car is one of

the latest British built cars, it having been constructed by the Pitt Yorkshire Machine Company, of Liversedge. The car runs very silently, with little or no noise from the engine or the exhaust, and is easy to manage. The tonneau is roomy and comfortably upholstered. The photograph was taken on the top of Standegge, one of the highest parts (in Yorkshire), of the Pennine Range, the car ascending the heavy gradient (some miles long) with a full load of four.

WE understand that Mr. John D. Hill, motor-car expert and adviser, has joined Mr. E. W. Hart, of Luton, who has established the Parkside garage at Park Road, Regent's Park, N.W. Mr. Hart will also have a number of motor-carriages on view at the Paris Salon, which opens on Wednesday next, the 10th inst.

THE drivers of the public service cars belonging to Messrs. Pigott and Griffiths, at Brighton, recently held their annual excursion, spending the day at Portsmouth in visiting the dockyard and other places of interest. On the return, Mr. Pigott met the men at the station, and conveyed them in his 10-h.p. Cannstatt Daimler to dinner at his residence, afterwards driving each man home, the party being shown in the accompanying illustration.

MESSRS. SMITH AND DOWSE, of the Isleworth Ironworks, Isleworth, S.W., have just finished a novel vehicle in the form of a sailing car. It has been built to the designs of Col. George Winter, who terms it a "motorless motor-car," and is intended for use in Egypt. The car consists of a tubular frame 12ft. long, 10ft. wide at the front end and 7ft. wide at the rear, mounted on four wheels 4ft. in diameter, shod with 6in. iron tyres, so that the wheels will not sink into the sand. At the forward end of the frame is a bamboo mast, 14ft. high, fitted with a large sail, which can be hoisted and controlled in the same way as in a small sailing boat. By means of the wind it is expected that the car will attain such a speed over the sand as to render it a much better carrier of despatches, etc., than the primitive camel corps or native runners. The vehicle reminds us of the sailing cars which for many years were one of the features on the beach at Southport.

A NATIONAL highway from the Atlantic to the Pacific Coast is, by a recent decision, to be a leading issue with the American Automobile Association.

THE Gardner-Serpollet Company have just completed a 40-h.p. steam car for the Shah of Persia. The body takes the form of a landau finished in the Louis XVIII. style.

ON the Crystal Palace track, on Saturday last, Fred Chase rode five miles in 6 min. 36 sec., and a mile in 1 min. 17 sec., on his Bat motor-bicycle.

THE Western Section of the Scottish Automobile Club propose to hold quarterly hundred miles trials on the lines of those of the A.C.G.B.I.

THERE are now, we understand, four 40-h.p. Mercedes in Great Britain, the owners being Count Zborowski, Mr. A. Harmsworth, Mr. C. Cordingley, and Captain Milner, J.P., of Norfolk.

ON Tuesday next Mr. Henry Fowler, A.M.I.C.E., will give a lantern lecture at the Midland Railway Institute, Derby, on "Heavy Motor-Vehicles."

THE Motor Hiring Syndicate, Limited, has been registered with a capital of £2,000, and offices at Winchester House, Old Broad Street, E.C.

THE entries for the 1903 Nice week are already coming in. So far eight Panhards, seven Mercedes, six De Dietrichs, four Mors, four Gobron-Brilliés and one Rochet-Schneider have been entered.

THE London to Brighton mail coach was upset at Thornton Heath on Tuesday, but fortunately the motor-mail van which runs between London and Redhill was able to take off a small portion of the load of the coach.

MESSRS. C. H. GUEST, LIMITED, of Draycott, Derbyshire, will open a motor garage and show-room in London Road, Derby, early next month. They will keep a stock of parts and petrol and an experienced staff of repairers.

A PRELIMINARY catalogue of French Gardner-Serpollet steam carriages reaches us from the Speedwell Motor and Engineering Company, Limited, of 50, Albert Gate, S.W., and Reading. This is fully illustrated, the sketches including a diagram showing the Serpollet system, and also a view and detailed description of the motor.

ON another page we reproduce a photograph of Mr. Chas. Homewood, of Balcombe, Sussex, on his De Dion voiturette. Mr. Homewood was recently summoned at Horsham, for travelling at a speed equal to twenty-one miles per hour. The case was dismissed, as it was shown in evidence that the dog seen in the picture had followed the car and had kept up with it for over eight miles. Mr. Homewood informs us that "this dog does not belong to me, but, if possible, will follow the car. It has often run from 14 to 20 miles without a stop."

THE Milnes Daimler Company has been registered with a capital of £20,000.

THE owner of the tool case found on the Maidstone Road, as mentioned in last week's issue, has been found.

It is reported that the Furness Railway Company, is about to make a trial of motor parcel delivery vans.

ON Thursday Friswell, Limited, held their last auction sale of the present year, several steam cars being sold under steam at the new premises in Albany Street, W.

THE Road Carrying Company, Limited, of Liverpool, has now fourteen heavy lorries at work and has dealt with 4,000 tons of goods, conveying the same between Liverpool and St. Helens and Liverpool and Blackburn, and *vice versa*.

LORD WOLVERTON, Under Secretary of the Board of Trade, and Mr. William James, of West Dean Park, Chichester, have each taken out a Gobron-Brillie car for use at the Delhi Durbar. The cars are adapted to work with alcohol (methylated spirits), owing to the petrol difficulty in India, but can be used for petrol if desired.

MESSRS. E. J. COLES AND COMPANY, of Upper Holloway, have now opened a West End office at 7a, Princess Street, Oxford Circus, W., and showrooms at 37, Margaret Street, Regent Street, W., where, in addition body-building, painting and upholstering will be carried on. For the 1903 season Messrs. Coles are bringing out a new pattern 12-h.p. car with live axle and patent clutch. The vehicle will be of light construction, having a frame of H-section steel, four forward speeds and reverse.

GARAGES in all the principal towns of the country will shortly be opened by Messrs. Evatt-Hall, Limited. The Nottingham branch, centrally situated near the Theatre Royal, is already open, while within a few days extensive premises will be opened at Brighton, where it is proposed to keep a number of cars for hiring purposes. The garages will be fitted up with reading, lounge, and other rooms, and the weary motorist after his journey will be able to rest and clothe himself in his everyday attire. Evatt-Hall, Limited, are also agents in the principal towns for the Oldsmobile and other cars.

MESSRS. HOLDING AND SON seek to produce adaptations of general styles of clothing made in high-class materials to motoring uses, whilst retaining their ordinary appearance—a fact which finds illustration in their well-known "Ayrshire" motor Ulster. The firm's leather waistcoats have many points of originality. These are fitted with warm backs of wool, whilst the front is impervious, as are also the sleeves, which are not, however, made of leather, a less cumbersome material being employed. The patent motor apron has six movements or six applications, as it were, for its various uses, and is chiefly made in box cloth.

WHILE Sir Thomas Lipton was driving his motor-car slowly on the road near Winchester a horse took fright and bolted, Sir Thomas having to put on speed to get out of its way. Unfortunately the driver of the animal was thrown out of the cart and killed. At the inquest a verdict of "Accidental death" was returned. A similar verdict has also been given at the inquiry concerning the death of Mr. A. Duckett, of Liverpool, who died owing to an accident to a motor-car he was driving for the advertising purposes of a Liverpool newspaper. While driving down an incline at Norton, a nut appears to have become detached from the steering gear, with the result that control of the machine was lost, and both the deceased and the car fell into a field twenty feet below the level of the road. The car fell on the deceased, who was badly crushed, and who subsequently died from internal hemorrhage caused through the ribs penetrating the lungs.

MOTOR CYCLES FOR 1903.

CONSIDERABLE interest is being shown in the Ixion motor-bicycle made by the Primus Motor Works, of Loughborough Junction, S.W. The motor is fitted to the head of the machine, on the lines of the old Werner, and drives the front wheel by means of a small rubber-covered friction wheel, in contact with the pneumatic tyre. The novelty lies in the motor, of which a vertical section is given in Fig. 1. The bore of the cylinder is 2 in. by 2 in. stroke, and at a speed of 1,500 revolutions per minute it is stated to develop $1\frac{1}{2}$ h.p. The engine is of the "two-cycle" type giving an impulse at every revolution, and its mechanism is reduced to the fewest possible parts, viz., cylinder piston and rod, crank shaft, and fly wheel.

FIG. 1.—SECTION OF PRIMUS TWO-CYCLE MOTOR.

all valves and valve gears being dispensed with. The action of the motor is as follows:—On the up stroke of the piston a charge of gas is drawn into the crank chamber; on the down stroke this charge is compressed until the piston has descended to nearly its lowest point, when it opens a port in the side of the cylinder communicating with the crank chamber; the compressed charge rushes into the cylinder, where by the next up stroke it is again compressed and exploded by electric spark in the usual way. Simultaneously with the opening of the inlet port the descending piston has uncovered the exhaust port at the opposite side of the cylinder, through which the burnt gases from the previous explosion escape, driven out by their own expansion and by the intruding new charge. This process is repeated during every revolution, and thus an explosion takes place and an impulse is given at every down stroke. The gas and air are admitted into the crank chamber through an opening in the hollow crank shaft. The ignition and spark-advancing device are of the usual type, and are actuated directly from the main shaft. Lubrication is effected by means of a drop sight-feed lubricator working continuously and automatically. The Ixion is claimed to be the lightest motor on the market, its weight being only eighteen pounds.

The New Rapid Cycle Company, Limited, Birmingham, are now turning out motor-bicycles. They are using the latest Kelecom $2\frac{1}{2}$ -h.p. motor, located behind the seat tube. The left handle controls the electric switch and exhaust valve lift. In addition to their well-known 4-h.p. Traveller Voiturettes, which have already been illustrated in these columns, Messrs. Alldays and Onions, Birmingham, have a motor-bicycle fitted with the new Minerva motor, with mechanically-operated inlet valves. The new Jesmond motor-bicycle of the Jesmond Cycle Company, Limited, Newcastle-on-Tyne may also be referred to. Attention is drawn to the loop frame, which is strengthened to carry a $1\frac{1}{2}$ -h.p., $2\frac{1}{2}$ -h.p., or $2\frac{1}{2}$ -h.p. engine, in a vertical position. Inspection of the machines shows that the rider can easily get at the valves and combustion chamber without removing the crank case from the frame. The Longuemare float-feed carburettor is employed; while a new speed-regulator is to be found on the machines fitted with $2\frac{1}{2}$ -h.p. and $2\frac{1}{2}$ -h.p. engines. Only three levers are used—spark-advance, gas lever, and exhaust lifter.

Messrs. Mills and Fulford, Coventry, are making a feature of trailing cars of new and improved design, suitable for use with motor-cycles. They are also introducing a novel forecarriage, suitable for converting motor-bicycles into two-seated tri-cycles.

Calvert's Motor Company, Limited, are introducing many bicycle motor parts, etc., noticeable among them being the Seer transparent plug. This has been shown working on a running engine with remarkable accuracy. The insulator is made of a specially annealed glass. It is tubular, and enclosed at the inner end only; the leading-in wire being hermetically sealed into the glass at this end, and therefore perfectly air-tight. The outer end of wire is clamped under a small band dip, to which H.T. wire from coil is connected. This clip is removable, and allows the gland nut to be instantaneously taken off and put on another insulator if required.

In the Phoenix motor-bicycle, with which the name of Mr. J. Van Hooydonk is associated, several improvements have been introduced. The lubricating arrangements have been improved, a transparent lubricator being fitted on the top tube, so that the rider has as complete a view of the state of his oil supply as on a motor-car. The contact breaker is fitted on the extremity of the lever which actuates the exhaust lift, and is made of a springy metal, enabling the exhaust valve to be raised slightly without interrupting the current. The Bowden wire lever on the handle-bar becomes the means of regulating the speed of the machine, as well as the start and the stop. Mr. Van Hooydonk recognises that the public demand will be for machines capable of ascending any hill, and for that purpose the 2½-h.p. Phoenix will be found of ample power. The "Trimo" fore carriage, introduced by Mr. Van Hooydonk, and illustrated in our issue of October 25th, may also be mentioned in this connection. This is an ingenious method of converting a motor-bicycle into a three-wheeled machine for two persons, and has attracted considerable attention.

Messrs. A. W. Gamage, Limited, had two stands at the Stanley Show, one of which included a wide range of motor accessories,

FIG. 2.—THE GAMAGE MOTOR-BICYCLE.

including Bleriot and other lamps, footgear of varied kinds, including boots in chrome-dressed leather and lined with asbestos, motor horns, etc. In the clothing department were pony and goat coats, while all the goods seemed to be lined in the most appropriate and useful styles. A novelty consisted of a coat for motorists with camel-hair lining. On the second stand the firm showed the motor-cycle once known as the "Red Star," and now designated the Gamage. The motor, which is of 2-h.p., is built into the frame, in a vertical position. The cylinder is of 68 bore and 80 stroke, and control is obtained through the handles, the right-hand one controlling the advance sparking, and the left handle the compression. A carburettor of the spray type is fitted, and for lubrication a pump is provided, which will secure efficient lubrication for about 25 miles on one charge. The transmission is by means of a V-shaped belt and a non-slipping pulley. The petrol capacity of the tank is sufficient for about 150 miles run, the compartment for lubricating oil holding enough oil to run twice that distance.

Reference has already been made in our "Motor-Cycling News" to some of the new features in the Ormonde motor-bicycle. The standard Kelecom, 2½-h.p. motor with which it is fitted, has a bore of 70 mm. by 75 mm. stroke; the 2½-h.p. a bore of 77 mm. and stroke of 80 mm.; while the 3½-h.p. motor for racing purposes will have a bore of 84 mm. and a stroke of 80 mm. The tank is now fitted with a float actuating a pointer upon a dial, which is marked off in quarts, so that the exact amount of the petrol in the reservoir can be ascertained at a glance. An outside automatic lubricator has been provided, and the carburettor, which is of the float-feed spray type is now made slightly larger than hitherto. The "Ormonde" motor tandem bicycle, and the "Ormonde" fore carriage for motor-bicycles are two other introductions of the company with which the well-known name of Ormonde is associated.

A NEW record in Massachusetts automobile runs has been made by a 6½-h.p. Weston car. With two passengers aboard, the car has ascended Mount Wachusett, near Fitchburg. The steepest grade is 19 per cent., or practically one in five, and the car took the mountain without difficulty.

THE ANNUAL CYCLE SHOWS.

BELOW we resume our report of some of the main features of the Stanley and National Shows:—

Messrs. G. T. Riches and Co. had a large collection of motor accessories and spare parts, including many novelties. Among the latter was an instrument to enable the amateur to charge his accumulator from the ordinary house or hotel electrical installation. All that is required is to take out one of the electric lamps in use and insert the bayonet holder carrying the special lamp attached to the charging board, and connect the hooks to the accumulator. M. C. M. Berthe, of Colombes, near Paris, made a big show of motor-cycles, small engines, carburettors, tanks, oilers, batteries, coils, plugs, pumps, horns, and all replacement parts for De Dion, Aster, Clement, Panhard, Darracq, Ader, and other cars. Lubricators and grease cups for motor-cycles and cars were included in the exhibit of Messrs. Rotherham and Sons, Coventry.

Motor roller chains were shown in various pitches, from ½ in. to 3 in., by Mr. Hans Renold, Manchester. These chains are made on the same principle as the Renold cycle chains, and are designed to give the greatest strength with the minimum of weight. A special ½ in. pitch roller chain is being introduced for use on chain-driven motor-bicycles. For high-speed work the Renold silent block chain is used. This is made in pitches from ½ in. to 1½ in., and in widths from ½ in. to 6 in.; the sample of the latter shown is the largest so far made, and has been designed for driving carriages on the Manchester to Liverpool Electrical Railway (Behr's Monorail system). Motor roller chains in a variety of pitches were to be found at the stand of the Coventry Chain Company, Limited, as also a special chain-band for motor-cycles, the latter consisting of a combination of wedge-shaped blocks of leather and steel side plates and rivets, and of novel and ingenious design.

The Phoenix Accumulator Company showed a new secondary battery for use on electrical cars. The positive electrode is composed of a cylindrical vessel of porous earth of a character possessing a high degree of porosity. Its resistance to the electric current is stated to be nil. In this cylindrical vessel is the positive material, the contact being assured by a leaden bar of special form. The upper end of the vessel is hermetically sealed, rendering the positive electrode indestructible. The negative electrode is composed of a leaden core of special form, around which oxide of lead (litharge) has been imparted. This work is done mechanically, and the electrode, when finished, has also a cylindrical form; when the litharge pasted round the core is dry it is covered by a case of ebonite to allow the circulation of the liquid. This case is formed of a large number of small discs. The accumulator is said to furnish 15 A.H. per kilog. of the electrode under a discharge of two hours; 18 A.H. 75 per kilog. of the electrode under a discharge of five hours; and 27 A.H. per kilog. of the electrode under a discharge of eighteen hours.

The Cologne Accumulator Works (Gottfried Hagen) of Kalk, near Cologne (Germany), had on view a series of accumulators for ignition purposes for automobiles, as used largely by the Benz Company.

Messrs. Charles Peacock and Co., Clerkenwell, E.C., are catering for the wants of motorists in the way of accumulators, charging boards, volt- and ampere meters, and had a large collection of these on view.

Mr. Charles R. Base was well to the front with a selection of motor clothing, including both fur and leather coats. Special reference may be made to the Motor Poncho, made in black and white rubber. This coat is cut like a Poncho cape, with sleeves, and a small opening at the neck for the head to pass through. The opening is cut on the round to prevent drifting rain from penetrating, and the sleeves are fitted with wind cuffs.

The Dunlop Pneumatic Tyre Company, Limited, showed a large variety of their motor tyres, from those suitable for motor-bicycles up to those for heavy motor-vehicles. Included in the exhibit was the identical set of tyres used by Mr. S. F. Edge in the Gordon-Bennett race. The Clincher pneumatic and solid rubber tyres for motor-cycles and cars were to be seen on the stand of the North British Rubber Company, Limited, Edinburgh. Tyres for motor-cycles and cars were also shown by the New Amalgamated Tyre Company, Limited, Coventry, and the Scottish Tyre Company, Limited, Glasgow, a feature of the latter being the Scottish de Luxe motor-bicycle tyres, with canvas insertion to lengthen the life of the rubber and heavy twill linings. The Self-Sealing Air Chamber Company, Limited, Birmingham, exhibited their self-sealing inner tubes for the prevention of punctures. This company is also making a speciality of the repair of motor tyres of all kinds.

Four cars were to be seen at the stand of the Star Engineering Company, one being a *fac-simile* of the identical vehicle recently supplied to the Automobile Club. It is a 7-h.p. twin-cylinder car, with tonneau body, finished in yellow and green. The motor is governed on the inlet valve, and is water-cooled by means of pump and radiators. The gear is on Panhard lines, giving three speeds forward and one reverse, all actuated by one lever; and the power is transmitted from the countershaft to the road wheels by two side chains. Two independent powerful double-acting brakes are fitted, one on the countershaft and the other on brake drums on the rear road wheels. The wheel base is very long, and wheels are 32 in. equal, by 3½ in., fitted with heavy pneumatic tyres. Another noteworthy vehicle was a 10-h.p. car, the body of which is of the Roi des Belges tonneau type, and manufactured by a new process, which the makers have protected. The body is of wood, and is said to come out considerably lighter than aluminium. The car is similar in design to the 7-h.p., but has four speeds. Aluminium is used in the tonneau body of the 20-h.p. four-cylinder car. Four speeds ahead and one reverse are available. The

body is provided with a high back, and is comfortably upholstered. Samples of the 7, 10, and 20 h.p. motors, as well as a 10-h.p. chassis, were to be seen on the stand to testify to the progress the Star Company has made in the construction of motor-cars. The 7-h.p. engine has two cylinders, $3\frac{1}{2}$ in. diameter by $4\frac{1}{2}$ in. stroke, and runs at a normal speed of 1,000 revolutions per minute. The bore of the 10 and 20 h.p. engines is $4\frac{1}{2}$ in. by $5\frac{1}{2}$ in. stroke, and the normal speed 800 revolutions.

Varied was the stand of Joseph Lucas, Limited, the "King of the Road" motor headlight being particularly prominent amid a good collection of side and rear lamps, as well as a useful lamp for voituettes. Pumps, horns, lifting jacks, luggage bags, etc., were on the stand as well as tins of the Wells-Lucas "Motoil A"—specially prepared for motor-bicycles. A new pattern of oil feed was also shown in Lucas's "forced feed" oiler, the advantage being that forcing of the oil right home is ensured.

Messrs. Sutherland and Marcuson showed a two-cell motor-cycle battery as well as batteries for cars—all fitted with elements of the "Umpire" type, in which ribbed porous separators entirely occupy the space between the plates. The latter are held together by means of acid-resisting elastic bands, thus keeping the active material constantly under pressure and preventing it from falling away or losing contact with the grid. The "Meyra" dry cells were exhibited by the Ideal-Meyra Electric Company, who had also on view many excellent electric hand lamps, etc. Induction coils, the G. and L. accumulators, volt meters, ampere meters, etc., were shown by Messrs. Gianoli and Lacoste, who also exhibited controller handles fitted to clips ready for attachment to the top tubes of motor-bicycles. Messrs. H. W. Van Raden and Co. had a stand whereon were exhibited woven glass accumulators, sparking plugs, charging boards, electric ignition apparatus, carburettors, etc.

Motor horns and lamps formed the staple part of the display made by Messrs. Steiner and Company, while at the stand of the London Autocar Company was a representative collection of launch motors, the "A.V." radiators, lamps, pumps, De Dion engines and parts, coils, oil pumps, and motor accessories of every kind. Complete sets for motor-bicycles and tri-cycles were also shown, the company demonstrating their capacity for supplying all the accessories required by the motorist. Aluminium castings, including a model crank case for motor-bicycles, were shown by Mr. Robert W. Coan, whose specialities in aluminium are well known to motor manufacturers. The Auto-Machinery Company, Limited, made a feature of their patent roller bearings, and also showed a motor-cycle frame fitted with the company's own 2-h.p. cycle motor with magneto ignition.

The Red-Grey Rubber Tyre Company, Limited, showed the speciality indicated in their title. Red rubber being necessarily "cured" with salts of antimony, is capable of resisting great heat, and presents a durability and toughness greater than the grey variety. The latter, however, being cured with sulphur only, easily combines with solution, thus being easy of repair. Combining these two advantages the red-grey rubber tyres are likely to become familiar on the wheels of motor-cars. Tyres were also shown by the Goodyear Tyre and Rubber Company, who took the opportunity of calling attention to their detachable motor-cycle tyre, which is made in three sizes.

Price's Patent Candle Company, Limited, had a good show of motor and motor-cycle lubricants, including "Motorine" for air-cooled and for water-cooled cylinders, motor piston oils, and Battersea gear oil, the latter being adapted for "bath" lubrication in change-speed gear boxes of the Panhard or Daimler type. These lubricants are absolutely neutral, and free from any oxidising or gumming tendency. A good display of lubricants was also made by Messrs. Stern Brothers, who drew particular attention to the "Fram" non-freezing lubricant for the gear cases of cars. Lubricators of various kinds were also shown by the firm.

Motorists in search of the latest things in motor clothing naturally turned to the stand whereon Mr. Alfred Dunhill exhibited his specialities in chrome-dressed leather clothing, etc. He is wisely seeking to give his motorists' clothing the appearance of ordinary raiment—a development very different to the efforts of tailors in the early automobile days. An "Umbrella" coat in cape form for motor-cyclists was also shown, together with a finely representative collection of gauntlets, gloves, caps, foot muffs, goggles, etc.

A car attracting considerable attention was the "Rigal," shown by the British Germain Motor Car Co. This is a light, two-seated car of good appearance. The tubular frame is carried upon semi-elliptical springs; a $6\frac{1}{2}$ -h.p. De Dion engine is fitted; there are three speeds forward and a reverse, the third speed driving direct through the gear box. Two brakes are fitted on the rear wheels, and the third is on the countershaft. Irreversible wheel steering has been adopted. The wheels are of the artillery style, fitted with pneumatic tyres. Although the "Rigal" car is primarily intended for use as a two-seated vehicle, there is ample room at the rear for a third small seat, or the space can be utilised for luggage. We understand that this car was run on Sunday last for the first time, and succeeded in doing between sixty and seventy miles on the main North Road through pouring rain and over bad and newly-stoned roads without giving the slightest trouble. About eighty miles were accomplished the following morning (Monday), the car returning to London in an equally satisfactory manner. At another stand the company had a 15-h.p. Germain car with a four-cylinder motor having 95 mm. bore and 130 mm. stroke. This is the car which obtained the silver medal in class G in the Reliability Trials of the A.C.G.B.I. The British Germain Motor Car Company, Limited, has opened a depot at Hanover Court, Hanover Square, W., where both cars are on exhibit.

MESSRS. HAYNES AND SONS, LIMITED, have taken up the agency for the Wartburg cars, which are of German construction. Several types are made, and a few days ago we had an opportunity of inspecting the little two-seated car, fitted with a $5\frac{1}{2}$ -h.p. two-cylinder vertical water-cooled motor, located in the rear of the tubular frame. Three speeds forward and a reverse motion are provided, the power being transmitted through a clutch and bevel gearing to the rear axle. The little car is neatly finished and can, it is stated, maintain an average speed of nineteen miles per hour.

CORRESPONDENCE.

GRADIENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "T." who is curious on the subject of gradients, may be reminded that the four or five miles of the Kirkstone Pass include no doubt an upward climb and a downward "slither." His calculation makes the Pass just twice too high. "An average gradient of 1 in 8" does not underestimate things if the portion alluded to is counted from Kirkstonefoot to Ambleside. Three-quarters of a mile from Kirkstonefoot the hill is all 1 in 10 to 1 in 8 up to the top, and then the part down to Ambleside is 1 in 6 at first, then mostly 1 in 7.

But there are main roads in the country with hideous gradients, and 1 in 5 is not at all unknown. May I draw "T.'s" attention to the following?—

Ilfracombe to Minehead.—At Parracombe, 1 in 7; descent to Lynmouth, 1 in 5, and 1 in 7 up again; descent to Porlock, 1 in 6.

Bala to Dinas Mawddwy.—Descent to the Dovey Valley, 1 in 5 and 1 in 7. This is almost the worst road in the country.

Inverness to Fort Augustus.—The descent to Fort Augustus is 1 in 7 in several places, and steeper for short pitches.

Glenelg to Shiel Inn.—The "Mam Ratachan" hill with a horrid double turn, 1 in 6. This is used for driving regularly through the summer.

Gairloch to Ullapool.—The descent to Aultnaharrie, near Ullapool, is precipitous, 1 in 6, 1 in 9, 1 in 5: however, this road is much used.

Aultnaharra (not the same place as the last mentioned) to *Eriboll*.—The descent to Eriboll is 1 in 6.

With the exception perhaps of the Bala-Dinas Mawddwy road these are all main roads, because there is no other way.

May I also mention the road from *Tornapress to Applecross*? Inside 12 miles the road rises from sea level to 2,040 feet, and returns to sea level. The gradient is not usually worse than 1 in 7.—Yours faithfully,

CATAMOUNT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "T." re a gradient of one in five on a main road, I think I am correct in stating that parts of Porlock Hill (on main road from Ilfracombe to Minehead) are one in five. Whether it has been subjected to the tests of the clinometer or theodolite, I cannot say, but I suppose it has. Perhaps "T." will walk up this hill one day, and I am quite sure he will admit of a one-in-five gradient.—Truly yours,

FLASH.

MECHANICALLY-OPERATED INLET VALVES

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one specially interested in the above subject, I have followed with close attention the correspondence as to the advantages or disadvantages of the mechanically-operated inlet valves, as compared with the automatic valves, but there appear to me to be one or two points that have not yet been touched upon. Many correspondents in their advocacy of the former, evidently basing their remarks entirely upon theory, lay particular stress upon the fact that the mechanical valve shall be opened exactly at dead centre, with the result, they claim, that the cylinder will necessarily be absolutely filled with a fresh charge, which would not be the case with the automatic valve. If this were always the case, then nothing else would require to be said in favour of the mechanical valve, as this advantage alone would more than compensate for the extra working parts employed. As the result, however, of experiments I have been carrying on in my own testing shop for months past, I have found that if the mechanical valve be opened exactly at dead centre as advocated, an entirely different result will, under certain conditions, be obtained to that anticipated, and which entirely destroys the very advantage which they so strongly claim.

Supposing the cylinder, from any cause whatever, is not thoroughly scoured on its exhaust stroke, what takes place if the mechanical valve be opened exactly at dead centre, as suggested? The result is that the remaining exhaust in the cylinder at once rushes out through the now opened valve, and the induction pipe (which is full of gas from the last suction stroke) is at once emptied, or partially emptied, of this fresh charge, and a considerable portion of the suction stroke has to be expended in refilling the pipe. Here seems to me something that must be seriously considered, and I have found that the longer the induction pipe, the worse the result. Hence, with the almost certain adoption of the mechanical inlet valve, my reason for fitting the carburettor in my new engine as close as possible to the engine, in order that, if from any cause whatever

the cylinder should not be thoroughly scoured, the effect would not be so detrimental as if a longer pipe were used.

Many correspondents also condemn the automatic valve on all points, whether of opening or closing, some even going so far as to state that this valve cannot close until the compression stroke has commenced. Is this so? I venture to state that, with a properly designed motor, and with a valve fitted with a spring of proper tension, the valve will be closed at the correct time for efficient working. Can this spring always be relied upon? There is no doubt in my mind that with certain given conditions the mechanical valve will score, and I am convinced that whilst these conditions can be maintained an engine fitted with this device will give greater power than one fitted with the automatic valve. Manufacturers, however, must bear in mind that in all probability after the motor has left their works these conditions may be materially changed, even to such an extent that any advantage which might be derived from the mechanical valve will be reduced so considerably that it may not be worth the extra cost and the additional number of working parts. I take it that we all are only too anxious to get all the possible power from our motors, and I shall be glad to see this matter thoroughly discussed.—Yours faithfully,

FRANK MORRISS.

GOGGLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question of goggles, on which you invite the opinion of your readers, has occupied my attention as an ophthalmic surgeon for some time, and my own feeling is that it is better to do without them. Personally, I never wear goggles at any time of the year, and my wife, who has driven with me long distances in all weathers, neither uses them nor a veil of any sort, and our eyes have never been the worse for the want of them. Some people seem to trap flies in their eyes with greater facility than others, and, of course, a fly in the eye of the driver may lead to an accident; then again, when dust is excessive, for instance when following another car, goggles, nay, even a respirator, become a necessity. Weak eyes which are easily inflamed need protection from cold wind and dust. For fast speeds no doubt some covering is advisable, but I am speaking of about twenty miles an hour.

A large transparent shield of talc covering the whole face is far better than any close-fitting glasses which keep the eyes hot whilst the rest of the face is cold. The goggles usually sold are not fitted with good glasses, for unless expensive, the glasses are moulded to shape, not ground optically true, and in consequence usually have the effect of slightly concave lenses. They also cause a certain amount of distortion of objects, and both of these defects are injurious to the eyes. Again, they are generally tinted to a greater or less extent, so that the effect of bright light after taking them off is more trying; their effect is weakening, and it becomes difficult to do without them. Driving in ordinary spectacles makes the eyes water unless the glasses are very large, for although protecting the eyes from the direct wind, there is a draught produced round the rims which is worse than if none were worn. The field of view with spectacles is dangerously limited, and this would be the case with a transparent mask (not too close fitting) of talc, or something similar to, but safer than, celluloid; on which, too, no deposit of moisture would be so likely to occur and obscure the sight as is usual with glass.—Yours faithfully,

M.A., M.D.

A GRUMBLE RE MOTOR REPAIRERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Darlington's letter in your issue of the 22nd ult., I have for a long time wished that a list of motor repairers could be drawn up and issued to users of motors; a book at a small cost ought to sell. It would be interesting to know what trouble Mr. Darlington had that was not properly done by the would-be motor repairer. I myself was in trouble with motor tyres near Ashford last year, and left the car at a repairer's (who had four motor-vehicles in the works) for three hours; it was then getting dark, and two men were still at work on the tyre. They certainly made the tube worse than before, they had not properly put the cover on, and blown a large hole in the tube. I decided to stop all night in Ashford, and went to the works about ten next morning. You ought to have seen the tube. "We cannot possibly do anything with this tube, sir, it is worn out!" They had not got a new one, so I asked permission to repair it. I cut two bad places right out and rejoined it in the two places. This occupied 1½ hour, after which away we went, and drove home, a distance of nearly 50 miles, the only one trouble experienced being that a patch put on by the repairers leaked. We mended this, and the tube afterwards ran about 300 miles without pumping up.

I wrote the repairers the same evening giving the result. I never go out now without my own repair outfit.—Yours truly,

Cox.

HOW TO DRIVE MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Almost every different make of car requires different driving to obtain the best results.

If "Gear Box" will say the particular make of car he is requiring the information about, there is no doubt those most directly connected with that particular manufacture will probably at once offer assistance.—Yours,

te.,

MANUFACTURER.

THE AUTOMOBILE CLUB BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to see you have declared against the reduction of owners of motor-cars to the level of cab-drivers, as will be the case if the proposed numbering legislation should ever pass through a panic-stricken House of Commons. There are two sides to the question, and, so far, practically only the official view has been published to the world. Although some well-known motorists have associated themselves with the numbering idea, there are hundreds of steady-going owners up and down the country who would object to the labelling policy, and who must be grateful to the *Journal* for having taken such a decided stand in the matter. May I appeal to your readers who have influence in the constituencies to inform their M.P.s that Mr. Scott Montagu does not voice the unanimous view of motorists—in fact, that his proposals have their keen opposition.—Yours truly,

W. H.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read in the *Journal* the text of Mr. Scott Montagu's Bill for the registration of motor-vehicles, and am greatly surprised to find that it is compiled in a great measure by the Automobile Club. I notice that it seeks to confer greater power upon local authorities, such as County Councils and other local bodies, than at present exists. If such a Bill passes through Parliament, then these County Councils, etc., would immediately make such tyrannical rules and regulations as would completely upset and prevent all further use of motor-cars throughout England and Wales. I have had considerable experience in connection with traction engines, and can truthfully say that under one Act of Parliament the tyranny of the various local bodies and voluntary magistrates has been something terrible in many districts. Local law is the most cruel and unjust of any that we can have. Mr. Scott Montagu's Bill is practically a Bill to suppress the use of all motor-vehicles on public roads. It would have no other effect!

I hope the Automobile Club will at once withdraw from the Bill and frame another one, altogether more consistent. The giving of any further power to local bodies should be most rigidly opposed before Parliament. The registration and numbering of motor vehicles should also be opposed, and the power to take away a man's license, or to prevent him getting a license, should also be resisted. A new Bill should be one which cannot be tampered with by any local body of men. It is local tyranny under which motorists are now suffering. Local bodies have already got too much power. I thought the Automobile Club would have seen this long ago. I hope the interests of motorists will be faithfully and rigidly defended in Parliament, in case of any legislation.—Yours faithfully,

MECHANICAL ENGINEER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think with you that Mr. Scott Montagu's Bill would do more harm than good. As regards numbering of cars (and I suppose motor-cycles), I fancy it will take a man with very sharp sight to read the number of a car travelling at say forty miles an hour on a dusty road, i.e., if the number is at the back. I also see that apparently there are no special clauses referring to motor-cyclists, and as I belong to that class I am naturally interested in the same.

If motorists in general could exert all their power in either bringing the fines down to that imposed for leaving horses unattended, etc., or else bring those fines up to the £5 and costs of the motorist, more good would be done than by numbering. In a few years the police will have to give their attention to flying machines; the only thing will be that there are no hedges or pigstyes for them to hide in up above.—Yours truly,

MOTOR CYCLIST.

ANTI-FREEZING SOLUTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the *Journal* that an anti-freezing mixture has been asked for. It is an important subject, and I believe the remedy for preventing water-cooled cylinders being cracked by frost to be three-quarters of a pound or thereabouts of ordinary salt well dissolved in each gallon of water carried by the car. Salt only costs about ½d. per pound, so the expense is little. In support of this I may mention that Fahrenheit, when making his thermometer, obtained his "0 degrees of heat (or rather cold)" by a mixture of salt and water, which he froze: 32° is the "freezing point of water."—Yours truly,

C. F. HAMMOND.

MEASURED DISTANCES.

NEAR Hailsham is a measured furlong which has just proved disastrous to a quartette of motorists.

BETWEEN Fishergate and Southgate, on the Lower Shoreham road, is a measured quarter of a mile.

THERE is a measured quarter of a mile on the road from Southbourne to Emsworth (Hants.).

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Hailsham ...	W. Josling	25 m. p. h.	£1.
" ...	G. Richardson, Peckham	25 m. p. h.	"
" ...	J. M. Gorham, Westminster	28 m. p. h.	"
" ...	E. Miller, Patcham	—	"
Steyning	H. Crossland, Pulborough	21 m. p. h.	£5, etc.
" ...	F. W. Norman, Burgess Hill	26 m. p. h.	"
Dublin	Dr. R. Lane-Joynt, Dublin	—	Dismissed.
Guildford ...	G. Robson, London, W.	21 m. p. h.	£3.
" ...	H. Von Laer, London, S.W.	25 m. p. h.	"
" ...	H. Strakosch, Chelsea	33 m. p. h.	£5, etc.
Doncaster ...	T. Scaife, Bradford	—	"
Chichester ...	H. Holland, Southsea	20 m. p. h.	£3, etc.
Stevenage ...	H. Good, Hampstead	—	Dismissed.

Where no alleged speed is given it is understood to be above the legal limit.

DR. LANE-JOYNT was summoned by Sergeant Rohan for furiously driving a motor-car to the danger of the Dublin public. The sergeant said cars were only allowed to travel at six miles an hour, while the doctor was travelling at twelve miles per hour. Inspector Connor said the police regarded the case as one coming under the Carriage Act, but upon Mr. Lane-Joynt, the defendant's solicitor, showing that the Light Locomotive Act allowed a greater pace the case was dismissed.

In the cases at Guildford Sergeant Jarrett was the prosecutor, and produced a plan of the road at Boxgrove, where the offences were committed. This was used for reference by the magistrates. Perhaps now he will go further, and obtain plans and drawings of the offending cars for the education of the Bench.

T. SCAIFE, a motor-car driver in the employ of the Bradford Motor Company, was charged at Doncaster on Saturday with driving at more than 12 miles an hour, and with failing to stop when signalled to do so by the driver of a restive horse. He was fined £5 for furious driving, but the charge of neglecting to stop was dismissed.

MISDEMEANOURS.

At Sparkhill, Birmingham, on Monday, Robert Colgate was charged with being drunk whilst in charge of a motor-car. According to the evidence of a constable, the defendant was driving the car at the rate of twenty-five miles an hour. Then he pulled up and backed the car in an eccentric manner, and threatened to "down" the constable who interposed. He was fined £1 and costs. The defendant denied the charge, and gave notice of appeal.

THE first conviction in Surrey for being drunk while in charge of a motor-car has just taken place, John Bowyer, driver of the motor-car belonging to General Sir John French, commanding the First Army Corps, being fined £1 and costs for being drunk in charge of the car at Camberley on the 15th ult. Constable Crowhurst had a suspicion that defendant was not in a fit state to control the car, and asked him to alight. Instead of complying, Bowyer put on full speed, and went off in the direction of Aldershot, being shortly afterwards found by a corporal of the Military Mounted Police with the car in a ditch which divides the road from the Empress Eugenie's estate at Farnborough.

CLAIMS FOR DAMAGES.

As the Clerkenwell County Court G. H. Armit, cab proprietor, 20, Aatey's Road, Canonbury, sued Mr. Lehnair, 51, South Street, Park Lane, for £5 19s. 6d. in respect of damage done to a cab. The counsel for defendant said his client was the owner of a motor-car, and his servant, without any authority and whilst not engaged on any business for his master, took the motor-car out between five and six in the morning and got into the Strand, where it ran into plaintiff's cab near the Hotel Cecil, and did the damage which was now claimed for. The Judge: If you can prove that was so, then there is no liability on the part of defendant. Mr. Lehnair said that not only did his driver take the motor-car out without his authority early in the morning of the day in question, but he did not get it back again for two days. Then he found it had been damaged by the driver to the extent of £40. Frederick Downs said he found the motor-car on July 18th in a livery stable in Earl's Court Road, but he saw nothing of the driver, and defendant, recalled, said there were £3 wages due to the driver, which he had never called for. He wanted to prosecute him for his conduct. The Judge said it was quite clear that no case stood against defendant, and a verdict was given in his favour with costs.

JUDGE REGINALD BROWN, at the Hyde County Court, has had before him a case in which Mr. B. C. Sellars, of Mossbrook House, Fairfield, Manchester, sued the Denton Urban District Council for £17 13s. 6d. damages sustained to plaintiff's motor-car through a collision with a fire engine on the 26th July. The case turned on questions of negligence and liability, and His Honour gave judgment for plaintiff for £12 17s. 6d., including 37s. 6d. for a new lamp. Leave to appeal was granted.

At Greenock Sheriff Court evidence has been heard in an action by Mr. Alexander McCulloch against Mr. James Cramb, Star Hotel, Port Glasgow, for £12 damages said to have been caused to pursuer's horse by being frightened by defender's motor-car. Sheriff Glegg said he had no reason to doubt that it was the motor-car coming round the corner that frightened the horse, and from the evidence negligence had been proved against defender. He gave decree for the sum sued for, with expenses.

At the Marylebone County Court (London) on Monday, before Judge Stonor and a jury, C. B. Butwright, 5, Connaught Place, Bayswater, W., sought to recover £10 from Mr. Frederick Hemsley, 16, Park Parade, Harlesden, N.W., the claim being in respect of personal injuries and damage to a bicycle, said to have been caused through the defendant's negligent driving of a motor-car. Mr. Staples Firth defended. The plaintiff stated that on June 27th last he was going on his bicycle to Burnham Beeches. At about four o'clock he was at the corner where the Slough and Windsor roads meet. As he approached the corner he saw the defendant's motor-car some twenty-five yards away, "swinging round the corner." Such a wide sweep did the defendant take that he came right over on his wrong side, and "bashed" into witness. His hand and leg were badly injured, and the machine also fared very badly. The driver of the motor-car was afterwards summoned at the Police Court for driving "to the common danger of the public," and convicted. Corroborative evidence having been given, the defendant stated that he was driving a voiturette. When within a few yards of the corner in question he sounded the horn and continued to do so as he turned. The jury returned a verdict in favour of plaintiff. Defendant's solicitor asked for a stay of execution with a view to an application being made for a new trial. His Honour said that such application must be made in the ordinary way, after proper notice. In the meantime judgment would be entered in accordance with the jury's finding.

A SCOTTISH CASE.

PROOF has been ordered by Lord Killyachy, in the Court of Sessions, in an action by Richard Sneddon, mining engineer, Hillhousebridge, Shotts, against Stirling's Motor-Car Carriages, Limited, Glasgow, for payment of £465, the price paid by the pursuer to the defenders for a motor-car. The pursuer avers that the defenders' secretary represented that the car had been built for the Earl of Aberdeen, that it had been in use by his lordship for two months, that it was in first-class order, that Lord Aberdeen had paid £620 for it, but that the defenders were taking it back as the Countess did not like it, and wished to have a car of the pattern used by the King. He says the defenders agreed to deliver the car two days later, but that it did not reach Shotts until 8th September, a month after the order, when he ascertained that it had broken down several times between Hamilton and Shotts, and had taken five hours to accomplish the journey—a distance of twelve miles. In the end, the pursuer says the engineer had to get the assistance of members of the public to push it up to Hillhousebridge. Subsequently, he avers, it frequently broke down, it was not built for Lord Aberdeen, who did not pay £620, it was in use for a much longer period than two months, and it was not in first-class order. The defenders refused to take it back or repay the price. They deny that the car broke down several times on its way to Shotts, that it did not answer to the description of the vehicle sold to the pursuer, or that any representations were made by them.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, DECEMBER 13, 1902.

[No. 197.]

Published: Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE great event of the motor-car industry—the annual Paris “Salon”—was opened on Wednesday last, in the Grand Palais, Champs Elysees. Considerable interest is shown in the exhibition, not only by motor-traders in this country, but by automobilists generally, and on Wednesday morning a large party of members of the A.C.G.B.I. and friends left Charing Cross en route for Paris, *via* Boulogne, to visit the “Salon,” which is by far the largest ever held in the French capital. The show this year has an added interest to English motorists, as for the first time British-built motor-cars are being exhibited in France, Messrs. S. F. Edge, Limited, showing the Napier cars, and the Wolseley Company half-a-dozen Wolseley cars. In our next and subsequent issues we shall give a description of the principal improvements that the leading concerns are introducing for the 1903 season, and also a report of the novelties that are on view.

Toll at Maidenhead.

THERE was an interesting scene at Maidenhead Bridge at noon on Monday. Upwards of 500 persons assembled in the vicinity of the toll-gate, including a large number of members of the corporation and some local magistrates. In due course Mr. Taylor, accompanied by Mr. Cecil Howlett and Mr. Fullbrook, rode over the bridge in the latter's motor-car, and the toll-gate was closed and locked. The collector demanded the toll, and Mr. Taylor paid the 2d. but demanded a receipt. This was given to him, and he then rose and said:—“You must clearly understand that this toll is paid under protest, and the court of King's Bench will avenge the King's highway.” The gate was opened with considerable difficulty, owing to the crowd, and amid cheers and groans Mr. Taylor and his friends rode through. The party then alighted, entered a cab, and returned, again paying the toll under protest. Considerable excitement prevailed at one time, but there was no breach of the peace.

Motor-Car Imports and Exports.

THE returns now available relating to the British imports and exports of motor-cars and cycles during November last show a decrease as regards the imports, and, on the other hand, an increase in the case of the exports. To deal first with the imports, 289 cars and cycles were imported into this country last month, the value of the same being returned at £78,679. The value of the “parts thereof” is given as £12,783, so that we get a combined total of £91,462, as compared with £102,817 in October last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised thirteen vehicles, amounting in value to £2,755, and £157 of parts, bringing down the net imports in November to £88,550. During the first eleven months of the current year imports of foreign automobiles and parts into Great Britain have reached a net total of £989,664, representing over 3,500 cars and cycles. As regards the exports of automobiles of home

manufacture, the shipments during the past month amounted to forty-nine vehicles of a value of £13,301. Of parts, the exports attained a value of £2,334, making a combined total for November of £15,635, as compared with £15,619 in October last. It is satisfactory to find that, so far as the year has gone—that is to say, during the eleven months ending with November—331 British-built motor-cars and cycles have been exported, their value being roundly £148,000.

The Portsmouth Automobile Club.

THE Portsmouth Automobile Club recently resolved, as already announced in the *Journal*, to inaugurate a series of monthly meetings at their historic headquarters, the George Hotel, Portsmouth, for the purpose of discussing automobilism. If the success of the initial meeting, which took place on Thursday week, can be regarded as any criterion, the innovation promises to be exceedingly interesting. The Mayor of Portsmouth (Sir William T. Dupree) presided over a fairly large gathering, who listened with the deepest interest to a lecture on the history of automobiles by Mr. J. H. Knight, of Farnham. A series of lantern slides illustrating the rapid developments in cars from the earliest period made the lecture both interesting and instructive, while the lecturer's easy flow of anecdote kept the audience in good humour. At the conclusion of the lecture Sir William Dupree, on behalf of the Club, expressed the thanks of the members for the lecture.

Pennington and Millions.

NEWS from the United States is frequently interesting, and many readers will regard the following item from the “Motor Age” with a certain amount of curiosity. “It is announced that the plant of the Racine Boat Manufacturing Company, of Racine, has been sold for 300,000 dol. to the American Automobile Company, which was recently incorporated for 500,000 dol. According to newspaper reports this capital is to be increased to 5,000,000 dol. and the concern is to endeavour to build 100 automobiles per week. Then comes the information that among the directors is the long lost E. J. Pennington, who has scalped clouds and small investors with flying machines, jumped material and financial ditches with motor-bicycles, and planned numerous wonderful automobile enterprises. It is to be sincerely hoped, if the report is true, that the other directors are as well posted in company organization as Mr. Pennington.”

A Busy Time.

So rapidly do events crowd upon each other in the automobile world that it is very difficult to arrange representative meetings of the trade. On Thursday of last week a meeting was held at the Automobile Club to consider the organisation of trials of light motor-vans for delivery purposes; on Tuesday there was a meeting of manufacturers interested in the Big Trial of 1903; at the present time many members of the trade are in Paris. In the second week of January the makers of motor-cycles will hold a meeting to consider a trial of motor-cycles, apart from cars, next year, and then, with the London exhibitions and Club discussion in progress, there will hardly be a

opportunity for the arrangement of additional meetings of the trade.

Another 1,000 Miles Trial.

ALTHOUGH some firms thought the notice convening the meeting of manufacturers on Tuesday was somewhat short, it was evidently unavoidable under the circumstances, and those who were absent will have confidence in the Committee that was elected to arrange the details of the organisation. It was decided at the meeting that next year's trial should be on similar lines to that of this year, with the Crystal Palace as the starting-point of daily runs aggregating 1,000 miles. The trial will take place in September, and the conditions to be imposed should convince the public that the cars that go through the test are really reliable vehicles—capable of doing all that is required in this country.

Stringent Rules.

NOT the least satisfactory feature of Tuesday's meeting was the evident desire of makers to make stringent rules so as to ensure the trial being a reliable guide to buyers. After the day's run the cars will be immediately placed under lock and key, and the time occupied in washing, adjusting, replenishing, repairing, etc., will result in the loss of marks. There

the benefit of themselves and of their two sisters, Marjorie Gwynne Gould and Helen Vivian Gould. In the centre is the Panhard imported from Paris, which is used by Mr. Gould and other members of his family. Of course the children are delighted with their motor-cars, but none more so than Master Gould, who, while still less than six years old, has developed ability to fully take care of the miniature vehicle seen in the photograph.

"Steam Tactics."

UNDER cover of this severe title, Mr. Rudyard Kipling contributes a lively story of adventure with a steam motor-car to the Christmas number of the "Windsor Magazine." A nautical officer in the yarn described the car as a "blighted land-crabbing steam pinnace on springs." His views of automobiles were somewhat hazy at the outset, the mirror to the right of the dashboard for the reflection of the water gauge being mistaken for a shaving glass. After a series of misadventures the party were stopped by "a person in pepper-and-salt raiment with a brown telegraph envelope in his hands." Having told the motorists they were driving at twenty-three miles per hour, the latter were good enough to take the constable in plain clothes aboard. And then they rushed along—the run being described in Kiplingesque fashion as follows:—

THE GOULD FAMILY AND ITS MOTOR-CAR "STABLE."

will be no refilling of fuel and lubricating tanks during the luncheon hour, as on the last occasion, and these regulations should be useful in encouraging manufacturers to take advantage of all improvements likely to bring their cars into the front rank.

Motor Delivery Vans.

USERS of light motor-vans for delivery purposes seemed agreed at the meeting on the 4th inst.—reported on another page—as to the economy and convenience of such vehicles as compared with horse-drawn carts and vans. A Committee is now in course of formation by the Automobile Club which should be able to draw up a satisfactory set of regulations for the proposed trial. It is clear that such an event will give a great impetus to the movement, and that its value to the motor-car trade should be as great as was that of the 1,000-miles Trial of 1900.

A Motoring Family.

THE above illustration shows the motor-car stud of the Gould family at Georgian Court, Lakewood, N.J., U.S.A. On the left and right of the picture are shown respectively a motor-quad and a Victoria Combination that Mr. and Mrs. Gould presented to Kingdon and Jay Gould, for

A Terrible Ride.

"SHE turned her broad black bows to the westering sun, and lifted us high upon hills that we might see and rejoice with her. She whooped into still hollows of elm and Sussex weed; she devoured infinite perspectives of grey split-oak park palings; she surged through forgotten hamlets, whose one street gave back, reduplicated, the clatter of her exhaust, and, tireless, she repeated the motions. Over naked uplands she droned like a homing bee, her shadow lengthening in the sun that she chased to his lair. She nosed up unparochial byways and accommodation-roads of the least accommodation, and put old scarred turf or new-raised mole hills under her most marvellous springs with never a jar. And since the King's highway is used for every purpose save traffic, in mid-career she stepped aside for or flung amazing loops about, the brainless driver, the driverless horse, the drunken carrier, the engaged couple, the female student of the bicycle and her staggering instructor, the pig, the perambulator, and the infant school (where that disembodied on cross roads), with the grace of Lottie Venne and the lithe abandon of all the Vokes family." And then the motorists deposited the poor policeman in a lonely spot miles from anywhere. But why does the artist introduce the picture of a petrol car into "steam tactics."

Dinner of the Yorkshire Club.

THAT the Yorkshire Automobile Club is annually growing in membership and in influence was shown by the large and interesting gathering at the annual dinner on the 5th inst. Mr. A. W. M. Bosville (Bridlington) was in the chair, and with him at the Northern Hotel, Leeds, were the Lord Mayor of York (Mr. E. Gray), Dr. Cragg (Lincoln), Messrs. Samson Fox, S. F. Edge, A. Grime, Charles Jarrott, B. Bagshaw, F. Kilner, A. W. Dougill, and Hey. Mr. N. R. Hepworth proposed the toast of the evening, "The Yorkshire Automobile Club and Automobilmism."

The Attitude to the Public.

MR. BOSVILLE replied. During the past year, he said, the motor-car had gradually settled down in this country. At one time the automobilist felt like a pocket edition of Napoleon if his car travelled fifty miles without a stoppage. Now-a-days, so much did he know of the car's ways and habits that he looked upon it as a sort of tame cat, and was quite unreasonably angry if it did not properly fulfil all its duties. Taking a retrospective glance at mechanical advances made of late, Mr. Bosville said it seemed to him that the seating accommodation of a car was in inverse ratio to its horse-power. A 10-h.p. car had five seats, a 20-h.p. car accommodated four people; a 40-h.p. car carried only two people, and an 80-h.p. car only one person. If horse-power further increased he presumed the car would have to be driven by wireless telegraphy from a central tower! As regards automobilists and the public, it was for automobilists to propitiate the public, not denounce them. The laws of this country were made by the majority of the people, and the number of persons who owned motor-cars were very few compared with those who had nothing to do with them. "Behave like gentlemen on the road," he concluded amid applause, "and the public will treat you like gentlemen."

The Gordon Bennett Race.

To the toast of the Yorkshire Automobile Club Mr. A. W. Dougill (hon. sec.) responded, stating that the membership of the Club was now 105, and that the finances were in a satisfactory state. Mr. E. H. Hepper proposed "The Visitors," eulogising the endurance and the far-seeing intelligence of Mr. Edge and Mr. Jarrott. Mr. Edge prophesied, in reply, that the motor-car interest would one day excel in its scope either the railway or the steamship interests. He looked for a great advance when such difficulties as tyre troubles were surmounted. Speaking of the next Gordon Bennett race, he said that if they could find a ninety-mile course in Ireland he was assured on good authority that they would be given permission to run it off there; failing this, it would take place on the Calais-Bordeaux course. As a manufacturer he was determined to do all he could to retain the cup for England, and he was glad to say that Mr. Jarrott would for the first time drive an English car. Mr. Jarrott also responded, remarking that if the race were run in this country it would give a great advantage to English competitors.

Sense from Salop.

THE cautious attitude of the Wellington District Council in adjourning for a month a discussion on the Yeovil proposals may be accounted unto them for wisdom. During the course of the first debate Mr. France-Hayhurst said if the proposed amendments were intended to apply to motor-cars he was afraid they would never get them to restrict the speed to ten miles an hour; nor did he think the police would be able to keep them to twelve. He himself was inclined to support the recommendation of the Salop County Council that the regulations applied to motor-cars be exactly the same as those applied to horses and carriages; and that nobody should be allowed to drive at such a rate as would be a danger to the public. Such, we may add, is all that motorists desire.

The Exhibition Question.

THE correspondence which has passed between the Secretary of the Automobile Club and the Secretary of the Automobile Mutual Protection Association, and which is published on another page, marks another step in what has become known as "the Exhibition Question." Having in April last decided to cease its interest in exhibitions—an interest which had resulted only in financial losses until Mr. C. Cordingley came to the rescue—the Club is apparently striving to reconsider the matter and to assume a position of impartial judgment between the two associations of the trade. To ask Mr. Helmore for the names of firms not exhibiting at a show with which he has not the least concern seems a most peculiar request—in fact, it would appear that the Club is going somewhat out of its way in seeking to adopt the position of arbitrator.

"The Best Interests of the Trade."

MUCH has been heard of "the best interests of the trade"; but they have not always been fully considered in Piccadilly. It may be that in other countries clubs have held trade displays; but it must be remembered that in such cases private enterprise has been entirely absent. Here, however, motor-car exhibitions were being held long before motorists became an organised body—even before the popular use of automobiles had been made possible by legislation. The exhibition to take place at the Agricultural Hall in March will be the eighth annual motor-car exhibition organised by Mr. Cordingley, and supported by the trade. Had these displays proved weaklings, the Club's anxiety might not have appeared so misplaced; but each has been more representative than the last, and that of 1903 will be no exception to the rule.

MISS RUBY RAY ON HER 7-H.P. BELLE CAR.

The Trade Difference.

AS is pointed out by the Automobile Mutual Protection Association, the difference in the trade is concerned with the date and the location of the exhibition—one section favouring January and the Crystal Palace; another a rather later month and the Agricultural Hall. But many who will be represented at the former recognise the importance of the latter, and have accordingly booked space thereat. Under these circumstances surely it would be more dignified on the part of the Club to cease from its efforts to interfere with purely trade matters and develop its social and propaganda work, where

there ought to be sufficient scope for all the activities of its persistent and energetic officials.

In the Spring.

the year is not so unsuitable as some advocates of the January show would believe.

Motor Racing Track.

WE have been much amused at the dialogue in two of our contemporaries with regard to the authorship of the idea of a racing track for automobiles. Our editorial friends apparently forget "there is nothing new under the sun," and that, after all, it matters little who suggests things. While on this point we would join in advocating the early acquisition of land suitable for the purpose of automobile races, and may be pardoned for reviving a suggestion published in our columns as long ago as June, 1900.

Automobile Racing.

"WE regard the provision of an automobile track as a matter of great importance to automobilism, and also as meeting the need for the organisation of sports and pastimes on a thoroughly representative scale. Firstly, such an institution would provide a centre for automobilism as a sport, and destroy the necessity for any suggestion for road racing—a form of motoring that is never likely to be acceptable to the great majority of the British public. In view of the rapid growth of the automobile industry and the favour with which the sport is being regarded, any scheme of the kind we have indicated should be conceived on broad lines, and carried out with a liberal policy.

Suggested Details.

"THERE should be varying gradients as well as straight runs, and a track five miles round would present an opportunity that all automobilists would enjoy. With a width of fifty or sixty feet, and with well-marked lines so that the motor-vehicles should not cross each other's paths, there should be every chance of getting up good speeds without the dangers and accidents that have proved inimical to the sport on the Continent. Such a track, with a good macadam road never traversed by horses, would give manufacturers as well as owners a means of adequately testing their vehicles, and so establishing a standard criterion which would be useful to buyers and serviceable to makers."

The Locality.

PROCEEDING to discuss the locality of the proposed track, we went on to say, "Such a venture would have to be established within easy access of London, say, at a distance of thirty or forty miles. There are plenty of estates within such a radius unprofitable as farm land, only poorly productive as market gardens, and not yet ripe for building, where such a track could be laid without any great road-making difficulties being encountered." Although nothing practical has yet resulted, motorists are not without hope of an automobile track being established ere long.

Paper Chase on Boxing Day.

ON Boxing Day the Sheffield and District Automobile Club will hold a paper chase on motor-vehicles. The hares will start from Rustlings Road at 11.30 a.m., and the pack—consisting of all members of the Club who choose to follow—half an hour later. It is requested that all cars and motor-cycles engaged in the chase should keep within the legal

limit, as well as on the proper side of the road. The hare will be expected to stop when called upon, but, if temporarily disabled within thirty minutes from the start, the second hare may take the bag and continue the chase. Tea will be taken at the Maynard Arms, Grindleford, and Messrs. J. Barber, F. B. Cawood, B. Hind, B. H. Foster, and J. R. Wade are the organising committee for the chase.

The Automobile Mutual Protection Association.

A STATEMENT of the objects of the Automobile Mutual Protection Association, Ltd., has been issued. These include the advising and defence of members of the Association in cases involving trade questions. It is hoped that every person interested in the welfare of the motor industry will join and support the Association, and thus enable it to persevere in the great and useful work it has already accomplished, notably in connection with the celebrated Maybach "Monopoly" pretensions, which at one time threatened very seriously to strangle the progress of the motor industry. Matters of vital importance alike to members of the trade and private users of motor-vehicles are constantly arising which it would be impossible for any private individual to deal or cope with, and the only possible method of successfully resisting unjust claims, and of supporting those that are valid, is by the combined and mutual efforts and support of all those whose interests lie together. This Association has decided to support the Exhibition to be held at the Agricultural Hall, in March, 1903, under the management of Mr. Cordingley. It has adopted this course because it believes in following an established success rather than in experimenting elsewhere. The Committee is strongly representative of automobilism.

Discussion on the Bill.

ON Wednesday of last week a conference took place between the Legislative Committee and the Club Committee of the Automobile Club with reference to the Bill which the Hon. J. Scott Montagu, M.P., has drafted in conformity with the recommendations of the former body. After discussion, it was unanimously resolved: "That this meeting hereby confirms the action of the Legislative Committee in accepting the principle of the identification of motor-cars, coupled with the abolition of the speed limit, but considers that, before the formal assent or approval of the Club is expressed, some assurance should be obtained that such regulations will be made as will, as far as possible, minimise the risks to automobilists which might arise from abuses of identification."

Restrictions Suggested.

EVIDENTLY it is dawning upon those who have fostered this suggestion of numbering that the risks attendant upon such a plan will be greater than were originally suspected. Hence the last clause in the foregoing resolution. It was also suggested during the discussion that the Bill ought to provide that this method of identification should not be made use of unless the driver could be charged with having driven to the danger of other passengers then on the highway, or with having failed to stop when called upon to do so by a police-constable or the driver of a restive horse. If every driver of a motor-car is to be at the mercy of every other passenger on the highway who may see fit to charge him with furious driving, the life of a careful driver of a motor-car may be unendurable, as it is at present under the twelve-mile-an-hour limit. We are afraid that, having adopted the numbering plan, it will be impossible to minimise its risks and absurdities with any such restrictions. The better way—in fact, the only satisfactory solution of the present position—is to advocate that motorists be liable to be summoned if they drive to the danger of the public, and that all talk of numbering and mileages be dropped.

Numbering Again.

WRITING on the question of labelling motor-cars with numbers the "Edinburgh Evening Despatch" says:—"Perthshire County Councils, like some other bodies of the same class, are still harping on the necessity of the registration of motor-cars and the affixing of large figures for purposes of identification. It happens that in the current number of THE MOTOR-CAR JOURNAL attention is called by its Continental correspondent to the utter failure of that method abroad, and he regrets that people at home do not profit from the experience of their neighbours. Unfortunately in this matter the Automobile Club in London is acquiescing in this hopeless scheme of the County Councils—reluctantly it may be, but still acquiescing. This strange conduct of the Club is, however, easily enough understood. Although it professes to be virtuously indignant with the doings of 'road-hogs,' as it styles motor scorches, it is notorious that some of the worst scorches are members of the Automobile Club. These men care only for one thing—limitless speed; and disfigurement by figures, which, however large, would either become obliterated with dust or be otherwise indistinguishable, is a matter of indifference to them. Scorching is their aim, and to secure the right to scorch they will yield on the subject of numbering. The great majority of motorists, however, are not of this class. They only seek reasonable speeds, and it is sincerely to be hoped that whatever legislation may take place on the subject will not be based upon prejudices."

A French View.

ELSEWHERE in the present issue we have pleasure in publishing the views of M. Georges Prade, the editor of the "Auto Velo," on the numbering question, and after reading his article our readers will assuredly reply "No" to the question with which he concludes. Now that the Bill is being reconsidered—and we are glad to hear that opportunity for general discussion is to be given at a meeting of the Automobile Club—we would urge our readers to do what they can to convince M.P.'s and others who are likely to have influence in the settlement of the question as to their dislike to the numbering proposal.

Numbering must Go.

THE contributor of "Motor Notes" to the "Lincolnshire Echo" describes the outcry fostered by some motorists for numbering as "lamentable shortsightedness," and goes on to add "that the organ of the Club is not wise in commenting so bitterly on the motor papers that hold a different opinion. Many of us see the folly of the numbering proposals, and object strongly to having to carry a big number like a convict or a cab-driver. A sample of the better way exists in Lincolnshire, where the authorities realise the utility of motor-cars, and where, so long as we drive carefully and with every regard for the other users of the road, we are not troubled with the legal limit, and can pass policemen without feeling that we are likely to be run in and heavily fined. As the numbering proposals in regard to cyclists have disappeared, so will they in respect to motor-cars, but once place ourselves under numbering and we shall never again be allowed to go out without a ticket. Let the Club invite some of the old brigade to its conferences, and not conclude, because the M.P. introducing the Numbering Bill is the editor of a motor paper, that therefore every other motor paper is prejudiced. Such an opinion is childish."

FRISWELL'S held their first evening sale on Tuesday at 6 p.m. Only steam cars were put up for auction, and amongst those sold were a 10-h.p. touring Locomobile, one of style 3, and a few of style 2.

WE learn by telegraph that on Wednesday the Automobile Club of America despatched a challenge to the A.C.G.B.I. for the Gordon Bennett cup. It is stated that Mr. Alexander Winton will be one of America's representatives.

THE PARIS MOTOR-CAR EXHIBITION.

BY AUTOMAN.

ON Wednesday morning M. Loubet, the President of the French Republic, surrounded by his general staff and accompanied by the Minister of Agriculture, opened the Fifth Annual Paris Automobile Show. To say that the immense building in which the show is held was crowded does not adequately describe the scene. The President was met by the Baron von Zuylen, the Marquis de Dion, and a large number of prominent members of the A.C.F., and of the automobile industry, who accompanied him on his tour of inspection round the principal stands.

The Exhibition, it is hardly necessary to add, is being held in the Grand Palais, which is situated at the corner of the Champs Elysees and the Pont Alexandre III. It is one of two permanent buildings which remain to mark the spot on which the great exhibition of 1900 was held.

Notwithstanding its many advantages it is clearly to be seen that it is now too small for the important automobile industry. Every available inch of space has been competed for, and the largest exhibitors have had to be satisfied with much less than they desired.

There is no doubt about it, 1903 is to be a Mercedes year, the Paris Exhibition shows it at every turn, and on nearly every stand. I may as well, therefore, commence my account of the show by describing the Daimler Motoren Gesellschaft's exhibit, which is one of the most important and interesting. I may also, perhaps, be permitted to remark on the singular development of the modern motor-car industry, which is so peculiarly connected with the famous Cannstatt firm. Daimler and Maybach, with motor and carburettor, certainly inspired the now great firm of Panhard and Levassor, and it is to them and their inventions that this great success is due; but Daimler and Maybach stopped at this point, and little progress would have been made in the heavy, unwieldy, unsightly, and under-powered vehicles which they had turned out, had not Panhard-Levassor taken up the matter and brought improvement after improvement into existence, until the Cannstatt firm were completely left behind and forgotten. But now they have taken their revenge, and the Daimler car of to-day, known by the name of "Mercedes" has not only borrowed all that was good in the latest French cars, but has gone one better and again produced improvements which nearly all the important makers are adopting as quickly as they can.

The Daimler Gesellschaft's exhibit six Mercedes cars with motors varying from 20 to 40-h.p. One of the most powerful has a very long specially-constructed frame which allows the fitting of a special body comfortably seating from six to eight people. The back seat is covered by a top like a hansom cab, which can be removed at will.

A petrol launch is also on view, said to be capable of making twenty-one miles per hour. Reference may be made to the new radiator which weighs 30 per cent. less than the old one and gives 40 per cent. more cooling surface. It is, of course, of the well-known honeycomb type.

As I have begun my account with foreign exhibitors—foreign from a French point of view—I may as well mention at once the Napier exhibit, which does credit to this firm. On the Napier stand are shown, in addition to the 16-h.p. model, a chassis and a complete car of the new 12-h.p. light model, which has a four-cylinder engine. This car has produced in France a very good impression, and the Napier Company are to be congratulated on their enterprise and skill. The Wolseley Company have an important and well-appointed stand with various handsomely finished cars. The Wolseley vehicles being already well known in England, no lengthy description is necessary. It is, however, a sign of the times to see another "foreign" firm exhibiting in France, and I may add that their stand is being closely inspected by French motorists.

(To be continued.)

THE LEPAPE TWO-CYCLE PETROL MOTOR.

M. LEPAPE, of Rue des Pavillons, Puteaux, near Paris, who has been responsible for many novelties connected with motor-cars, notably, an air-cooled motor with cylinder walls some three inches in thickness, has struck

FIGS. 1 AND 2.—SECTIONAL AND GENERAL ELEVATION.

out again this year with a single-cylinder 12-h.p. two-cycle engine, that is to say, an engine in which an explosion takes place upon every downward stroke of the piston. The illustrations herewith show respectively a section and elevation of the new motor. B is the water-jacketed cylinder proper, which has no mechanically-actuated exhaust valve as usually found in petrol motors, its

FIG. 3.—GENERAL VIEW.

place being taken by a series of ports in the lower end of the cylinder. Side by side with this is another cylinder A, provided with piston and connecting rod, it being driven by a crank set at an angle of about 180° with the engine crank. This auxiliary cylinder acts as a mixture pump. As the crank shaft rotates and the piston of the cylinder A moves downward a charge is

drawn in; on the return stroke of this piston its inlet valve is closed and the gas is slightly compressed and forced into the cylinder B through the valve at the top. This takes place when the piston of cylinder B uncovers the port E and during part of its upward stroke. The charge is then fired and the cycle recommences. The cranks are so set in relation to one another that when piston of cylinder A is at the end of its upward stroke that of cylinder B is not quite at the end of its downward stroke, so that the inrush of the slightly compressed charge into cylinder B aids in clearing out the burnt gases through the ports E. M. Lepape claims that by his arrangement he gets not only a better balanced motor, but, by the suppression of all exhaust valve gear, one of simple and cheap construction. We have seen one of the new motors in operation, and can report that it appeared to work very satisfactorily at speeds ranging from 100 to 1,000 revolutions per minute.

WALKING AND MOTORING.

CIRCUMSCRIBED are the pleasures that come to the tourist who sees a landscape from the narrow and confined outlook of the railway train. He rushes from town to town, speeding by the hamlets that constitute the peaceful charm of most European countries and never comes into contact with the actual life of the places he scans. How little does the average tourist know of the countries he travels, while how slight is his acquaintance with the customs and habit of the people through whose country he scampers as fast as the train will take him? Dr. Johnson it was who said some men learned more from a coach ride from Hampstead to London than others did from the Grand Tour of the Continent—a trip regarded as absolutely essential to the enjoyment of life half a century ago.

Lovers of nature have really deplored the splendid facilities that exist for travel because of the superficiality that they engender. "In the olden days of travelling toil was rewarded partly by the power of deliberate survey of the countries through which the journey lay, and partly by the happiness of the evening hours." So wrote Ruskin in the "Stones of Venice," and we would claim the automobile as something that will assist the "deliberate survey" that enhances the value of a tour and increases the permanent joys of life. Of course, no reference is made to the motorist whose ideal of pleasure is the utmost rapidity of motion, but rather the ordinary individual who will accept the view of Colonel Chichester, the Chief-Constable of Huntingdonshire, that "for a comfortable ride twenty miles per hour was the best speed." These reflections have been made while glancing through the introductory pages of a book just published by the Walter Scott Publishing Company, Limited, entitled "The Tramps of the Walking Parson," the Rev. A. N. Cooper, M.A., Vicar of Filey. Mr. Cooper has walked through life—avoiding the hurry of railway travel, scorning the "stampede to the buffet" which characterises every stop at a large station, he has seen most of the sights of Europe, and knows his England as well as the touring motorist. Hence the interest that his "Tramps" possess for those who have combined the convenience of the train with the steadier progress of Shanks' Pony.

The first great walk undertaken by the reverend gentleman was from Filey to London, and "the road that leads from Brigg to Lincoln is the best road to walk on that I know." In 1887 he walked to Rome from Rotterdam, a distance, as the crow flies, of 800 miles; then across Ireland and finally to Venice, the latter being a trot of 653 miles, the average daily walk being twenty-four miles, and the reverend walker, who seems to have never wearied of the exercise, confesses that during the journey he "slept in twenty-seven different beds, in as many different hotels, and I did not put a black mark against anyone of them," a tribute to the character of modern hotels that is comforting to the motorist who finds enjoyment in long tours. With a good car and the companionship of Mr. Cooper's book we feel we could enjoy any of the roads he describes so pleasantly and chatily.

NUMBERING IN FRANCE.

By GEORGES PRADE.

NUMBERING in France has already produced evil results during the short time it has been in operation. If, on the one hand, which is undeniable, they have had no good effect, it is equally certain that they have considerably injured the trade. First of all there is the annoyance of the formalities to be gone through.

When a car is bought, not only has the owner to pass a driving examination and obtain a certificate, but he must also register his carriage and obtain from the maker a certificate showing that the particular type of car has been authorised by the department. Then he is required to write to the police, on official paper, couched in certain fixed terms, making an application. When all these operations have been successfully completed he is given a number and a letter which must be placed on the front and in the rear of the car. The back number must be visible at night, and the owner has the constant worry lest his lamp should have gone out, and he is running the risk of a fine.

If all these troubles which fall to the lot of the owner of a

view of the annoyance and risk brought about by the adoption of numbering, prefer to stick to horse-drawn vehicles.

There is, however, another great difficulty, and that is with reference to second-hand cars, the sale of which is an absolute necessity to the trade, for unless one can easily dispose of one's old car it is often not possible to purchase a new one.

Here the numbering constitutes a new difficulty, for the number belongs to the car and not to the owner—that is to say, the number represents the system, power, speed, brakes, etc., of a particular car, and is therefore to be sold with the car. Of course the new owner has to register himself as such; but, as motor-cars frequently change hands several times, and the formalities of re-registration are not always promptly executed, it becomes difficult to prove, in case there is a police prosecution, who was the owner at the time, and again the reasonable, law-abiding driver runs the risk of being the victim of the scorcher to whom he may have sold his car. It is true that he may be able to win his case, but still he has all the expense and worry of fighting it, and all this on account of the numbering, which identifies the car and not the driver.

Then comes the question, is it legal? A recent judgment i

Dr. Versin of Nhatrang, crossing a stream in his Clement-Panhard Petrol Car.

MOTORING IN INDO-CHINA.

The Natives are Interested in Dr. Versin's Serpollet Steam Car.

[Spido-Gaumont.]

car brought any advantage to the State there might be some excuse. But they do not.

The chauffeur travels neither slower nor faster on this account. He has the annoyance, and that is all the gain. Should the police take his number as he is passing by, there is most generally a mistake, and though the policeman will swear that the speed was so great that he could hardly see the car pass, he will, nevertheless, swear to seeing the number correctly.

Again, it is very simple for the real scorcher, who is the only person whom the law wants to get hold of, to escape, for he has only to allow the dust and mud to obscure his number, or have a poor lamp, which insufficiently lights it up at night. Thus it is that numbering in France has had the result of making reasonable law-abiding drivers suffer and scorchers go scot free, with the result that numbers of the former have decided to give up motoring rather than subject themselves to such trouble, risk, and annoyance.

The real sufferers are, therefore, the automobile manufacturers; for, seeing that horse-drawn vehicles are free from all these difficulties, a considerable number of customers who, above all, desire peace and quietness, are lost to the motor-car trade, and, in

the Court of Appeal has declared that the fact of taking down the number of a passing car does not constitute a legal proof sufficient to condemn an individual; for, even should the owner of the car admit that the number has been correctly noted, that is no proof that he was driving the car himself on that particular occasion, and, therefore, he cannot possibly be responsible, except for any damage the car might do. This judgment was given in the case of Monsieur Archdeacon. Numbering in France has, therefore, proved harmful to the industry and useless to the police. It has run its course and its disappearance is only a question of time. In view of all this, is this the time for England to adopt a system of numbering?

Two very artistic 1903 calendars are to hand from the Birmingham Aluminium Casting Company, of the Cambridge Street Works, Birmingham.

MESSRS. BROUHOT AND COMPANY, of Vierzon (Cher) have decided to take part in all the big motor-car races in France next year. They are building a special 40-h.p. racer, which will be driven by M. Tourand.

MOTOR-CYCLING NEWS.

ON Sunday, the 14th inst., the Motor Cycling Club will have a run to Rickmansworth, starting from the Marble Arch at 10.30 a.m. and calling at the Salisbury Arms, Barnet, about a quarter past eleven o'clock. The annual dinner of the Club

MR. J. VAN HOOYDONK ON HIS "TRIMO" SOCIABLE.

will be held at the Frascati Restaurant on the 13th or 14th of January.

MR. MERVYN O'GORMAN has promised to read a paper on "Motor-Cycles" before the Automobile Club during the winter session.

At the Alexandra Palace Velodrome F. W. Chase has just made a successful attack on the one mile (flying start) motor-cycle track record, his time of 1 min. 54 2-5 secs. beating the record by a second.

At the meeting at the Automobile Club on Tuesday, it was decided, on the suggestion of Mr. S. F. Edge, that the trials of motor-cycles should, next year, be held apart from those for motor-cars. A meeting of firms interested in this matter is to be held during the second week in January to suggest the lines upon which the Trials should be arranged and to appoint an organising committee. It is satisfactory to find the A.C.G.B.I. thus encouraging motor-cycling.

MR. C. JACKSON writes:—"I am sorry to find that all the motor-cycle clubs only seem to have Sunday runs. This policy must, I think, prevent many motor-cyclists, who do not wish to ride on Sundays, from becoming members. Why not have the club runs on Saturdays, leaving those members who wish to ride on Sundays the option of arranging a tour on their own account? I also wish that the clubs would agitate for the repeal of the motor-cycle tax.

THE "Clarendon" is the latest motor-bicycle to appeal for public favour. It is made by the Clarendon Motor and Cycle Company, Limited, of Earlsdon, Coventry, and is illustrated herewith. As will be seen, the frame is of special design, the motor being attached thereto in a vertical position. This, it is

claimed, resulting in great freedom from vibration. The engine has a cylinder 71 mm. diameter by 73 mm., and at a speed of 1,500 revolutions per minute develops 2½ h.p. The cylinder and head are cast in one piece, and the radiating flanges are elongated in the front and rear, and brought to an egg-shape finish, thereby combining neatness of appearance with about 36 square inches of extra cooling surface. The bearings are of phosphor bronze 1½ in. wide. Electrical ignition is adopted, while the specially-designed spray carburettor which furnishes the mixture is stated to ensure easy starting under the worst possible conditions. The power is transmitted by a belt from the pulley on the motor shaft to a rim attached to the back wheel. This rim is built into the driving wheel, and suspended by a separate set of spokes. This system allows the rim to be trued up independently of the driving spokes, and also relieves the latter of the side strain from the belt drive. The belt is of V section, ¾ in. wide and copper clamped. A feature of the machine is a ball race carried in a specially-designed bridge attached horizontally to the left side of the crank case; this bearing takes the full driving strain of the belt, the latter actually running between two bearings, an arrangement which is claimed to prevent any possibility of the flywheel running out of truth owing to uneven wear on the bushes, while it admits of the belt being tightened without detriment to the running of the motor. The makers state that the machine can attain any speed from three to forty miles per hour, and draw a trailer and passenger weighing twelve stones over any give-and-take road without the use of the pedals.

MESSRS. OSMOND, LTD., Birmingham, have sent us a copy of the motor-cycle catalogue they have just issued. Two machines are being made, both fitted with the Clement-Garrard motor, one being belt-driven, the other being a two-speed chain-driven machine. A feature of the catalogue is that a dozen pages are devoted to small pen-and-ink illustrations of the various parts, to each of which is given a number and their name in English and French. The parts being all made on the interchangeable system, it is only necessary, when requiring replacements, to quote the number.

THE CLARENDON MOTOR-BICYCLE.

MESSRS. G. T. RICHES AND COMPANY, of Gray's Inn Road, W.C., have sent us a copy of their 1903 catalogue. It shows a considerable growth in bulk over its predecessor, and comprises about sixty pages, in which will be found illustrations and prices of the various accessories and spare parts motorists are likely to require.

BALLOON HUNTING.

THE original intention of those holding the balloon chase on Saturday last was for the aeronaut to "rise" about nine o'clock in the morning and keep aloft till the late afternoon, so that a fair test of the capability of both the balloon and the motor could be made. The rate of progression of the motor-car is well known, and, given roads of fair condition, decent speed can be easily maintained; but the balloon—depending upon the wind—is always an uncertain quantity, for, when a stiff wind is available, a speed of 40 miles per hour can be exceeded,

The muster of motorists was scarcely as good as expected; but the distance from town may have militated against a larger attendance. Reading, with an east wind blowing, is an ideal place for an ascent, good roads radiating in all directions, with Salisbury Plain on the one hand, the Marlborough Downs on the other, and miles of open spaces nearly everywhere.

off for the Bath road in hot pursuit, the Mercedes being the last to leave. The air in the terrestrial firmament was several degrees below freezing point, and the roads were as hard as iron, but there was a considerable quantity of white dust about—this not necessarily always being raised by the motor-cars. The vehicles soon "tailed" off; a short stoppage by Mr. Mayhew, to permit of one of his passengers retrieving his hat, enabled our car to take premier position. Continuing our progress along the deserted and wind-swept roads, a village with an open space was reached, and here a halt was called to search for the missing balloon. The passengers of the Pascal assisted in the operation, but nothing except the lowering clouds could be seen, and so a restart was made after the phantom game, until the top of Marlborough Hill was reached. Within a few minutes of each other five cars were assembled in the following order: Mercedes, Pascal, 12-h.p. Panhard, 16-h.p. Darracq, and 10-h.p. Panhard. After waiting some time an informal meeting was held, the general opinion being that the cars were ahead of the aeronauts, and tha

MR. AND MRS. CHARLES CORDINGLEY ON THEIR 40-H.P. "MERCEDES."

We, in our "little red cottage"—yept the Mercedes—reached Prospect Park, Reading, punctually at twelve o'clock, and then learned, on our arrival, that the balloon would not ascend till an hour later. This was aggravating, to say the least of it, especially as no stoppage had been made in Reading for sandwiches. Repairing this omission as well as the limited time at our disposal allowed, a hasty return was made to the Park, and there we met Messrs. Bucknall, Butler, and Rolls, with M. Gaudron, the aeronaut. There were about a dozen motorists present, including Mr. Mayhew, on a 24-h.p. Pascal; Mr. Clift, on a 16-h.p. Darracq; Mr. W. Bersey, on a 12-h.p. Panhard; Mr. A. H. East and Mr. A. Dew, on a 9-h.p. Speedwell; a 10-h.p. blue Panhard, etc.

A minute or two after one o'clock the balloon Vivienne II., with its four passengers, was cast off, and quickly rose above the heavy snow-laden clouds, and the waiting motorists started

these latter had drifted in the direction of Salisbury Plain. As a result of the discussion Mr. Bersey made up his mind to turn towards Aylesbury, and Messrs. Mayhew and Clift along the Salisbury road. Messrs. East and Dew ran with the other cars as far as Newbury, but afterwards made for Amesbury. Arriving there before 3.30 p.m., they reconnoitred the district, hoping to see something of the quarry, but to no purpose, although it eventually transpired that the balloon settled five miles away. We ourselves proceeded westwards, and at Silbury another halt was made, and an attempt made at climbing the Mound, but the frozen grass was too slippery, so there was nothing for it but to continue the journey to Bath, which was duly reached without lighting up.

Good luck attended Messrs. Mayhew and Clift in the direction they followed, for after passing through miles of densely-wooded country over rough flint roads, they suddenly espied the aeronauts

half a mile away. The Pascal car was leading, and with skilled driving was steered in and out of narrow lanes, over deep frozen ruts, until they got close to the balloon. Then suddenly the chance of capture seemed to fade, for the quarry threw out most of its ballast and, rising again some 200 feet, caught a breeze. What made matters worse was that Mr. Mayhew went down a long narrow lane which was found to lead only to a farmyard.

The balloon was sailing along half a mile ahead, but immediately it was realised that further pursuit by the car was impossible. Mr. Mayhew jumped out and sprinted over frozen furrows and fences, finally jumping a ditch and capturing the balloon, thus winning the prize we had offered.

The descent was made, as had been anticipated, near Pewsey, a little place about midway between Savernake Forest and Amesbury. Unfortunately the descent was not without incident, for, owing to it being pulled up sharply by the anchor, the balloon burst from top to bottom. It is very hard luck to entirely wreck one's balloon on its maiden trip. Mr. Bucknall's enthusiasm for ballooning has, however, not thereby been lessened, for we hear that he has already given orders for another one to be made as soon as possible.

After a pleasant evening spent at the Empire Hotel, Bath, we started next morning for the return journey. Although the sun was shining brilliantly, riding in the teeth of the bitter cold east wind was rather trying at first; but this, after riding a few miles, we got used to, and the ride was one of the pleasantest yet experienced on the Mercedes. The roads were almost entirely deserted, and there were long stretches of straight roads, which could be taken advantage of without annoyance or inconvenience to other users. Only two other cars, coming in the opposite direction, were met as far as Maidenhead, where a stoppage was made for luncheon, town being reached comfortably without incident before dusk.

Mr. Butler has since kindly furnished us with a few notes on the trip of the balloon. He describes the journey "above the clouds" as a sort of cheap and quick trip of two hours to the Riviera and back.

"After leaving ground we soon got through the cold, freezing clouds to bright, hot sunshine, with a magnificent dark blue Mediterranean sky. What with the heat of the sun and no wind, one could have basked in it for hours, although the thermometer was 14 degrees below freezing point. The reflection of the balloon, car, and ourselves on the clouds, with a frame of red and other rainbow colours round, was a very pretty effect. The balloon made its first drop over Savernake House, and we trailed through the magnificent park, deer, rabbits, peacocks, and pheasants running about as if we were some huge hawk coming down on them. The descent was made at 3 p.m. at Pewsey. The "captured" were treated with a splendid repast, and taken in the capturers' motor-cars back to London."

ON Monday evening next a meeting of the members of the Western Section of the Scottish Automobile Club will be held in Glasgow, when Mr. John Adam will introduce a discussion on "Speed, Numbering, and Registration Questions."

WE understand that a new light car is shortly to be put on the market by Messrs. J. W. Brooke and Company, of Lowestoft. It will have a three-cylinder engine, which, on trial has developed 14 b.h.p. The change gear is adapted to give three forward speeds and a reverse. The car, which it is anticipated will not exceed 10 cwt. in weight, has a long wheel base.

As briefly stated in our last issue, a company has been registered with the title Milnes-Daimler, Limited, and a capital of £20,000, to deal in motors, motor-cars, air-ships, etc., to acquire all or part of the property comprised in an agreement made November 10th, 1902, between George F. Milnes and Company, Limited, of the one part, and the Daimler Motoren Gesellschaft of the other part, and to carry on the business as electricians, electrical and general engineers and contractors, etc.

CONTINENTAL NOTES.

BY "AUTOMAN."

To solve the problem of aerial navigation there have been continued efforts ever since the days of Montgolfier, but the spherical balloon has made little progress, and proves to be absolutely servile to the air currents which it encounters, making it both hazardous and unreliable. All attempts to steer it either by sails or propellers have been unsuccessful. Even the attempts by Count de la Vaulx to steer a spherical balloon over the sea, and to make it tack against the wind, by means of a sort of rope ladder or Venetian blind trailing behind on the surface of the water, have only accomplished a very limited result.

AVIATORS, although very attractive in theory, have never yet passed out of the stage of the crudest experiment, strictly limited as far as the carrying of a human being is concerned, to some most interesting experiments in soaring downward from a higher level in the air. The many attempts to lift an aviator with a human cargo from off the ground by means of its self-contained means of propulsion have hitherto produced an entirely negative result. The first serious advance in the science of air navigation was made by the French Government, who commissioned the Renard Brothers to make experiments with a cigar-shaped balloon, from which was suspended a long wicker-work car which contained a set of electrical storage batteries, an electric motor, and a long shaft at the end of which was placed a two-bladed propeller. This air-ship made a few short voyages and marked a distinct step in the progress of the science. It was, however, handicapped by the excessive weight of the accumulators, and it became evident to the engineers in charge of this work that the weight and conditions of charging and discharging of secondary cells would prevent experiments in this direction from producing practical results until a more efficient accumulator was produced. Some years later Santos Dumont came into the field with the enthusiasm of youth to prompt his efforts and the force of wealth to back him up. Inspiring himself from two different sources—namely the experiments of the Renards on the one hand and the progress made in reducing the weight per horse-power of petrol engines. On the other hand, Dumont constructed his world-famed air-ships, and made experimental voyages which astonished the whole world and set people a-thinking. Many people have reproached M. Dumont for allowing his experiments to become the centre of much advertisement. I am not, however, one of those who feel that way towards him, for that very advertisement has reached the ears and stirred up the unimaginative brains of hundreds of inventive minds all over the globe and brought aeronautics down into the field of practical politics. But the experiments of M. Dumont have had other and far more important results; they have been the immediate cause of setting in motion powerful means of grappling with the interesting problem of discovering the secrets of the air, and if progress in this direction is possible, we may look forward in the near, very near future, to startling developments.

IN addition to private inventors like Severo and Bradsky, who sacrificed their lives to a too hasty desire to test their untried air-ships in the ocean of the air, instead of first being content with short trips near the ground, and like the Lebaudys, who with all their millions behind them are making systematic and careful experiments, in the course of which no needless risk is run and no new improvement left untried, the French Government has taken up the matter again. The other day I had the good fortune to meet Colonel and Commandant Renard, and I had a long conversation with them on the subject of aerial navigation, from which I gathered that in their opinion the problem, which is the subject of this note, is on the point of being solved, and the solution is to reside in a combination of the cigar-shaped balloon type of air-ship and the aeroplane. The Government has accepted the plans of the Renard Brothers, and sanctioned the immediate construction of an air-ship, the gas envelope of which will contain 3,000 cubic metres of hydrogen, and which will be four

times as long as it is wide at the widest part. This envelope will be made of two layers of cotton cloths with a sheet of rubber between them, and will weigh just over 14 ounces per square metre, and have a resistance to rupture of nearly three tons per square metre. The means of propulsion will be electrical, for the Renard Brothers do not approve of the petrol motor for two reasons, first on account of the danger of fire, should the exhaust of the motor, from any cause come in contact with the escaped hydrogen from the balloon. It will be remembered that Severo's fatal accident was due to an explosion of the hydrogen escaping from the balloon and mixing with the outside air and becoming ignited by the exhaust from the motor. The Renards' second objection to the petrol motor is on account of the fact that as the petrol tank empties the equilibrium of the air-ship will constantly change and endanger its stability. The new Government air-ship will be ready in the spring time, when it may be confidently anticipated that substantial progress in aerial science will be achieved.

◆ ◆ ◆
In a full meeting of the Committee of the A.C.F. the question of whether there should be a speed or a reliability test was brought to the vote. The Executive Committee had decided, after a stiff fight, to adopt the Marquis de Dion's proposal to combine speed and reliability in the results, and to run in series of five cars of each make. The full Committee have reversed this decision and decreed that the winner of the Paris-Madrid race shall be the car that accomplishes the distance in the shortest time, but in order to propitiate the partisans of reliability it has been decided that there shall be a reliability section. The organisation of the Paris-Madrid motor-car race is now being actively studied on both sides of the frontier, and it is reported that the young King of Spain takes a great interest in the event, and will do all he can to facilitate matters. With regard to the roads, as far as St. Sebastian it is all plain sailing, but from thence to Madrid there are several difficulties to be overcome, and the choice lies between four different roads, viz.: *via Burgos* and Valladolid, 347 miles; *via Burgos* and Lerma, 292 miles; *via Vittoria* and Logrono, 322 miles; and *via Pampeluna* and Soria, 298 miles. "La France Automobile," in its issue of last Saturday, says that the Spanish authorities report that all these four roads are first-rate, with exception of some twenty-five miles between Tolosa and Pampeluna on the most easterly route; but, on the other hand, automobilists who have made the journey declare that certain other parts of all the routes are indescribably bad, so that one begins to wonder in what condition must be the twenty-five miles which the authorities admit to be in bad repair. The most westerly route, namely, the one which passes through Burgos and Valladolid, is the old coach road, passing through important localities where it would be possible to obtain fresh supplies of petrol, etc., but this is the longest route of all. The other three roads pass through very thinly populated districts, where it would be difficult to obtain even water, and where, in case of a breakdown, it would be next to impossible to obtain food and lodging.

◆ ◆ ◆
In connection with the Paris-Madrid race there is sure to be an excursion to the enchanting southern Spain, and this will perhaps be one of the greatest attractions in connection with the event. There are certainly a great many automobilists who will take part in the race in order to have the opportunity of visiting Andalusia under such favourable conditions, for there is no doubt that the excursion will meet with a good reception everywhere. The Spanish people are particularly hospitable in that sense of the word, and as they are highly excitable and demonstrative there will be scenes of unparalleled enthusiasm—official receptions, gala bull fights, and Andalusian dances at every important stopping place. The A.C.F. has already accepted the idea of organising such an excursion in connection with the Paris-Madrid race, should it be found possible to organise and hold the latter.

MONSIEUR JOUSSELIN, the Paris municipal councillor, who has taken up the cudgels for the motorist, has gained an important victory, and has got, therefore, the assurance of a good hearing and a careful study of the question of speed. The special commission appointed to hear him and consider his proposition, which I spoke of last week, has agreed to assist at a public demonstration of the safety of motor-cars. The commission will be taken to the Bois de Boulogne in automobiles and accompanied by official time-keepers, members of the police force, and even the chief of the police himself; constables will also be posted along the roads. The cars will be run at varying speeds, which the official time-keepers will note. The police both in the cars and on the roads will make notes of their opinion as to the speed being indulged in from time to time, and then the police notes and the actual times will be compared. It will also be demonstrated that the speed allowed for motor-cars is less than the ordinary speed of the horse-driven vehicles, and that, on the other hand, the former can pull up in a much shorter distance when going at the same speed. This public demonstration of the greater relative safety of the new mode of locomotion will, no doubt, be the greatest step in the direction of the education of the public which has yet been made in any country. That it is needed even in France is evident from the fact that ever since M. Joussetin took up this question he has been bombarded with insulting letters, written, he says, by members of all classes of society, calling him "l'avocat des ecraseurs," which means "the advocate of those who run over people."

A ROADSIDE LUNCH.

◆ ◆ ◆
AN automatic time recorder, invented by Mors, has just received the official sanction of the A.C.F., and will now be put into operation for registering the time on the mile and kilometre trials. The apparatus consists of three switch-boards, one of which is placed at the starting point, the second at a point 609 metres from the starting point, and the third at a point 1,609 metres or one mile from the starting point. Each switch board is supplied with a hook to which is attached a thin wire, which is stretched across the road. As the car comes by it strikes this wire, which before breaking pulls the hook, which in its turn presses an india-rubber ball and forces the air into a rubber finger, thus bringing two metal contact springs together and close an electrical circuit. A single wire with an earth return unites electrically the three switch-boards, the second and third of which have chronometers attached to them which are started and stopped by electro magnets, operated in each case by a battery and relay. This, then, is what happens when a car passes over the track. When it has got up its speed and reaches the first switch-board it breaks the wire and, as I have already described, closes an electrical circuit which sends a current along to the other two switch-boards and starts up the two chrono-

HERE AND THERE.

meters. On reaching the second switch-board a second wire stretched across the road is broken, and in closing an electrical circuit stops the chronometer which is affixed to the second switch-board; on arriving at the third switch-board the same operation takes place, and the chronometer placed on this board is stopped. The number of seconds marked by the last chronometer gives the time occupied in covering the mile, and if the number of seconds marked by the other chronometer be subtracted from this the time occupied in covering 1,000 metres or one kilometre is also arrived at. To describe the operations in detail may possibly give the idea that some fraction of a second may be eaten up in the operations of the various instruments, but in point of fact experiments have proved that the action is for all practical purposes instantaneous.

It is reported that Captain Laycock has purchased two Mercedes Simplex cars—a 20-h.p. and a 60 h.p.—and that the latter will compete in next year's Nice races.

THE Coblenz Automobile Club has just been formed at Coblenz, Germany, with Herr W. Wilson as first president.

THE Committee of the A.C.F. has awarded the sum of £12 to M. Baras, to M. Marcellin £8, and to M. Collin £4, voted by the Club to the three first winners of the vehicles driven by alcohol in the Paris-Vienna race.

THE Belgian Automobile Club has decided to hold a "Circuit Belge" next year. It will be of the nature of a reliability trial, lasting an entire week, during which the principal towns of the country will be visited. In addition to the circuit itself, the programme will include exhibitions in each town, of races, hill-climbing tests, etc.

THE authorities have again allowed the Dourdan Road to be used for record trials, and on Monday quite a number of attempts were made. Lamberjack, Demester and Maurice Farman made a number of runs on motor-cycles, but without approaching record times, Henri Loste, on a direct-driven Bucket motor-tricycle, meeting with no better result. Fournier next went along on his Mors car, but the valve gear of his engine becoming disarranged, he was forced to retire. Le Blon afterwards came up to the starting point on a Serpollet steamer, but engine troubles prevented him making any change in the record times. Altogether Monday was an unfortunate day for the would-be record breakers.

MR. WM. M. LETTS, of the Locomobile Company, sails to-day (Saturday) for New York. He hopes to return about the second week in January.

COLONEL CROMPTON, Sir John Thornycroft and Mr. Paris Singer have been invited to act as judges in the forthcoming side-slip competition to be organised by the Automobile Club. The prize fund has nearly reached £300.

THE Hon. J. Scott Montagu, M.P., is preparing a paper for the Automobile Club on "Motor-cars as Feeders for Railways," and we would suggest that an effort should be made to secure the attendance of railway directors and managers on that occasion.

AN inquest was held at Reigate on Monday on F. R. Stevens, who was killed by being thrown off his horse in Redhill. Deceased was returning from a professional visit, and when in the Brighton road his horse shied at a motor-car and he was thrown on to his head. The driver of the vehicle helped to carry deceased into a house, but he then rushed out, declined to give his name, and drove away.

IN the course of a brief conversation with Mr. Albert Farnell, of Bradford, the other day, we learned that quite a brisk business is being done in motor-cars in Yorkshire. Mr. Farnell, who, during the Reliability Trials, was much struck with the quiet running of the Oldsmobile, purchased one of these vehicles, and has since made various little alterations in it, notably a new valve-actuating cam, by means of which the horse-power developed by the motor has been considerably increased.

A MOTOR-CAR exhibition is to be held in Berlin from the 8th to the 22nd March next.

MR. C. JARROTT has sold the Napier car which he proposes to drive in the Gordon Bennett race to Mr. G. Kirk, of Leeds.

THE Austrian Automobile Club is organising a heavy-vehicle competition for March next.

SIR REDVERS AND LADY AUDREY BULLER have been motoring in Devonshire during the last few days.

COLONEL H. MCCALMONT, M.P., whose sudden death was announced on Monday, was an enthusiastic motorist.

THE Committee of the A.C.F. have decided to hold an international automobile congress in June, 1903.

ON the conclusion of the Lincolnshire Assizes the Lord Chief Justice, Lord Alverstone, journeyed to Woodhill Spa *via* Horncastle, by motor-car.

FOR driving a motor-car on the wrong side of the road, Mr. A. E. George, a local motorist, has been fined 40s. and costs at Newcastle.

"MOTORS for Men of Moderate Means" is the alliterative title of a chapter to be included in the new edition of the Badminton book on motor-cars.

AT last week's motor-car auction in Bradford (Mr. Albert House) the lots sold included three 11-h.p. Clement cars and a 8-h.p. Darracq.

IT is reported that M. Santos Dumont has decided to build a steam-driven airship, and that he has placed an order with the Serpollet Company for a 40-h.p. engine.

OPENING a bazaar at Coventry last week, Mr. Choate, the United States Ambassador, suggested that if Lady Godiva were now to ride through the city she would use an electric automobile.

IN the Christmas issue of the "Royal Magazine" is an article on "The Performing Motor," in which the trick-driving of Mr. J. Worth, an American chauffeur, is described.

PRINCE FREDERICK LEOPOLD of Prussia, who has recently become a member of the Mid-European Motor-Car Club, recently paid a visit to the Marienfelde Works of the German Daimler Company.

FROM the British Consul at Buenos Ayres the Commercial Department of the Board of Trade has received the following telegram:—"Enquiry being made here as to electric automobiles for all purposes. I have no price lists."

ON the proposal of the Marquis of Dion the A.C.F. is considering the question of establishing consulates abroad, to furnish information which may be of service in the development of the export trade in French-built motor-cars.

THE value of the exports of motor-cars and parts from the United States during the month of September last amounted to £12,369, bringing up the total value for the first nine months of this year to £169,597, as compared with only £41,360 for the same period of 1901.

REAL estate agents in North Dakota are making use of motor-cars for the purpose of taking prospective farm purchasers over the prairie acres which are for sale. The roads in North Dakota are smooth, level and hard, and an automobile is extremely useful in covering the great distances which separate the towns.

THE Roots Oil Motor and Motor-Car, Limited, is the title of a company formed with a capital of £50,000 in £1 shares, 26,000 of which are offered to the public. It will acquire the business of Messrs. Roots and Venables and also the benefit of the agreement recently entered into with Messrs. Sir W. G. Armstrong, Whitworth and Company, Limited. Mr. Roots has undertaken to remain in the service of the company as managing director for five years.

THE Automobile Club of Portugal has been definitely formed, with headquarters in Lisbon.

THE Hotchkiss Gun Works at St. Denis, France, are reported to be taking up the construction of motor-cars.

THE Duke and Duchess of Manchester have been motoring with a party of friends in their car through the west of Ireland.

ON the occasion of the wedding of Mr. Rowland Winn, of Leeds, last week, no fewer than fifteen automobiles were engaged in the conveyance of guests.

THE Secretary for Scotland has promised the Perth County Council that their petition in favour of numbering motor-cars shall receive due consideration.

THE Portuguese Ministry of War is reported to have placed an order for five motor-cars with an Italian firm of builders. The first vehicles are to be delivered in Lisbon in March next.

THE Belgian Automobile "caravan" to Algeria will start on January 5th next, the route being *via* Namur, Charleville, Reims, Chalons, Dijon, Lyons, and Marseilles. At Algiers and Biskra races and fetes are to be held.

THE Duke Victor de Ratibor has been elected President of the German Automobile Club, with Prince Christian of Hohenlohe-Oehringen and General von Rabe vice-presidents. A Committee has been appointed to revise the racing rules.

AT the annual meeting of the New Centaur Cycle Company Mr. S. G. Wootton congratulated the directors on dropping the motor business, and hoped to see the item in the balance-sheet for motor stock and experiments (£1,321) rapidly wiped out.

A SUB-COMMITTEE of the A.C.G.B.I. has been appointed to report as to the methods to be adopted with reference to the granting of driving certificates by the Club, and also as to the certificates acceptable by the French Government.

THREE firms have been suspended from participation in competitions organised by the A.C.G.B.I. in consequence of non-observance of the rules on the occasion of the Anniversary Run to Oxford. In one case the suspension is for six, and in the other two for twelve months.

APPLICATION has been made for permission to work, for a period of twenty years, a service of motor-wagons for the public conveyance of goods at Liege. The vehicles, which will be of 24-h.p., and driven by petrol or alcohol, will run at a speed of 10 kilometres an hour, and carry a load of six tons.

THE Chameroy Tyre Tread Company is introducing a "renforce" type of tread for 90 mm. section tyres. It is intended to fit this new type of treads to tyres for heavy cars, while retaining the use of the ordinary 90 mm. treads for "voitures legeres." The company have just issued a new price list of their metallic non-slipping tyre treads.

MR. HARRY HARKNESS, a well-known American motorist, who is looked upon as a probable driver of a car for the United States in next year's Gordon Bennett cup race, has recently been doing some fast road work on his big Mercedes. A few days ago he made a record trip from New York to Stamford, Conn., the time being an hour for the forty miles.

THE Indian Government has placed an order for a 10-h.p. Miesse steam-car for use in connection with the Rohilkund and Kumaon Railway, in India. Hitherto passengers have been conveyed from the terminus of the railway up to the hills in bullock wagons, but this is being changed, the bullock wagons giving place to motor-cars.

THE FIREFLY MOTOR AND ENGINEERING COMPANY, of Croydon, claim to be the first to adopt the idea of a free *garage*, as they commenced storing cars free when they opened their premises in March last. They have found the experiment so successful, and also sufficiently remunerative to themselves, that it has been decided to considerably enlarge the premises during the winter, so as to be able to store an additional fifty cars.

THE Daimler Company have just completed a 12-h.p. car for Lord Windsor.

RIGAL, the well-known motor-cycle record breaker, will, it is announced, drive a Mors car in next year's races.

A PROJECT is on foot at Nice for the creation of a special automobile cement track from Nice to Cannes.

THE Lambeth Borough Council is experimenting with motor-wagons in connection with its street-cleansing work.

THE Motor Power Company, Limited, has been registered with a capital of £100 and without articles of association.

A COMPANY has been formed at Amiens, France, to establish a public service of motor-cars between a number of small towns in the district.

THE Philadelphia postal authorities are experimenting with a motor-car on the route between the main office and Darby, a suburb about six miles out.

TWO large Serpollet steam omnibuses are being built for the day school of the Dominicans at Arcueil, France. They will be used to convey the scholars to and from Paris.

FREDERICK AND CHARLES INGHAM have been sentenced to two and one month's imprisonment respectively for stealing a motor-car, the property of the Manchester Motor-Car Corporation.

MOTOR-CAR mechanics in Chicago are reported to be about to form a union, with a view of securing shorter hours and less work. They will refuse to wash cars, but will consent to drive them and generally supervise all necessary repairs.

HEREWITH we illustrate a new oil can which has lately been brought out by Messrs. J. Lucas, Ltd. It is known as the "Forced Feed Motoiler," the oil, as the name implies, being

forced to the desired bearing or part requiring lubricant. The oiler, which is made of brass, has a capacity of half a pint.

THE Oldsmobile cars are, we learn, now being fitted with the improved carburettor used on the vehicles which competed in the recent New York-Boston reliability run.

THE Bishop of Bath and Wells finds his motor-car of great service in his visitations to distant parts of his diocese. The other day he was able to conduct two confirmation services at distant places owing to the assistance of his automobile.

THE Coventry Motor Fittings Company have just issued a new catalogue, in which particulars are given of the lubricators, silencers, motor bonnets, etc., for motor-cars, of which they are making a speciality.

UNDER the auspices of the Automobile Club of America, Mr. A. Ward Chamberlain, Chairman of the Sign Post Committee, has erected along the Hudson County boulevard a large number of enamelled iron signs directing automobilists to the various ferries and adjacent towns.

UNDER the name "Bijou" the Protector Co., Ltd., of Eccles, near Manchester, are bringing out a little car to seat two passengers side by side. It is fitted with a water-cooled engine of adequate power to take any hill with its full load, and to attain a maximum speed of twenty miles an hour on the level.

JAPAN would seem to be the "happy land" of the motorist, for, according to the Japanese agent of the Locomobile Company, there are no speed limits in either Yokohama or Tokio. Recently he drove his car between the two cities, a distance of 22 miles, in 25 min.

A NUMBER of students in Delft, Holland, have formed the Delft Students' Auto Club.

THE Automobile Club of America has now 324 active members and 68 associate members.

THE New York Society for the Prevention of Cruelty to Animals has ordered a second Daimler motor-wagon.

THE Spalding Rural Council has resolved to petition for the reduction of the speed of motor-cars from 12 to 10 miles an hour.

AN apparatus for accurately ascertaining the effective horsepower on the road-wheels of motor-vehicles will probably be included in the equipment of the motor storehouse recently acquired by the A.C.G.B.I.

NOW that most of the streets of Bournemouth are "up" while being prepared for the electric tramways the public motor-cars seem to be doing good business, especially as all the local horse-drawn 'buses have been disposed of.

THE "Prunel" light delivery vans, which obtained first place and the silver medal in their class in the trials held recently by the French Automobile Club, will shortly be seen in London. Messrs. Brun and Robert are about to open a depot for their sale in the West End of London.

M. CORMIER, who started on October 13th last to put one of the new De Dion-Bouton light cars to a heavy test by a journey round Europe, returned to Paris on November 20th. He was absent about five weeks, covering in all a distance of about 4,200 kilometres. The ride was exceedingly satisfactory, as M. Cormier went through without the slightest trouble to either car or tyres. He met with very bad weather and all sorts of roads, especially in the mountainous districts in Switzerland and Italy, where the snow was several feet deep. On his arrival home the car was at once dismantled, and the gear and working parts examined; no apparent wear was found, all the working parts being simply burnished. Owing to its comparative cheapness the demand for this little car is already very great.

THE governing gear on a four-cylindered engine, particularly the throttle governor, when once correctly set, is unlikely to give trouble; so, if a car appears to be governing badly, look to the cylinders and see that they are all firing, and in all probability one will be found to be missing occasionally.

BE very careful about tightening up chains in wet weather, for, when running in dirty weather, the chains pick up a lot of wet and mud and run very tight. If the chains are found to be loose, take them up about one quarter the amount they would be taken up in dry weather.

WHEN repairing a cut through the tyre from the inside, do not spare canvas for the repair. A little piece stuck on is no good at all. Suppose there is a gash three-quarters of an inch long: first place one piece projecting a good three inches each way beyond the gash, and then place another piece projecting an inch each way beyond the first, and, finally, a third piece an inch each way beyond the second. It will be found that this repair (which can easily be done by the roadside) will be a very effective one and will not blow through.

THE RENAULT PETROL MOTOR.

UNTIL the present year Messrs. Renault Freres used the De Dion motors in their voitures, but the vehicle which won the Paris-Vienna race was equipped with a four-cylinder motor of their own construction, and of which an illustration is given herewith. Nominally rated at 20-h.p., the engine develops 25-h.p. at a speed of 1,500 revolutions per minute, and weighs only 286 lbs., fly-wheel included. The cam gear is entirely enclosed, while a governor is fitted acting on the inlet.

For next year Messrs. Renault are bringing out a 12-h.p. double-cylinder engine of their own make. Each cylinder is cast separately, but integral with its head. The cranks are set at 180 degrees, while the valves of each cylinder are in line with each other. The admission valves are not operated mechanically, but are automatically controlled by the suction stroke, and closed by coiled springs at the moment that the pistons begin to compress the charge in the usual way. The sparking plugs are located between the valves, as in the De Dion motors. To remove the admission valves it is only necessary to loosen two nuts, one to each valve, then turn the yoke 90 degrees and lift out the cage. The cam shaft is parallel to the crank shaft. It

is driven by a counter-shaft fitted with a helical gear at each end and which is in turn driven by the crank shaft. The contact breaker is mounted on the extension of the counter-shaft, and its cam, therefore, revolves in a plane at right angles to the plane in which all the other cams and the flywheel revolve. The cylinders and heads are water jacketed and the pistons, connecting rods and the journals are lubricated by splash. The crank case is a dust and oil-proof aluminoid casting. Each admission valve has its individual inlet pipe and carburettor. The exhaust pipes are not united and terminate in separate silencers. The speed of

THE RENAULT FOUR-CYLINDER MOTOR.

(Le Chauffeur)

the engine is normally about 1,500 revolutions per minute.

FOR cleaning a tyre for repair purposes petrol may be used. It is far quicker than sand-paper.

A BAD burst in a tyre, say three inches long, cannot as a rule be satisfactorily patched, and the only thing to be done is to cut the burst section out and insert another piece. Now this is not such a difficult operation as generally supposed. Remove the burst piece and take a piece of old tube (the same cross section) and measure off a piece the same length plus three and a half inches each way for the join. Clean off the two ends thoroughly, and coat with solution in the usual way; the ends of the cut tube must be turned back for three and a half inches and cleaned and coated with solution. Leave everything to dry well (a good join cannot be made unless the solution has dried well), then turn back the ends, and previous to inserting the extra piece dip it (as far as the solution goes) into benzoline or petrol. Then insert and press the joint well, commencing from the inner end. A joint made in this way should be perfectly sound.

CORRESPONDENCE.

THE GORDON BENNETT CUP RACE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your criticism of the fact that the Automobile Club has decided that, at least two Napier cars will defend England's title to the Gordon Bennett Cup for 1903, why should you find fault with this decision? What car has a public record behind it that more fully justifies it in defending the cup than the Napier? Do not forget we raced unsuccessfully in the year 1900; then again in 1901 we spent some thousands of pounds on racing cars, had luck again attending us; but experience was being built up. In 1902, however, we were successful against the pick of Continental firms—in fact, the Napier was the only car good enough in the Gordon Bennett race under the new racing rules in regard to weight to get through to the finish.

Surely this record is good enough for the Napier to have at least two cars running next year. Personally, I have sent in my £500 entry, so that I am running cars in the Eliminating Race also, and I hope then to produce cars better than others running. A third Napier may thus be chosen to defend the cup, not merely because it has past successful records, but by merit on the day of the Automobile Club's Eliminating Race.

I cannot point out too clearly that I am going to try and prove by merit that three Napier cars shall defend the cup for England! Naturally, as an English manufacturer, I shall only be too pleased to see other successful cars; but so far, up to date, English racing efforts—with the sole exception of 1902 racing Napier—have merely caused smiles of derision from foreign manufacturers.

I trust that this explanation will go in some measure towards making it clear why the English Automobile Club has chosen Napier cars to uphold England's honour in the Gordon Bennett race of 1903.—Yours truly,

S. F. EDGE.

THE EXHIBITION QUESTION.

[The following letters have been sent to us for publication.—Ed. M.C.J.]

The Automobile Club,
119, Piccadilly, W.,
3rd December, 1902.

DEAR SIR,—The Society of Motor Manufacturers and Traders have requested the Committee of the Automobile Club to receive a deputation to discuss the Show question. The Committee, in reply, called the attention of the Society to the following resolution made on Tuesday, April 29th, last: "The Committee of the Club have been very anxious to assist the trade and the movement generally in this important matter of Exhibitions, but they feel that they cannot with dignity continue to negotiate with a trade which is divided against itself."

The Society of Motor Manufacturers and Traders claim that they do represent the views and wishes of the trade as a whole, and that the trade cannot now be said to be in any way "divided against itself."

They claim that the Society's Exhibition at the Crystal Palace is supported by the entire trade.

Before further considering these representations, the Committee would be glad if you would kindly favour them with your Society's remarks on this statement, and with the names of any companies or firms which are not associated with the Society of Motor Manufacturers and Traders and which are not exhibiting at the Society's Exhibition at the Crystal Palace.—Yours faithfully,

G. R. Helmore, Esq., Secretary,
Automobile Mutual Protection Association, Ltd.,
88, Chancery Lane, London.

(Signed) C. JOHNSON,

Secretary.

88, Chancery Lane,
London, W.C.,
December 6th, 1902.

DEAR SIR,—I am in receipt of your letter of the 3rd instant, which I placed before the Committee of this Association at a meeting held here last evening. The Committee desire me to say in reply that they regret that in the matter of exhibitions the trade is still in the same position as it was on the 29th April last, when the Committee of the Automobile Club passed the resolution quoted by you in your letter. The position referred to consists of a difference of opinion as to the date when and the place at which the Automobile Exhibition should be held. One section of the trade chose the month of January and the Crystal Palace, whilst the other section of the trade which this Association represents chose the Spring of the year and the Agricultural Hall. It has, therefore, come about that two principal exhibitions will be held. The Committee of this Association have no information with regard to the number of persons who will exhibit at the Crystal Palace Exhibition, but what they do know is that over 200 representative trade firms have taken space and will exhibit at the Motor Show to be held under the auspices of this Association at the Agricultural Hall during the week from the 21st to the 28th of March next.—Yours faithfully,

(Signed) GEO. R. HELMORE, Secretary,

The Automobile Mutual Protection Association, Ltd.
C. Johnson, Esq.,
Secretary of the Automobile Club,
119, Piccadilly, W.

SOLID v. PNEUMATIC TYRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have for the past three years driven cars with solid tyres, but am shortly to receive a car fitted with pneumatic tyres. A mishap which has recently occurred to a friend seems to give cause for some apprehension as to what may be to me the result of the change. My friend was driving his Serpollet steam car, fitted with Clipper-Michelin tyres, and had run down a hill and was ascending a slight incline when one of the front tyres burst with a considerable report. As the road was greasy he feared to apply his brakes lest the car should skid, but he shut off the steam, trusting that the incline would steady and stop the car. However, the car becoming unmanageable, ran into a telegraph post, upsetting the occupants on to the road siding, luckily without causing them serious injury. Now, an accident of this kind may, it would seem, happen to any one, for the tyres referred to are, I take it, not more liable to burst than those of other makes. The tyre which burst had been transferred from a hind wheel to a front wheel. Possibly it had lived its life. But the idea of such an accident occurring to one is unpleasant, and I would ask if any of your readers can suggest any means by which one could avert a catastrophe, or could say what, if any, way there is of knowing when a pneumatic tyre has arrived at that state when a burst is possible. I have ordered Collier tyres for my new car. Do they diminish the risk?—Yours faithfully,

ANXIOUS ENQUIRER.

CAPRICES!

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers explain the causes of the following two freaks of behaviour in a M.M.C. voiturette engine? If, through want of judgment, the engine is stopped in trying to pick up on the third speed after slowing down, in traffic say, why are several turns of the starting handle required before it can be got to go again, when one turn is generally sufficient?

In the second case, when backing the car up an incline (when leaving the stable, which is at a lower level than the road, for instance), sometimes the engine cannot quite manage it, and the effort stops it, but the stoppage is with a jerk, dead, as if the sprag had caught; this, however, I have satisfied myself is not the case; nor is the gear defective. It is not a matter of an abrupt rise at the top of the incline, or an obstruction, such as a stone.—Yours faithfully,

THETA PHI.

MECHANICALLY-OPENED INLET VALVES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have observed some of the arguments put forth for and against the mechanically-opened induction valve. It is, of course, no new invention, though many I have met seem to think otherwise. Having due regard for the conditions under which a light, high-speed explosive motor works, it would appear that its general efficiency is best served by the ordinary type of spring-valve. The wear and tear on the extra valve-gear upon such an engine is considerable, and it is very doubtful whether the advantages claimed are gained when taking into consideration the rapid revolutions of the piston.

Turning to the motor running up to 700 to 800 revolutions per minute, here the conditions are different, and if the valve-gear be of suitably stout construction, with, perhaps, roller or similar bearings, I am inclined to think that increased power and regularity in working is the result. Especially is this the case with multiple-cylinders, for it can be readily imagined that to procure two light springs of identically the same "temper" is of itself a difficult achievement. It is an interesting theme, and one which is well worth the close attention of motor manufacturers. I trust that others engaged in the industry will let your readers have their views upon the subject.—Yours faithfully,

G. HUGH OWEN.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to your always interesting "Continental Notes" re mechanical or automatic inlet valves, your correspondent suggests that I have fallen into a peculiar error in referring to the superiority of suction induction valves, and that no one has remarked this mistake. Now in the first place I have never set myself up as an apostle or an advocate of suction induction valves, or any others! I have merely stated facts as they appeared to me at the moment, and with present experience before me.

If your correspondent will carefully read my letter over again he will see that I never suggested that we made the crank-throw of the "Napier" one-sixteenth longer. I merely pointed out that to do this would have a certain effect. I, of course, quite appreciate the effect of this same increase on a mechanically-operated inlet-valve engine; but, supposing this was done, the extra increase of efficiency would be slight.—Yours truly,

S. F. EDGE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—The above subject seems to be causing a great deal of theorising. When your correspondent of last week mentioned the advisability of a short pipe he forgot that it does not give all the advantages he claims.

For instance, take the case of a 1½-h.p. engine of 66 mm. bore and 72 mm. stroke, running at twenty miles per hour, and geared to eight to one, and the inlet pipe equals 20 mm. diameter, the gas will travel through this pipe at the rate of seventeen miles per hour when the engine is taking its full charge. Now, when one considers this speed has to be stopped and started again some 385 times per minute, it must not be overlooked that when the gas enters the cylinder (when the piston gains the bottom of its stroke) the valve does not shut immediately, but lets the gas in motion in the pipe still pass in owing to its kinetic energy, and the longer the inlet pipe the greater must be the energy to stop the velocity of the gas in it, owing to the greater bulk of gas therein.

Now, the effect of this kinetic energy of the gas will vary according to the speed, so that at a very low speed it is almost a negligible quantity, but owing to the high speed of most motors it must be taken into account. With the automatic inlet valve I have seen it stated that the puff back has nothing to do with the valve; but I know as a fact it is purely dependent on the amount of life given to the valve. For the compression in the cylinder nearly always takes place before the inlet valve closes, and the amount of time that elapses between the starting and shutting of the valve on its seat is sufficient to allow this small portion of gas to pass back. The greater the valve lift, the greater the puff back. Having made an automatically adjustable inlet valve, I am able to state this as a fact.

For engines used on motor-cars with water-jackets and running at a constant speed, probably a mechanically-worked inlet valve may be a

THE PURCHASE OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Motor-cars are not all the fancy of either the seller or the buyer paints them, and I think it is time that some relaxation should be made in the terms of payment. Let me give my experience, and no doubt other interesting disclosures will follow.

Recently I bought a car for a friend and paid the usual one-third with the order. On the car being ready for delivery I paid £100 on account and said I should like to try it myself before it was delivered to my customer. Accordingly a driver, provided by the makers, drove me through London, colliding with a cab on the way, smashing the front lamp and putting one of the steering wheels out of truth; otherwise the car ran extremely well. He then proceeded alone to meet my friend, and took two and a half hours for a journey of about twenty miles (it was a 10-h.p. car). Owing to the petrol not flowing properly my customer was not able to proceed on his journey with the car, but had to go home by rail, and he could not show the car to another intending purchaser *en route* for the same reason.

The makers' driver went home, leaving the car in the above condition, and the next day I had a letter from the makers stating that they would not send a driver down to instruct my friend in the working of the car until I had paid the whole of the purchase money. I then telephoned them that I was sending that day all but £10 (I may add that some small

THE EARL OF SHREWSBURY AND TALBOT, PRESIDENT OF THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION, ON ONE OF HIS PANHARD CARS.

success; but for the air-cooled engine of varying speeds, which already is inclined to get too hot, it is a mistake.—Yours truly,

LEONARD JONES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the pros and cons of the above are still being aired by your readers, we take this opportunity of forwarding you the results of a workshop test carried out in our works. The motor was cooled by a blast from fan, and by a number of tests by the same engine we got the following results:—

INCREASE ON THE SUCTION-OPERATED INLET VALVE.			
300 revolutions,	an increase of	8 per cent.	
800	"	"	10 "
1,250	"	"	14 "
1,640	"	"	17 "
2,120	"	"	21 "
2,600	"	"	28 "

The engine was the same in both cases, but the lever that worked the inlet valve was taken away and another spring put on the valve; the carburettor was a spray, and was not altered all through test, which took four days. We have fitted motors with mechanically-operated inlet valves to our cycles since the beginning of this year. They have given every satisfaction.—Yours truly,

THE ENDURANCE MOTOR AND CYCLE COMPANY.

parts included in the purchase money have not been sent to this day), and they replied they had "sent a man down who would put matters right." Nearly a week after, to my surprise and disgust, I heard from my friend that they had not sent anyone, and up to the time of writing no one has been sent. Is this business, is it honourable, and is it likely to be beneficial to the motor-car industry?—Yours truly,

HENRY J. ROGERS.

A DOCTOR'S SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At the recent cycle shows I was very much impressed by the Singer arrangement of a 2½-h.p. motor within the front wheel of a Governess tricycle, designed to carry three persons. Also with its great possibilities for supplying the requirements of a very large portion of the community longing for a handy little "gadabout" for visiting, shopping, or running short distances from home, amongst whom are ladies, elderly and lame people, also others of limited walking powers, incapable of mounting a cycle saddle, and perhaps some lazy folk.

Instead of the Governess car body, I would suggest a roomy cane chair to hold two adults side by side, hung upon easy C springs behind, with suitable front spring. The floor to be as near the ground as possible for convenient ingress and egress. Two independent pedal brakes acting both ways. The motor in the front wheel should be manipulated from the seat by means of levers on the tiller steering handle, as adapted to the

little Eureka. The hind wheels should be so placed as to secure good wheel base stability, and also afford a platform behind for tank, etc., and small parcels. Large solid tyres would eliminate tyre troubles, and a light canvas hood afford protection against wind. Many old fossils (like myself) would gladly welcome such a motor-tricycle Bath chair, in preference to the cumbrous cars now prevailing, which cater only for tourists and active young people. The Bath chair need not be very expensive (say, within £150), and would, I believe, be used by medical men as a supplementary makeshift whenever their larger cars were suddenly stranded.

Having successfully driven my own little car, I have some knowledge of the subject, and of the practicability of my suggestions, which I hope will appeal to the desire of manufacturers to provide for all sections of the public, especially when, as in this case, it can be accomplished profitably to themselves.—Yours faithfully,

HENRY HARLAND, M.D.

THE AUTOMOBILE CLUB BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a reader of your valuable journal, I have been greatly interested in the letters appearing therein with reference to the labelling of motor-cars. It seems to me that the Automobile Club should do everything possible to prevent the proposed numbering legislation, which would not only prove a severe check to a rising industry, but which would prevent numbers of people moving about the country, spending money, who would otherwise remain at home.

I consider the Automobile Club should take the lead in this matter, as it appears to me the Club is practically responsible for the suggestion, by adopting the numbering system at all their runs and trials. Why was it necessary to have a big ticket on every competing car, when a list of members is available with details of each member's car?

I notice one of the clauses in the proposed Bill is to give greater power to local authorities. This would certainly be a great mistake, especially in an agricultural district, where the County Council is composed of farmers and landowners, who derive a large portion of their incomes from horse-breeding. It would simply mean that no motor-car would be allowed on the road in such a district. I have a small car (not a racer), and I use it entirely for pleasure, and therefore strongly object to the hackney cab system of numbering, and hope you will do your utmost to prevent the objectionable proposal becoming law.—Yours faithfully,

TONNEAU.

EXHAUST TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you allow me to ask if any of your readers can enlighten me on the following point? I have a voiturette with 4½ h.p. De Dion engine which runs admirably in every way since I took the advice of one of your correspondents and installed a 6-volt accumulator. I was, therefore, much surprised, a few days since, when driving at night, to observe that, almost immediately after starting the engine, the exhaust tube becomes absolutely red hot from the cylinder to the silencer. Ought this to be the case, and if not, can any of your readers tell me how to remedy it, as it seems to me to point to a great waste of unexpended gas, and therefore power somewhere?—Yours faithfully,

PERPLEXED.

THE conclusion of the letter on "Goggles" last week should have read, "The field of view with spectacles is dangerously limited, and this would not be the case with a transparent mask."

VALVES writes:—"Can any of your readers give me the reason why my exhaust valves burn away so quickly? My engine is 6 h.p., water-cooled, and a new valve was burnt away in two hours."

MR. C. JACKSON writes:—"I am pleased to see that there is an outcry against numbering cars. As the owner of a motor-cycle which cannot travel fast, being geared low for hill-climbing, I would rather accept the speed limit than be numbered, and only be numbered if necessary, if I had a fast car or cycle."

DANGEROUS DRIVING OF A HORSE.

A REVERSAL of the ordinary state of things was made at Richmond last week when Captain Lowcock summoned George May, a contractor, for driving a horse and trap to the common danger of passengers. Mr. T. Staplee Firth appeared in support of the summons. Captain Lowcock said he was used to driving motor-cars, and drove slowly all the way from the Star and Garter, and reduced his pace to three or four miles an hour when near the Fire Station. He had a clear road to pass an omnibus which was stopping to discharge passengers, and he had the choice of going on to meet the trap which defendant drove, or to stand still. He pulled up and blew his horn when he was standing alongside the omnibus, but the trap dashed into him. Defendant was coming at from fourteen to seventeen miles an hour, and witness held up his hand and shouted. He suggested that defendant was driving so negligently that he could not pull up. The motor-car was absolutely at rest. Mrs. Florence Rose, who was in the motor-car, corroborated, as did Frederick Meyer, engineer to Captain Lowcock. After hearing the defence, the Bench decided to dismiss the summons, but made no order as to costs.

THE TRIALS FOR 1903.

MOTOR DELIVERY VANS.

ON Thursday, the 4th inst., a meeting of users and makers of light motor-vans for delivery purposes was held at the Automobile Club under the chairmanship of Mr. Roger W. Wallace. The object of the meeting was briefly stated by the chairman as being to elicit the views of users with regard to the proposed trial. He invited representatives of firms who were present to give their experiences.

On behalf of Messrs. Bullers, Ltd., of Tipton, it was said that they had had a motor-van in use for eighteen months for delivery purposes in Birmingham. Previously two horses and a covered van had been employed, leaving home at 9 a.m. and finishing about 7 p.m. But the motor-van started at 10 a.m. and was home again by 2 p.m. His firm were willing to place their delivery business at the disposal of the Club for the purposes of the trial.

Mr. Houston, of the General Post Office, said his department would be willing to try any suitable vehicle submitted to them; but it must not be forgotten that their business was done by contractors. Reliability was absolutely essential in connection with their work.

A director of Messrs. Bryant and May, Ltd., referred to the success of the Daimler delivery van used by the Diamond Match Company in Liverpool.

Messrs. Debenham and Co.'s representative stated that their traveller had been able to work the suburbs more effectually since they adopted a motor-car, and urged that attention should be given to motor-tricycles for delivery purposes.

The chairman said the Westminster Electric Supply Company had found a motor-vehicle of advantage in connection with "breakdown" work, and representatives of Messrs. Bass and Co., W. H. Smith and Sons, Colman and Sons, and the Hyams Clothing Company, having expressed favourable views with regard to the proposed trial,

Mr. Shrapnell Smith proposed a resolution asking the Club to organise the trial, adopting four classifications, from 5 cwt. to 2 tons, and also taking cubic capacity into consideration.

This having been adopted, it was decided, on the motion of Mr. Edge, that the trial should extend over a period of three months, and that it be held as near the month of January, 1904, as possible.

A vote of thanks to the chairman concluded the proceedings, and in reply Mr. Wallace invited probable users of light motor-vans for delivery purposes willing to serve on the Organisation Committee to send their names to the Club.

THE BIG TRIAL.

ON Tuesday afternoon, at the Automobile Club, a meeting of manufacturers of automobiles was held to consider the Big Trial for 1903. The attendance included Messrs. Paris Singer (who presided in the early stage of the proceedings), S. F. Edge, E. M. Instone, W. M. Letts, J. D. Siddeley, F. F. Wellington, Basil Joy, C. Friswell, W. Astell, H. G. Burford, W. Gutmann, Wilson, E. H. Arnott, H. Sturmeay, J. W. Stocks, J. S. Critchley, T. B. Browne, and C. Johnson (secretary).

Letters of apology from Mr. H. Austin (Wolseley Company) and Mr. M. H. Buckea (Motor Manufacturing Company), both of whom regretted the shortness of notice, were read by the secretary.

Mr. S. F. Edge briefly introduced the proposals of the special committee which had been appointed to deal with the question. The committee having agreed that it was desirable to have a 1,000 miles Trial, had to select a centre. London was chosen as against Harrogate, and the Crystal Palace in preference to the Alexandra Palace. It was thought well to have hill-climbing competitions every day, and the month of September was selected as the least busy month for the trade.

A general discussion then took place on the proposals, which were ultimately amended and adopted as set forth below. On Clause 3, Mr. Instone raised the question of giving marks for durability as well as for hill-climbing. A long discussion took place with regard to the appearance of cars. Mr. Sturmeay argued that it was unfair to makers of new cars to insist too closely on the upholstery of the vehicles. On the motion of Mr. Edge, a suggestion that an hour should be allowed each day for washing the cars was rejected. Some amusement was caused by the proposal for making the silent running of vehicles an object of commendation, being met by a further suggestion to deduct marks from cars emitting visible vapour. The original proposal to allow time for the replenishment of tanks, etc., was thrown out, it being recognised that if marks were deducted for the time thus occupied, makers would be encouraged to give attention to those parts.

Mr. Basil Joy introduced a brief discussion on Observers, and the matter was referred to the consideration of the Committee, as was also a proposal by Mr. H. G. Burford that the judges should, as far as possible, be chosen from outside the trade.

The trade section of the Trials Organisation Committee was then appointed as follows:—Messrs. W. Astell, H. G. Burford, J. S. Critchley, S. F. Edge, C. Jarrott, W. M. Letts, J. D. Siddeley, Basil Joy, H. Sturmeay, E. M. C. Instone, F. Lanchester, with one of two other gentlemen who received an equal number of votes.

Recommendations to the Committee:—

- (1) That the Automobile Club shall hold a trial (generally on the same lines as the 650 miles Reliability Trial of 1902) in the year 1903.
- (2) That the Crystal Palace shall be the centre, and runs be made to seaside places.

- (3) That the Trial shall include hill-climbing records, but efforts be made to include marks for durability, and not too much importance placed on the hill climbs.
- (4) That the Trial shall take place early in September.
- (5) That the total distance shall be 1,000 miles, comprised of eight runs of about 125 miles per day.
- (6) That the cars shall be required to be within the gates of the Crystal Palace by twelve noon on a Wednesday, entry being also permitted the night previously, the first run to take place on the Friday, and the Trial to terminate on the following Saturday week.
- (7) No manufacturer or seller to enter more than one car of a type in a class. No duplicates.
- (8) That the public should be given to understand that the Trial is a trial of trustworthiness, and that only cars that have been painted and upholstered shall be entered.
- (9) a. That at the end of the day's run the car shall be immediately on arrival placed in the storage building from which the public, the owners, drivers, mechanics, and everyone except the Club's Stewards shall be rigorously excluded.
- b. In the morning, when the Observer has taken charge of his seat on a car, the driver and mechanic may be admitted to the storage building, and the word will be given to start. Adjustments, washing and repairs may then be made, but one mark will be deducted in respect of every minute during which the car is stopped, or during which the driver or mechanic leave their seats for the purpose of adjustment, washing, or repairs.
- (10) Marks will be deducted from vehicles which emit visible vapour, and the absence of noise when running will also be taken into account.
- (11) As the exclusion of the public from the storage building might interfere with opportunities of doing business, arrangements should, if possible, be made by which one exact duplicate of each car entered and running may be shown in the upper part of the Palace.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Shoreham ...	Capt. M. Buller	22 m. p. h.	£5, etc.
" ...	H. Reynolds	25 m. p. h.	£5.
" ...	L. Strode	—	Adjourned.
*Braintree ...	G. Bishop, Sible, Hedingham	28 m. p. h.	10s., etc.
Daventry ...	H. S. Jones	—	40s. "
Portsmouth ...	C. P. Rose, Southsea	12½ m. p. h.	10s. "
" ...	J. A. Koosens, Southsea	15 m. p. h.	Dismissed.

Abergele ...	A. Paganini, Stalybridge	28 m. p. h.	£1, "
Haywards	W. A. Spriggs, Birmingham	22 m. p. h.	£1, etc.
Heath ...	P. Joseph, London. W.	26 m. p. h.	"
" ...	L. Krapt, Chelsea	—	Warrant issued.
" ...	W. Astell, Twickenham	25 m. p. h.	£1, etc.
" ...	E. Ruben, London, W.	20 m. p. h.	"

Where no alleged speed is given it is understood to be above the legal limit.

* Motor-cycle cases.

IN the five cases heard at Hayward's Heath all the defendants—except Lueling Krapt—wrote regretting inability to attend before the magistrates. A warrant for the apprehension of L. Krapt was issued.

H. S. JONES, who was summoned at Daventry, is motor-car driver to Mr. D. C. Guthrie, of East Haddon. On the occasion of the alleged offence he had taken Lord Annaly and Mr. Stewart, who were going hunting, to Daventry, and it was while waiting for their return that he attained a speed said to be above the legal limit.

IN the prosecution of Mr. Herbert Goode mentioned in our list of cases last week, a police-constable said he was in plain clothes when he saw defendant; he was not concealed in any way; his bicycle stood beside him. When he had covered a mile on his bicycle the motor-car was out of sight. He measured the mile by his cyclometer and he had also paced the distance. The witness was cross-examined by Mr. Staplee Firth as to the exact time; it appeared that his measurement of the time was, he believed, correct within a second or two. A passenger on the car having given evidence that the pace was not more than twelve miles an hour, the magistrate dismissed the case.

SEVERAL motorists have lately been summoned at Portsmouth, and in one case, although the speed was but three-quarters of a mile an hour in excess of the twelve miles, a conviction was recorded, and a nominal fine inflicted. The defendant in the other case was Mr. J. A. Koosens, of Southsea, but this information (although the fact that he was travelling at fifteen miles an hour was undisputed) met with the same fate as a similar summons

against him some time ago being dismissed on the ground that common danger had not been made out. Mr. Koosens has a unique record. Some time before the passing of the Light Locomotives Bill Mr. Koosens purchased a Lutzmann car, which he has driven to the present day, and has travelled a distance of over 80,000 miles without an accident.

IN the case against A. Paganini, at Abergele, police-constable Rowlands said that he saw defendant driving a motor-car through Llanddulas at a rate of between twenty-eight and thirty miles an hour, but in cross-examination informed the Bench that he had no chance to time the car

ALLEGED BREACH OF WARRANTY.

IN the Probate Court (Dublin), before Mr. Justice Andrews, the case of Sykes v. Langrishe, reported in our issue of the 29th ult., has again been mentioned. The plaintiff, Major Sykes, sought to recover £210, the price paid by him to the defendant for a motor-car, on the ground that he warranty given with the machine was not fulfilled. At the trial of the action before Mr. Justice Johnson, after four days' hearing, the jury disagreed. Mr. Gibson (instructed by Mr. Lane Joynt) has since applied to have a consent entered into between the parties made a rule of Court. The consent was that the defendant should pay the plaintiff the sum of £210 and the plaintiff's costs on the action when taxed and ascertained, the plaintiff agreeing to accept the payment of that sum in four instalments, all imputations on either side to be withdrawn. The defendant was to get back the motor-car, and the plaintiff to pay the expense of storing and repairing the machine at Messrs. Hutton's. Mr. Justice Andrews has made the consent a rule of Court.

CLAIMS FOR DAMAGES.

AT the Bristol County Court Judge Austin has heard an action in which Alexander Robb claimed £30 from Frederick Burris, as damages alleged to have resulted from his being knocked down by a motor-bicycle. Plaintiff was in the Queen's Road, and was crossing the roadway when a motor-bicycle came suddenly upon him, knocked him down, went over him, and then passed on some little distance before it could be stopped. The injury was so bad that plaintiff was not able to do any work for sixteen weeks. For the defence, a policeman said a great noise was made as the motor-bicycle approached, and the plaintiff seemed to make a false step. The judge expressed the opinion that the plaintiff did not look about sufficiently, and gave judgment for the defendant, with costs.

AT the Isle of Wight County Court at Newport, before the Registrar, Henry Pearce sued Mr. H. Aubrey Hoffmeister, of Ryde, for £38. Plaintiff alleged that on August 1st last, while in charge of his horse and carriage on the Esplanade, Ryde, the defendant came on the Esplanade in his motor-car, and that in consequence of his failing to stop in accordance with plaintiff's request, his horse became unmanageable, fell, and sustained serious injury. For the defence it was alleged that the plaintiff waved the owner of the motor-car to go on, and that he did so, proceeding cautiously at the rate of about six miles an hour. Corroborative evidence having been given, judgment for the defendant, with costs, was given.

MEASURED DISTANCE.

THE police of the Braintree district are using the distance between telegraph posts for the purpose of timing unfortunate motorists going that way.

NO LIGHT.

AT the Winchester County Bench, on Saturday, Bernard Humphreys, motor-car driver for Sir Thomas Lipton, was summoned for driving a motor-car on the highway at King's Worthy, Hants, without having affixed to the rear of such motor-car a red light as required by the Statute, on November 21st. A fine of 10s., with 9s. costs, was imposed.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, DECEMBER 20, 1902.

[No. 198.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

Notice.

IN consequence of Christmas the *Journal* will go to press earlier than usual next week. To ensure the insertion of advertisements in that issue instructions should reach the Publisher not later than the first post on the morning of Monday next, the 22nd inst. We shall be obliged if our editorial correspondents will also be equally prompt with their communications.

Scotch Opposition to Numbering.

FROM the discussion of the Western Section of the Scottish Automobile Club on Monday, which is reported on another page, it will be seen that our northern friends are as fully opposed to the numbering proposals as are southern motorists. In fact, the advocates of friends of the Bill were in a hopeless minority, despite the earnest and thoughtful speech of Mr. Adam, who was more inclined to favour numbering than any of the other speakers. The truth is that in advocating the labelling, numbering or ticketing of private motor-cars, the supporters of what many of our correspondents call the Automobile Club Bill are merely seeking to inflict upon this country a system that has failed altogether elsewhere in Europe.

French Antipathy.

LAST week the editor of the *Auto Velo* proved that fact in our columns, and confirmation of his view now comes from his confrere of *La France Automobile*, who, in commenting upon a letter from M. J. Pernod, president of the Automobile Club of Avignon, reminds his readers that he prophesied the failure of the numbering plan from the day of its inception. It appears that M. Pernod has been summoned for running over a dog while alleged to have been motoring at Pontoise, the identification having been made through the system of numbering. How reliable this plan has proved may be seen from the fact that on the day in question M. Pernod was at home, and has been able to provide all the evidence for an *alibi*. Had the dog been a man, what an outcry would have been raised? M. Pernod would probably have had a wearying time waiting for trial ere he could have proved his innocence. The frequency of such incidents is alarming French motorists, and no wonder that M. Georges Prade asked, in our last issue, "Is this the time for England to adopt a system of numbering?"

The Lincolnshire Club declares against Numbering.

ON Saturday, Sir Hickman Bacon, Bart., presided over the annual meeting of the Lincolnshire Automobile Club, and Mr. C. Nelson, hon. solicitor, opened a discussion on Mr. Scott Montagu's Bill. The general trend of the speeches made was in favour of the line we have taken on the proposals made. Mr. Nelson argued as to the numbering proposals that the supposed advantages would be far outweighed by the disabilities, which, instead of being removed, would be increased, and make it possible for any prejudiced person to institute pro-

ceedings, where the motorist would have extreme difficulty in defending himself. Capt. J. A. Cole (Roxholme) also spoke against the Bill, and appealed to the members to stand together in this important matter. They in Lincolnshire did not feel the question so much as in other districts, thanks to a sensible tolerance, but they knew that numbering was not of the slightest use. Scorchers would drive as recklessly as ever, and carrying numbers would have no effect, for, with oil on the plates and dust, they would remain un-identified. To carry a number would, he urged, spoil the privacy of automobilists, while drivers of other vehicles would go free. Mr. Rasdall spoke for the other side, but he was the only one, and it was evident that his views were not shared by the members present. Mr. Wilkinson suggested that if horse drivers were as comparatively skilful in driving as motorists were, there would be less complaint. Mr. C. W. Pennell, the Chairman of the Club, argued against numbering, and declared that if the speed limit was raised to eighteen or even twenty-four miles an hour, there would still be the same prejudice and therefore the same persecution. Sir H. B. Bacon explained how unpleasant it was for magistrates to have to adjudicate in other cases when they knew that every time they ventured out on their cars they were breaking a stupid law. Ultimately a resolution against the Bill in its present form was adopted.

A Year's Record.

IN presenting the report of the year's work, Mr. C. W. Pennell referred to the services rendered by Dr. Cragg, the hon. secretary. Mr. Rasdall raised the question of the charges for the stabling of cars at hotels, and it was agreed to give further attention to the matter. Mr. Pennell, in answer to a question, said the Committee had come to the decision that it was useless trying further to reduce the charges at certain bridges, for the lessees had it pretty much in their own hands. But it was hoped that in the course of time these would realise that they were losing much by charging such excessive tolls to those driving motors, whether cars or motor-cycles. The question of re-affiliation with the A.C.G.B.I. was left in the hands of the Committee, many of the members being of opinion that the present affiliation fee is more than the Club can afford. Sir H. B. Bacon was re-elected president; Dr. Cragg, hon. secretary; Mr. C. W. Pennell, chairman; and among the vice-presidents are the Marquis of Exeter, Lord Willoughby de Eresby, M.P., Capt. J. A. Cole, J.P., J. D. Sandars (High Sheriff of the County), and Mr. W. Garfit, M.P.

What Worcester Wants.

CONSIDERING the subject of motor-car speeds more closely than many local authorities, the Worcester County Council has adopted a series of suggestions which, in their view, should find embodiment in legislation. They are as follows:—
(1) That provision should be made by which each motor-car could be easily identified both by night and by day; (2) that in addition to power to cancel the certificate of the driver of a motor-car, justices should be empowered to suspend it upon a first conviction; (3) that motor-cars should be chargeable with higher rates of duties than at present; (4) that "indication boards"

should be placed on main roads at the termini of towns and villages and also at any places where it was advisable that motor-cars should slow down. The outlay for these boards would be recouped to the Council out of the fees to be charged for registration of the cars; (5) that Section 7 of the Act of 1896 should be amended so as to provide that £100 should be the maximum penalty for an offence instead of £10 as therein provided.

Motorists to Bear all the Expense.

POSSIBLY on a reconsideration of the matter these Worcester worthies would be willing to go further and maintain the roads, pay the police, and look after the poor—all out of the fees charged to motorists. Surely those who drive motor-cars ought to be made to bear all the expenses of local administration! That, at least, seems the logical sequence of many of the mutterings now made against those who claim equal rights on the highway with the owners of horses and other quadrupeds.

A VIEW OF SAVERNAKE HOUSE, WILTSHIRE, AS SEEN FROM MR. BUCKNALL'S BALLOON.
Photo by] (Mr. Frank H. Butler.)

Unattended Horses.

IF motorists would inform the police and induce them to prosecute, much would be done to lessen the number of unattended horses to be found on our highways. At Chichester recently a carman has been fined 10s. and costs for leaving his horse and cart on the roadway, the principal witness in the case being Mr. M. F. Mieville, of Chichester, who explained that he bore no malice, but as drivers of motor-cars were constantly getting into trouble he thought someone else might also have that experience. The horse was grazing on the bank, and the cart was broadside to the road. He pulled up and blew his horn several times, but no one appeared. By taking the car round at the back of the cart over some rough and stony road he got past, and afterwards the defendant came from a cottage. They argued the point as to whether the defendant should have left his cart unattended in the way he did. As defendant declined to admit that he was wrong, witness informed the police; hence the prosecution. A few such cases in every country town would soon prove to the advantage of automobilism, in removing one of the dangers of the highway.

The Hozier Engineering Company, Limited.

THE second annual meeting of shareholders of the Hozier Engineering Company, Limited, was held in Glasgow a few days ago, Mr. Wm. Alex. Smith, chairman, presiding. The figures laid before the meeting were of a very satisfactory character; after debiting revenue with all proper charges, including advertising, etc., the balance at the credit of profit and loss account amounted to £4,966 11s. 9d. Of this amount

£924 0s. 9d. was absorbed in payment of debenture and other interest. In view of the growth in the business of the company it was resolved to apply the greater portion of the balance in writing off and depreciation, and to pay a dividend of 5 per cent. It was reported that a large number of orders for the 1903 model had already been booked, and the prospects of the company were exceedingly bright. A number of those present then inspected the works, and were highly satisfied with the general efficiency and with the new automatic machinery recently installed by Mr. Govan, the managing director.

Up Porlock Hill.

LITTLE has lately been heard of Porlock Hill, but now and again news comes of some venturesome motorist making the ascent. The latest to do so is Mr. A. J. Millership on Mr. J. C. S. Rashleigh's Lanchester car. There has been a new road cut from Porlock up to Oarpost, about a mile to a mile and a half longer, and not quite so steep a gradient as the old one. This is the road that the ordinary coaches use, and which takes eight horses to get up. The car left Minehead at eleven o'clock on a recent Friday, carrying 1 cwt. 3 qrs. 24 lbs. of sand in a sack, a large bag, overcoats and rugs, the whole totalling 20 stones, also a man, making a full complement of four passengers. On arriving at Porlock village and enquiring the way to Ilfracombe, they were informed they had missed the road, and that it was impossible for the car to go up the hill. However, they drove the car on, and the climb of three miles was accomplished in twenty-eight minutes, or slightly over six miles an hour. There were two "V" corners on the hill, and the surface was more like a river-bed than a high road. Mr. Millership then ran down into Lynmouth, and enquired the way, and was told "straight on, up the hill." The gradient of this hill is, if anything, worse than Porlock, rising 400 ft. in half a mile. After one fearful turn at the start, this hill was surmounted easily, doing the half-mile in five minutes exact. Running on to Parracombe, the hill out of there was climbed easily, although this is a gradient of about 1 in 5.

The Maidenhead Toll.

THE Maidenhead Bridge agitation is being prosecuted with vigour, and the Corporation is being forced to come to some definite decision at once. Maidenhead has enjoyed some £120,000 out of building a bridge costing only £19,000. For over fifty years at least they have been exacting tolls, when the bridge should have been freed, and what was unjust before would become scandalously so now to the general public if the continuance of the tolls is allowed. The investigations re the illegality of the tolls upon Maidenhead Bridge have been proceeding nearly two years, most valuable and important information has been obtained, and the motor tolls reduced from 6d. to 2d., which was effected the day previous to the challenging the toll on December 8th of the present year. But the question of the tolls can only be decided in a court of law. The cost of proceeding has been and will be considerable. Counsel have to be retained, etc., and it is absolutely necessary that the gentlemen who have led the agitation should have pecuniary assistance if the matter is to be brought to a successful result. A fund has been started to this end, and subscriptions may be sent to Mr. J. Taylor, Eton, Mr. Joseph Fullbrook, Slough, or Mr. Cecil Howlett, Eton.

The Latest Phase.

THE Maidenhead Town Council on Monday evening adopted several important recommendations of the Bridge Committee with reference to the Maidenhead Bridge tolls. They were that steps be taken to obtain an Act of Parliament which shall (a) Repeal the Maidenhead Bridge Act of 1772; (b) Abolish the bridge tolls as from November, 1903, when the present letting expires; (c) Vest the bridge and bridge property in mayor, aldermen, and burgesses of the borough of Maidenhead for ever. The lessee of the tolls has applied to

the Corporation for recompense owing to tolls for motor-cars having been reduced from 6d. to 2d.

The Scottish Club.

THE Eastern Section of the Scottish Automobile Club held its first social evening on Monday week at the Royal Hotel, Edinburgh, at which Mr. John Macdonald, Chairman of the section, presided. The Right Hon. Sir J. H. A. Macdonald, president of the Club, related, in characteristic style, some of his motoring experiences during the past summer. He also took the opportunity of urging the advisability of motorists showing gentlemanly and courteous consideration for other users of the King's highway. Dr. Dawson Turner (vice-president) also gave some of his experiences, which date as far back as 1896. Sir John Murray (vice-president) said his car had been so reliable that he had practically no experiences to relate—quite a novel experience in itself for a motorist. Sir John has been engaged throughout the summer in superintending

Their hardness and solidity minimise the production of mud or dust—an important consideration to that portion of the public that goes a-motoring. In developing the ideas expressed in the pamphlet the Irish Roads Improvement Association will be doing useful work deserving encouragement by all motorists.

Carriage of Motor Spirit on the Thames.

WITH regard to the carriage of motor spirit by water, it may be of interest to Metropolitan readers to know that there are four London firms owning duly-licensed barges for the purpose. These are the Anglo-American Oil Company, Ltd., Messrs. S. Bowley and Son, Battersea Bridge, S.W., Messrs. Stone Brothers, Erith, and the Union Lighterage Company, Ltd. The Conservators of the River Thames are alive to the increasing importance of the trade in petroleum spirit, and they have just passed a resolution that tank barges of suitable construction shall in future be allowed to convey the spirit on the river. This should greatly facilitate transit, and probably reduce its cost. The Conservators are now taking expert advice as to the specifications for

MR. H. E. MOSS, J.P., ON HIS NEW 24-H.P. DAIMLER.

the sounding of the Lochs of Scotland, and he said that he got through his work much faster and more expeditiously by the help of his motor-car than he could have possibly done by any other means. Besides the above named-gentlemen and a good turn-out of members, there were also present Mr. N. D. Macdonald, and Mr. J. C. Smith, the newly-elected General Secretary. The Chairman took this opportunity of introducing the new General Secretary to the members of the Eastern Section in proposing his health, to which Mr. Smith replied.

Good Roads.

FOR the Irish Roads Improvement Association Mr. Thomas Aitken, the author of the well-known treatise on "Road Making and Maintenance," has written a practical pamphlet on the subject, in which he points out that the gradients for fast traffic should not exceed one in thirty-three; one in forty is, however, preferable. According to Mr. Aitken, roads properly constructed can be maintained with little cleaning.

the tank barges, as well as for those for carrying spirit in barrels or other packages.

"In the Multitude of Trials," etc.

THE compiler of the usually interesting motor notes in the "Daily News" fell into an amusing error in Saturday's issue, leading us to the conclusion that he is a diligent, if not over-careful, student of the automobile journals appearing on the Friday. After giving some idea of the conference held between users and makers of motor-delivery vans, he went on to say that "the trial will be held on the same lines as the reliability trials, and will take place probably in August, 1903. The Crystal Palace will be the starting place for the daily runs. The total distance will be 1,000 miles, divided into about 125 miles a day for eight runs. There will be four classes of vehicles, viz., those designed to carry 5 cwt. or under; those designed to carry half a ton or under; those designed to carry a ton or under; and those designed to carry two tons or under." Had the writer been present at the conference he could not have fallen into

such confusion; nor would it have been the case had he read his authorities more carefully.

Paper Chases on Boxing Day.

LAST week we announced that the Sheffield and District Automobile Club intended to hold a paper chase on Boxing Day. Now we learn that a similar enterprise is also to be held under the auspices of the Yorkshire Club, starting from Pool Bridge, near Leeds. Tea will be taken at the Prince of Wales Hotel, Harrogate, at 5 p.m., where motorists who do not participate in the chase will be welcomed. The hares have offered a prize to the member of the pack who catches one of them.

The Tyre Trials.

THE awards in the tyre trials organised by the A.C.G.B.I. may shortly be expected—in fact, as soon as the resiliency tests by the British Association dynamometer are completed. Sections of the tyres submitted for trial are to be suitably exhibited in the Club-house, in order that members who have purchased tyres of similar manufacture may satisfy themselves as to whether their purchases are as heavy and substantial, and generally of the same quality as those entered for the competition.

Increased Speed of Racing Cars.

AN interesting table of speeds has been drawn up by a French contemporary, which shows how rapidly the average pace of motor-cars has increased in the few years since they have become practical vehicles. In the Paris-Bordeaux-Paris race of 1895, the late M. Levassor accomplished an average of 13.4 miles an hour on a 4-h.p. Panhard, a feat which was regarded at the time as astonishing. In 1896, in the Paris-Marseilles-Paris race, M. Mayade on a 6-h.p. Panhard achieved 15.78 miles an hour. These two races extended over a distance of more than 750 miles, so that the test was severe. Owing to the varying length of the contests from which the subsequent figures are gathered, it is not easy to make a true comparison. M. Jamin, on a 4-h.p. Bollee, accomplished twenty-nine miles an hour from Paris to Trouville in 1897. The next year showed no breaking of the record, but in 1899 Lemaitre, driving a 20-h.p. Peugeot, achieved thirty-two miles an hour in the Pau-Bayonne-Pau race. Later in the same year, Levegh, in the Bordeaux-Biarritz race, made a notable advance, scoring an average of forty-one miles an hour on a 20-h.p. Mors. The next year raised the figures several times. At Pau Rene de Knyff, on a 16-h.p. Panhard, averaged forty-four miles an hour; Jenatzy, in a 100-kilometre race, did forty-eight and a half miles in the sixty minutes, and Levegh, on a Mors, in the Bordeaux-Perigueux contest, was the first to average fifty miles an hour. In 1901 Fournier's pace in the Paris-Bordeaux race was fifty-two and a half miles an hour, on a 60-h.p. Mors, and on the second day of the Paris-Berlin race of last year Antony, on a Mors, reached fifty-four miles an hour. Coming to the present year, Rene de Knyff accomplished fifty-five and a quarter miles an hour on a 70-h.p. Panhard on the first day of Paris-Vienna; while in the first 100 kilometres of the Circuit des Ardennes, Baron de Crawhez, on a 70-h.p. Panhard, covered sixty and a quarter miles in sixty minutes. Thus, in eight years the average speed of motor-cars over a long distance has increased from 13.4 to over sixty miles an hour.

The Gordon Bennett Contest.

THE Automobile Club de Belgique has invited the A.C.G.B.I. to hold the race for the Gordon Bennett cup over the Ardennes course. According to the rules of the competition, however, if the race cannot be held in this country it must take place in France. With reference to the entry of the Star Motor Company, it is understood that the deposit of £500 has been made conditionally on the receipt of satisfactory answers to certain questions. Should they withdraw—and the Executive Com-

mittee has agreed to allow them to do so if they desire—Messrs. S. F. Edge, Limited, will also be at liberty to withdraw their £500, and the Committee may then make fresh proposals. On the other hand Messrs. Edge, Limited, may reserve the place by allowing things to remain as they are. In that case there will be no Eliminating Test, the Club having the right to retain the £500 unless they produce a suitable car by the date fixed.

Some Motor Troubles.

NOWADAYS, when a really serviceable and reliable motor-vehicle is procurable, most failures can be put down to the inexperience of the owners. That a large number of people drive cars who know practically nothing about their working is very evident. The owner tinkers unsuccessfully for hours and hours and then sends for a competent man to rectify the trouble, which he does in a few moments. The owner with only a smattering of knowledge is sometimes worse off than those who know nothing at all. We all know this man well; a nut drops out from the bottom of the base-chamber and he discovers the fact, and thinks his compression gone. It is quite true that De Dion tremblers are rather difficult to adjust, but it is a much better plan to see that the cells are fully charged, first, than to screw and unscrew the platinum-tipped screw for an indefinite period of time, and then to discover the cells are low. Yet this is quite a common occurrence. Then, perhaps, we know the other man with a smattering of knowledge who in an evil hour takes his engine down when there is nothing wrong with it, and puts it together and finds it absolutely refuses to start. Result, expert arrives and explains that all four-cycle engines usually work better with the exhaust valve correctly set, and not by chance! High-tension wires, too, have their correct places, and if not in their correct places the engine will exhibit rooted objections to starting, much to the alarm of the "man with the smattering," who in the end will seek the inevitable expert. This list could doubtless be prolonged, but it is sufficient to show how some of the motor failures we hear of, and with good cars too, can be accounted for.

SIR EDWARD JENKINSON, K.C.B., has resigned his membership of the Automobile Club.

THE Bristol and District Motor Club has been formed, with Mr. Charles Franklin as secretary.

WE are authorised to announce the resignation of Mr. Claude Johnson, the secretary of the A.C.G.B.I.

MR. ALFRED HARMSWORTH's latest acquisition is a Lohner-Porsche-Mercedes combination petrol electric car.

MR. F. GARRATT has been elected captain of the Nottingham Motor Cycle Club and Mr. E. G. Young hon. secretary. The inaugural run will be held early in the New Year.

THE Great Northern, Piccadilly and Brompton Railway proposes to acquire the garage in Down Street Mews, W. The Automobile Club will oppose the scheme of the company.

BARON HENRI DE ROTHSCILD's paper on "Seven Years of Automobilmism" will be read at the A.C.G.B.I. on the 9th prox. During next month the Baron de Zuylen will also be entertained by the Automobile Club.

MR. RUDYARD KIPLING's story entitled "Steam Tactics," noticed last week, was not wholly devoted to the performances of steam-propelled vehicles, both artist and author introducing a petrol vehicle in concluding the incident.

MESSRS. CHARLES LETTS AND COMPANY, the well-known diary publishers, are about to issue a special book for the use of motorists generally. This book, besides other useful features, will contain a list of recommended hotels whose proprietors are anxious to cater for motorists, and who have agreed to a fixed charge for stabling, etc.; a list of recommended repairers, and also names of agents where petrol may be obtained. The proprietors of any hotels wishing to have their names included in this book should write at once to the Editor of the Log Book, care of Messrs. Charles Letts and Company, 3, Royal Exchange, E.C.

The Paris Motor-Car Exhibition.

(Continued from page 789.)

GENERAL VIEW OF THE SALON.

PANHARD and Levassor have several innovations which are remarkable, and we had the good fortune to visit their stand early on the opening morning, when Chevalier René de Knyff and the Commandant Krebs were there. The most noticeable feature of the exhibit is the introduction of a chassis fitted with a three-cylinder motor. This is of 8 nominal h.p., the cylinders and cylinder head being cast in one piece; the exhaust and induction valves are on opposite sides of the cylinder head. The high tension system of electric ignition is used, but in order to insure against the trouble of discharged accumulators a small dynamo

FIG. 1.—THE 15-H.P. LIGHT PANHARD DOUBLE PHAETON.

driven off the flywheel of the motor is provided. The function of this dynamo is to keep the accumulators fully charged at all times. A friction-driven pump of standard pattern is still used for the water circulation, but in conjunction with a Mercedes type of cooler and an entirely enclosed engine, air being drawn through the apertures of the cooler and past the motor by vanes attached to the periphery of the fly-wheel. Governing is by a throttle on the inlet pipe, and both the amount of throttle and the time of ignition can be regulated to a nicety by the driver by means of two convenient disc wheels ingeniously arranged on the steering wheel.

Georges Richard's exhibit comprises three new models, a 12-h.p., a 24 h.p., and a 40-h.p. The first has a two-cylinder engine, with magneto ignition and a new starting arrangement. The 24-h.p. car has two twin 12-h.p. engines, and the 40-h.p. vehicle has a stamped steel frame, four-cylinder motor, regulator acting on the admission and worked from the steering wheel, magneto ignition, and powerful brakes.

Serpollet is still far ahead of all competitors in heavy steam touring cars, and this year he has reduced the weight of his

FIG. 2.—THE SERPOLLET BERLINE.

chassis considerably. Last year's 12-h.p. car weighed 1,000 kilos, whilst this year the 40-h.p. car weighs 920 kilos in touring trim, and 820 kilos in racing order. In the new chassis the boiler is very much lower, while the heating surface is the same, although there are fewer elements in the boiler. The cam shaft on the engine has been done away with, and in its place the pump is worked by an eccentric motion and a slide valve, which gives an easier and better speed regulation. Serpollet also exhibits an

omnibus with a 20-h.p. motor, to carry fourteen people at an average speed of from fifteen to sixteen miles per hour.

La Société des Automobiles Delahaye exhibit two new types of vehicles with vertical engines of 12-h.p. and 24-h.p. respectively. The Delahaye Company have not given up horizontal engines altogether, for they are still fitting them to the larger types of cars, such as omnibuses and delivery vans. The 12-h.p. vertical motor has two cylinders and the 24-h.p. four. The cylinder and valve chambers are cast in one piece, and the head is formed of a plate which is removable to expose the pistons. The cylinder is water-jacketed down to about two-thirds of its length, and below this the air circulates around the motor, to be warmed before

stamped U-shaped frame, throttle and advance ignition worked by two levers in the steering wheel, thus combining all the novelties of the year. The radiator has the air drawn through it by means of a fan placed just behind. The steering pillar is of a novel form; it is conical in shape, tapering towards the steering wheel. The carburettor is the smallest and most compact that we have observed; of course, the regulation is done by the carburettor, which consists simply of a float feed, with a wing tap at one side. The air is drawn in on one side of the wing, and passes the petrol jet; on the other the air alone comes in, and by varying the wing either can be altered at will as well as the admission of the mixture into the cylinder. It is the acme

FIGS. 3 AND 4.—ELEVATION AND PLAN OF THE NEW DELAHAYE 24-H.P. CAR.

entering the carburettor. The cranks are set at 180 degs., and the engine is further balanced by dividing the weight of the flywheel on each end of the crankshaft. In both the 12-h.p. and 24-h.p. engines the cylinder diameter is 100 mm. and the stroke 140 mm., the normal speed being 950 revolutions per minute. A noticeable feature of the vehicles is the independence of the motor, change-speed gear, and differential, each of which may be removed without interfering with the other. The countershaft carrying the differential is solidly bolted to the sides of the frame, and is connected with the rear road wheels by chains.

Mors shows two new models—the 11 and the 18-h.p.—with mechanically-worked admission valves, honeycomb radiator, steel

of simplicity, and if it works as well as report would have it, there is little further improvement to be made in that direction.

Messrs. Mildé and Co., in addition to a number of electric broughams, landaus, omnibuses, etc., display a new combination petrol-electric car, one of which is expected to be shortly seen in London.

La Minerve Company, of Billancourt, exhibit, among other vehicles, a little car driven by a single-cylinder water-cooled 6½-h.p. engine. The valves are all mechanically operated. The power is transmitted through a clutch to the gear box, and thence by a universally-jointed shaft and bevel gear to the live axle. Three speeds and reverse are available.

M. Darracq explained in person the novelties which his firm are putting on the market next year, and it may here be remarked, by the way, that no less than 1,050 Darracqs have been turned out at Suresnes in 1902, and that actually there are a series of 1,200 cars passing through the shops for next year. There are to be four models—a one-cylinder 8-h.p., a two-cylinder 9-h.p., and two new cars with engines having mechanically-operated valves, one of them a two-cylinder 12-h.p. and the other a four-cylinder 16-h.p. The frames of these two cars are of U-shaped steel, and the motors are provided with honeycomb radiators

FIG. 5.—THE 12-H.P. DARRACQ.

throttle carburetors, worked by a lever on the steering wheel, and all the other Mercedes improvements. M. Darracq claims that these cars are even more silent and supple than the Cannstatt vehicles. There can be no doubt but that the transformation of the Darracq is complete.

Renault Frères exhibit a new four-cylinder 14-h.p. chassis, with a tubular frame and ordinary radiator, but, not satisfied with blindly following the mechanically-driven valve of the Mercedes, the Renaults have gone one better. They have constructed a

done in quite a novel manner. In the first place, oil is placed in the base chamber and thrown up by the revolving cranks. This oil falls and is collected in three tanks, through which it runs out to the bearings; thence, by means of holes in the hollow crank shaft, it runs down the cranks by centrifugal motion, and in each crank there is a hole which allows the oil to be thrown out into the cylinder.

FIG. 6.—THE BOULET QUADRI-VOITURETTE.

An interesting development of the quadricycle is to be seen in the "Quadri Voiturette Suspendu" shown on the stand of Messrs. Boulet and Company. Three types are made—4-h.p. and 5-h.p. for two persons, and 6-h.p. for three riders, the latter being illustrated in Fig. 6. The motor, which is water-cooled, is located at the back, and drives the rear axle through a clutch and two speed gear.

Decauville shows a 16-h.p. four-cylinder, mechanically-operated inlet-valve car with a Mercedes frame. The engine is

FIG. 7.—THE NEW 9-H.P. RENAULT.

mechanically-actuated admission valve, in which the lift is not only positive but also variable, and they regulate the speed of the car by varying the lift of the inlet valve, either by hand or by foot or by an automatic governor, and this appears to be a distinct advance. It is true that they admit that mechanical valves with them do not produce quite the same power as the automatic valves, but the other advantages are counterbalancing. All the brakes of the Renault car will in future act inside instead of outside a drum.

The lubrication of the cylinders, crank-shaft and cranks is

exceedingly compact, or, as they very aptly describe it in French, "très ramassé," there are three speeds and a reverse, controlled by one lever, and, of course, the direct drive for the third speed. The back axle is mounted in a novel manner, the wheels being free to revolve on the outer fixed tube and being rotated by the inner shaft, which at each extremity has a cap with notches cut in it. These notches engage in corresponding ones in the hub of the wheel. The advantage claimed for this system is that the centre shaft can be withdrawn, and the wheels then are quite free and can be taken off. The

C

rear suspension of the chassis consists of three springs, two of which are parallel with the side frame of the car and attached to it at the front end of the springs only. The third inverted spring at the back is across the frame of the car and connected to it at the centre, the two ends being attached to the loose ends of the two other springs.

The new 18-h.p. chassis which the Peugeot Company are showing has attracted a great deal of attention, and is really deserving of it. The frame is of U-shaped steel, and at once strong and light. The four cylinder motor has, of course, mechanically-operated valves and the cylinders are fitted with

FIG. 8.—THE 18-H.P. PEUGEOT.

both magneto and electric ignition. The former is extremely simple, and consists of a rocking lever pivoted on a pin which enters the side of the explosion chamber and carries the contact breaker. It is silent in its action and entirely dispenses with the clicking noise usual with most magneto ignitions. The radiator (Figs. 9 and 10) is of the honeycomb type with a fan behind it driven by a belt; the speed regulation is accomplished by means of a throttle valve, worked by a hand lever on the steering pillar. The transmission is by chains, and there are four speeds forward and one reverse; the fourth speed is direct and without the intermediary of different sized pinions. The suspension of the gear box is well thought out. The differential shaft supports it at one end and it is held at the other on two points, one at each side.

FIGS. 9 AND 10.—SECTIONAL ELEVATION AND FRONT VIEW OF PEUGEOT HONEYCOMB RADIATOR.

The Rochet-Schneider car has been almost entirely inspired by the Mercedes. In one direction, however, the Cannstatt lead has not been followed—the frame is of armoured wood. The four-cylinder motor has mechanically-actuated valves and the ignition is by magneto with a rupture in the cylinder. In this case there is a long vertical rod, worked by a cam on the second speed shaft, which turns this rod round, a spiral spring twisted round it bringing it back with a jerk; the top of this rod carries a little hammer, which strikes on a pivoted lever placed on the top of the valve chest and traversing it. This pivoted lever is held in position by a small spring, and when the hammer strikes it the rupture in the cylinder is made, while the small spring brings the contacts together again. The ignition is advanced or retarded in an ingenious manner. On the top of

the four vertical rods already mentioned there is a bar sliding forwards and downwards at the same time. This bar presses down the rods in such a manner that the cams on the second-speed shaft attack them earlier and thus make the blow which causes the rupture and spark earlier. Should the motor have a back explosion and reverse the whole motion is put out of gear, and no further spark occurs. The transmission is by chain, and the change-speed lever works on two sectors like the Mercedes and has a lateral as well as longitudinal motion. There is, however, no rack and pinion movement as in the Mercedes, but a new and original method of accomplishing the same result. The two "train balladeurs" (for, of course, it will be understood that in change of speed gears of the Mercedes type there are always two sets of sliding gears instead of one set, as in the Panhard type) are each worked by a rod, and the two rods project from the gear case and each carries at its extremity an open stirrup. The change-speed lever has a side motion which allows it to engage with either stirrup or to pass between the two without engaging with either. One rod has three positions coinciding with the 4th, 3rd, and 2nd speeds, and the other rod has two positions corresponding with the 1st speed and the reverse motion. The clutch spring of the car is placed alongside of the side frame instead of behind the clutch. It can thus be seen and can be regulated instantaneously.

The Fabrique Nationale, of Herstal, Belgium, after turning out several experimental types of cars during the past two or three years, are now putting on the market a light car which presents some interesting features. The new vehicle is driven by a 16-h.p. (nominal) engine of the four-cylinder vertical type. One of its special features is that it is probably the slowest engine fitted to a vehicle of this class, its normal speed being only 650 revolutions per minute. The engine is of extremely simple construction, with every part enclosed in accordance with modern practice. Another interesting feature about the car is the change speed gear. It is adapted to give three forward speeds with a direct drive on the top speed. It is composed of two triangular pieces known as a "cavalier," and they swing to the right and left on a shaft at the apices. At each of the bottom angles they are connected by shafts carrying wheels for the first and second speeds, and the triangular pieces are cut away between these shafts for the passage of the motor shaft. By moving the "cavalier" one way or the other either the first or second speed wheels are put in gear with the pinions on the motor-shaft, and when the triangular pieces are moved to a vertical position, so that neither of the side wheels are in mesh, the drive is direct through the central shaft. The gear is very small and compact and runs in an oil bath. Power is transmitted to the rear live axle by a longitudinal shaft, in which the usual Cardan joint is replaced by an expanding joint, which is claimed to be stronger and more efficient. The shaft is, moreover, carried in a sleeve extending from the differential box.

Messrs. Vinot and Deguingand, of Puteaux, are turning out three models for 1903—a 10-h.p. two-cylinder car, with ordinary inlet valves, a 14-h.p. car, and one of 18-h.p. Both the latter have four-cylinder engines in which the inlet valves are mechanically actuated and interchangeable with the exhaust valves. The governor acts on the admission and a wide range of motor speed is obtainable by means of a hand moderator and a foot accumulator. The change gear is of the one-lever control type, and gives four forward speeds and a reverse, the power being conveyed from the differential shaft to the rear road wheels by a couple of chains.

Messrs. Henri Popp and Company exhibit a car they have built for use as a "Poste Ambulant" in connection with the Branly-Popp system of wireless telegraphy.

Messrs. Turgan, Foy and Company, of Levallois-Perret, this year confine their exhibit to heavy steam wagons, one having a wooden van body, specially fitted up for the transport of horses.

(To be continued.)

PARIS SHOW GOSSIP.

MANY are wondering if any English visitor will be lucky enough to win the 6-h.p. Gillet-Forest voiturette, which forms the first prize in the Tombola.

ON one agent's stand we noticed an 18-h.p. Mors, stated to be built for the Empress Eugenie, while on another is a 28-h.p. Panhard for the King of the Belgians.

UP and down the show are a number of racing cars which have made themselves famous one way or the other, and they have been keenly criticised by English visitors. Among them may be mentioned the Renault racer which won the Paris-Vienna race, and the Mors on which Augieres recently established a new kilometre record.

AS at all shows, there is among the "wheat" at the Salon a good deal of "chaff," to cover up the defects of which frequent use of the paint brush is made. English buyers need to exercise great care when dealing with concerns of whose names little or nothing has been heard before.

THE Gillet-Forest Company is among the few French builders who still pin their faith to the horizontal engine. These cars have, by their special bonnet and radiator, a distinctive appearance, and large numbers are to be seen in use in Paris.

A CARD bearing the words "English spoken" is to be seen on nearly every stand. The "Velo" refers to the large number of English and American visitors as the "note dominante" of the 1902 Salon.

THE British War Office Committee on Mechanical Traction has been busily engaged in going the rounds of the exhibits, and on Friday last week had a trial run on one of the Turgan-Foy steam wagons. It may be mentioned that one of the heavy vehicles on the Turgan stand has been built for Messrs. Kynoch, of Birmingham.

WE met quite a number of English motor-car agents on the look-out for a reliable little car to sell at about £150. There are quite a large number of voiturettes on view which could be sold at this price, but it remains to be seen whether they can be classed as "reliable." However, a number of different makes of these "populars" are likely to be soon seen in England.

SUNDAY last was a record at the Exhibition as regards attendance, over 60,000 persons visiting the Salon. Close inspection of the cars was impossible, the gangways between the stands being simply impassable. As for the gallery, we attempted to get round, but so thick was the crowd that we got blocked for nearly half an hour, and were glad to get out into the fresh air.

CLOSE upon eighty members of the Automobile Club and friends went over to Paris via Boulogne on Wednesday last week, while the party on Friday numbered over 120. Apparently, the French Customs authorities had got wind of the invasion, for the staff at the *douane* had been increased, and quite a number of the "foreigners" had to pay duty on the cigars, etc., they had with them.

THE King of the Belgians was among the visitors to the Salon on Friday last week. The visit was quite without ceremony, the Royal motorist examining closely the new models of the large makers.

THE scene outside the main entrance to the Grand Palais all day long is of a most active kind—motor-cars and horse-drawn

vehicles following one another in a continuous stream, setting down visitors. The cars drawn up opposite the Petit Palais form no small exhibition in themselves. The Salon closes at 6 p.m., and at that hour one evening this week we counted no less than 117 cars awaiting their passengers, the queue extending from the Alexandre Bridge into the Avenue des Champs-Elysees.

MANY of the stands are most artistically decorated and at dusk are illuminated with an elegance and delicacy of colouring which gives the whole show a charming effect, especially when viewed from the gallery. There is one great drawback, however, in the all-pervading dust. Such a fine building as the Grand Palais is surely worthy a better flooring than loose dusty gravel, which is not only tiring to walk upon, but speedily covers every body and everything in a thick layer of white dust.

AMONG the new departures in the Panhard cars, it may be noted that the starting gear has received attention with the object of making it much easier to turn round the big motors which are now essential to an efficient automobile. Looking at the front of the car, on the left-hand side, just by the starting handle, there is a little knob like a tiny door-handle forming the end of a rod, which can be drawn out or pushed in at

A YOUNG ENTHUSIAST ON AN ARGYLL CAR.

will. This rod is attached to a cone which slides inside the valve cam. The cam in itself is in two pieces, one of which pivots on the other, and can be displaced by the sliding cone in question. The displacement of this part of the cam causes the valve to keep open for an interval more or less considerable, and thus reduces the compression and makes it easier to turn the handle.

THE ninth annual meeting of the National Traction Engine Owners' and Users' Association, of which Mr. John Allen is chairman, has been held at the Agricultural Hall, London.

THE SIRDAR RUBBER COMPANY, LIMITED, makers of the patent buffer tyre, have received the appointment of tyre manufacturers to the King.

DESPITE the protest of County Councillor Jones, who has seen motor-cars rushing about "barking like dogs," the Holywell Urban Council has declined to adopt a resolution seeking to interfere with the present condition of things.

MR. KENNETH A. SKINNER has established a new record, reducing the net running time for the journey between Boston and New York and back, a distance of 488 miles, to 32 hours 22 min., or 8 min. better than the previous record. The car used was an 8-h.p. De Dion.

MOTOR-CYCLING NEWS.

TO-MORROW (Sunday), the weekly run of the Motor-Cycling Club will be held, the destination being Hertford. A start will be made from the Marble Arch at 10.30 a.m. The annual dinner of the Club will be held early in January, with Mr. S. F. Edge in the chair.

MR. J. BERRYMAN is enthusiastic in praise of the motor-bicycle as a helpmate to the angler. Distance is the chief obstacle to the angler's enjoyment, and distance the motor-bicycle goes a long way towards annihilating. And then the feeling of independence it gives! You are off at a moment's notice and your progress is a sport of itself. Indeed, the two sports blend delightfully. "Once the motor-bicycle under your control, think how independent you will be of train or trap. Arbitrary hours, inconvenient stations, delays, ticket-takings, and cold-catchings, how I miss them all, and do not want either! And how I go right to the water's edge without a timetable and without a groom! And how restful it is, your angling over and the shades creeping on, to sit on your spring seat and let your steed glide you joyfully homewards without whip or cord."

A SNAP-SHOT AT DIEPPE.

MR. T. EVANS, of Garston, has been giving his views on motor-bicycles to the members of the Liverpool and District Cycle Trades' Association. He said he had come to the conclusion that 1½-h.p. was ample, except when a trailer was to be used, in which case he recommended an engine of 2-h.p. Bicycles with engines more powerful than those he had named were generally heavy and cumbersome. He had weighed several machines, with the following results: A 1½-h.p., all on, came out at 100 lbs.; 2-h.p., 120 lbs.; and 2½-h.p., 170 lbs. Dealing with trailers, Mr. Evans pointed out that when used in conjunction with motor-cycles they should be provided with two brakes. Subsequent speakers in the discussion included Mr. J. Edge, of Liverpool, who preferred the spray carburettor and the spring type of valve. For general purposes, he recommended a 2-h.p. engine. Mr. Edge expressed the opinion that the millimetre system of measurement should be at once adopted. Compared with the system of measuring by inches, it was simplicity itself. Mr. G. B. Mercer (managing director of Robinson and Price, Limited) advocated the free loan of motor-bicycles to prospective customers. The sale of English engines should be encouraged; the work in them was generally better than in the foreign makes. Mr. T. H. Lancaster (hon. secretary Liverpool Motor C.C.), and Mr. W. Corbett (St. Helens), also spoke.

IN the annual New Year's midnight ride from New York, to Yonkers and Tarrytown the Associated Cycling Clubs of New York will this year include a special class for motor-bicycles.

AMONG the newest attachments for converting motor-bicycles into three-wheeled vehicles for two persons is that which has been introduced by Mr. Leonard Straker, of Farnborough, Kent. It consists of a comfortable seat attached by C-springs, at the ends

of which are mounted forked lugs. The latter carry, on centre-pin hubs, so that, when steering, the seat is not moved, the wheels turning on their hubs as in a motor-car. The axle is attached to the frame of the machine by three tubes, two running to a single clip on to the head tube and one to the back forks just behind the bottom bracket, as shown in the illustration, in which part of the chain and chain wheel are broken away to show the method of fixing. The rear rider is not hampered in any way, the centre stay being carried underneath the motor, leaving him as free as when riding an ordinary bicycle. The steering is arranged from the forks of the machine, a distance piece being bolted between them, carrying on it a socket between which and the left hand side hub is arranged a rod with a socket joint at each end. No strain whatever is thrown on the front forks, with the exception of that required for steering.

THE motor-cycle section of the Austrian Touring Club will next year organise a number of motor-cycle events, including a 10 kilometre hill-climb (Schwettwein-Semmering), a 90 kilometre consumption trial (Vienna-Semmering), a 100 kilometre road race (Vienna-Pressburg and back), and a 100 kilometre race on the Vienna Prater track. The entries will be limited to motor-bicycles weighing under 50 kilogs.

THE "Auto-Fauteuil," or the arm-chair motor-bicycle, illustrated herewith, is one of the novelties at the Paris Salon, where

it is exhibited by Messrs. Gauthier and Company, of Blois, France. The motor is of 2½-h.p., and drives the rear wheel through a clutch and chain. The usual pedals are not fitted, the engine being put in operation by means of a detachable handle. The framework is low, the rear wheel being 23in. in diameter, and the front wheel 19in. The motor is fed through a spray carburettor, and control is effected through the sparking advance and throttle levers. A compression tap is also provided.

CONTINENTAL NOTES.

BY "AUTOMAN."

STANDING by the Peugeot brougham shown in the accompanying photograph is M. Armand Peugeot, whose work in connection with automobilism is well known both on the Continent and in England. He was born in 1849 at Valentigney, and after passing through college in France went to England to gain experience of the methods and practice of British engineers. When he returned to his native land in 1871, it was to take a prominent position in the works established by his father and uncle. Five years later M. Peugeot turned his attention to a self-propelled tricycle, but soon abandoned it for heavier types of motor vehicles. Experiment followed experiment, until the Paris Exhibition of 1889. About that time M. Armand Peugeot came into contact with the late Herr Gottlieb

THE field of utility of the automobile seems to be enlarging continually, and the possibilities of the future will no doubt disturb our grandmotherly legislators into framing useless preventative legislation in more directions than in the regulation of speed and the application of the obnoxious number. According to the latest automobile sensation in Paris, it will be no doubt advisable to frame a Bill for the prevention of elopement by motor-car, in which no doubt one of the clauses will be the compulsory bearing of a distinctive badge by all eligible young *chauffeurs*. Monsieur Maurice Marcile is a rising Parisian medical man in love with Mademoiselle Le Play, whose parents, however, had other matrimonial designs for their daughter and refused to consent to her marriage with the young doctor. In France a marriage cannot take place without the parents' consent, and in order to obtain the same Dr. Marcile imagined a scheme in which an automobile played a leading part. He retained a motor-car at one of the garages in the Avenue de la Grand Armée and had it kept in readiness with a relay of drivers, so that on the first

M. ARMAND PEUGEOT.

[Mr. C. Friessell.

Daimler and the late Monsieur Emile Levassor, who drew his attention to a light carriage propelled by a Daimler engine that did its duty very well indeed, so far as was considered "well" at that comparatively remote period. M. Peugeot at once recognised the value of this engine, and with characteristic energy co-operated with M. Levassor in promoting its successful application to motor road vehicles. Working quite independently, he soon produced successful vehicles; indeed, the first petroleum spirit motor-car to successfully undertake a long journey was made by the Peugeot firm. This was in 1891, when the now celebrated Peugeot car made its historic journey from Valentigney to Paris, from thence to Brest and back to Paris, and ultimately again to Valentigney, accompanying the competitors in the first great long-distance cycle race held in France, and reaching home, we are assured, in excellent condition. Since then the progress of M. Peugeot and the vehicles associated with his name have become the common knowledge of all who follow the history of the automobile movement.

call by telephone or otherwise it could appear on the scene of action. Enlisting the help of several friends, an occasion was awaited when the young lady was out walking, and then the motor-car was telephoned for. The young lady, who did not seem unwilling, was seized, and in spite of the screams of her governess, carried off in style in the automobile, which made for Chantilly on the fourth speed. At Chantilly friends were waiting for the party, and subsequently the lovers went off to Italy to await events and give time for the wrath of the parents to subside. A happy ending, of course, was the end of the adventure, and the fugitives couple are to be married shortly.

It is a moot question whether or no driving certificates for automobilists are of any use. Certain it is that the most incompetent driver can get a certificate with the greatest ease. Personally, I have been driving motor-cars in France for the last four years, both in Paris and in the provinces, without having a certificate at all, or without even being asked if I had one. I started

with a 4-h.p. Hurtu and passed through the whole gamut of powers up to the 40-h.p. Mercedes, and I have driven from Stuttgart in Germany to London, through Paris, and indulged in the higher speeds to my heart's content. For a long time past I have been seriously thinking of applying for a "permis de conduire," but my difficulty has always been that the formalities to be gone through in Paris are annoying and the time for the test run is uncertain, so that as I travel a great deal I can never be certain to be available when my turn comes round. Under these circumstances I determined to apply for a certificate in a provincial town, where the whole business could be got rid of in a few hours. A friend of mine in the town, which for obvious reasons shall be nameless, made the appointment for me and lent me his car, a one-cylinder 5-h.p. car, which I know nothing about, but which has an adjustable carburettor which you have got to thoroughly understand before you can drive the car; in addition to this, the change of speed lever and gear was quite different to that in the usual run of cars. Five minutes before the inspector turned up I had a run round, which convinced me that I should require a day or two's acquaintance with the car to be able to make anything of it. When the inspector arrived, however, I took the heroic resolve and the steering wheel, and off we went on the first speed. It was freezing keenly and the inspector had no furs. One turn round the town, never off the first speed, was quite enough for him, and I was the happy possessor of a certificate authorising me to drive any petrol car in France.

THE question of the efficiency of mechanically-operated inlet valves is occupying the attention of automobile circles in France as well as in England, and there is the same difference of opinion here as there is in England. All makers admit that they are more suitable for motor-cars, but on the question of efficiency opinions are divided, for the results obtained in different cases have varied considerably. I had a long talk with Monsieur Darracq on the subject, and he informed me he had found an increase of 10 per cent. in the power of his motors, attributable to the adoption of mechanically-operated valves. The secret of success, says M. Darracq, is in not allowing the inlet valves to open too soon, but to let the piston first begin its suction stroke and then opening the valves sharply. Marcel Renault, on the other hand, judges that he loses power by operating his inlet valves mechanically. Monsieur Gaillardet attacks the question in an article in the "Bulletin de l'Association Generale Automobile," and he seems to think that the delicate question is the moment at which the inlet valve should be closed, and he seems to imply that this precise moment is better left to the automatic valve to fix for itself. In M. Gaillardet's opinion fashion has a great deal to do with the adoption of the mechanically-operated valve, though throughout the article he is very guarded and does not express a distinct opinion as to the efficiency of the one or the other.

Two events of interest to aeronauts close the year in a seasonable manner. In the first place, the unfortunate disputes which divided the French Aero Club at the time of M. Santos Dumont's now historic experiences in the navigation of the air which culminated in his rounding the Eiffel Tower and securing the Deutsch prize of 100,000 francs, have been arranged with satisfaction to all parties. The hatchet has been buried and M. Dumont (the prodigal son, as the "Auto-Velo" calls him) has re-entered the Club, and has been promptly presented with the gold medal of that Association and the congratulations alike of his friends and late adversaries, and thus the regrettable incidents which raised such journalistic polemics have ended happily. The other event is the hibernation of the "Lebaudy Air-Ship," which is now doing its winter slumber in a shed on the banks of the Seine at Moisson. It should first have made a trip to Mantes and back, and to witness this event a party of Parisians set off by automobile and by train last week, and assembled on the estate owned by the Lebaudys. However, Jack Frost arrived before them, and had done his work so completely that it was

found impossible, even after prolonged efforts, to get the motor to turn, and the spectators, after standing shivering for some hours in the biting wind of the plain, returned to Paris. It has been decided to abandon the trial run until the spring time.

THE general meeting of the Association Generale Automobile was held last week at the Hotel Pastoret, Paris, and was presided over by the Baron von Zuylen, who, in his address to the members, told of the good work taken up by the Association in several directions, one of the chief of which had the object of studying and making records of the roads open for tourists, marking out the dangers and difficulties, choosing suitable hotels where members will be able to receive attention and buy supplies, and in general making the way more easy and agreeable for the tourists. The question of vexatious prosecutions was also gone into, and Maitre Guerinet, a barrister *chauffeur*, announced that gradually even the severest of the judges are beginning to cool down, and are actually sometimes giving judgments in favour of the automobilists instead of, as formerly, ruthlessly condemning them without a hearing. Whilst referring to the A.G.A., I would like to call the attention of English *chauffeurs* who sometimes drive in France to the effort the A.G.A. is making to mark off all the dangers of the roads by means of a set of painted signals which have been very cleverly designed to give an indication of the danger ahead. The cost of doing this is, of course, enormous, and it would be impossible for the A.G.A. to undertake it. The A.G.A. have therefore called for *chauffeurs* to subscribe to this expense in the following original manner. The average cost of a sign-post is twenty-five francs, and for this sum the A.G.A. undertake to set up such a post at the spot indicated by the subscriber of twenty-five francs and on the sign-post the name of the donor will be painted. It would be a graceful act for an English tourist, when he observes a difficult corner, a bad hill, an awkward *caniveau* or any danger of the same kind, to carefully note the spot and signify it to the A.G.A., and send a subscription of twenty-five francs for a sign-post to mark it.

THE automatic time recorder, invented by Mors and adopted by the A.C.F., and of which I gave a description last week, has been set into operation for the first time at Dourdan. As far as the recording instruments themselves are concerned, the results were satisfactory, but the automatic portion of the apparatus was a hopeless failure and had to be abandoned. The automatic part consists of a thin wire stretched across the road, which is intended to break as a car passes, and by pulling a lever set the apparatus in operation.

INSTEAD of operating as it was intended to do, this wire either breaks without pulling the hook, or does not break at all. But the worst thing that happened to it was, as reported last week, whilst Le Blon on a Serpollet was making his trial. The first wire broke and duly started the chronometers, and Le Blon came on at record speed, but just as he came up to the next wire a passer-by ran out of his way, snapped the wire, and spoilt the record. To add to Le Blon's misfortune and to prevent him having another try, his chain broke. The day's adventures were not confined to Le Blon, for Fournier, who was to attempt to beat the record on his Mors car, after spending hours thawing the ice which had gathered in the bends of his water-pipes, kept his motor running so as not to allow it to freeze again, but the distributing ignition cam becoming unkeyed, broke a tooth in the gear which drives the magneto, and put the car *hors de combat* for the time being. The following day, despite the intense cold, the trials were begun again, the Mors recorder being used, but worked by hand. Fournier twice over did the kilometre in 29 seconds, and thus tied the record which he could not break.

MAURICE FOURNIER, on a Carreau motor-bicycle, covered the mile in 1 min. 5 secs. (55.38 miles per hour), being a record for the 50 kilog. class, as was also Lamberjack's 39 1-5 secs. for the kilometre (57.06 miles per hour).

STEEL ROADS IN AMERICA.

WORK has been commenced on the first section of the experimental steel road, three samples of which are to be laid in New York under the direction of General Roy Stone, by subscription of members of the Automobile Club of America. The track is being laid in Murray Street, between Broadway and Church Street, New York. The necessary steel has been presented to the Club by Mr. Charles M. Schwab, of the Steel Trust. The idea of the steel road is simply that of

FIG. 1.—SECTION OF THE STEEL ROAD.

providing tracks for the wheels of vehicles and letting the horses, where there are any, walk between the tracks. The steel road, according to General Stone, is essentially a modern idea, especially adapted to the era of automobiles and other rubber-tired vehicles. A general idea of what the rails look like can be obtained from the accompanying illustrations. They are forty feet in length and one foot in width. At the outer edges of the upper side there is a rounded ridge a quarter of an inch in height which will serve as a guide for the wheels and yet may be easily overcome. The plates are three-eighths of an inch in thickness. The big flanges

FIG. 2.—THE STEEL RAIL.

on the under side are 2½ inches wide, and are designed to be sunk into a bed of crushed stone so as to prevent the plates from side-slipping. In order to further assure perfect alignment fish-plates and binding rods will be bolted to the side plates underground, every thirteen feet. The ends of the plates, or rails, will also be bolted together. The rails will be laid with their inner edges 4 ft. 6 in. apart, or a distance of 6 ft. 6 in. over all. The foundation bed is 18 in. in depth and width. The larger stones are at the bottom and the smaller ones and gravel at the top. The foundation bed has a tile drain—an important feature of the construction. Considerable interest is being shown in the trials by American motorists.

AMONG the new members of the Automobile Club are Sir W. D. Pearson, Bart., Messrs. G. Montagu, M.P., and W. Younger, M.P., Sir W. B. Barttelot, Bart., and Sir C. Cameron, Bart.

At the annual meeting of the Dunlop Pneumatic Tyre Co., Ltd., last week, the chairman dealt at length with the subject of the Dunlop motor tyres, and in referring to the success they had recently achieved he pointed out that this was largely due to the intelligence, devotion, and application of Mr. John Gooding, the manager of the company's Para Mill.

THE COTHAM INLET VALVE.

IN our correspondence columns in a recent issue we published a letter from "H. C.," in which particulars were given of a novel form of inlet valve he has devised as a result of experiments with his 1½-h.p. motor-bicycle. Mr. H. W. Cotham, of Prescott, the gentleman in question, has, at our request, furnished us with the accompanying full-size sectional drawing of the valve. What led up to the idea was that Mr. Cotham noticed that while the motor of his machine was running, particularly at high speeds, there was a considerable amount of gas blown out of the mixing valve, this occurring in a series of puffs. At first he put this down to the inlet valve; and so reground it carefully, but that did not alter it in the least; then it occurred to him that the spring was too weak to overcome the inertia of the valve soon enough, so he fitted a stronger one. This decreased the amount of air blown back, but then the power of the engine was considerably decreased. He then designed a valve to be of less than half the weight though of the same strength. Referring to the

illustration, A is the dome-shaped head of the valve; B is the stem; C a brass liner, in order that a smaller stem may be fitted than that in the original valve; D is a standard 2½-h.p. De Dion valve seating; EE are the holes usually drilled in the seating to allow of the passage of the gas; FF are nuts to hold the spring in position and adjust the compression on the same. As will be seen, the shape of the valve is a part of a sphere, with the part of the sphere at which the seating is at right angles to the latter. The stem is 1½ in. long and 3-16 in. diameter, the valve seating is 1½ in. diameter and 3-32 in. broad, the dome is 1-80 in. thick, and the nuts on the stem ½ in. thick and ¼ in. across the corners. This works out at less than half the weight of the same size of standard valve, is just as strong, and, with a standard strength of spring, obviates the blow-back entirely without decreasing the power of the motor. Anybody may make use of the new idea, as Mr. Cotham informs us that he has decided not to patent the arrangement.

THE "K.C." MOTORS, LIMITED, has been registered with a capital of £20,000, to carry on business as cycle and motor manufacturers, etc.

ON Wednesday evening, in the Royal Institution, Colquitt Street, Liverpool, at the instance of the Liverpool Engineering Society, Mr. A. W. Brightmore, D.Sc., M.Inst.C.E., read a paper on "A New System of Motor Traction."

ARTHUR THACKERAY, aged twenty-five, a tramway-car conductor, in the employment of the Leeds Corporation, was getting off his car when he was knocked down and killed by a motor car, driven by Mr. Haydn Leigh, of Kirkstall. Mr. Leigh was not only unaware that Thackeray was about to cross the road, but he could not see him, owing to the tram-car obstructing the view, until he was upon him.

AN ENTHUSIAST'S FIRST MOTOR RIDE.

"GEE WHIZ," full speed ahead; we don't know anything about speeds, gears and combustion, but our driver does. He shall tell of these. Away from the "Wilds of Wales" and "Tally-Ho" first for Caerwent, the ancient Roman city, there to inspect bronze brooches, pottery, tessellated pavements and other objects, all fascinating to the antiquarian. After Caerwent we away for the Wye Valley and Forest of Dean. Are there many more beautiful rides than up the Wye Valley? Old Chepstow is soon left behind and we climb towards the Wyndcliffe, and then "Let her go" down the decline. Lovely Tintern is soon reached and then for Coleford. We fly through the Forest of Dean, while in the villages the sturdy coal-be-grimed miners smile at our car and jovial party. No high road motorists we, but by devious bye-ways and country lanes reach Newnham, where, in the old-fashioned, spotlessly clean and comfortable Victorian coaching inn, we take our ease for the evening, varied by a stroll to the tidal Severn.

The following morning we soberly proceed to Gloucester, and leaving, after a while, the Bristol main road, we again dive amongst the lanes and come out at Arlingham. Here an ancient house is our objective; its hoary walls and moat tell of generations long since gone. Once again we get under way, making for a dear old village green, Frampton to wit, the quaintest of old-

NAILSEA COURT.

time houses, timber-worked, with the oddest of gables, dwellings leaning this way and that, some supporting one another, others standing crookedly but cheerily alone, fit examples of a bright old age. Afterwards away to Dursley and Berkeley Castle. And now we get upon the Bristol road, and slide quietly down-hill into Bristol, where fresh petrol and stores will be obtained.

Next morning off to Avonmouth Docks, there to see the big work being commenced by Sir John Aird, and to find his busy representative, the general in command, marshalling his forces to carve out big docks, and so away again and good luck to "Bristol Redivivus." From Bristol we follow the high road for the west for a time, but soon betake ourselves to the bye-ways, for we seek for Nailsea Court, the home some 250 years ago of Major Wade, the defender of Gloucester against the Royalists, and after him the home of Rogers, the owner of the vessel which, being wrecked, left Alexander Selkirk alone on his island, and so gave us dear delightful Robinson Crusoe. A fine old pile, this Nailsea Court, redolent of ancient history; there are quaint tales of Madame Rogers, but no space here to tell them.

From Nailsea to Clevedon and thence over the Mendip Hills to Axbridge and from there to Bridgwater, stopping to dine at seaside Burnham, off the route, of course, for our car will, whenever possible, get off the big roads. Shall we ever forget the precipitous and sandy lanes of Wentwood? But that, gentle

reader, "is another story." And after Burnham the night ride to Taunton, the night air crisp, the roads freshly rained upon, just enough to lay the dust, and the car doing its very, very best. Is there any experience much finer than the first night ride on a motor and in good company? The ride all too short and Taunton too soon reached, for here we have to leave our car, and so — farewell.

The driver informed me that the car was one of the old type—6½-h.p. Daimler wagonettes turned out in 1899, and since November in that year has been running daily on public service and pleasure trips for the Aberdare Valley Motor Company, Limited, averaging at least forty-five miles per day. The motor is gravity fed with tube ignition, and, taking into consideration the mileage the car has done, goes to show what good work is in it. During the trip from Aberdare to Taunton a distance of about 450 miles was covered, and the driver did not open his kit box once.

SOME USEFUL NOTES.

NEVER push down upon a starting handle, always pull up, for, in the event of a back-fire, the hand may easily be released.

FOR treating belts use Collan oil. Never use resin or any similar compound. Resin has a most detrimental effect upon leather.

MANY cars will start away on second speed, but it is not an advisable practice. Always start with as little load on as possible, i.e., on the bottom speed.

SINGLE-CYLINDERED cars—e.g., the De Dion, Darracq—should be carefully managed as regards the gas. Drive upon as weak a mixture as possible, or the engine will overheat and the petrol consumption increase.

Do not forget to use the paraffin washer on a car; it prevents an engine becoming stiff from the oil sticking up the rings. If such a washer does not happen to be on a car, squirt a little paraffin down the compression taps.

AFTER a wet drive chains should always be removed and washed in paraffin, and then allowed to stand in warm Russian tallow until the latter is cold. Then wipe the chain well. Treatment of this sort will greatly prolong the life of a chain.

In a live-axle car always keep the universal joints well cleaned and well oiled. These joints take up any shock, and if they are not well cleaned and lubricated, one stands a very good chance of stripping the driving bevel or twisting off the crank shaft.

SHOULD a car develop a very fierce clutch, do not neglect it for one minute, as a fierce clutch can do very great damage. For a temporary remedy apply Collan oil to the clutch leather; then take the car home and ascertain the cause of the fierceness.

TYRES are not given the attention they should by the majority of automobilists. All conspicuous cuts should be plugged with cotton-wool and solution (in some outfits a special preparation is provided), otherwise the wet works in farther and farther every day, and the result is that the tread becomes loosened and peels off.

If the commutator on a car be on the dashboard, worked by a chain from the half-time shaft, be careful to either mark a link of the chain on a corresponding tooth of the chain wheel (both wheels must, of course, be marked), or have some distinguishing mark, so that the firing can easily be set if the chain comes off. On a dark night it is not a particularly easy task to set the firing of a four-cylindered engine.

HERE AND THERE.

LORD LOVAT has joined the ranks of automobilists.

AMONG the Society ladies motoring in Hyde Park, on Sunday, were Lady Newtown-Butler and Mrs. Gervase Beckett.

OWING to the demands upon the time of Mr. Lancaster, the engineer to the Automobile Club, it has been found necessary to appoint an assistant, who is now engaged daily in giving instructions in motor-car driving.

The 20-h.p. Wolseley double tonneau car built for Mr. J. Waddington, of Frant, Sussex. The body is specially designed to take an omnibus top for winter use.

IN addition to the many special features of their Christmas display, Messrs. Gamage, Limited, have not forgotten the claims of motorists, and gloves, gauntlets, caps and other seasonable clothing for them are being shown in great variety in their showrooms in Holborn.

IT is reported that the Chief of Police of Uralsk, Russia, has issued a peremptory order that no motor-car is to be allowed to run within his jurisdiction, owing to the scenes created by the appearance of one of these modern vehicles in the streets of a town which is largely frequented by peasants from the Steppes with their half-wild horses and camels.

AMONG motor-tailors Mr. Lovegrove is achieving distinction by the ingenuity of the ideas he embodies in cloth, fur, skin, or any material that comes to hand. At 175, Piccadilly, he has a very varied display of garments specially designed for motoring and well calculated to protect the wearer from all the vagaries of the English climate. There is an overcoat with a lining of silk and cotton in combination that defies the wind, and can be worn without attracting conspicuous attention when walking. One lapel folds over the shoulder below the coat lining, while the other crossing and fastening under the collar provides a complete protection for the chest. In ladies' garments Mr. Lovegrove has several excellent coats in fur, pony skin, and cloth, a brown leather coat being a notable feature of this department. Of recent introduction is a capital travelling and motoring rug, which is folded round so as to form a pair of waterproof trousers, perfectly obviating the unpleasantness of sitting on a damp driving seat. Being finished off with water-tight shoe soles, the feet are amply secured against the cross currents that often spoil the delight of motoring, while also preventing boots being muddied. This rug, which is likely to be a familiar feature on motor-cars ere long, is made in various materials, ranging in value from tweed to the most expensive fur. Of Mr. Lovegrove's stock of motoring accessories we shall have more to say in a later issue—but it may now be mentioned as completely embracing all the minor requirements, such as lamps, goggles, caps, etc., required by motorists.

WARNE'S Hotel at Worthing will be re-opened on the 21st inst., owing to the numerous applications that the proprietor has received from motorists and others.

Two entries have been received for the Eliminating Race for the Gordon Bennett Cup—one entered by Messrs. S. F. Edge, Limited, and another by the Star Engineering Company, Limited.

THE first of the lectures on "Locomotion," at the Royal Institution, by Professor H. S. Hele-Shaw, will be delivered on the 27th inst., the subject being the invention of the wheel. On the following Tuesday the principles of the motor-car will be explained.

MESSRS. J. W. BROOKE AND COMPANY, LIMITED, are designing a six-cylinder motor. With reference to the exhibition of a three-cylinder car at the Paris Show they write reminding us that they were the first firm to make three-cylinder motors in this country.

AN automobile, lent by Messrs. H. Smith and Co., of Barrow, was recently requisitioned in connection with carrying the "copy" of a political speech from Ulverston to Barrow—a distance of nine miles—and enabling the *Barrow News*, containing the address, to be sold in both towns the same evening.

WE have received a very effective pamphlet on Dunlop tyres for motor-cars, in which are several most useful pages dealing with the repair and care of tyres, as well as some excellent testimony to the value of the particular tyres with which the booklet is concerned. Novices will be interested in the page dealing with the selection of motor tyres.

MESSRS. VAUGHAN AND BROWN, the agents in this country for the Gillet-Forest cars, appear to be devoting special attention to the question of motor delivery vans. The accompanying illustration shows the van supplied by them some time ago to Messrs. John Barker and Co., of Kensington. This vehicle,

THE GILLET-FOREST DELIVERY VAN.

which is capable of carrying a load of one ton, covers about seventy miles per day, doing the work of several horses. So successful has the van been that three more are to be supplied to the same firm early in the New Year.

MR. THROPP, the County Surveyor for the Lindsey Division of Lincolnshire, says that the experiment of oiling the surface of the roads to prevent dust is only a temporary success, as when the wet commences a slimy mud is produced that is objectionable. The system is also too costly to be undertaken for the ordinary maintenance of roads. The suggested method of using tar macadam for country roads would, Mr. Thropp thinks, be far too costly for Lindsey.

CORRESPONDENCE.

THE AUTOMOBILE CLUB BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was with great satisfaction that I read the decision of the Joint Committee of the Automobile Club to adhere to the policy of conceding in any Statute for altering the present absurd speed limit that cars shall not be driven on the road without having on them some symbol which shall afford means of identification. I agree with the objection to numbers, but a name to be associated with a number in the Register will serve quite as well and be consistent with the old usage of naming coaches, and the present practice of naming pleasure boats, yachts, etc.

We are told in the automobile press that what is proposed is quite unnecessary, and I notice that editors head paragraphs with "Let Well Alone," and correspondents sign letters with "Let Sleeping Dogs Lie." It will be obliging if they will tell us what it is that is "well" and to be left alone, and who are the dogs that are asleep. Until they do so, we may take the liberty of holding the opinion that there are more ostriches than dogs about, and that these proverbial expressions are as appropriate to the actual situation as was the solemn utterance of a certain sleeper at the bottom of the Hill Difficulty: "Then said Presumption, 'Every tub must stand on its own bottom.'"

Meantime I shall continue to have the belief that things are anything but well, and that this is no time for sleeping. It is a time for all moderate men to dissociate themselves from a class of automobilists already too numerous, who sacrifice to their own gratification that kindness and consideration towards their fellow-citizens, the absence of which tends to make the life of others unpleasant, and to rouse just indignation. Our principal reason for proposing now to put a symbol on our cars is that we desire our fellow citizens to know that we are out of sympathy with the apparent determination of some to use our roads as if they were made for racecourses, tearing along with roaring exhausts; in dry weather enveloping other users of the road in such a cloud of dust that for minutes they cannot move with safety, and so must sit until it settles down on them, while in wet weather they bespatter carriages and foot passengers with showers of mud—in a word, displaying a cynical want of ordinary courtesy and consideration that deserves the strongest condemnation.

I say nothing just now of the great alarm caused to people—even those who are not abnormally nervous—and of the actual risk which express-train speed on open roads necessarily gives rise to.

I am prepared, as a protest against the conduct of such enemies of true automobile sport, if some other gentlemen will do the same, to put a name on my car now without waiting for statutory compulsion.—Yours truly,

J. H. A. MACDONALD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The lot of the motorist is truly an unhappy one. We are boycotted by the railway companies and persecuted by bucolic county magistrates. We have to pay a heavy tax to be allowed on the road at all, and now they want to number and licence us like cabmen.

To the small car owner this means an increased expense for the number-plates, license, etc., besides endless worry with his "lit-up" numbers at night.

According to some motor papers, the industry in the future will be largely dependent for orders on the small car owner, but I venture to think that by the time we have been tied down with a few more restrictions by a paternal Club, he will be as extinct as the dodo.

No, Sir; in my humble opinion it would be better to have one's name and address on the car in one-inch letters, thus getting off the two-guinea tax; it could hardly destroy the privacy of a car more than the proposed ugly number plates. I should like to add that, until lately, I thought there was something in numbering, but was completely converted after reading the arguments in last week's *Journal*.

It is much to be hoped that the motor trade is alive to the dangers of this proposed numbering Bill, and that they will oppose it to the utmost.—Yours truly,

"OPPOSER."

NUMBERING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The action of the Club and Legislative Committees at their meeting on the 3rd December reminds one of the "man and his cuddy." He tried to please everybody. He pleased nobody and lost his donkey into the bargain.

The numbering proposals of anti-motorists are made because they hate the motor-car, and wish to see it banished off the road; or, not to be uncharitable, they ask for a number so that the car going beyond the legal limit may be identified. Of course a car travelling over the legal limit could not be identified by its number, and more particularly on a dusty or muddy road, but county councils and other authorities who have no experience of motoring will not believe anything to the contrary. Of one thing the motorist may be certain, and that is that these authorities have no intention of conceding the abolition of the speed limit. They desire a limit to speed, and to have a number too. On our highways, be there little traffic or otherwise, I do not think that even motorists who are content to travel, say, at twenty miles an hour have any desire that these

highways be overrun with cars geared to sixty or seventy miles an hour. They are a positive danger to all users of our roads, and should be confined to a special track.

At the meeting it was suggested that the Act or regulations made under the Act might provide that the "method of identification should not be made use of unless the driver could be charged with having driven to the danger of other passengers." A clause to this effect will not prevent cantankerous people putting the motorist to the trouble and expense of going to court to prove there was no danger to other passengers, and with a prejudiced magistrate on the bench the chances are ten to one the motorist comes off second best.

Like all other innovations, motoring has to run the gauntlet, and till then it is surely better to put up with the ills we know than take on those which would simply make the life of the motorist unbearable and put back for a generation an industry which can only be for the welfare and the best interests of our country.

Our thanks are due to the Editor of "Auto-Velo" for his able article on the question in last week's *Journal*, and it is to be hoped it will be made as public as possible.—Yours, etc.,

JOHN LOVE.

MECHANICALLY-OPERATED INLET VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think Mr. Frank Morriss falls into a little error in supposing it to be possible that any cylinder can "be thoroughly scoured on its exhaust stroke." There must be an amount of used gases left to fill the firing chamber, and if the exhaust valve be set to its best advantage these used gases may scarcely be above atmospheric pressure. Therefore there would be no tendency to escape through the mechanically-operated inlet valve.

In all engines this amount of gas must mix with the fresh charge, so contaminating it. Mr. Morriss is quite right in advocating a short induction pipe, but not for the reason he gives. Suppose any burnt gases do escape through the mechanically-operated inlet valve into the suction pipe, a short pipe would be beneficial if a spray carburettor be in use, as the gases would then escape through the air holes; but if a surface carburettor, then the gases would remain in the carburettor. In his letter he does not state which. On this theory it would indicate that a surface carburettor must in no case be used in combination with a mechanically-operated valve.

In engines coming under my notice for repairs, I take the liberty of altering the timing of the exhaust valve where I find it differing from my ideas, which is to set the exhaust valve so as to close very late, viz., at the commencement of the suction stroke. We all know that there is a time (however small) when the piston is absolutely stationary; therefore, why not utilise this time to allow the expanded gases to escape through the exhaust, so leaving as little as possible behind? In order to gain this result, three years ago I fitted a large valve to a tricycle, operated from the top bar of frame, allowing the exhaust gases to escape into the air through a two-inch pipe, and only three inches from the exhaust valve. Naturally, I used this only on roads void of traffic, but with grand results. I see the Mercedes are now, fitting something of the kind.

From experiments I have made, I find the automatic inlet valve does not close as soon as it is generally supposed to do. Granted, that on the suction stroke taking place a vacuum is formed, more or less according to the strength of the spring, but this vacuum is immediately filled when the valve opens, and the inrush of gas is so great that it causes the valve to remain open until the completion of the down stroke, so that the cylinder must get fully filled. This rush of gas, when once started, has a power of its own, and when the valve does close (and possibly this does not occur until after the commencement of the up stroke) this power is not expended, for if you drill a small hole in the inlet pipe near the valve and hold a flame near it, the out-rushing gas fires in a long stream at the moment of the closing of the inlet valve. The same phenomenon can be observed by suddenly turning off your sink tap (when connected with the main): a loud shock will be heard, generally taking place where the pipes are highest in the house, caused by the impetus of the water knocking against the ends of the pipe.

I think it, at present, remains to be proved which of the two kinds of inlet valve is the better, especially when some of our great authorities, like De Dion, hesitate which to use.—Yours faithfully,

FRANK COX.

WIRE & WOOD WHEELS FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would prove interesting if some of your readers who have had experience of both would give their view of wire wheels as compared with those of the artillery type for use on light cars. Until recently the light motor-car has been largely supplied with the cycle type wheel, but there appears to be a general tendency to discard that in favour of those of the artillery type. The points to be considered are strength, durability, and appearance. As to the first point, much needless discussion would be avoided by subjecting wheels of the different styles to practical tests. A series of tests could be selected that would no doubt prove conclusively the relative strengths. Citing isolated examples of cases where wheels of the two types have failed is absolutely without value in determining facts. The strength of such an argument will evidently be on the side of

the one who has the greater amount of energy and displays the greater number of cases. Durability evidently cannot be so easily determined. It will, however, depend to a great degree on the strength. The third point, appearance, is largely a matter of individual taste. It does, however, to some extent depend upon the general lines of the vehicle. A heavy motor-wagon would look just as incongruous on slender cycle tyres as would a lightly-made bicycle equipped with wood wheels.—Yours truly,
F. R. R.

SCOTTISH VIEWS ON NUMBERING.

A MEETING of the Western Section of the Scottish Automobile Club was held in the Windsor Hotel, Glasgow, on Monday, for the purpose of discussing speed, numbering, and registration questions. Mr. H. M. Napier presided, and there was a large attendance of automobilists from different parts of Scotland.

Mr. John Adam, of Larchgrove, who opened the discussion, said that his object was to endeavour to come to some reasonable basis which would satisfy the public without at the same time hindering the progress of the trade, which was at present in its infancy, but which might in the near future revolutionise the inter-communication of what might be called the district carrying trade. It would not confine itself to passenger and pleasure vehicles, but the larger portion of the motor manufacturers' business would

from an official source, which showed that in 1830 the stage coach between London and Birmingham went at from eleven to eighteen miles an hour. The average speed of the Shrewsbury coach worked out at seventeen miles, and at the present day London 'buses were driven at twelve miles an hour. Yet motorists were breaking the law if they went a little faster than a London 'bus. He did not think he was far out of it when he said that Glasgow tramcars, at some part of their runs, touched sixteen miles an hour. Coming to the Act of Parliament by which they were at present governed, and which had caused so much feeling, he quoted from the speech delivered by the author of the Bill, the Rt. Hon. Henry Chaplin, at a dinner of the Automobile Club. He thought that the County Councils, both in Scotland and in England, were looking at the motor law in a very reasonable frame of mind. They all admitted that an amendment of the law was desirable, if not necessary, and most of them thought that numbering and registration would meet that requirement. If a "Road Hog" knocked a man down on the highway his car could be identified by a number. If they could show how a person guilty of such an action could be brought to justice he believed a large part of their trouble would be overcome. On the other hand, many motorists had well-founded objections to their cars being ticketed like cabs, and these objections came from very careful drivers. It was quite within the bounds of possibility that persons, who had no ideas of speed, and had at the same time prejudices against motoring, could easily be got to swear that the most considerate driver was endangering the lives of a whole neighbourhood, and even the incorruptible policeman might lose his usually perfect judgment if backed up by a horsey member of the great

A "FAIR" LOAD ON AN 8-H.P. MERCEDES CAR.

[Allgemeine Automobil Zeitung.]

consist in building conveyances for goods. The more perfect and reliable motors became, the more they would be used for business purposes. The first point they had to consider was the reason of the opposition to motoring. The motorist, known as the "Road Hog," could not be defended, and he was afraid the "Hog" was often the cause of the reasonable man being caught and fined. Any law made to stop him would be willingly accepted by the majority of gentlemen who were considerate for the comfort and safety of their fellow men and road users. Coming to the question of non-motorists—who had not taken advantage of the opportunities afforded of informing themselves of the power of control and safety of cars—he had been told of an engineer who had seen a motor-car going along the streets of a Glasgow suburb at the rate of from 80 to 100 miles an hour. (Laughter.) Probably it had been going at about 30 miles an hour. He contended that motor-cars were as safe as horse-drawn carriages going double the pace. He had been met with the answer that horses could not be driven at the rate of eighteen miles an hour, but that was easily replied to by quoting

unpaid. That was the risk of numbering. In conclusion he hoped the day was not far distant when this country would see that it would be to its advantage to promote an industry which would, he thought, have more far-reaching effects than most people at present imagined.

Mr. James Burns, Town Clerk of Motherwell, considered that numbering was not a satisfactory means of identification. Some other means should be devised. He thought it would be much easier to recognise offenders from the goggles worn by the driver, or by the numbers of passengers, or by their sex. If they could not tell from these, how much less could they tell from a number attached to a dusty machine?

Mr. William Kingsburgh pointed out that if the number on a motor-car was damped before going out for a run, the car would not go far before the number became totally obscured.

Mr. T. Blackwood Murray expressed himself in similar terms.

Mr. Norman D. Macdonald, Chairman of the East of Scotland Section, said he objected to private owners being subjected to the rules, regulations,

and restrictions of cabmen. He could not see why the nobleman's carriage, or the noble lady's brougham, should be immune from the restrictions which were imposed on a motor-car owner. He was strongly against the proposal, and did not see why the matter should be brought up at all. His advice at present was to wait.

Professor Galt said he was opposed to delay, and asked what was to be gained by it.

Mr. R. J. Smith, Secretary of the Western Section, Mr. F. A. Macquisten, Mr. John Shaughnessy, and the Chairman also took part in the debate, the last-named suggesting it was more necessary to license drivers of horses than automobilists. He thought waiting was the policy. As for county councillors, they were a lot of busybodies who wanted something to do in their spare time.

Mr. Adam was, at the close of the meeting, awarded a vote of thanks for his paper, but in regard to the numbering question he had only the support of Professor Galt, the feeling of the others being that legislation should not be invited in the meantime.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Sheffield	H. Bush, Leeds	25 m. p. h.	£1, etc.
Horsham	C. M. Guy, Crawley	23 m. p. h.	40s. "
Stockport ...	H. Chapman	—	Dismissed.
Bedford	A. du Cros, London	20 m. p. h.	£5, etc.

Where no alleged speed is given it is understood to be above the legal limit.

IN the case against Mr. Arthur du Cros at Bedford the Police Superintendent said that the Chief Constable of the county had given instructions that no prosecution should be taken in connection with the driving of motor-cars unless it was accompanied by danger to the public.

SEQUEL TO A REGENT STREET ACCIDENT.

THE sequel to the motor-car smash which occurred in London earlier in the year has just come before Mr. Justice Darling and a common jury. Leonard Gay, of 91, Regent Street, suing Mr. Oswald Lord for £1,175, the amount of damage done to his shop front and goods. Mr. J. A. Symmonds, who appeared for the plaintiff, said that shortly before two o'clock on the morning of April 23rd defendant drove his motor-car, in which a lady and gentleman were riding, down Regent Street. He was running at 25 or 30 miles an hour, on the wrong side of the road. He tried to stop, and put on the brakes, but the car skidded, mounted the pavement, and crashed through the revolving shutter of the plaintiff's shop. Police-sergeant Parker gave evidence of the accident. The jury assessed the damages at £600.

NO LIGHTS.

T. TAYLOR, Reading, has been summoned at Guildford for driving a light locomotive at Knaphill on the 15th ult. without having the necessary lights attached. Fined 20s.

EDGAR COLLETT, motor-car proprietor, of Bournemouth, was summoned at Christchurch for not exhibiting the necessary lights on his motor-car after lighting-up time on the 17th November. Mr. George Chilton, solicitor, appeared for the defendant, who pleaded not guilty. P.C. Carter said he saw the motor-car in the High Street proceeding in the direction of Purewell at eleven o'clock on the 17th ult., and seeing no red light at the rear of the vehicle, he stopped the driver (the defendant) and asked him where it was. The defendant said it had gone out. There was a red lamp at the rear of the car, and defendant lit it again. In answer to Mr. Chilton, witness said there were three white lights on the front of the car. He did not see the small red light at the back of the lamps on the sides of the front of car when he was standing at the rear of the vehicle. The defendant, on oath, said the small red panel which was set in the back of his two front lamps could be seen from the rear of the car. The red lamp attached to the rear of the car must have blown out just after passing the railway bridge in the Barrack Road. Sidney Millett, motor-car proprietor, of Boscombe, who was driving his car in company with the defendant on the night in question, said the small red light in the rear of the car was alight up till the time he passed him by the corner of the Station Road. The Bench fined defendant 1s. and 13s. costs.

DISPUTE AT NOTTINGHAM.

AT a special sitting at the Guildhall, Nottingham, on Monday, Frederick Collins, motor-car driver, was charged with stealing a motor-car, the property of Messrs. C. Allen and Co., on the 2nd inst. Mr. H. B. Clayton prosecuted, and Mr. W. B. Smith appeared for the defendant. Mr. Clayton explained that Messrs. Allen and Co. found that the motor-car required repairing, and in September last sent it to the premises of Mr. Arthur Collins, brother of the defendant. At that time, Frederick Collins was in the employ of Messrs. Allen and Co. as a motor-car driver. The repairs to

the motor came to £16, but there was a dispute as to the amount of the bill, and the car was taken to some premises and stored, as the prosecutors would not pay the amount charged, thinking it unreasonable. That matter had not been settled yet. At the end of September the company again got possession of the car, paying the cost of the storage previously. This was because they had received a letter in which it was threatened that if the £16 was not paid the car would be disposed of. The car remained on Messrs. Allen's premises until November 22nd, when defendant was discharged from the prosecutors' employ. On December 2nd the defendant went to the premises, where the car was stored, and took the vehicle to the premises of his brother, Arthur Collins. Then it was removed to the premises of a man named Crofts, who was the landlord of Arthur Collins. It was perfectly clear, said Mr. Clayton, that the defendant had no right to remove the car from the prosecutors' premises. The result had been that the prosecutors had been unable to regain possession of the car, a valuable property, as the wheels had been taken off. Mr. Smith submitted that there was no case for him to answer. He admitted that they still had the car, and that the wheels had been taken off, but that was for protection, as a claim against the debt owing by the prosecutors.

The Bench intimated that they would require stronger evidence than had been submitted to convince them that there had been felonious intent on the part of the defendant. The summons was dismissed.

MR. H. SCOTT RUSSELL, of the D'Oyley Carte Opera Company, is doing his journeys in Ireland on his 8-h.p. Peugeot car.

Madame must really be careful. In a recent issue she referred to an English lady who is "having built for her by the Motor Garage Company a 60-h.p. Mercedes-Simplex."

THE following advertisement is taken from the columns of a New York daily:—"Wanted to Exchange—Topsy, a full-grown elephant, for an automobile.—Address, Lund Park and All World's Amusement Exposition, Coney Island."

MR. F. W. PECKHAM, of the Oldsmobile Company, who is at present in the United States, is reported to have secured the English agency for the Winton cars. It is also stated that he is bringing to England the Baker electric torpedo, with which he hopes to capture the mile and kilometre record.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, DECEMBER 27, 1902.

[No. 199.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN our Correspondence columns this week Mr. Norman D. Macdonald contributes an important letter to the discussion which has been going on with regard to the numbering of motor-cars and the harassing of motorists. He suggests that a plebiscite should be taken of all motorists with regard to their views on the question, and also as to the desirability of delay in the matter. The idea is a decidedly good one, and can, moreover, be carried out without delay or difficulty. All that is required is for each Club Secretary to send a

Prosperity follows the Car.

postcard to the members of his own association and thus obtain their opinions. We feel sure such action would reveal the strength of the opposition to the numbering proposals that have lately been advocated.

ago John Bright and others—as a correspondent who has lately been motoring in East Anglia reminds us—pointed out that magistrates who owned and rented game preserves were not always the most desirable persons to try poachers. So the question may arise as to whether horse-breeders and others interested in similar pursuits should be allowed to adjudicate in motor-car cases.

Hotel Enterprise.

AMONG the evidences of the national prosperity associated with automobilism is the expenditure that has been necessitated at the leading hotels at seaside resorts. At Warne's Hotel at Worthing, for instance, more than 800 cars have been stabled during the past season. To the equipment of the garage there has now been added a 7-h.p. motor-car for emergency purposes, and any motorist whose car breaks down within twenty miles of the town has only to telephone to 0199 Worthing and the car will be despatched with a competent engineer to assist the hapless motorist. A new charging station for accumulators has also been fitted at the hotel, and Mr. Warne has also made arrangements with the Corporation Electricity Works for the charging of electrical cars.

Educating the Public.

AT the last meeting of the Renfrew County Council Mr. Cross called attention to the speed of motor-cars, and moved that it be remitted to the County Road Board to consider the advisability of posting up notices in the various villages of the county setting forth the existing state of the law regarding the matter, and showing the rights of those in charge of horse vehicles in connection with the speed of motor-cars. This was agreed to.

"Wake-up, England."

"IN France, even now, there is a feeling amongst travellers that they have been born too soon to be able really to enjoy the joys of the automobile, for roads and road laws have not yet been made for us, and they therefore suffer continually. But in England matters are worse, and what a pity!" Thus writes M. D. Yzelen in a French contemporary. This gentleman, who has recently been touring in this country, goes on to remark that "Hospitality there is so genuine, life so comfortable, and the roads across a very pretty country are most agreeable. I have still before my mind the delightful picture presented by the landscape during a tour from London to Bournemouth, *via* Maidenhead, Basingstoke, and Southampton. There, thanks to the system of undivided property, the country is nearly always like one continual park. It does not assume that ugly utilitarian aspect it does in France wherever cultivated; there are no pieced-out fields, cut up by innumerable hedges and bordered by ugly pollards; instead, the emerald undulation of the meadows, shaded by the rich foliage of magnificent trees in the soft bluish but pleasant mist of the atmosphere. But I must stop, I will not linger on the charms of which Wordsworth and Constable can give a better idea, and in the meantime will wait for Great Britain to rouse herself from a lethargy already too long, and open her mind to the automobile movement and at the same time her doors to foreign *chauffeurs*, whom the fear of contraventions, the scarcity of petrol depots, etc., at present prevent from visiting her many beauties."

"Who's Who."

"WHO'S WHO" is an annual biographical dictionary of nearly every person of public importance. The 1903 volume, just issued by Messrs. A. and C. Black, is as complete and accurate as the preceding volumes, and the recreations of well-known people afford interesting reading. Motoring is among the chief sports of the Earl of Shrewsbury and the Right Hon. A. J. Balfour. The Right Hon. Sir J. H. A. Macdonald is described as a strong supporter of the automobile movement. Mrs. Kennard's motoring enthusiasm is mentioned, and her favourite summer amusement is "to go off on a tour and ride forty or fifty miles a day, seeing the country, natives, etc." Mr. Alfred Harmsworth is duly described as editor of the *Badminton* volume on motoring, while motoring is also among the recreations of Messrs. Hildebrand and Leicester Harmsworth, M.P. The Hon. C. S. Rolls has for recreations "music, acting, football, motoring, and ballooning," and for hobbies "engineering: business." Altogether "Who's Who" is interesting as well as informative.

Hunting and Motoring.

THERE is a complaint in hunting districts that motoring has affected the hunt, and that most devotees of fox-hunting have found new interests in the automobile. Probably there is a great deal of truth in the statement; but it must not be thought that because sportsmen have become motorists they have ceased to be huntsmen. They may occasionally miss a meet, but that they have permanently given up following the hounds is hardly conceivable. Many huntsmen—Masters of

Hounds included—recognise that the motor-car has its place in our countryside, and that it really opens up the pleasures of an open-air life in a way never before known. In fact, we have heard it said that, in facilitating the foregathering of those interested in the chase, the motor-car has rather helped than lessened the attendance at meets in many otherwise inaccessible places.

A Scene Near Brighton.

WITHIN easy distance of London-by-the-Sea are several charming hamlets well worth visiting by the many motorists who spend the week-end at Brighton. Rottingdean has many artistic and literary memories of Sir E. Burne-Jones, William Black, and Mr. Rudyard Kipling, while a few miles distant is Ovingdean, with its tiny church and picturesque location. Here was taken the accompanying photograph of Mr. Frank Taylor on his 6-h.p. Weston steam car—the same car as that on which he toured Ireland in the summer.

A 6-H.P. WESTON CAR AT OIVINGDEAN (SUSSEX).

Mechanically Operated Inlet Valves.

COMMENTING on the tendency towards the adoption of mechanically-operated inlet valves, both for high speed and low speed petrol motors, the "Horseless Age" considers that the adoption of these valves for motors of high piston speeds is easily explained.

Mechanical operation permits the valve to be made larger, heavier and stronger, so as to endure more rapid closing. The larger the valve-opening, and the shorter the time of opening and closing, the higher will be the speed at which the motor gives its maximum power, and the greater, therefore, its horse-power. In low-speed motors, this consideration does not apply. The motor speed is purposely kept down to reduce wear and tear, and a complete charge can easily be obtained with the ordinary suction intake valve. The reason for the adoption of the mechanically-operated valve must therefore be of another order. It is, without doubt, because mechanical valves, in spite of the added complication, are less troublesome than automatic valves. It is well known that the spring pressure of an automatic valve must be minutely adjusted if the valve is to give good results. If the spring is too stiff the valve opens insufficiently and the motor is choked; if, on the other hand, the spring is too slack the valve closes late, some of the charge drawn in is forced out again before the valve seats, and in extreme cases back-firing occurs. What aggravates the matter is that a spring valve once correctly adjusted will not remain adjusted, even if precautions are taken to prevent dislocation of the spring stop on the valve stem. The effect of the rapid compression and extension of the springs is to reduce the elasticity, and the springs therefore lose some of their original

pressure in course of time. This effect is the more pronounced the greater the ratio of the compression to the total length of spring, and, as in practically all automatic inlet valves the spring is enclosed, it is necessarily short and the above ratio large.

Experience will Show.

ORIGINALLY automatic inlet valves were the general practice. The present adoption of mechanical valves is a deviation from this practice, which has not yet become sufficiently general to form a conclusion whether the mechanical valve will eventually supersede the automatic one or not. Both kinds of valve are, of course, quite practicable, and the question of the superiority of one or the other involves some points that can only be decided by long experience with both kinds.

Another New Book.

THE popularity of the automobile is responsible for the filling of bookshelves; and to the lengthening list of books on motor-cars must now be added another, Mr. Rhys Jenkins, M.I.M.E., having written "Motor-Cars and the Application of Mechanical Power to Road Vehicles." This is published by Mr. T. Fisher Unwin, and is apparently designed to fill a place between the technical volumes of Mr. W. Worby Beaumont and the Badminton book on "Motors and Motor-driving." Like all Mr. Fisher Unwin's publications the tome is attractively got up, and although the hundred or so illustrations in its pages are familiar to all who follow the *Journal*, they will have some interest for the general reader.

Early History.

IN his introduction Mr. Jenkins refers to the present agitation for the removal of the speed limit, but dismisses it with a curtness that adds nothing to the discussion. On the subject of roads the author writes with fuller knowledge, and rightly insists on the necessity of improvements on the highways being necessary in the development of the automobile to a more perfect state than the present. Several chapters are devoted to animal power cars, carriages propelled by the wind, early attempts to apply steam power to road vehicles, and the boom between the years 1824-1840—all well-known phases of automobile history. The section devoted to the steam carriages brought out between 1858 and 1881 is of considerable interest. Electrical carriages are given a short historical chapter, concluding with the failure of the electrical cabs in London, in 1897. Another deals with developments since that date.

The Present Movement.

NATURALLY the greater part of the volume is concerned with what Mr. Jenkins calls the modern revival. A good account of the common features of petrol cars is followed by descriptions and diagrams of all the well-known cars:—Wolseley, Daimler, Lanchester, Argyll, M.M.C., Panhard, De Dion, Benz, Mors, Mercedes, etc., while shorter accounts are given of the principal features of nearly all the leading British, French, and American vehicles. The work also includes chapters on motor-cycles and motor vans and wagons, concluding with a consideration of such technical questions as gearing, brakes, horse power, etc.—the whole three hundred and fifty pages forming a useful book, well suited to the requirements of the motoring novice.

Motoring and the Profession.

THE dramatic profession has been most kindly disposed towards the automobile, not only introducing it on to the boards, but also in promoting its popularity in the streets. Actor-managers like Mr. Beerbohm Tree and Mr. Lewis Waller are ardent motorists, while a goodly number of actresses have proved themselves expert drivers.

For Touring.

Napier is a triumph of the coachbuilders' art, and reflects credit on the Coupé Company, who have carried out Mr. Ogilvie's suggestions. We hope to give an illustration of the car together with further particulars in a later issue; meanwhile some account of the body itself will be of interest.

Seating Arrangements.

THE carriage is designed to carry six passengers, including the mechanic. The central seats are raised nine inches above the front one, thus overcoming an objection to the rear seats of most automobiles. As a rule the passengers at the rear see little or nothing of the road ahead. But not so in Mr. Ogilvie's new car. The raised seats are protected at the back with a hood, which, when down, entirely shields their occupants from dust. The hood is so designed that (by the addition of two

MR. LESLIE BUCKNALL AND THE WRECKED BALLOON "VIVIENNE II."

Photo by]

moveable side columns and a section of the roof, which are carried on the car) it can, in less than three minutes, be converted on the open road into a landaulette or miniature brougham. This covered in carriage will prove useful and convenient, not only while touring in bad weather, but for driving out to dinner and evening parties, as the owner is dispensing with his horses and intends to rely solely on his car. The rear Spider seat, which is on a level with the central seats, is for the servant (when not driving) and the fifth passenger.

Luggage Carriers.

SPECIAL attention has been given to the disposal of luggage, a necessary point in touring. Under the seats of the landaulette is a boot—somewhat on the lines of that on a four-in-hand, access to which is obtained from the rear of the car. Into this boot are fitted two canvas suit cases or dressing bags 19in. by 29in. by 13½in. Below the Spider seat is another large dust-proof tin portmanteau, japanned like an officer's kit case, measuring 30½in. by 18½in. by 10in. Under this again is a groove or slot, which carries the moveable flap of the top and the side columns of the landaulette when not in use. Beneath the footboards of the Spider seat are two compartments divided into

various pigeon holes, to carry all necessary spare parts and tools, while under the frame, and between the rear wheels of the car (with doors opening out backwards), is another large box to carry the Castle and Bleriot search lamps during the day time. While going on long tours, picnic or shooting parties, this box is designed to be available to carry further luggage, a luncheon hamper, or guns, ammunition, etc., instead of lamps. There is also a large and roomy well beneath the footboards of the landaulette, where the servants' luggage and emergency stores are carried.

Naming the Car.

ALTOGETHER the novel appearance of the body well warrants the space we have devoted to this description of its main points. Our impression on seeing it in the Regent Street garage the other day was that it presented some of the elegance and substantial appearance of the old stage coaches. Its long wheel base is certainly notable. The body is painted in Napier green with black moulding and fine lines of red, the wheels being of a rich red colour with broad green lines. Mr. Ogilvie has christened his car "Stai," the familiar cry of the

READING AS SEEN FROM A BALLOON.

(Mr. Frank H. Butler.)

Venetian gondoliers and motorists in the eastern counties will welcome him to their ranks. At one time he sat on the Kingston and Guildford benches as a Surrey county magistrate. Were he to do so now he would probably not be happy in such uncongenial company, from a motoring point of view.

MR. C. D. ROSE, one of the candidates for the representation of the Newmarket Division of Cambridgeshire, is touring the constituency on a motor-car.

THE report is being widely circulated that the London County Council may shortly be experimenting with an automobile ambulance.

THE first of the motor-omnibuses designed by Mr. Stirling for the London Motor Omnibus Syndicate has commenced its trial runs on the Cricklewood and Oxford Street route.

A SERIES of balloon ascents for reconnoitring purposes was inaugurated at Aldershot on Saturday, by Mr. Harold Norfolk, of the 13th Hussars, the balloon being in charge of Mr. Spencer. The Hog's Back was crossed at an altitude of 5,000 feet, and after passing over splendid country a good descent was made one mile from the sea at Angmering, near Worthing.

The Paris Motor-Car Exhibition.

(Concluded from page 810.)

GENERAL VIEW OF THE SALON.

VISITORS to the Exhibition have this year been more numerous than ever, and the English contingent has been particularly large. One distinctive feature this year was the arrival of the provincial agent, who no longer relies on the London firm, but comes over from Edinburgh, Glasgow, Dublin, Manchester, Liverpool, Birmingham, and countless other towns to see and judge for himself. There can be no possible doubt that this will greatly influence next year's trade, for the provincial agent will no longer be satisfied with old models. The Exhibition itself has much the same appearance as last year, except that one misses the navigable balloon and Ver-

lines. Fig. 11 gives a plan view of the 20-h.p. chassis, and Fig. 12 an illustration of the four-cylinder motor; it is fitted with mechanically-operated inlet valves, and a governor acting on the admission. The connection between the engine and the

FIG. 11.—PLAN OF THE BROUHOT 20-H.P. CAR.

cingetorix, which were the first things that struck one's attention on entering the Palace.

Messrs. Brouhot and Company, of Vierzon (Cher), have given up their old construction, and are now turning out 10-h.p., 15-h.p. and 20-h.p. cars on what may be termed the standard

FIG. 12.—GENERAL VIEW OF THE BROUHOT 20-H.P. FOUR-CYLINDER MOTOR.

change-gear box is through a special form of clutch, which consists of a leather-faced steel spring band. The latter is held in position on the male clutch by means of a gun-metal disc, and is prevented from twisting round by a steel key on the male clutch. The frame of the car is built of wood and steel.

The cars of the Societe des Automobiles Gillet-Forest, of St. Cloud, are easily distinguishable by reason of the form of their bonnet and radiator. Two standard types of chassis are being made, one having a 6 to 7-h.p. motor and the other one developing 9 to 10-h.p. In both the engine is of the single-cylinder horizontal type, running normally at a speed of 900 revolutions per minute. A governor is provided, this acting on

with either a Clement or Aster motor. This vehicle has a long Mercedes style of bonnet and cooler, air being drawn through the tubes in the latter by a belt-driven fan. Governing is by a throttle on the inlet, the levers for throttle and ignition control being placed on the dashboard. The frame of the chassis is of wood, backed by a steel fish-plate. The change gear is driven by a leather-faced cone friction clutch, and gives four speeds

FIG. 13.—THE GILLET-FOREST 9-10-H.P. TONNEAU.

the exhaust valve; by means of an "accelerator" the speed of the motor can be varied at will from 200 to 1,200 revolutions. Three speeds forward and a reverse motion are available by means of a train of sliding gears. The engine transmits its power through bevel gearing to the change-gear box, and thence by a longitudinal shaft and bevel gear to the rear live axle. A special form of radiator is used, the water circulation being on the thermosyphon system. Messrs. Gillet-Forest claim to have produced a

forward and a reverse. All the bearings are lubricated by grease from a central feeder on the dashboard. The countershaft brake is lined with iron, and the brake drum is cast with an internal flange on the face; this flange has teeth cut on it to engage with a pawl, which can be raised or lowered by the driver, and, when in action, it entirely prevents the car from running backwards. The Gladiator Company are also building a two-cylinder 10-h.p. car fitted with the honeycomb cooler.

F, Brakes.

car which requires a minimum amount of attention on the part of the owner, and the large number to be seen running about Paris bears testimony to their success.

A distinct advance both in design and detail is to be seen in the Gladiator cars. The most interesting exhibit on their stand is the new four-cylinder 12-h.p. car, which may be fitted

The Roadway Autocar Company, Ltd., has a stand on which they show a 15-h.p. Mors in racing trim, and one of the new type Renault 10-h.p. two-cylinder cars.

Mr. P. Corbeau, of Port Audemer (Eure) is making a speciality of leather suitable for the upholstering of motor-cars, and exhibits some excellent specimens.

Les Usines de Prunel, of Puteaux, exhibit a range of Prunel cars, including a little 6-h.p. which they have named the "Indispensable." This has a tubular frame, in the fore part of which is mounted a De Dion or Aster motor. Three speeds and a reverse are provided, the transmission being by means of a longitudinal shaft and bevel gear to the rear live axle. Fig. 15 shows the Prunel light delivery van, one of which did so well in the recent

FIG. 15.—THE PRUNEL LIGHT DELIVERY VAN.

trials of the A.C.F. It has a 9-h.p. De Dion and Aster motor, and three speeds and reverse. In this car the power is conveyed from the differential shaft to the rear road wheels by two chains.

Considerable interest is being shown in the automobile fire-engine exhibited by Messrs. A. Thirion and Fils, of Rue de Vau-

shaft. A clutch is provided so that the engine may be put out of gear with the transmission shaft, and into gear with the pumps. The pumps are of the usual plunger type with large air compressors. A hose reel is carried at the rear of the pumps, and there is accommodation for five firemen. The vehicle can attain a speed of fifteen miles per hour; it can pump 40,000 litres of water per hour to a height of 100 feet.

It is not only English firms that have this year invaded the Salon, Italy being represented by La Fabbrica Italiana di

FIG. 16.—THE F.I.A.T. 8-H.P. DELIVERY CAR.

Automobili, of Turin, whose cars are known as the F.I.A.T. Amongst the exhibits are a 12-h.p. car, a chassis of 12-h.p., a complete model of a 16-h.p. motor, and model of the change gear. In the cars, the four-cylinder engines have automatic inlet valves, but the new type has induction valves operated mechanically,

FIG. 17.—THE THIRION PETROL FIRE ENGINE.

girard, Paris, and illustrated in Fig. 17. For a fire-engine the vehicle is built low; it has a two-cylinder horizontal petrol engine in front, driving by the usual speed gear box—giving three speeds forward and reverse—and Cardan jointed shaft on to the differential on the rear live axle. The pumps, which are placed fore and aft of the vehicle, are driven from a two-cranked shaft by means of a large roller chain running from a chain wheel on the transmission

The cylinders are 110 mm. diameter, by 110 mm. diameter, the normal speed being 800 revolutions per minute. Magneto ignition is fitted, with an ingenious centrifugal device for automatically advancing and retarding the ignition. Between the clutch-shaft and the first shaft of the change-speed gear there is a flexible connection formed of a number of teeth, on which are fixed leather cone. A radiator of the Mercedes type, with fan, is

being used. The F.I.A.T. cars have been very successful in races in Italy and Portugal, and are used by the King of Italy, the Italian War Office, the Italian Postal authorities, while quite recently the Portuguese Minister of War placed an order for several cars.

One of the most novel vehicles in the *Salon* is that which made its appearance on Monday of last week on the stand of the Societe des Automobiles Hautier, and of which a plan view is given in Fig. 18. It is to be made in three sizes—one cylinder, 7-h.p.; two cylinders, 13-h.p.; and four cylinders, 18-h.p. The frame is of U-steel; the usual arrangement of motor in front is followed, but a number of modifications have been adopted. In the first place, it will be noted that the fly-wheel, instead of being to the rear of the engine, and forming part of the clutch, is situated just behind the radiator. It has vanes formed on it, so that it acts as a fan to draw air through the radiator. The four-cylinder motor has a bore of 100 mm. by 115 mm. stroke, and runs at a normal speed of 1,000 revolutions per minute. The inlet valves are mechanically operated, and are interchangeable with the exhaust valves, which are placed on the opposite side of the motor. The governor is adapted to act on the inlet valves, and

inside it. The weight of the 10-h.p. engine is 78 kilogs. without the flywheel, or 100 kilogs. complete. The water-circulating pump is provided with an ingenious spring drive. In the basement Messrs. De Dion-Bouton have a large space devoted to motors driving pumps, dynamos, machine tools, and applied to various other processes. They also have a staff of girls engaged in the manufacture of sparking plugs, and it is interesting to the automobilist to watch the different stages through which this necessary article passes, starting from lumps of metal and clay and finishing off ready for immediate use.

Some well-thought-out vehicles are shown by M. Berliet, of Chemin des Quatre-Maisons, Lyons. The four-cylinder motor has a bore of 125 mm. and a stroke of 140 mm., and running normally at 600 to 700 revolutions, develops 24-h.p. The change-speed gear, with two trains of sliding wheels, is arranged for a direct drive on the top speed. M. Berliet is also turning out 10-h.p. and 16-h.p. cars, both having four-cylinder engines.

Messrs. Chenard and Walcker show two-cylinder and four-cylinder motors, in which the regulation is effected by means of increasing or decreasing the length of time during which the inlet valve is lifted. On the half-speed shaft there is a cam mounted

VO, Flywheel.

La Locomotion.

regulates, not the degree of lift, but the time they are allowed to remain open. The water-circulating pump is mounted on an extension of the crank shaft. Rotary magneto ignition is adopted, although the ordinary electric ignition can be fitted if desired. A special clutch is employed between the engine and gear-box; it is metal to metal, and forms at the same time a speed-reducer, decreasing the engine speed in the ratio of 5 to 1. Four speeds forward and a reverse are available, the gears being constantly in mesh; from the gear-box the power is transmitted by a longitudinal shaft and bevel gear to the rear live axle. The radiator employed is a novel one, consisting of a spirally-wound coil. The engine, clutch, and gear-box form three distinct units, each of which can be separately taken out in a very short time. Altogether the 1903 Hautier is an interesting vehicle.

Messrs. De Dion-Bouton et Cie. make a prominent feature of their new 6-h.p. Popular car and of their new change-speed gear, giving three speeds and reverse. This is fitted to the 10-h.p. car with two-cylinder motor. A peculiarity of the latter is the method of lubricating the gear and motor by means of a pump, which sends the oil to the top of the gear-box and crank case, where it is distributed by a perforated channel running round

on a sleeve and with the eccentric part of it finishing in a flat right angled triangle with unequal sides, the short side being in the direction of rotation. When the sleeve is pressed forward to its fullest extent the valve stem is lifted up and held up whilst the side of the triangle passes under it. As the sleeve is drawn back the distance traversed is less and less, so that the time that the valve is lifted becomes smaller, although the height of the lift is always the same. The makers claim that this is most the economical and efficient mode of governing. The sparking commutator employed by Chenard and Walcker for a two-cylinder engine, or rather the contact breaker, has only one contact, there is, therefore, a spark in both cylinders at once, although only one is used; the makers claim that this arrangement, although it uses up the batteries a little quicker, has great advantages, for it avoids the difficulty of adjustment which occurs when there are two contact breakers to regulate in synchrony. The Chenard and Walcker cars can be supplied either with live axle or with a chain drive; the differential shaft and the live axle are almost identical in form and independent of the change of speed gear.

An excellent display of the Turcat-Mery system of cars is made by Messrs. Dietrich and Co., of Luneville, examples of the

8-h.p., 12-h.p., 16-h.p., and 24-h.p. cars being shown. As is known, these vehicles are now built on standard lines, with the engine in front and driving through a clutch and gear-box to the differential shaft, which is connected with the rear road wheels by two chains. There are a number of interesting details in the cars, not the least of which is the facility with which the clutch can be adjusted.

La Societe de Constructions Electro-Mecaniques, of Levallois-Perret (Seine), exhibit a combination petrol electric car, known as the "Electrogenia." Fig. 19 herewith shews a view, in plan, of the arrangement adopted. A is a 9-h.p. two-cylinder petrol motor mounted longitudinally in the front of the car, and coupled directly to the dynamo B. The terminals of the dynamo are connected by cables to the horizontally-mounted controller C, from which a second set of cables run to the electro motor D, which drives directly on to the differential gear E, by means of enclosed spur-wheel gearing. It will be seen that the car represents to all intents and purposes an electric vehicle in which the battery of accumulators is replaced by the combination of a petrol engine and dynamo. It consequently enables the flexibility of the electric car to be very largely

FIG. 19.—PLAN OF "ELECTROGENIA" COMBINATION PETROL-ELECTRIC CAR.

A. Petrol motor. B. Dynamo. C. Controller. D. Electric motor. E. Differential.

realised, though this undoubtedly means a slight extra weight. Change-speed mechanism, otherwise indispensable in a petrol car, is dispensed with, while the electric braking effect, which is so useful in an electric vehicle, can be obtained.

On Messrs. Malicet and Blin's stand we notice a new steering motion which is particularly ingenious. The usual sector and pinion, or worm and wheel, is replaced by a cam movement. The idea of the invention, which is due to a Monsieur Denis, is to make the steering irreversible when the car is going in a straight line, and reversible when going round corners, that is to say, whilst the tendency of the car will always be to keep on in a straight line, it will at the same time be much easier to turn the wheels in either direction than with the usual steering gear. In addition to this there is no back lash or play in the motion. At the foot of the steering pillar there is mounted a V-shaped cam, which moves the steering lever backwards and forwards, transmitting its motion through two conical rollers mounted on the

steering lever. When the wheels are straight the V angle of the cam is mounted on top of the front conical rollers, and it is then quite impossible to move the lever either backwards or forwards. When the steering wheel is turned to the right or left the cam forces the lever, through the rollers, to move either forward or backward as the case may be. The whole movement is made of steel, tempered and case-hardened, and is enclosed in an oil-bath.

The Gobron-Brillie Company show their two-cylinder, four-piston motor with the explosion taking place between the pistons. The cars on the stand comprise a 35-h.p. racer and an 18-h.p. tonneau. This firm have on the stocks a new racing car with four cylinders and eight pistons, calculated to give 100-h.p. The car will have four speeds and reverse and a direct drive.

At each Salon there has generally been shown an arrangement of converting horse-drawn carriages into motor-vehicles. The novelty in this line is the "Avant-Train Cantono" of La Compagnie des Vehicules Electriques, of St. Ouen. In their system a set of forty-four accumulators, controller, and motor are mounted on two front wheels with a steering pillar. By removing the front wheels and front axle of any ordinary carriage, and cutting a suitable opening for the steering pillar to get through the driver's footboard, an ordinary horse-driven brougham can be transformed into an electric vehicle.

M. A. VILAIN, of Rue de l'Atlas, Paris, exhibits an ingenious water-cooler for petrol motors. It consists, as will be seen from Fig. 20, of a series of coils of copper tubes connected at the top to a collector, in which is a safety valve M, and at the bottom to another collector, in which is a draw-off cock C. The cooler is intended to be fixed in a position where the air has free access to it, and placed in such

FIG. 20.—THE VILAIN CIRCULATION WATER COOLER.

position that the lower collector is above the head of the motor. Fig. 2 illustrates the method of connecting up the cooler to a two-cylinder motor. The coil is hermetically sealed so that there is no loss of water; in fact, M. Vilain claims that once the coil is filled with water it needs no further attention for a long period.

M. E. Chaboche is one of the few French builders devoting attention to steam vehicles; as regards pleasure cars, he has on view a limousine and a double phaeton, while the industrial section is represented by a light steam lorry shod with solid rubber tyres. A number of improvements have been introduced in the Chaboche vehicles, the main one being the adoption of petroleum as fuel in place of coal.

The Clement Company have gone in for mechanically operated valves and honeycomb radiators, together with stamped steel frames and magneto ignition. The most attractive vehicle seems to be a four-cylinder car of about 16-h.p., with the motor very low down and the flat square bonnet, which is the prevailing fashion this year. There is also a two-cylinder car with mechanically-operated valves.

The Continental Rubber Company have an important stand chiefly noticeable for the 100 and 125 mm. covers, which fit 85 and 95 mm. rims. Messrs. Falconnet and Perodeaud, in addition to their solid and pneumatic tyres, show their new flat armoured tread, which can be fitted to any tyre, and which, they claim, does away entirely with side-slip.

AN interesting car is that shown by La Societe des Automobiles "Motobloc," of Bordeaux. Figs. 21 and 22 give respectively an elevation and plan of the chassis, while a section through the two-cylinder motor is given in Fig. 23. The name of the car is derived from the fact that the motor and variable gear form a compact single set. The frame of the car is constructed of steel and wood. The motor develops 10-h.p. at a normal speed

FIGS. 21 AND 22.—ELEVATION AND PLAN OF "MOTOBLOC" CAR.

of 1,000 revolutions. Its feature lies in the fact that the change gear, which gives three forward speeds and a reverse, is mounted in the crank case, which is extended at the side for the purpose. Only eight gear wheels are used to give the different speeds, and to actuate the exhaust valves and ignition. As will be seen, the engine is mounted in the fore part of the frame in an inclined position. The change-speed gear is ingeniously arranged, the drive being direct on the top speed. A single chain connects the variable gear shaft with the rear axle.

One of the neatest two-seated cars in the *Salon* is that which is somewhat hidden away among larger cars on the stand of the Societe Parisienne de Cycles et Automobiles. It has a frame of tubular construction, and is a replica, as regards general arrangement, of the standard style of car. The motive power is supplied by a 4-h.p. Aster engine, and the change-speed gear is adapted to give three speeds ahead and one reverse. From the gear-box a longitudinal shaft and bevel-gear transmits the power to the rear live axle. We understand that arrangements are in hand for the placing of this vehicle on the English market. La Societe Parisienne also show a 1903 model 18-h.p. Mors, fitted with one of the most sumptuous bodies we have seen. It is the handiwork of Messrs. Lamplugh and Co., and is more like a small Pulman car than anything else, the passengers being provided with comfortable seats and lockers.

The Tony Huber is a comparatively new car with a four-cylinder 20 to 24-h.p. motor of 112 mm. bore and 140 mm. stroke. The engine has mechanically-operated valves, and only one cam shaft. The governing is on the admission, with a foot accelerator. Each pair of valves is held in position by a stirrup which swings aside and allows them both to be taken out easily. The transmission is by universal joint and live axle. On the water-jacket of the motor there is a peculiar attachment to obviate the difficulty of making and remaking the joint by means of rubber tubing; instead of this they have a wire spring clasp, similar to the well-known fastening for beer bottle stoppers, and by means of this the joint can be instantly removed if necessary.

The Societe d'Automobiles et de Traction (Systeme Bardon) show a new type of light carriage, with steel frame, and fitted with a 7-h.p. motor. In order to allow of the employment of shaft transmission, the position of the engine has been changed. As it well known, power is transmitted from the crank shaft by bevel gear to the primary shaft, which is parallel to the cylinder, and instead of being placed across the front of the car they are now arranged longitudinally. The secondary shaft is below the primary shaft, and thence the drive is taken through a universally-jointed shaft to the differential on the live axle. The single cylinder two-piston motor is retained, but the inlet valves are now operated mechanically, and, owing to the distance of the valves from the half-speed shaft, and also to their position, this is done by means of a sort of trip gear. The engine is also now governed on the admission. The Bardon Company also show one of their two-cylinder four-piston cars, with the old style of transmission.

Henriod shows a combined change speed gear and live axle, with sliding gear, four speeds and reverse, and direct drive. It is very compact and of small dimensions. The carburettor made by this firm has no float feed; the jet is in the suction pipe, and the pointer which closes and opens the jet is attached to a valve which lies across the suction pipe. The stroke of the piston sucks up the pointer and allows the petrol to flow, or lets the pointer drop and stops the petrol from flowing as required.

Pneumatic tyres are fairly well represented in the Exhibition. We say fairly well, because a motor show can hardly be complete without a stand representing the productions of Michelin; but this year the great Clermont-Ferrand firm have declined to exhibit, and thereby hangs a tale. Everyone who has visited previous exhibitions will well remember Michelin's circus, where solid wheels and wheels with pneumatic tyres went round and round over obstacles. Everyone will also remember the nail extractor at work, [and the *mechanicien* showing how quickly a tyre can be fitted or a tube changed. All these side-shows attracted a great deal of attention and helped to instruct the public. This year Messrs. Michelin were refused their usual positions, and there was a desire to relegate them to a side gallery, which in their opinion was derogatory to their importance, and they therefore withdrew entirely from the Show.

FIG. 23.—SECTION OF "MOTOBLOC" 10-H.P. TWO-CYLINDER MOTOR AND CHANGE-SPEED GEAR.

M. Jeantaud again makes a display of electrical vehicles, included among which is one of his special design of four-wheel hansom. On this stand also is a huge omnibus built for the Compagnie de Traction Automobile, for service at Montalban. The vehicle is designed to run on ordinary roads, but to derive its current by means of a trolley on an overhead conductor, the same as an electric tramcar.

Messrs. Cottureau and Co., of Dijon, have made great strides since last year, and show a four-cylinder motor weighing $3\frac{1}{4}$ cwt. The cylinders are 92 mm. bore by 126 mm. stroke, and mechanical admission valves are fitted. The magneto-ignition arrangements are particularly simple and allow for efficient advance and retardation of the moment of rupture in the cylinders; should there be a back explosion a spring dashpot receives the blow which would have made the rupture. The regulator works on the admission. The chassis for which this motor is destined will be chain-driven, and will have four speeds and reverse, the fourth speed being direct, on the lines of the Mors and Georges Richard arrangement. In addition to this Cottureau and Co. are putting on the market a new small car for two persons, with a single-cylinder motor, mechanically-worked valves, three speeds and reverse. The chassis will only weigh about 6 cwt. This car will, however, not be ready until February next.

La Societe des Automobiles Belgica, not to be left behind, has produced a two-cylinder and four-cylinder motor with mechanically-operated valves, and a regulator on the admission. The supply of lubricating oil in the base chamber is maintained at a fixed level by a float valve. Both motor and gear case are mounted on the frame and attached at three points, forming a triangle. Between the motor and the gear-box there is a universal joint. The cars exhibited by the Belgica Company are particularly well finished, for show purposes the engine parts are in some cases nickel plated, while a glass window is fitted in the bonnet to enable the motor to be readily seen.

The "Pipe" car with four cylinders is on view, but the model with mechanically-operated valves is not yet ready; the carburettor, however, of the present car is supplied with a slide throttle valve on the Mercedes principle; the slide, however, which opens and closes the inlet is conical in shape and fits into a cylinder in which triangular-shaped slots have been cut, and in this manner the flow of the gases is regulated with precision. The motor at present used is similar to the well-known Phoenix.

Krieger shows his well-known electric carriages, and in addition to this a new combination petrol-electric car. It is fitted with a single-cylinder 8-h.p. De Dion motor, which drives a dynamo at a constant speed, the dynamo being so wound as to be able to give either a high current at a low tension or a low current at a high tension. The current thus produced is transmitted to two motors placed on each side of the front axle, on the usual Krieger system.

A large crowd of visitors is all day long to be found round the stand of Messrs. Charron, Girardot, and Voigt, examining the eight-cylinder motor this firm is introducing, with the idea of doing away altogether with mechanical change-speed gearing. On one large crank chamber are mounted eight 5-h.p. cylinders, arranged in sets of four. The power is transmitted direct to the countershaft, and all intermediate gears are entirely dispensed with, the speed of the car being controlled entirely through the engine by means of a throttle governor and by the timing of the ignition. Any speed from three miles an hour to the maximum can, it is claimed, be obtained at will. The cylinders and combustion chambers are of cast steel, bolted to an aluminium base; the water-jackets are of brass. The induction and exhaust valves are on opposite sides, both being mechanically operated. All the cylinders are entirely separate one from another, and are interchangeable. The frame of the chassis is of unusual construction, being made up of a core of hard flexible wood of square section, over which is a light steel covering of solid-drawn round steel tube, pressed over the wood to a rectangular form, the whole making a strong, flexible frame. The new C.G.V. clutch is practically a metal band-brake, which, rotating as part of the flywheel, can be made to grip a metal pulley on the clutch shaft. A 15-h.p. military car is also to be seen on this stand. It has a steel-protected body, and is equipped with a Hotchkiss machine gun firing 600 rounds a minute.

AMONG well-known automobilists who have recently taken possession of Daimler carriages are Lady Meux, Sir William Pearce, Bart., Sir Ralph Hare, Bart., and Sir William Gordon Cumming.

CONTINENTAL NOTES.

BY "AUTOMAN."

"LE VELO" views with alarm and regret that the English language seems to be gaining ground in the French automobile world. "Why do our builders," remarks this daily, "want to bring in English to say what they have to say to visitors, when the French language is so convenient and possesses quite as many appropriate expressions as the former? It is only necessary to look at the catalogues published this year by builders, and the placards they post up, and there you will find more frequently than in preceding years the two letters h.p. voiture, 8-h.p. tonneau, 6-h.p., etc. As far as the number of words goes we see no reason for substituting something else for 'cheval-vapeur.' But in colloquial French we should not say 'cheval-vapeur,' we should simply say 'cheval,' so that one word suffices, as against two in English." "Le Velo" considers that it is merely snobbishness which makes French motor builders use a foreign expression instead of their own language.

THE sensation of the week has been the challenge that Santos Dumont has issued to the Lebaudy Brothers for a race in mid-air. It came about through an article which appeared in "Le Velo," in the course of which it was reported that M. Edouard Surcouf, in an interview, has declared that the Lebaudy balloon, of which he is the pilot, was capable of attaining a higher rate of speed than the Santos Dumont No. VI., the winner of the Deutsch prize. The young Brazilian aeronaut could not stand this, and almost before the ink which printed it was dry he drove to the Aero Club and deposited a challenge for 100,000 francs to race the Lebaudy balloon, when, where, and how the Aero Club should settle. One quarter of the sum was deposited to show that he meant business and the sporting press of Paris took up the matter and considered it a matter of course that the Lebaudy Brothers would at once accept the challenge.

THEY have, however, sent a letter to the "Auto Velo" in which they state that they learn from the press that they have been challenged to an aerial race. They do not, however, know the conditions of the race, but in any case, should any such challenge reach them, they would not be inclined to accept it. They wish to continue the experiments they began three years ago, without changing their programme.

I WAS glad to see, from the last issue, that you had noted the case referred to by "La France Automobile" under the heading "La Faillite des Numeros"—the failure of numbering—where M. Pernod, who is President of the Automobile Club of Avignon, has been prosecuted for killing a dog belonging to a municipal councillor at Pontoise, when he was going about his ordinary business quietly in Avignon, which is at the other end of France, several hundred miles away. Possibly M. Pernod will be acquitted—I say possibly—for it is not at all certain, but whether acquitted or condemned will make very little difference to his pocket or his convenience.

AFTER writing the above paragraph I looked up the actual distance between Pontoise and Avignon, for the sake of bringing the matter home to those automobilists in England who still have leanings towards numbering, or who have an open mind on the subject and are willing to take a lesson from their neighbours. Avignon is 466 miles by rail from Paris, while Pontoise is about twenty miles from the capital in quite another direction.

To make a good comparison, imagine an owner of a motor car living at Esher receiving at breakfast a summons for running over the dog belonging to a municipal councillor of the town of Kirkcaldy, on the east coast of Scotland, between Edinburgh and Dundee. If he is a very busy man, the best, and, indeed, the only thing he will be able to do, is to let the case go by default, and pay for the dog and the expenses and probably also

a fine. But what if it is an accident to a human being. In that case he cannot let it go by default, but he will have to fight the matter to save himself from imprisonment. Here comes in another question. Suppose somebody has been run over and killed and a false number taken, our friend at Esher may be actually arrested.

THE other day I met a member of the Committee of the A.C.G.B.I. in the Salon, and I asked him, knowing that he is a practical automobilist, what he thought about numbering. He did not give me his opinion, but said that if a numbering Bill was not brought in by automobilists one would surely be brought in by the Government, and that this was the reason for the promotion of the Automobile Club Bill. If this be the case, there is no time to be lost for the press to get up an agitation against numbering—an agitation such as will reach the ears of the Government and cause them to look into the question seriously. One thing is certain, and that is that

It is proposed to organise an excursion into Andalusia at the termination of the Paris-Madrid race.

A COMPANY has just been formed in Sweden with a capital of 135,000 kr., to be known as the Actiebolag Svensk Automobil-fabriken.

MESSRS. GILLET-FOREST AND COMPANY, who still adhere to the single cylindered, horizontal engine for touring cars and delivery vans, are, I hear, building a 100-h.p. four-cylinder racing car, which is not to be sold, but which is solely intended to compete in next year's important races.

L'AUTOMOBILE DE CUGNOT A WOLSELEY is the title of a well compiled booklet in French which is being distributed by the Wolseley Company at their stand at the Paris Salon. In addition to comprising a series of about a dozen views of the works and departments of the Adlerley Park Works, where the Wolseley cars are built, the pamphlet touches upon the growth

THE 50-H.P. SERPOLLET STEAM LANDAULETTE BUILT FOR THE SHAH OF PERSIA.

[La France Automobile.

numbering in France is doomed, and it will only require a sheaf of absurd mistakes similar to that of M. Pernod, of Avignon, to cause the law to be changed. In the meantime the trade and the public must suffer for the shortsightedness of the legislator.

THE old maxim, "Better bear the ills we have than fly to others that we know not of," just fits the case nicely and expresses the sentiment of most British automobilists. The persecutions of the police will gradually die out as motor-cars become more general, and, above all, as magistrates and police superintendents become motorists themselves. The narrow ideas of speed will become wider and the objectionable restriction of twelve miles an hour will become a dead letter, whilst the real scorcher will be watched for and condemned, just as the drunken waggoner is attended to now. Everything points to this result in every country, and, after all, if the aggregate fines were added up and proportioned out over all the users of motor-cars, the results would be quite insignificant.

of the motor industry from the earliest known type of car to the present day. The last paragraph in the work reads "At this date (December, 1902), the company has orders on hand for over 800 cars of different types, representing a value of about £300,000. The output of the works is now actually ten cars per week."

THE Dukes of Manchester and Newcastle are among the candidates for admission to the Automobile Club.

A COMPANY is being formed at Tenerife, Canary Islands, to introduce a number of motor-cars to ply between the different towns in the island. The cars will be furnished by Messrs. Panhard and Levassor.

MESSRS. FORTIN AND HIJO, of Tegucigalpa, Honduras, write that they are interested in motor-vehicles for carrying merchandise over macadamised roads with a maximum grade of 12 per cent., and would be glad to receive price lists, etc., from makers of such cars.

THE "ANTI-SHOCK" STARTING HANDLE.

MOST motorists know from experience that unless the ignition is well retarded, a petrol motor has, on starting, a nasty tendency to back-fire, and if one is not careful, a sharp blow on the wrist from the starting handle is experienced, the result being a sprained, if not a broken, wrist. During our rambles at the Paris Show we came across a novel starting handle, which automatically disengages itself at the slightest attempt of the motor to backfire, and so prevents these unpleasant and inconvenient experiences, and as we feel sure it will be read with interest, we hasten to publish a description and illustration of the device. It is known as the "Anti-Shock," and, devised by an engineer named M. Duchene, has just been put on the market by Les

Etablissements Montauban and Marchandier, of St. Quentin Aisne. It consists of a plate B, which is to be keyed at A on to the shaft of the engine. The handle is pivoted on the plate at C, as is also at d^1 , the short lever D, the end of which bears, owing to the action of the spring E, against a stop F, and lightly on the end of the lever C. The spring E is so mounted that the effort necessary to compress it is slightly above the degree of compression of the explosive mixture in the combustion chamber of the motor. The operation is as follows: To start the motor, turn the handle in the direction shown by the arrow; if all goes well, the whole device will turn as one piece; if, however, there is any tendency to premature explosion, the force of the back-fire is taken up by the spring E, which, becoming compressed, causes the lever D to be lifted off from the end of the starting handle proper, the latter thus becoming quite free and independent, and receiving no shock whatever. To put the handle in position for a fresh attempt to start the motor, it is only necessary to give it one complete turn. The "Anti-Shock" starting handle costs about £2; it is made in two sizes, one for motors under 8-h.p. and one for engines over that power. The makers state the device can be fitted to any engine. The only information required being the horse-power, the diameter of the engine shaft, and the direction of rotation of the motor.

AT the thirteenth annual meeting of Alldays and Onions, Limited, the Chairman said that in the cycle and motor departments they had done better than before, and it was gratifying to announce that the considerable loss of the previous year on the motor department had been turned into a small profit, with excellent prospects.

THE American National Association of Automobile Manufacturers' executive committee has sent out a circular letter to the makers of lamps urging a standardisation of lamp brackets.

MOTOR-CYCLING NEWS.

IN connection with the Liskeard Literary Institute Dr. C. C. Lord, of that town, has been lecturing on motor-cycling. Dr. Lord is the only Liskeard resident using a motor-tricycle for professional purposes. With regard to the working expenses connected with his machine he said that fuel (petrol) cost 3s. per 100 miles; electricity, by the time the accumulator had reached Liskeard, 4d. per 100 miles; while a quart of lubricating oil at 1s. 6d. would be a liberal allowance for 100 miles, so that altogether the cost worked out at 4s. 10d. per 100 miles. Then tyres were a big item, the first cost being about £3 10s. per wheel. The cost of the machine was close on £70; with an air-cooled motor of the same type the cost would have been about £10 less. Including in his working expenses an item of £10 for a big smash, he found that he was still £3 per month to the good on what it had cost him to drive horses.

At the first meeting of the Derby and District Motor-Cycle Club, Dr. Barwise accepted the presidency and Mr. Isaac Hill the vice-presidency. The committee consists of Messrs. C. T. Leech, Collinbell, Dowell, Cyril Smith, Wall, and Hallam, with Mr. T. R. Turner as secretary. The inaugural run will be held on Boxing Day.

It is proposed to form a Belfast branch of the Motor Cycle Union of Ireland.

THE "Roue Automotrice," illustrated herewith, is one of the motor-cycle novelties at the Paris *Salon*, where it is exhibited by Messrs. Gaston Rivierre and Company, of Courbevoie (Seine). As will be seen, there are two pairs of two-cylinders built in the rear wheel. Of each pair, only one cylinder is used for propelling the machine, the other serving to compress the charge. In this way the usual valves are done away with, and an explosion is obtained in the working cylinder at every revolution. The driving wheel has no through axle; the

connecting rods of the cylinders have a common big end bearing upon the crank pin of the fixed hollow crank axle carried in the back fork ends. The bosses of the driving wheel run on ball bearings on this fixed axle. The cylinders, of course, rotate with the wheel, of which they form practically the central spokes. The mixture is introduced to them through the hollow axle and suitably-made drilled bosses and connections therein. Messrs. Rivierre claim great efficiency for this machine, as the back wheel, with its revolving mass of cylinders, acts as a most efficient flywheel, and the cylinders are kept very cool by their rapid rotation in the air.

A NOTICEABLE feature of many of the motor-bicycles exhibited at the Paris *Salon* is the fact that instead of a rim brake acting on the rear wheel as is found on such machines in this country, the inner surface of the large belt pulley is made to serve as the brake drum. Such a brake is found on the Werner 1903 model and appears to be most effective.

"THE MOTOR MANIAC."

MRS. EDWARD KENNARD is well known to motorists as an enthusiast for their sport; to the reading public she is favourably familiar as the author of "The Girl in the Brown Habit," "Tony Larkin, Englishman," and other novels. Now she appeals to both sections of the community with "The Motor Maniac"—a novel just published by Messrs. Hutchinson and Company. Chapter I. opens well with the heading, "Mrs. Jenks decides she must have a motor-car," but not till the sixth chapter does she receive her first driving lesson. After the momentous decision to purchase a car had been come to, the good lady read the advertisements in the *Motor-Car Journal* and sallied forth to Holborn Viaduct—a reference to the location of the motor-car depots that has already become out of date. Having spent some time in investigating the points of a Peugeot and trying the patience of the salesman, she went to "the home of the Decauville," from whence Mr. Soppet Board took her for a drive on a 5 h.p. car.

"Mrs. Jenks mounted into the car, and Mr. Soppet Board got in on the driving side. A minute later, and they were whirling through the traffic at a surprising speed; now stopping dead short, just when it seemed as if nothing could save them from going crash into the rear of an omnibus; again, dashing past the very nose of a hansom cab horse, and performing marvellous, awe-inspiring feats of dexterity. Once a policeman cast a severe glance at them as they glided by; but Mr. Soppet Board waved his hand in token of good fellowship, and moderated the pace for about fifty yards. He and the blue-coated official were evidently not unknown to one another. Meanwhile, he discoursed most agreeably to Mrs. Jenks, and quite won her heart by his charm of manner and the happy flow of his conversation. Her only regret was when she found herself back again at the starting-point, after what seemed to her their headlong flight through the City streets. However, no accident had occurred, although she thought every moment they were on the verge of one."

Trips were then paid to Messrs. Hewetson's place, to Holland Park to see an Orient Express—and home again to argue with Mr. Jenks. Next morning a sight of the motor-car journals rekindled her ardour, and she rushed into East London in search of a second-hand Benz Ideal—the property of a Mr. Long, who became the good lady's first motor tutor. On page 88 there is a reference to business methods, and then Mrs. Jenks goes into raptures over "the handsome Francis," whose place in the story need not be detailed here.

Then comes the inevitable—if prejudiced persons speak truly—viz., "the first smash."

"Faster and faster went the car, but the cart ahead moved not an inch either to right or left. There was room to pass, but its mere proximity flurried Mrs. Jenks. She gave a wobble, then another, and managed to graze past with about a foot to spare. But the effort was so great, it caused her to steer an erratic course, and the car began to lurch in a most disagreeable, not to say alarming, fashion. She herself believed she would have got to the bottom in safety; but all of a sudden her companion stretched out his hand; seized the steering lever from her grasp, and gave a tremendous wrench. The car had been perilously close to a grass bank, but in answer to the helm it shot almost out into the centre of the road. Then, without any warning, an extraordinary thing happened. It turned completely over, and both Mrs. Jenks and Mr. Bone were hurled to the ground with great violence. For one agonising moment they perceived a yellow flash over their heads, which threatened to annihilate them. But the flash passed beyond where they lay, and a hideous crash followed. For full a minute there was deathlike silence. Flat amid the dust reclined two prostrate forms; on its side on the grass reposed the damaged car."

After that Mrs. Jenks progressed wonderfully, and it was not long ere Mr. Jenks was converted and went for a drive himself, his initial trip being such a success that he "contemplated writing to the *Motor-Car Journal* and recording his doings." The incidents of touring and the introduction of Miss Angela Marrimee are responsible for many pages in the book, over which we glanced with general interest until Mr. Montmorency Black comes upon the scene with his Napier—a car which was one "of clever Mr. Napier's latest productions fitted with all the improvements that the joint intelligence of himself and the celebrated Mr. Pellin Sedge could devise." Timothy Snooks having become the motor confidant of Mr. and Mrs. Jenks, the lady wanted

something more than a Benz and decided on a motor-tricycle. One of the early trips on the latter is thus described:—

"She had a delightful run of about thirteen miles, and was nearing an important village, where she proposed turning round, when, on taking a corner at rather a high rate of speed, a horrid little fox-terrier jumped out suddenly from a hedge and flung himself defiantly right in her path. Before she had time to alter her course the front wheel passed clean over his body with a tremendous jolt. So great was the force of the impact that the tricycle all but upset. In frantically endeavouring to right it Mrs. Jenks partially lost control of the steering. Leaving the road, they bounded on to the grass at the side, and were very nearly precipitated into a wide cut ditch. Avoiding this by a miracle, the tricycle next dashed off in the opposite direction, traversed the road again, jumped the low bank that bordered it, and finished off by executing a marvellous leap in the air. All three wheels seemed to leave the ground simultaneously, and it was just touch and go whether they descended in an upright position or not. Fortunately, they ended by doing so, but not before the rider experienced moments of agonising uncertainty. And to owe such sensations to a wretched little dog! Mrs. Jenks scarcely knew whether to be more frightened or angry. As a matter of fact, she was both. Such a hairbreadth escape could not be characterised as pleasant."

After getting summoned, and appearing before the magistrates, Mrs. Jenks decided to obtain converts to automobilism

Photo by]

[Mr. W. C. S. Luther.
A SNAPSHOT AT COBHAM.

The chapters on this development as well as the sale of the first car are as entertaining as any in the novel.

Later, Messrs. Peto and Radford are introduced—probably the first time they have thus appeared in literature—and then follow in quick succession the Hon. Cyril Rowley, Mr. Lark Hewmay, Miss Cutler, Mr. Macpherson, Mr. Master Sidbrook,—to say nothing of a visit to "Mr. Napier's works in Vine Street, Lambeth." The last few chapters bring out the names of many leading cars, and if the plot of "The Motor Maniac" is slight the automobile interest is undoubtedly strong—as might well be imagined from Mrs. Kennard's enthusiasm for the pastime.

THE Wolsley Tool and Motor-Car Company, Limited, have sent us a copy of a leaflet they have just issued, in which they point out that with the approach of winter it becomes necessary to remind owners of motor-cars that during cold and frosty weather there is great danger of the water in the cylinder jacket and radiators freezing during the night, or while the car is stabled. It is therefore most important to see that the water is drained off when the car is not being used. For this purpose a tap is fitted in each combustion chamber of the Wolsley motor. The pump cover should also be taken off and water-bottle caps removed. When refilling the motor with water it is advisable to occasionally sluice out the pipes, etc. This may be done by inserting a hose in one of the water bottles, leaving the pump cover off, and sending a stream of water through the pipes for about ten minutes.

HERE AND THERE.

THERE are now thirty-five automobile clubs in France.

MESSRS. BRYANT AND MAY, Ltd., will have a steam delivery van from the Lancashire Steam Motor Company running in London early in the new year.

AN automobile census has been made by the "New York Sun," in which the output of the American factories during the first eight months of 1902 is placed at 19,000 vehicles, valued at more than £4,000,000.

THE Albany Motor Company, Limited, has been registered with a capital of £10,000 to adopt an agreement with the Albany Manufacturing Company, Limited, to carry on the business of a motor company generally.

ONE of the latest American novelties is the tilting steering wheel illustrated herewith. To allow of easy ingress and egress to and from the front seat the steering pillar is, in a number of cars, pivoted at the bottom in order to permit of it

being tilted up into a vertical position. It is, however, not so much the pillar that is in the way as the wheel itself, and Mr. P. L. Hussey, of Clarke Avenue, Detroit, U.S.A., the maker of the device illustrated, gets over the difficulty by fixing the wheel in such a way that it can, by releasing a catch, be tilted up.

AMONG the tailoring firms now seeking to be of service to motorists is Messrs. Walker and Co., the well-known sporting tailors of Sackville Street, W. They are bringing out a motor coat of smart appearance, with ample pleats at the back, which allow for the knees being fully covered when sitting, while in walking there is the maximum of freedom for the legs. Fitting closely round the throat, the lapels afford good protection for the chest, and Messrs. Walker and Co. should find the ideas they have incorporated into the coat very acceptable to practical motorists—of whom the principal of the firm is one. They also make coats lined with fur, or with the fur on the outside, and in this department have some distinctly good styles.

ON Saturday, at Christchurch, St. Leonards-on-Sea, the marriage of Mr. Lionel Savory and Miss Beatrice Norton was celebrated. Mr. Savory is the proprietor of the Westminster Motor Car Garage, and drove from London on the Friday on his 12-h.p. Gladiator car. He was closely followed by the best man, Mr. Martin, in his 12-h.p. M.M.C. car; Mr. Reynier came next on his 8-h.p. M.M.C. car, and he was followed by Mr. Shaw on his 7-h.p. M.M.C. car. There was quite an interesting meet of motorists at St. Leonards. Even at the wedding breakfast the motor atmosphere did not cease, for the cake was decorated with miniature automobiles, and lilliputian policemen. After the ceremony the bridegroom drove the bride away in his car to Brighton and the West of England.

A BRIGHTON correspondent informs us that the local police are very watchful in the neighbourhood of Patcham.

SIR JOHN FULLERTON, Groom-in-Waiting to King Edward, has, we learn, entered the ranks of motorists, his choice having fallen on a Beaufort car.

THE Belgian Automobile Club has decided to hold a congress of motorists on the 9th February to protest against the action of the police with regard to motor-car traffic.

AT the inquest at Leeds on the body of Arthur Thackray, 25, a tram-car conductor, who was killed by a motor-car driven by Mr. Haydn Lee, engineer student, the jury have found the latter was guilty of negligence which was not culpable.

A MOVEMENT is on foot to establish an automobile school in Philadelphia, where the novice may take a full and thorough course in the art of handling a motor-car, receive his or her diploma, and be entitled to a certificate as a full-fledged *chauffeur*. Several wealthy motorists are said to be behind the project.

In addition to Mr. Alexander Winton, it is reported that Mr. H. S. Harkness, Mr. W. T. White, Mr. L. P. Mooers, of Cleveland, and Mr. W. K. Vanderbilt, Jun., are claimants for the honour to represent America in next year's Gordon Bennett race. It is said that Mr. H. S. Harkness is having a special Peerless car built for him, and that a special steam car is in course of construction for Mr. White.

MR. GERALD PILCHER has designed a neat form of note book for motorists, which he terms the "Practical Motor Record," and which will shortly be published by a London firm. It will form a convenient pocket-book on the re-fill plan, enabling the automobilist to keep a daily, weekly, and monthly record of his runs; and will also contain a list of hotels recommended by the Automobile Club.

NOW that the King's stud of motor-cars is increasing to such an extent, it has been found necessary to appoint an official engineer and repairer, and Mr. Frank Morriss, of King's Lynn, has been appointed. Mr. Morriss is to be congratulated upon the Royal appreciation of his services and of the satisfactory manner in which he has executed the necessary repairs, etc., to His Majesty's cars from the commencement of the latter's automobile career.

THE IVEL AGRICULTURAL MOTORS, LIMITED, is the title of a company registered with a capital of £10,000, to adopt an agreement with Mr. Dan Albone, and to build and deal in and with, and let to hire any oil, steam, electric, or other motors or tractors for purposes of traction, especially for agriculture, and motor ploughs, and all agricultural implements. The directors are Messrs. C. Jarrott, S. F. Edge, and D. Albone, and there is to be no initial public issue.

SOME little time ago Messrs. John S. Morris and Son, of the Victoria Bridge Oil Works, Manchester, sent us a sample of their "Speedon" motor-cylinder oil, and as a result of actual use we may say that it appears to thoroughly fulfil the various claims made for the lubricant. "Speedon" is a pure hydro-carbon oil, and does not clog or "gum" the working parts in any way. The flash-point and viscosity are high, and it is free from objectionable smell. It does not appear to foul the sparking-plugs, nor yield any carbonaceous deposit. In addition to its durability under extreme heat, it has also the advantage of being fluid at low temperatures, a valuable desideratum in a motor-car lubricant. As well as for cylinder lubrication "Speedon" is adapted for use in axle-bearings, pinion-wheels, and valve-lifter guides. To meet the varied requirements of motor-car lubrication the oil is manufactured in two consistencies, the thinner oil being specially recommended to those who motor in the winter, as it is very free flowing at all temperatures experienced in this climate, and there is no necessity for warming the oil in order to make it pass down the tubes to get to its work.

CORRESPONDENCE.

CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your large number of readers recommend a good economical carburettor? I have a 9-h.p. Rex car, fitted with a small unnamed spray float feed, and even when driving on the hand throttle can never get more than eight miles out of the gallon; perhaps someone used to this particular make of car can advise me how to overcome this difficulty.—Yours faithfully,

L. P. MELL.

BUSINESS METHODS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I corroborate the complaints recently made in your columns as to the carelessness of subordinates in the motor-car trade. I have over and over again been unable to use my car for a fortnight because everything has been sent wrong and has had to be returned to one of the leading firms. Articles not in stock have to be specially manufactured and arrive unsatisfactorily. They are returned and have to be made again. For instance, an induction valve stem was wanted two months ago. "Not in stock" was the reply. I then applied to another company, and was supplied by return. My order was for stem only. The letter of advice states "valve stem." The post brings a 2 in. square parcel, which by outward appearance is enough to insinuate, as usual, "wrong; not ordered"; will be returned not wanted.—Yours truly,

SOLID v. PNEUMATIC TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of "Anxious Enquirer" in the issue of the 13th inst., asking a question as to tyres, the best answer I can give is my own experience of the Collier. I had these tyres fitted at the commencement of last year to a Locomobile, and ran the whole season, only having had one puncture from a three-inch nail. A new tube was inserted, and the tyre has run ever since without giving any trouble. Early this year I had my 10-h.p. Wolseley car fitted with four Collier tyres. It has travelled nearly 5,500 miles, and I have had only one puncture, from a four-inch nail. In all the tyres the treads show practically no wear, and I shall be exceedingly disappointed if I do not get 10,000 miles out of my Wolseley car without any additional expense in respect to tyres. I have never had any bursting or pinching, and it is almost impossible to pinch an inner tube with a Collier tyre owing to the nature of the seating and fastenings.—Yours truly,

A. E. WILLIAMS.

GREASE CATCHERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to suggest to motor-car builders the desirability of providing to every car means for catching the grease and oil which have an obnoxious way of working out of gear and crank cases, generally through worn bearings, and forming disagreeable and convicting pools whenever any (or almost any) car is at rest for a few minutes after a period of running. Such leaks make an ugly mess even in a coachhouse, and are detrimental to rubber tyres, but at one's front door, or, worse still, at one's friend's front door, they are an intolerable nuisance. If the offending grease gets on to an unwitting hostess's skirt or drawing-room carpet it is likely to result in the owner of the peccant car finding a much less cordial welcome on the occasion of his next visit. It should not be very difficult to devise means of preventing any drops of oil or grease reaching the ground, and the leather or other guards which are nowadays frequently fixed to protect the flywheel and adjoining gear-case, etc., from mud and wet to some extent probably effect the object in view. On the occasion of the last Anniversary Run I had an object lesson as to the amount of grease dropped from cars, for, happening to start from Grosvenor Place some time after all the others had left, I had no difficulty in tracing the route, which I did not know, through Kensington and Hammersmith by the iridescent sheen caused by the drops of oleaginous liquid on the surface of the swimming streets. Although after the first stopping-place I had no need to depend upon this method of finding my way, it would have been available all the way to Oxford.

I was also struck by the number of bolts and nuts and other parts that were dropped upon the road, which also points to the necessity of alterations in practice on the part of some car-makers or owners.

Referring to the subject of lubricants, a doubt has occurred to me with reference to Captain Longridge's suggestion of adding water to the oil in the crank chamber—whether there would not be a danger of fracturing the chamber in frosty weather. I should like to take the opportunity of expressing my sense of the obligation motorists are under to Captain Longridge for his most valuable paper, rich both in information and suggestion.—Yours faithfully,

EDGAR SOAMES.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In addition to the writer, it would probably be of great interest to many of your readers if some really practical drivers of Serpollet, Miasse

Locomobile, and other types of cars gave their experience. The following are a few queries on which I should like information. Firstly, after about what distance or time would the poppet variety of admission valve require grinding in, and which has generally to be replaced first, piston ring, or poppet valves of the same engine? Are the reliefs of Serpollets really reliable, as it appears to the writer that tightening the packing gland would affect the relief by causing more friction, which would vary after the valve had been worked a few times. Are not the D valves of a Locomobile, or similar type of same, a trouble to keep free from scores, working at 200 lbs. pressure, and about what relation with regard to wear have they to the wear of the piston rings of the same engine, presuming both types of engine above mentioned are properly lubricated by forced lubricant.—Yours truly,

STEAM.

THE DURYEA TRANSMISSION GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Our attention has been called to a volume entitled, "The Automobile: its Construction and Management," by G. Laverne, translated by Paul N. Hasluck, in which an illustration and description of the Duryea change-speed and transmission gear is given. As, however, this shows a gear which was abandoned as far back as 1897, and does not in the slightest degree resemble the method now employed, we would ask you to permit us to state, in order to avoid misunderstanding, that the present gear, which has been used for the last five years, consists of a simple epicyclic gear carried upon the motor shaft, which is inoperative at high speed, when power is delivered direct by a sprocket and chain to the road wheels, and gives a low gear for hill work and a reverse when needed, by tightening a brake band on either the outer member of the gear or upon the pinion carried, as required.—Yours truly,

THE DURYEA COMPANY.

THE S.A.C. AND PROPOSED LEGISLATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On page 819 in your account of the meeting of the Western Section you dub me the chairman of the Eastern Section. That honour belongs to my friend Mr. John Macdonald. I am chairman of the General Council of the S.A.C. as a whole. And I should like to say that in any remarks or letters I have given on this subject, I spoke for myself in my private capacity and not for the S.A.C.

The large and animated Western meeting was almost to a man against numbering, and I think even the one or two who half supported it had not at first considered the various difficult and also trouble-causing points which could only evolve after the country had plunged into licensing and numbering. Even Professor Galt, I think, in the end only went the same length as I did—that if every vehicle whatsoever were numbered we had no complaint to make; unless as citizens who don't like to see their country do idiotic things. To a man, I think, the meeting agreed that delay was the proper policy, and hoped no more panic legislation would hamper progress.

We have been through all this before, as to railways, bicycles, and what not. At present the public has motor measles and Parliament must be infected also, and it is madness to throw any Bill on the floor of the Houses and fondly imagine that we can control them by any arrangements. You can't "arrange" with Parliament what it will impose on you, nor bargain for freedom in one thing if you allow yourselves to be stamped as specially dangerous as an exchange. We are in danger of selling our birthright as free citizens, who want to do no harm, for a mess of pottage in the shape of a removal (or is it merely an increase to eighteen or so miles an hour?) of the present legal limit. The fire of a fussy set who may guide Parliament is worse than a legal frying pan which is fast melting away by its own sheer absurdity. The motor measles has come out so badly that it is certain the cure will be the more rapid, and when County Councils get tired of minding other folks' business, and have had some rides, and Parliament has become a place of petrol, then we may leave it to the Government to legislate on sane lines on a number of problems which will by then have become plain.

I find that outsiders argue in favour of numbering because carts, etc., have to have names painted on them. But the fact is that these names require to be only on one side, and in letters one inch high. They are not intended for identification at all, but are for Inland Revenue purposes. It is in order to make them (if no tax is paid on them) so prosaic and businesslike that the owner (who might otherwise have a private carriage and pay a tax) would not care to use them for private purposes. And also to mark them in case of any point arising as to evasion of the tax, etc.

Consider what will happen if the law to licence drivers and number motor cars were passed. The regulations would be left with the President of the Local Government Board and the Secretary for Scotland. They would certainly understand the intention of Parliament to be identification; and would, considering dust and speed, devise and ordain a size of standard board, and a colour and class of numbers, more conspicuous than elegant. I suppose the State would provide these; perhaps ordain one in front also. I do not attempt to deal with the darkness problem, it makes a grand field for the inventor, no doubt. And don't let us throw dust in our own eyes; some fondly talk of oil to make its face to shine (for a moment), and others of the Irish car driver's negligent rug which will droop over his number when racing a rival to Phoenix Park. The law is "a haas," but it will

hold that almighty Parliament meant the number to be seen for identification and one may be hauled up for not having it so, entailing stopping every few miles to wipe its beautiful face.

Then a tribunal will have to be set up to act as censors of driving. But what or which? As the Board of Mines does in France, perhaps the Board of Lunacy would do here, if it is not fully occupied already. How long will it take even 100 examiners to pass the (say) 10,000 persons who already can drive? I reckon that imports and home make will give us over 5,000 motor-cars in 1902. If each requires one and a half persons to use it we arrive at 7,500 examinations this year. And next year? and the year 1912? By the latter date the Government machinery and red tape will have become a great thing in the earth; and in spite of perhaps nine-tenths of the traffic being done by a safer mechanical method, and most men seeing the folly of the 1903 short-sightedness of the A.C.G.B. & I. and Imperial Parliament, still it will be difficult to undo the precedents and practice.

Do our numbering friends contemplate asking Parliament to number, and the rest, only up to, say, 1908? Are they looking to the future at all, or are they merely so mad to get out on to the roads to rush around in hot blood, free from the twelve miles an hour nightmare, that they are ready to sacrifice principles and the future? Cannot they wait and go more slowly, till the sense of the nation asserts itself in the light of knowledge?

Again, is Parliament to follow the cabman principle and have the convictions endorsed on the licence? I think I see the old women of the English J. P. sort poisoning their gleeful pens! And then how about the poor fellow (who may be innocent) who goes a second time before another court with his condemnation card humbly in his hand? Then, is a citizen who has had luck on the road, or in his Bench, to be debarred from driving his own carriage at his own risk because he has three times (or more, or less) been convicted of some nominal offences, like driving to the common danger (a very elastic term), or not obeying some sudden impulse of a policeman, etc.? If I lose my temper on seeing mine enemy on the street and drive my horses at him and kill him on the spot, the High Court of Justice can give me penal servitude for life. If I behave myself to the satisfaction of H.M. Prison Board I am let out at the end of twenty-three years, and no one has the power to prevent me driving my horses in Princes Street again that very joyful day. What power will restore to a motorist his freedom of action if his licence is taken from him?

How are we to learn to drive at all unless we have private grounds, if we cannot be on the roads without a licence?

I pin my faith to the very statesmanlike declaration which the A.C.G.B.I. made on the subject of numbering in its "blue book" to the County Councils of England and Wales last year. So far as I know the vast body of motorists has never asked it to turn round on that.

I think this is a matter so vital that the views of all the clubs should be taken, and if there is any doubt about what they are, a general plebiscite on signed voting cards "Yes" or "No," to the following two questions:—

1. "Are you in favour of car numbering?"

2. "Are you in favour of delay in the matter of any legislation?"

One to be sent to each member of all the clubs.

As good subjects we shall submit to what the Crown may impose. It is another thing to seem to ask for licences and labels *ourselves* by the hasty action of some people who gird at the twelve miles an hour nominal restriction.—Yours truly,

NORMAN D. MACDONALD.

CAPTAIN C. C. LONGRIDGE writes:—"In your issue of December 13th, p. 800, in the letter from the Endurance Motor and Cycle Co., occur the words: 'Increase on the suction-operated inlet valve.' Is this 'increase in power' or 'increase in weight of charge'? I presume the former was meant."

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Newark	Sir W. Barttelot, London	25 m. p. h.	£10, etc.
Shoreham L...	L. Strode	—	£5, etc.
"	H. Clark, London	—	"

Where no alleged speed is given it is understood to be above the legal limit.

At the Newark County Police Court, two summonses have been heard against Sir Walter Barttelot, charging him with furiously driving a motor-car in the parish of Kelham on the 11th November. Defendant was not present, being on the Continent, nor was he represented. The evidence showed that he drove a car past Newark Cattle Market at the rate of twenty-five miles an hour, and a telephone message to Retford failed to stop him, but he was intercepted at Doncaster. The Bench fined the defendant £10 and costs on one charge, and £1 including costs on the other, the total amount being £15.

FINANCIAL EMBARRASSMENT.

At the London Bankruptcy Court a sitting has been held before Mr. Registrar Hope, for the adjourned public examination of P. H. Easton, late of London Road and James Street, Brighton. In examination, the debtor gave particulars of his career as a cycle dealer. Afterwards he again started at North Road, Brighton, under the style of the Motor Fittings and Engineering Company. This business, after some months, was closed. In March, 1902, he, with a Mr. Browne, promoted the Automobile Components, with a capital of £2,000. The business was carried on at premises in Featherstone Street, London. As the result of the bankruptcy he had resigned his directorship. He was also connected with the promotion of the Central Steering Traction Company. He attributed his insolvency principally to loss in connection with the purchase and sale of motor-cars. The examination was concluded upon accounts showing debts £985, and assets £450.

CLAIM FOR HIRE.

At the Newbury County Court the Hon. Arthur Russell has retried a claim for £24 made by Messrs. Stradling and Plenty, motor-car agents, of Newbury, against Dr. W. S. Whitcombe, of Aldermaston, balance of account for the hire of a motor-car for three months. The case was first heard in April, and his Honour then stopped it, deciding on the agreement that all plaintiffs agreed to supply was a car, all liabilities being covered by the agreement. He therefore gave judgment for the plaintiffs' claim, remarking that if the High Court thought he was wrong, they could send it back again. Application was made in due course to the High Court, and an order was made for the retrial of the case at the Newbury Court. After a long hearing the Judge said it was ridiculous for them to be called upon to try a case which ought to have been referred to some expert with a knowledge of the subject. It was, he said, an action to recover £24, the balance of £36 incurred for the hire of a motor-car at £12 a month. Dr. Whitcombe had it for one month, and then returned it. The only direction he had to give the jury in point of law was that plaintiffs undertook to supply a car reasonably fit for use, and reasonably fit for the purpose for which it was supplied. They had listened to the evidence, and had heard of the different contretemps and incidents which had happened to Dr. Whitcombe, and had heard his explanation of them. It was for them to say whether they were satisfied that it was reasonably fit for the purpose for which it was supplied. This was the whole case in a nutshell, and he did not intend to say anything further about it. It was for them to say whether they found for the plaintiffs or the defendant. The jury returned a verdict for the plaintiffs, and judgment was entered accordingly.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shos Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JANUARY 3, 1903.

[No. 200.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WE have now entered upon a new year, and a review of the past twelve months affords proof of the gratifying advance made by automobilism during that period. The trade outlook will be distinctly improved as soon as the present agitation in favour of numbering ceases and matters are left alone, or the speed limit withdrawn, and driving to the public

danger is made the indictable offence. We agree with the "Field" in saying that "the question is one of extreme difficulty, for it is by no means certain that the numbering proposals which are the basis of the bill introduced into the Lower House in the session now closed would not have left the automobilists in worse case than before. At any rate, it is imperative that in the coming year there shall be an alteration of the law which will afford to the public protection against the inconsiderate driver, and yet free the careful motorist from vexatious prosecutions for breaking a regulation which no one thinks he ought to obey."

Racing Rules.

The position of members of the trade acting on committees in connection with trials and tests is, undoubtedly, an awkward one. It has already been mentioned in discussions with regard to the competitions organised by the A.C.G.B.I., where the difficulty of finding experts unconnected with the trade has been pointed out. This is also felt on the Continent, and found expression at the conference of delegates of the various European automobile clubs held a few days ago in Paris. Several representations with regard to the details of races were there made by the British delegates, and these are to be further considered by the clubs of the various countries with a view to arriving at some international agreement on the subject.

Royal Institution Lectures.

On Saturday Professor H. S. Hele-Shaw, F.R.S., began his Royal Institution lectures on Locomotion, remarking that the wheel was the secret of man's power of artificial locomotion upon the earth. Its speed was only limited at the point where it flew into pieces. A number of models, showing the actual working of a wheel under various conditions, were placed in the lantern, and from the pictures projected on the screen the audience observed how the pneumatic tyre absorbed the obstacles, while the solid iron rim peacefully climbed over them. Fifty years ago a brougham fitted with pneumatic tyres was running in the streets of London, yet the invention only caught on some few years ago owing to recent mechanical advancements and improvements in rubber manufacture. People used pneumatic tyres on vehicles because these reduced shock and vibration more than any other kind of tyre. But pneumatic and solid rubber tyres offered more resistance than a hard iron tyre provided the roads were fairly smooth, and for this reason spring wheels had been invented. Professor Hele-Shaw has been experimenting with a new spring wheel fitted on a motor-car, and he mentioned that he found the vibration exceedingly small, even though iron tyres were used.

The Motor on the Road.

THE second lecture of the series was given on Tuesday, when "The Road Motor" was dealt with, the principles of the petrol engine being described. It was called an internal-combustion engine because it took the fuel and utilised it inside a cylinder, whereas in the steam motor a boiler was necessary. The fuel could be petrol, alcohol, benzine, or petroleum. It was first vaporised, then mixed and compressed, and then ignited at the proper moment in the cylinder, thus giving the required force to drive the engine. Professor Hele-Shaw had models and actual engines, and by means of these he made the audience understand the cycle of operations in the petrol engine. He showed how the combustible mixture was generated, how the charge was fired, how the speed of the engine was regulated, how the cylinder was cooled, and how it was lubricated. With reference to the motor-bicycle, he believed it would become popular in the course of a few years. He had ridden one constantly in all weathers, with just a slight covering for the knees, and his belief was that of all kinds of automobiles that was the most useful and convenient for practical purposes. Thursday's lecture was concerned with the steam motor on the rail, and to-day (Saturday) Professor Hele-Shaw's discourse will be on the electric motor.

Motor-Lurries and the Emission of Smoke.

A CASE of importance to motor-lurry owners has been before the Manchester County Police-court. An owner of motor-vehicles was summoned for an infringement of the law with regard to the emission of smoke and vapour. He admitted that vapour was emitted, but pleaded that in the particular instance it did not constitute an offence because the Act made an exception in the case of "some temporary or accidental cause." His driver found that the valve of the condensing pipe had not been turned, which Mr. J. M. Yates, the stipendiary magistrate, attributed to carelessness. The defendant then added that as there was a damp atmosphere on the day of the offence the presence of so much vapour might be put down to that cause. Mr. Yates said it was always damp in Manchester. He imposed a minimum penalty of 5s. and costs, and said he thought that this provision of the Act should receive careful attention, because until horses became used to motor-vehicles there was danger to the public.

Oiled Roads.

SOME few months ago a portion of the Hampshire roadway was treated with oil, and the early experiences of motorists who passed over that particular road were duly chronicled. But we have waited for further reports as to the efficiency of the treatment. Now that they are to hand they are somewhat confusing. Mr. Walter Philips, M.I.M.E., says: "I have had a conversation with a mounted policeman, who was over the road six or seven times a day, and he testified that during the heaviest rain no splashing mud came up; although the surface became muddy, it never cut up, and as soon as the rain ceased it commenced to dry at once. Another conversation I had was with the road foreman, who confirmed what had been told me by the patrol, and added that it did not require so much cleaning as the

other parts. During the month it had been down he had not heard of any side-slips or accidents of any kind. Taking into consideration these reports and my own observations, I am of opinion that had the road been newly made up when dressed with oil, it would have been even a greater success than it is, as I understand the part selected was about the worst portion there was. In a conversation I had with a doctor living in the neighbourhood, he said that being a daily passenger, by cycle principally, over this road, his opinion was that it was a decided success, and that the Bagshot Town Council were going to treat the High Street, Bagshot, in a similar manner, as during the summer time it was impossible to open any windows facing the street, owing to the dust."

An Adverse View.

MR. A. W. RUMNEY, a councillor of the Cyclists' Touring Club, has also published his experiences, and concludes by suggesting that an application of the oil in March would possibly be more efficacious than in the later summer. An *habitué* whom he questioned said that undoubtedly the road was more slippery, and that the mud was stickier. Pedestrians told him that they believed the oil injured their boots and made them puerous to water. The horse drivers seemed to condemn it without reserve, though they admitted its cure of the dust in September. Finally, Mr. Rumney took the opinion of the foreman roadman, who said that he had been sanguine at first, but now regarded it as a failure, and was very strong on the boot question. He also believed that the oil had a decidedly rotting effect on the flint, with which one portion of the road is laid, but that so far it had made no bad impression on the Cherbourg quartzite with which the other section is laid. It is possible that too much oil had been applied, and that one effect was that the road was to some extent waterproofed, and the moisture prevented from sinking.

MR. STUART OGILVIE'S NEW NAPIER TOURING CAR.

A Touring Napier.

LAST week we described at some length the notable bodywork of Mr. Stuart Ogilvie's new 24-h.p. Napier car, a photograph of which we reproduce herewith. The chassis, so far as the engine and gear are concerned, is a standard Napier type, but the channel steel frame itself has been specially constructed to suit the particular conditions laid down by Mr. Ogilvie. The ignition is by the Napier electrical system, worked by a quadruple coil and accumulators, with the commutator on the dashboard within sight of the driver. Four speeds forward are provided, and a reverse; the gear wheels are of ample proportions, dead hard, and run in a bath of oil inside an aluminium case. One lever only manipulates the whole of the speeds and the reverse. Powerful strap and drum brakes are pro-

vided, two of which act on the rear wheels applied by a lever to the right of the driver. The third is operated by the driver's foot, and acts on a drum placed on the cross-shaft carrying the chain wheels.

Porlock Hill.

COMMENTING on our recent note with regard to the ascent of Porlock Hill by a Lanchester car, Mr. Arthur Baker, of Horley (Surrey), who knows the Porlock district well, points out that the coach uses the old road, six horses being required. With regard to the new road, Mr. Baker drove a 6½-h.p. voiturette up the hill several times last summer, carrying four passengers weighing more than fifty stone, at the same time towing a friend on a bicycle.

Automobiles and Elections.

MOTOR-CARS are a familiar feature in connection with Parliamentary elections in towns, and are now regarded as indispensable in contests in rural districts. Last week we mentioned the political peregrinations on his motor-car—a 20-h.p. Clement—indulged in by Mr. C. D. Rose, one of the candidates for East Cambridgeshire. For several days during the campaign his opponent, Mr. Leonard Brassey, drove from place to place in his four-in-hand. But meanwhile Mr. Rose was getting over three times as much ground, and towards the close of the contest Mr. Brassey, too, used a motor-car. In the selection of candidates political associations evidently will have to inquire as to their nominee's motoring exploits and experience.

Road and Path.

WHEN local authorities begin to give serious consideration to the conditions of the roads they will have to clearly distinguish between roadway and footpath. At present it is often almost impossible for the ordinary man to realise where one begins and the other ends. At Ascot, for instance, Mr. Granville Kenyon has found this a very real difficulty—in fact, it led to his being summoned before the Windsor County Bench, charged with driving a motor-car on the footpath. He explained that the pathway was not clearly defined and that the roadway was covered with newly-laid road metal—facts which were admitted by the policeman who proved the case. In the end Mr. Kenyon was fined 10s. and costs, and justice was satisfied.

Common Sense versus Law.

BUT the point is one worth consideration by motorists, who frequently find portions of roadway newly laid in a way well designed to impede their progress and cause damage to their tyres. Under such circumstances common sense would lead most people to see whether there was not a way round, and, if the road and path seemed one, it would be perfectly natural to traverse that a few yards. That is the common-sense view; but, then, common sense availeth little in law.

America and the Gordon Bennett Race.

IN view of the criticisms that have been made as to the conditions imposed by the A.C.G.B.I. in connection with the Eliminating Test to select the English representatives for the Gordon Bennett cup race, a summary of those governing the entries from the United States is of interest. Already the Automobile Club of America has accepted and nominated one entry for the Gordon Bennett cup race, presumed to be Mr. Alexander Winton. They are open to receive further entries, from which two will be nominated, upon the following conditions: Each entrant shall deposit with the Club the sum of 600 dols. The racing committee of the Club shall decide which of the entrants not yet accepted may compete in the cup race. This decision may be arrived at by a contest or by the committee without a contest. Any entrant who is not

nominated by the racing committee for the cup race shall have his entrance fee returned to him. Any entrant who, after being nominated for the cup race by the committee, does not start shall forfeit his entrance fee of 600 dols. If three entrants are nominated to take part in the cup race, each entrant shall have two-thirds of his entrance fee (after deducting his proportion of the expenses incurred in holding the race) returned to him, provided he starts in the race. If two entrants only are nominated, each of such entrants shall have one-half of his entrance fee (after deducting his proportion of the expenses incurred in holding the race) returned to him, provided he starts in the race.

Technical Education.

AT the Polytechnic, Regent Street, W., there has been an exhibition during the week of specimens of the work of the students in various classes. The engineering departments were strongly represented and one of the features of the display attracting much attention has been a half-finished steam automobile, the carriage work in connection with which has been executed by the students of the carriage-building classes. It is evident that these classes are proving popular, and that many interested in automobile matters are thus becoming practically acquainted with the technicalities of the motor-car.

The Sheffield Paper Chase.

THE Sheffield and District Automobile Club organised a paper chase on Boxing Day. Messrs. P. W. Fawcett and J. W. Needham were the hares, the former being mounted on a 12-h.p. Humber. The hounds included Dr. Thorne, Messrs. W. W. Clarke, A. G. Blyde, T. Davage, E. F. Coupe, J. H. Pickford, B. Hind, J. Ellis, J. W. Dewhurst, W. Hydes, W. James, E. H. Hill, E. Ledoux, B. Shaw, J. Truelove, J. T. Thompson, H. Foster (president), and J. R. Wade (secretary). The hares led the hounds a pretty run through Ecclesall, Carter Knowle, Beauchief, Dore, Fox House, Grindleford, and Calver, and finished at Baslow. Mr. Ben Hind caught them, and thus won the kit of tools given by Mr. James Barber. A return was made to Grindleford for tea, after which the party broke up. There was very good sport, the only drawback being the weather, which made the roads very slippery, and when Derbyshire roads are slippery they take the palm for awkwardness.

The Transport Motor-Spirit.

WITH reference to the new regulations of the railway companies for the transport of benzoline, petrol, gasoline, naphtha, etc., it is now understood that they have definitely refused to withdraw Clause 2 of the consignment

THE SHEFFIELD AUTOMOBILE CLUB'S PAPER CHASE—THE HOUNDS READY TO START.

[Mr. J. H. Lygo.

Driving to the Public Danger.

AT the inquest held at Bottisham, recorded on another page, the county coroner of Cambridge pointed out that it should be generally known that although the Act of Parliament, and the bye-law made in pursuance thereof, fixed that the maximum speed might not be more than twelve miles an hour, that did not authorise drivers of automobiles to run at that speed under all circumstances. If the state of the traffic on the road was congested, or the lights of a motor-car were dull and insufficient, or from any other cause running at that speed would be dangerous, drivers of motor-cars could only run at that speed, or even at less speed, at their own risk, and if accidents happened, and death followed, then they would be liable to be indicted for manslaughter. With this pronouncement few motorists will disagree; all we want is that the law shall be so altered so that driving to the danger of the public shall constitute an offence. Once let legislation run on that line, and few complaints would be heard.

note, although they have made some slight concessions. The liability the railway companies thus put on the senders of inflammable liquids, Class A, is without precedent, and is naturally regarded by the trade as most unreasonable and entirely unjustified by the circumstances of the case. In view, however, of the great loss and inconvenience caused to customers, Messrs. Carless, Capel, and Leonard have decided to sign the consignment notes under protest, reserving to themselves the right of taking further action.

Over Maidenhead Bridge.

IT is reported that on Saturday a trio of motorists passed over Maidenhead Bridge without paying toll. They drove their cars through the toll-gate before the collector could close it, but on the return journey only the first vehicle escaped payment. The others found the gate closed, and, so it is said, a stubborn man in charge. Ere they could recross the bridge toll had to be paid. So far as the legal movement for

13

the removal of the impost is concerned it is hoped that motorists will give all the support they can to Mr. Taylor, of Eton, and the others who are working with him in the matter.

Proposed Taxation of Motor-cars.

At the annual meeting of the Warwickshire Chamber of Agriculture, Mr. R. Rutherford moved: "That this chamber considers it advisable to put a small tax on cycles and motor-vehicles (such tax to be applied to the repair of the county and district roads); also that any motor-vehicle driven at a greater speed than five miles an hour shall display a number, so that its identity can be known." He said that it was unfair that cyclists and motorists should use the roads and not keep them in repair. Therefore he suggested that cycles should pay a tax of 2s. 6d. each (workmen's cycles excepted), and motors 20s. Mr. F. E. Muntz agreed with Mr. Rutherford that motor-cars should be taxed, as they were owned by wealthy men who could afford to pay, but he objected to the taxing of bicycles. Sir H. Fairfax-Lucy moved an amendment, "That the Excise Act should be so amended that motor cars under one ton should be taxed on a graduated scale." It was never intended by the Legislature that motor-cars should escape locomotive duty.—Mr. J. J. Bourne seconded the amendment, for which six voted, while seven were against. Seven then voted for the motion and six against, so that the Warwickshire Chamber of Agriculture has decided in favour of taxation.

Horse Traffic as well

UNFORTUNATELY, in coming to such a decision the Warwickshire Chamber of Agriculture showed a lamentable lack of knowledge; or else the members failed to recognise simple facts that should be apparent to everybody. Motor-vehicles are less destructive of the road surface than traffic of any other class. There is nothing of the wear and tear occasioned by hoofs, and if the taxation of vehicles is to become a recognised thing the equitable proportion to be borne by horse-drawn traffic will be found far higher than anything that automobiles will be expected to bear.

Yorkshire Hares and Hounds.

THE paper chase of the Yorkshire Automobile Club, which has its headquarters at Leeds, was held on Boxing Day, and was a great success. The meet was at Poole Bridge at 11 a.m., and Mr. and Mrs. Jackson and Mr. Hey, on a 10-h.p. Daimler, Mr. H. A. Jones on a Pieper car, and Mr. Kirk on a 12-h.p. Gladiator were the hares. The rest of the meet formed the hounds, namely, Mr. Faiers (9-h.p. Clement), Mr. A. W. Dougill (8-h.p. Loidis), Mr. and Mrs. Walker (4½-h.p. De Dion), Mr. and Miss Armitage (8-h.p. Korti), Mr. Owen Brookes and Mr. Chippendale on motor-bicycles, Mr. H. Hey (motor-tricycle), and Mr. Albert Farnell (Oldsmobile). The hares started away at twelve o'clock, and laid the trail through Otley, Denton Park, Ilkley, Addingham, Skipton, and on to Grassington. The first car, namely, Mr. Faiers' 9-h.p. Clement, discovered the hares at Cracoe, beyond Skipton. Mr. Chippendale on his motor-bicycle was the second. The return route was through Pateley Bridge and Blubberhouses to Harrogate, where tea was arranged for at the Prince of Wales Hotel.

A Festive Gathering.

THE second annual dinner to the employees at Mr. Frank Morris' Sandringham Motor Works, King's Lynn, has just been held in the new Sandringham Motor Garage. The customary array of motor-cars had been removed from the building in favour of the more genial embellishments of Union Jacks and other flags, and a most comfortable salon was the result. Mr. Morris presided, and there were some fifty employees and friends present. The chairman was supported at the head of the principal table by Messrs. A. J. Thompson (manager), H. D. Smith (works manager), Day (driver

to the King), E. Colman, J. E. Briggs, and others. After the loyal toasts had been honoured, "The Motor Industry" was proposed by Mr. J. E. Briggs in a happily-phrased speech. He spoke of the pleasure it gave him to propose the toast, and recalled the days when the "horseless carriage" was the wonder of the day, and now they were more prominent than some of the poor hacks we saw. In responding, Mr. Morris said the industry was one he had especially at heart. It was now something like six years since he first launched out. Why should the business go abroad? They could build a car in England—and in King's Lynn—as well as any other country in the world. In conclusion Mr. Morris said the motor industry was going to be far bigger in the future, and there were greater hopes than they knew of. "The Employees" was proposed by the chairman, and the health of Mr. Morris was received with musical honours.

Motoring Prospects in New Zealand.

A CHRISTCHURCH correspondent of the "Motor Age" reports that there is every indication that within another year the automobile trade in New Zealand will be a very important one. During the past year there has been a steady increase in the interest in light cars, and especially in motor-bicycles. Already several large American firms have established agencies for their automobiles, and now France, the home of the automobile, will send over not less than three of its most prominent makes. The Darracq, De Dion-Bouton, and the Gladiator firms will open branches within a short time, and everything indicates that they will meet with prompt success. It would be advisable for some motor-bicycle manufacturers to open branches in this country, as they will certainly do as well, if not better, than in their own country. Our roads are especially well fitted for these machines. Our people also are generally quite familiar with machinery and much interested in technical matters. As to automobiles, the time is not yet ripe for the larger or heavier vehicles. What is in demand just now is a two or four passenger vehicle, giving a speed of about thirty miles an hour, and which can be placed on the market here at from £300 to £400.

THE annual meeting of the A.C.G.B.I. will be held on the 27th prox.

ON the 10th inst. the annual dinner of the Nottingham Automobile Club will be held at the "Black Boy" Hotel, Nottingham.

THE Anglo-American Oil Company have agreed to despatch petrol "under protest" in accordance with the new requirements of the railway companies.

THE German Automobile Club has sent a challenge to the A.C.G.B.I. in respect of the Gordon-Bennett cup. Germany will be represented by three Cannstatt Daimlers.

THE Wolseley and Napier Companies have both been awarded gold medals in the Elegance Competition organised by the A.C.F. in connection with the exhibits at the recent Paris Salon.

AS the various annexes to the galleries of the Agricultural Hall, Ilington, will be in use at the Automobile Exhibition, to be held there in March next, special arrangements have been made for a large electric passenger lift to be in operation during the period of the Show.

MESSRS. LAKE AND ELLIOT, of the Albion Works, Braintree, are bringing out several useful accessories for motorists, including a motor jack which can be instantly raised to reach any axle within its range. The body is of aluminium with oxidised handles and knobs. A tyre lever and petrol can opener is another useful device. This is provided with a square projection to fit Messrs. Carless Capel's cans, while one edge is formed to fit the slots in Pratt's spirit cans. A motor-bicycle stand, the width of which can be easily adjusted, is also made by Messrs. Lake and Elliot, who have prefixed the distinctive word "Millenium" to their motor specialities.

A LONDON GARAGE.

IN the country the automobile house is becoming an indispensable building in connection with all well-ordered mansions and residences. Considerations of space do not restrict the ideas of motorists and the addition of motor-car accommodation to existing arrangements adds little expense of maintenance. But in London it is different; land is valuable and the cost of sites in West End thoroughfares conveniently near the houses of owners of cars is too great to encourage any universal system of motor-houses adjoining London residences. Hence the necessity for centrally located establishments, where "all sorts and conditions of cars" can be received, stored, cleansed, replenished, and sent out again in proper trim for the park or for visiting. Enterprise and capital as well as knowledge and organisation will be necessary in the development of such garages, or they will be unable to cope with the irregularities of the services required, or to deal with the great variety of work to be done.

One of the first institutions of the kind—for institution it really is—is the Regent Street Garage, in which are stored nearly a hundred cars belonging to the nobility and the people of the West End. About eighty cars, on an average, are housed every night, their owners being charged a definite rental for such accommoda-

lators. Sand buckets are plentiful, while the fire-proof construction of the whole building should give confidence to owners sending their cars for regular storage in this garage. To the rear is a boiler-house, where extensive preparations for improvements are now being made. The petrol store is large and well ventilated in accordance with the requirements of the London County Council, three ventilating shafts being particularly notable.

Upstairs on the first floor the space devoted to motor-cars has been somewhat restricted by the recent increase of office room, but on the top storey one can learn something of the facilities provided for motorists. Cars are carried aloft by means of the three-ton lift, and the feature on the third floor is the series of wired-in compartments—private lock-ups—in which owners can store their vehicles, and only their own men are permitted to enter to attend to them. The Duke of Devonshire and the Earl Cairns are but two of the long list of titled people who have used this garage for their cars. Theatrical leaders, too, have recognised the convenience offered, and Mr. Beerbohm Tree and Mr. Lewis Waller's cars spend their nights in this garage; while until recently Mr. Frederick Harrison's car was there to be seen. But Mr. Harrison now houses his vehicle himself. At the time of our visit there were singularly few cars in. Mr. Harvey Du Cros' Napier was being overhauled,

THE PARIS-MADRID ROAD—TWO VIEWS NEAR THE FRONTIER.

[La France Aut. mobile.]

tion. Conveniently situated in a central position in the West End, the garage has an easy approach from Regent Street, and when the yard is covered in—as is the present intention of the proprietors—will be regarded with even greater favour by drivers and other users. The ground floor is of large area, nearly square in outline, and surmounting the wine cellars of Messrs. Hedges and Butler, which extend far in all directions. Their subterranean avenues and streets necessitated the exercise of much ingenuity in locating the three pits provided for the inspection of cars, and also the bed for the great lift. But difficulties exist for the purpose of being overcome, and none have been allowed to interfere with the usefulness of this splendid garage.

Calling there one afternoon recently, the scene presented to us was an animated one. On the ground floor were two score or more *chauffeurs*, mechanics, clerks, etc., busily overhauling cars, cleaning parts, checking supplies, and variously engaged, while to have a few minutes uninterrupted chat with Mr. G. Marsh, the manager of the garage, was apparently impossible until we were lifted above and beyond the reach of the busy throng below. In addition to the inspection pits there is also accommodation on the ground floor for the simultaneous washing of four cars on a properly prepared floor, allowing for efficient drainage. The whole place is lighted by electricity, and there is every convenience on the premises for the charging of accumu-

and in its private cage Mr. Charles Cordingley's 40-h.p. Mercedes—"the little red cottage," as it has been felicitously described—appeared to be calmly contemplating the "other members of the trio that constitute his "motor stud," viz., the Napier and the M.M.C. In another wired-in compartment Mr. Crompton's car awaited orders to go, and a few voituresses were being duly inspected.

The system of noting vehicles as they arrive, and not allowing them to be taken away until entry is made of their departure, is most thoroughly maintained, while the efficient repair department is not the least requisitioned of the branches of activity. A good business is done with the leading hotels, such as the Grand, the Carlton, the Metropole, and Claridge's, whose vehicles are housed at the garage, and can be despatched on receipt of telephonic instructions. Taken altogether, the Regent Street Garage presents about as complete a picture of automobile industry as is anywhere to be seen, and during the hours of night—it never closes—contains as fine an array of motor-vehicles as is brought together in the metropolis. But in the daytime the view is less comprehensive, though more animated.

THE Electric Ignition Company, of Birmingham, have just brought out a new ignition-wire terminal, which, it is claimed, cannot break or work loose.

CONTINENTAL NOTES.

BY "AUTOMAN."

ON Christmas night, at eleven o'clock, the Paris 1902 Automobile Salon closed its doors, after it had been decided who were the winners of the 5,000 prizes of the "Tombola." One hundred and forty-two lucky numbers were settled in the usual Continental style—that is to say, with the aid of a machine which is rapidly rotated until it stops at a certain number. No. 113,508 won the first prize, a Gillet-Forrest 6-h.p. two-seated motor-car, and No. 13,435 gained the second prize, a bedroom suite. The show was a record one in every sense of the word, for there were more and better cars, and certainly there was more uniformity of design. With regard to the attendance, from first to last it was a record, beginning with the formal opening by the President of the French Republic and the Ministers of State. Visited in the mornings by serious purchasers, or those in search of knowledge, in the afternoons it became filled with an aristocratic crowd, amongst whom a king, several princes,

by the crowds on the racecourse and to the strains of the German national anthem. I well remember how the French makers derided these cars and all that appertained to them, including the honeycomb radiator. They had no influence whatever on the trade of 1902, although, taking into consideration their horse-power, they ran remarkably well. What, then, has made the Mercedes car in one short year the model to be purchased and copied by nearly the whole trade? Race-winning in the first place, for of all advertising this is the best, and it is the cheapest in comparison to the result produced. The successes of Nice and Vienna established the Mercedes as a redoubtable competitor to Panhard and Mors. The throttle regulator on the admission worked by a hand lever on the steering wheel, and combined with the mechanically-worked inlet valves, did the rest.

THIS is the history of the Mercedes, but the lesson to be learned by it is never to despise your competitors; for, had the great makers given a little more attention to the products of the Cannstatt-Daimler, they would not have let the latter get such an

THE DUCHESS OF SUTHERLAND (AT THE HELM OF HER LIGHT PANHARD), WITH MR. AND MRS. FRASER LYTHE, OF ALDOURIE CASTLE, AND MR. CLIFFORD.

and innumerable dukes, marquises, and counts freely mingled. On Sundays and on Christmas Day the building was unbearable; the crowds, packed like sardines in a barrel, moved in slow and solid lines up and down the passages, and to stem the tide was impossible.

Now that the excitement is over and the doors are closed one has time to collect one's thoughts, and to see if there is any great lesson to be learned from the French show, and if so, what it is, and how best to profit by it. The most impartial observer is bound to admit that the history of the Paris Exhibition is the history of the Mercedes. I well remember when I first saw the Mercedes; it was at Chartres, on the occasion of the Paris-Bordeaux race, in May, 1901, and M. Dannat had just got his 35-h.p. Paris-Berlin model. Then, again, I saw four of them on the road to Berlin; one smashed up near Hanover and three arrived rather late in Berlin to the cries of "Deutscher Wagen"

undoubted advance. The honeycomb radiator is not new; it has been used for years by the Cannstatt Company. It is destined to replace all other systems of cooling motor-car engines, and yet twelve months ago no one took an interest in it. But, if the French makers have been a long time in learning their lesson, they have not been long in putting it into practice when once learned. The Salon just closed has shown what energy and vitality there is in the French trade, for this year has produced a complete transformation to the now established lines of stamped steel frames, magneto ignition, mechanically-operated inlet valves, and throttle governing. True it is that one still hears that the trade is going on wrong lines, and will come back to automatic valves and armoured wood frames, but then the same was said of tube ignition and tiller steering, which are as dead as Queen Anne.

THE Paris Exhibition has also brought to a close the year

1902. It may be of interest to briefly review the past twelve months, and point out the lessons which the British trade have learned, and those which they have neglected to learn. I recall with some pride and pleasure the advice which I repeated time after time in these notes to the British makers to come over to France and see what their neighbours were doing, and not be content to sit at home and imagine they were turning out the best cars in the world. To those who said their cars were superior to the French vehicles I replied, "Come over and race them on equal terms, and if what you say is true you will win, and get the world's trade, and if not you will learn a lesson which will save you from great loss in the future." Two British firms followed my advice, and one of them pulled off the Gordon Bennett Cup, made itself respected by all its competitors, and got a huge advertisement into the bargain. If it did not get the world's trade, it is because the car it entered was not powerful enough to compete with the high-powered cars of its competitors. It is, however, in a fair way to get into this coveted position if it will continue to recognise the distinct tendency the trade is taking, as exemplified by the Paris Show. A German firm has proved my argument up to the hilt, and stands to-day an easy first, even in France, for its productions command a fabulous price.

I HOPE that another bubble has also been exploded, namely, the danger of reducing the weight of cars. How often have wise heads wagged from side to side in disapproval of the lightening of cars; how often have we been told by good authorities that the racing car was only fit to run a race and then fall to pieces as the result? All this has been disproved by every succeeding race held on the Continent, and to-day we have 40 and 50-h.p. touring cars, weighing little over one ton, stronger than the old 12-h.p. models, which weighed 30 cwt. All this has been brought out by means of races, which are the only serious test of the capabilities of a motor-car. The British motor-car builder who wishes to succeed should take the latest French model, and, instead of copying it, study how he can lighten every part whilst not taking from its strength, and how he can increase the power without increasing the weight, and if he works on those lines he has splendid prospects. These are the two problems which should take precedence over all others.

THE powers that be in England, in official automobile circles, when they have leisure from framing Parliamentary bills destined to brand the inoffensive and already-persecuted automobilist with a number which will render him an easier prey to the country constable, inspired by the prejudiced magistrate, turn their attention, it seems, towards discouraging high-powered cars, entirely forgetting that the words "high powered" are merely comparative terms, liable to change considerably from year to year. Judging from what I see around me on the Continent I think they would be wiser to let the matter alone, for whatever they decide on the subject can have no possible ultimate effect on the trade. If high-powered cars are useful they will survive, if not, they will die a natural death; but again, what is a high-powered car? Two years ago 10-h.p. was considered high power and now it is certainly a low power, and who shall doubt that the same progression will take place in future? If, however, the official circles of automobilism in England discourage what they regard as high-powered cars, they will retard what has been the great mainstay of the business—that is to say, the yearly purchase of the rich man who wants the latest improvements, in other words, the greatest powers for the least weight, and who passes on his old car into the hands of the less wealthy, and thus doubly encourages the trade. No one doubts for an instant that the intentions of the authorities are good and are meant to encourage the trade in England. The road to Avernus, however, is also paved with good intentions, and if they were to devote their attention towards popularising racing in England, either publicly on the roads, by judiciously using the Gordon Bennett race as the thin edge of the wedge, or on private tracks, they would have a precedent in the enormous trade which racing has produced in France. These are some of the lessons,

which may be learned from the success achieved here in France. The future of the British share of what is going to be one of the greatest of the world's trades depends upon how these lessons are taken to heart.

ONE of the large Swiss electrical engineering concerns, La Compagnie de l'Industrie Electrique et Mecanique of Geneva, has lately taken up the construction of electrical motor-cars for industrial as well as pleasure purposes. It is also at work on a new combination petrol-electric car, which will be put on the market at an early date. The car will be provided with a 9-h.p. petrol motor, which will drive a dynamo at a constant speed. The latter will furnish the current for the electric motors which propel the car, any excess being utilised in charging a small battery of secondary batteries.

BARON PIERRE DE CRAWHEZ, Chairman of the Sporting Committee of the Belgian Automobile Club, is presenting a prize for a competition for the best automatic apparatus to record the times in automobile races and records.

AT the recent Paris Salon a neat little voiturette was shown by Messrs. Vauzelle, Morel and Company, of Rue des Goncourt, Paris. A general view of the vehicle is given herewith. The motive power is supplied by a 4-h.p. Aster engine, located in the rear of a tubular frame, and driving through a Bozier two-speed gear direct to the rear live axle. Wheel steering on an inclined

pillar is provided, and all control levers are handily placed. The petrol and oil tanks are affixed to the dashboard, a false bonnet in front forming a convenient tool receptacle. The engine is water cooled, the circulation being on the thermo-syphon system. Band brakes on the hubs of each of the rear wheels and also one on the differential are provided.

DURING the course of the recent *Salon* some official trials were made of the time occupied in detaching and refixing the new 870 by 100 mm. Continental motor pneumatic tyres. The tests were carried out under the supervision of M. Tampier, official timekeeper to the A.C.F. In one trial, the tyre was detached, the tube taken out, and the whole refixed in position (with the exception of screwing down the holding bolts) and inflated in 3 min. 30 sec. In another trial the tyre was entirely detached from the wheel, refixed in position, and inflated, with the bolts and valve cap screwed home, in 5 min. 2 4-5 sec.

It is reported that a company has been formed in Mexico, with a capital of £40,000, for the purpose of manufacturing motor-cars in that city.

MR. F. CLARKSON was returning from London to Chelmsford the other evening in his "Chelmsford" steam car, when in driving up Widford Hill he observed the lights of two approaching vehicles. On getting quite close to them he saw a third van drawn by a pair of horses, and it was impossible to stop the car until it had collided with the off-side horse, inflicting fatal injuries.

MOTOR-CYCLING NEWS.

THE Consul-General of the United States in London, Mr. H. Clay Evans, has sent a report to his Government upon the automobile trade in Great Britain. He says that the motor-cycle trade in the United Kingdom is a matter of practically only two years' growth; but it promises to become a most important branch of the automobile business. While there is, popularly speaking, a boom in motor-cycling and there are over a score of machines on the market, the majority are of French or Belgian make, and a number that are advertised as English machines, with English names, are either imported outright or consist of Continental motors built into English frames by local companies. There are probably half a dozen machines that are really English-built throughout, and of these only three are the product of big factories that have previously made a reputation in the cycle business, and have now turned their attention to motors, owing to the popular demand. America is already represented in the market by three standard machines, all of which, he believes, compare favourably with the best English and Continental makes.

THE Committee of the Automobile Club has decided to appoint an assistant secretary who will give special attention to motor-cycling matters.

THE Liverpool Motor-Cycle Club has drawn up an excellent programme for the winter, including a series of smoking concerts and meetings at which short papers of interest to motor-cyclists will be read and discussed. On Monday next Mr. F. W. Wheeler, the Captain, will read a paper on "The Rise and Progress of the Motor-Bicycle." To-morrow's run is to Sefton.

AUTOMATIC lubrication, and if possible sight-feed lubrication, should be incorporated in every motor-bicycle to ensure satisfaction to the rider, with the minimum of trouble. During the past season the Ormonde motor-bicycles have been fitted with an automatic lubricator with successful results. For the 1903 machines a further improved sight-feed lubricator has now been devised, in connection with the automatic lubricator, particulars of which will shortly be available.

THE Fire Brigade of Charlottenburg, Germany, which has been equipped with bicycles for some time past, are now about to make some trials of motor-bicycles. On receipt of a call, one of the firemen is despatched at once on the machine to render what assistance he can, pending the arrival of the fire engine.

A TWENTY-FOUR hours motor-bicycle record was recently accomplished by Mr. H. B. James, of Melbourne. Mr. James left the G.P.O., Melbourne, at 7 a.m. on Monday, November 17th. His course lay from Melbourne to Hamilton direct, through Camperdown. When he arrived again at Camperdown on the return journey he went down to Warrnambool and back, then on to Melbourne again. In the twenty-four hours he covered 460½ miles. He was at Lara, 12½ miles from Geelong, at the end of this period. The time he was in the saddle was 19 hours 43 minutes. Continuing his ride home to Melbourne, he got back after having been away for 26 hours 35 minutes, and riding 503 miles in that time. The machine, fitted with a 2½-h.p. motor, used 9½ gallons of petrol and two pints of lubricating oil.

THE Alexandra Palace Velodrome was the scene of some interesting racing on Saturday. Maurice Fournier, the French motor-cyclist, made several attacks on track records, but as his racing machine had been damaged on the previous evening he had to ride a comparatively low-powered bicycle, and was thus heavily handicapped. From a flying start he rode half a mile in 59 1-5 sec., and 1 mile in 1 min. 49 sec. F. Chase's record for the latter distance is 1 min. 41 2-5 sec.

Now that we have just commenced a new year, motor-cyclists may be reminded that it is necessary to renew their licence to "keep a carriage to be drawn by two or more horses or mules, or to be drawn or propelled by mechanical power." If such carriage has four or more wheels, the licence costs two guineas; but with less than four wheels, only fifteen shillings. Those riders who keep a trailer would do well to take out a two-guinea licence instead of two separate licences at fifteen shillings each for the cycle as one carriage and the trailer as another, so as to be able to claim that the combination forms one vehicle. Occasionally an over-zealous policeman issues a summons for a motor-cycle and trailer exceeding a pace of six miles per hour; although the magistrates will not always follow the argument, there is much more chance of the summons being dismissed if

it can be shown that the Inland Revenue authorities have recognised the combination as a single vehicle which is permitted a speed of twelve miles per hour. On the other hand, those riders who are using an *avant-train* or fore-carriage in connection with their motor-bicycle have only need to take out a fifteen-shilling licence, the combination in this case having less than four wheels.

IN accordance with the recommendation made at a meeting of the makers and sellers of motor-vehicles, which was held at the Automobile Club on the 8th ult., a conference of the makers and sellers of motor cycles will be held on the Club premises in Piccadilly on Tuesday, the 13th inst., at five p.m. The

purpose of the meeting will be to consider what, if any, trial of the trustworthiness of motor-cycles should be organised during the present year.

IN the event of the engine of a motor-bicycle being taken to pieces for any purpose, before disengaging the spur wheels constituting the 2 to 1 gear actuating the cams and commutator a scratch should be made across the faces of the spur wheels to indicate the teeth which are to be in contact when re-fitting. Should this precaution have been neglected, the proper timing of the engine, etc., can be adjusted by observing the following points:—The ignition box should be held vertical with the engine. When the piston reaches the very top of the stroke the trembler should be just on the point of parting from the platinum screw, causing an explosion to take place. The makers of the Minerva also suggest that it is well to notice on slowly turning the engine round that the exhaust should commence to open when the piston is about 5-8 in. from the bottom of the stroke.

It may interest our readers to know that in connection with the Royal Agricultural Hall (Islington, N.) Exhibition, all the spaces in the Great Hall, the Minor Hall, and the Arcade have been allotted. Every bay in the Gallery has also been let as well as most of the wall and centre spaces therein.

A PRETTY SCENE NEAR NEW YORK.

[Automobile Topics.]

SOME USEFUL NOTES.

It must not be forgotten that in proportion as the temperature falls ordinary grease becomes thicker, and that it is well to add a little oil.

WITH live-axle cars be sure to always have the bevel-gear case well lubricated; plenty of grease and heavy oil should be frequently put in.

A GLASGOW motor-car driver has had a small drain tap fixed to the bottom of the float chamber, and has found this to answer admirably in cases of flooding and water in petrol.

NEVER neglect to screw down the nut which holds the valve stem on the rim; to all intents and purposes this nut answers as a security bolt, and if it is not tight the valve may be torn out.

AFTER valves have been ground in with emery in the

VERY high-powered cars can usually be started by turning over compression with the spark off, so that gas may be drawn into the cylinders, and then the switch may be put on; if this plan is adopted, there is no chance of injury through back-firing.

NEVER use a brake unless necessary, but when necessary do not hesitate to bring the car to a full stop.

If a tour is contemplated, thoroughly overhaul the car before a start is made, and do the same at the finish.

ALWAYS keep an eye upon the gear-box bearings and engine bearings. Neglect of these may cause great trouble.

IN making repairs to petrol-motors the greatest care is necessary in reassembling the parts, to see that everything is put back in

A 16-H.P. DE DIETRICH (TURCAT-MERY) CAR AND HEAVY PETROL LORRY AT THE 1902 FRENCH MILITARY MANŒUVRES AT CARCASSONNE.
(Le Chauffeur.)

ordinary way, a very nice finish can be given by running them round with putty powder.

THE guides in which exhaust valves work should be oiled frequently. This is a place where lubrication is often either overlooked or forgotten, and in some cases the guides have broken.

It is a very bad plan to slip a clutch much, in order to surmount a hill on a high speed, instead of changing to a lower one; it wears the clutch leather very considerably.

FOUR-CYLINDERED engines usually start themselves when they have recently been working, but do not forget to put the spark lever to late firing before switching on.

the correct position and that all adjustments are made exactly right. Particular care must be used with the ignition mechanism when making any changes affecting the timing. In such cases, before it is attempted to start the motor, it should always first be ascertained that the spark occurs at the proper moment. As is well known to all motorists, when the spark occurs too early a back fire is produced in the engine, and if the spark occurs exceptionally early bodily injury may result to the person attempting to start the motor. This point ought, remarks the "Horseless Age," to be particularly impressed upon users of machines in which ordinarily the spark is automatically retarded in starting, since they need not pay any attention to the adjustment of the spark when starting under ordinary conditions.

"A NEW SYSTEM OF HEAVY GOODS TRANSPORT ON COMMON ROADS."*

THE author of the work under notice had the superintendence of a vast amount of traction-engine haulage, and from watching the progress of the work he has, by a gradual evolution of ideas, come to the conclusion that an improved system of goods transport on common roads could be economically carried out. Certain axioms are laid down:—(1) Minimum cost of transport is of greater importance than speed; (2) mechanical means must be devised to give the maximum of road adhesion to the propelling power, and the minimum of road resistance to the engine and the wagons; (3) damage to the road must be minimised; (4) goods must be capable of being transported in any large quantities for the longer distances, and of being split up into smaller units for collection and distribution through branches and terminals; (5) the system must include a cheap and efficient means of collecting and distributing empty wagons or units, and a separate and more powerful means of collecting and distributing them when loaded; (6) rehandling of goods must as far as possible

should be spread over as large an area as possible, especially on small country bridges. The author refers to the cost of breakages and repairs to traction engines, caused by the want of springs to ease the heavy weight of the engine when it jolts over irregularities of the road. These constant repairs form a large proportion of the working cost. The life of an ordinary traction engine is only about four or five years. In the author's engine, "the gear-wheels on the road axles are mounted on the centre of the axles with a special form of universal joint inside the gear-wheels, which not only admits of both axles being steered for turning corners without disturbing the line of the gear-wheels with the rest of the engine, but it allows the axles to oscillate horizontally to an almost unlimited extent." Diagrams are given which explain the alternative positions of the four wheels of the engine, in plan and elevation. In one engine the spring movement admits of a front and back wheel on alternate sides being simultaneously raised 6in. higher than the other two.

Col. R. E. Crompton, who was employed by the Indian Government from 1869 to 1875 in carrying out a series of experiments on road traction on the Grand Trunk

GENERAL VIEW OF THE DIPLOCK "PEDRAIL" MOUNTING AN OBSTACLE.

be abolished; (7) the motive power must be separate from the wagons, and must not be kept waiting whilst the wagons are loading or unloading. The experience of ordinary railways has taught something, and it has, the author believes, not been utilised in dealing with road traffic by ordinary traction engines. The author, after giving reasons for the above axioms, describes in the next chapter an engine he patented in 1893 to drive and steer by all four wheels, which would have the effect of doubling the surface contact of the driving wheels. In the ordinary traction engine two large wheels are used for driving and two small ones for steering; the bulk of the weight of the engine is thrown on the driving wheels. "When pulling a heavy load, the winding action of the gear wheels round the road axle reduces the weight on the steering wheels, and concentrates it on the driving wheels, even to the extent of occasionally lifting the steering wheels off the ground, when it is obvious the entire weight of the engine must be on the two driving wheels." This happens when ascending an incline to pass over a bridge, when the weight

read of India, prepared a report on this engine (Diplock's patent specification, No. 19682), in which he states: "I think it is necessary in this report to dwell on the obvious advantages of transmitting the power to four wheels instead of two, as is now the case. Amongst these I need only mention the reduced wear-and-tear of the road surface due to the weight of the engine being distributed over four wheels instead of being concentrated on two wheels; and that, as the front wheels now become driving as well as steering wheels, side-skidding of these wheels is prevented, which obviates a serious difficulty well known to all users of traction engines."

The report enters into the several advantages: the symmetry of the arrangement, a complete self-contained frame, supported on swivel-end carriages; the arrangement of the central ball-socket drive, by which the axle-boxes can rise and fall in horn blocks without fear of strain on the axles, and the satisfactory working of the gearing. A great advantage is, it is pointed out, that the axles are free to swivel not only in the horizontal plane, but also to swivel round a horizontal axis when the engine is seen in end view, thus allowing all four

*By Bramah Joseph Diplock. With illustrations. London: Longmans, Green and Co.

driving wheels to take a bearing when the engine is standing on irregular ground. This will have the effect of distributing the driving power over the four wheels, and largely increase the total tractive power. Other merits pointed out by Col. Crompton are that the boiler is free from the stresses of the driving machinery, and the use of springs.

Another report addressed by Col. Crompton to the chairman and directors of Diplock's Patent Traction Engine Haulage Syndicate, Limited, in December, 1899, is equally satisfactory. The writer says: "I have never yet heard of any results approaching the figures given. The engine was able to exert a pull equal to 35 per cent. of the total weight of engine—a satisfactory co-efficient of adhesion," and the report speaks of the tests made as so satisfactory as to promise a great future for this engine.

The other chapters describe the latest engine in detail, and an ingenious mechanical arrangement or wheel called the "pedrail." The pedrail is a combination of an endless railway with a trotting machine. The wheel which is used is constructed to imitate as far as possible the structure of the horse's leg. To imitate the horse's foot (to which is attached his leg which is mounted on an ankle-joint, which enables the horse to twist to any reasonable angle to suit the surface of the road) was the aim of the inventor. A diagram shows how ingeniously the wheel or "pedrail" is arranged to meet this view. On "a railway a rail is laid down, and wheels are run over it; in the pedrail, wheels or rollers are laid down, and the rail is run over them. The principle is the same, only the railway is inverted. The sliding spoke represents the horse's leg, or lever, and each leg is pivoted by an axle-joint to its foot. By turning the railway upside down, the parts coming in contact with the road are broken up into a number of comparatively small feet, which can twist in varying directions as required." This ingenious part of the invention is fully described. The "pedrail" shows as it moves forward two or three feet alternately on the ground. The feet simply set themselves to an angle in passing over a stone that is thrown in its way. By four such pedrails the surface adhesion is so increased that the slipping of driving-wheels would be an impossibility in this system. Another diagram shows the pedrail moving up an inclined road with the feet on the incline. The mechanism, in fact, imitates the structure of the horse's leg. The pedrail rolling stock is described, and No. 2 engine, which comprises many new features, forms another chapter. Professor H. S. Hele-Shaw has written a report on a trial of this engine, which he describes as the "real solution of one of the greatest difficulties which will be met with in developing self-propelled traffic." This book is worth reading by all interested in heavy goods transport on our roads.

THE Cambridge University Automobile Club will shortly open a garage for the use of its members.

AS mentioned elsewhere in the present issue, 113,508 proved to be the number to win the first prize in the Tombola held in connection with the Paris "Salon." The prize was a 6-h.p. Gillet-Forest car, and the winner was M. Pangaud, the owner of a sawmill in Paris.

THE third volume of Mr. Rankin Kennedy's work on "Electrical Installations of Light, Power Traction, and Industrial Electrical Machinery" has just been published by the Caxton Publishing Company, who are to be congratulated on the letterpress, illustrations, and binding. The work is to be issued in four volumes, and that now before us takes up the survey of the several prime movers employed to convert heat energy into electrical energy. It is written for the electrical engineer, and although few of that branch of the profession are called upon to design dynamo-electric machinery, some knowledge of its design is necessary. Hence the special methods that are given by Mr. Kennedy, C.E., for various classes of machines, continuous current, and polyphase. More than two hundred diagrams and illustrations are scattered through the pages of the present volume.

THE SOLIGNAC ELECTRIC CAR.

A NEW electrical car has recently been introduced in Paris by the Société des Voitures Électriques. It has been built to the designs of M. Solignac, and, as will be seen from the accompanying illustration, it is of the *avant-train* class of vehicle, that is to say, the motor, battery, and transmission are all carried on the fore-carriage. The latter comprises a horizontal frame divided into three compartments. The central one contains the accumulators, and the side ones the wheels, the electro-motor, and two Bovet electric brakes. Each wheel is driven independently. The complete fore-carriage is connected by plate springs to a plate, which in turn is bolted to another plate below the driver's footboard. A non-reversible steering wheel is provided, this being claimed to act with the greatest ease, in spite of the weight of the bogie, which weighs with the accumulators nearly 13 cwt. Another feature of the Solignac carriage is that it does away

with any speed-regulating mechanism, as the speed is varied by altering the strength of the current. The carriage advances by means of a series of intermittent contacts, and by regulating these the speed is controlled. If the contacts are long and frequent the speed increases, and vice versa. If they are short and intermittent the speed decreases. This is effected by means of a wheel concentric with and beneath the steering wheel. When the lower wheel is brought close to the other by the hands of the driver the speed increases in proportion. Owing to the location of the accumulators the centre of gravity is low down, giving the vehicle great stability. The cells of the battery are suspended in the frame on a double row of twenty rubber balls, with a view of reducing the effect of bumpy roads on the same. One of the great advantages claimed for the Solignac arrangement is that the front bogie containing the driving mechanism and accumulators can be applied to any vehicle, which may thus be moved either by electricity or by horses at pleasure.

MESSRS. S. BELMAN AND COMPANY, of Pershore Street, Birmingham, have sent us samples of the "J.M.N." trouser clips of which they are making a speciality. Motor-cyclists should not omit to use clips when riding in ordinary costume. Messrs. Belman make them in two forms, the Excelsior pattern being exceedingly compact.

THE STHENOS CARBURETTOR AND ITS ADJUSTMENT.

THE Sthenos carburettor, which appeared in a form slightly differing from its present one at the 1901 Paris show, has already obtained a considerable measure of popularity; and as it differs somewhat in principle from most of the usual types, a drawing of the latest pattern, for 10-h.p. engines, with some remarks on the adjustment thereof, may be of service to those whose cars are fitted with this type of carburettor.

As usual the essential parts consist of a float-chamber, by which the petrol—or other fuel, as it is stated to be equally suitable for alcohol, a claim which the writer has not personally tested—is supplied at a constant level to a jet. These parts—the float *F*, valve *V*, and jet *J*—are clearly shown in the illustration, which, though correct in details, is not accurately to scale, and the jet is, obviously, of somewhat large proportions. It is, however, closed by a conical-ended stem (squared along part of its length to afford passage to the fuel), which can be raised, thereby opening the jet by the differential screws *M* and *O*. Of these, *M* has a

coarse thread externally, and screws into the body of carburettor, a small screw-plug and packing *P* making a petrol-tight joint for the spindle *N*. *M* has a somewhat finer thread internally, into which the sleeve *O* is screwed, the latter being clamped to the spindle by the set-screw *S*, which at the same time prevents *O* from rotating when *M* is turned, by entering a slotted fork *T*. It will be obvious that when *M* is screwed inwards, it will also drive *O* outwards (downwards), but to a less extent that it rises itself, thereby giving a very slow upward movement to the spindle and cone, and gradually opening the jet, while the reverse movement, i.e., a left-handed rotation of *M*, will close the jet and reduce the petrol supply. The black pin projecting from *M* prevents more than one revolution being given to it without removing the set-screw *S* from *O*.

The rim of the jet *J* rises about 3/32 of an inch above the cone that closes it, and enters an inverted conical passage, along which air is drawn through the gauze *Q*, and which has above it a jacket warmed by the exhaust *E*, and a throttle-valve *H*. The effect of the flow of air along the conical passage is to diminish its pressure at the narrowest part—the well-known and at first

sight somewhat paradoxical "Venturi tube effect"—and thereby to suck a charge of petrol from the jet there located, the amount being regulated by the milled-head *M*. It will be seen that this forms the only mixture adjustment, and is said not to require much attention when once correctly set, a claim fairly borne out in practice. The writer's first experience, however, was one of dirt in the carburettor, which proved to be located in the passage *K*, and was easily removed by taking off the lid *Z*, carrying the float and valve spindle *V* with it, and the judicious use of a hairpin; not, however, until he had vainly dismantled the jet, cone, and nuts, and had to discover how to readjust same. To do this *M* and *O* have to be screwed into the body of the carburettor, of course with *S* removed, leaving about two threads of each visible. The black pin on *M* must then be turned, so as to be just on the near side—in the drawing—of *S* when inserted. The spindle *N* is then pulled down as far as it will go, and clamped by the set-screw *S*. *M* can now be turned one complete revolution, and this must be done with carburettor *in situ*, trial being made of the performance of the engine with *M* in different positions. From three-quarters to a shade over one revolution of *M* may be the approximate position; but if more than the one revolution is necessary *S* must be removed without, if possible, disturbing spindle, and the black pin of *M* turned past it. Excessive opening is, of course, indicated by smelly exhaust and sooting of sparking-plugs, while insufficient gives want of power and tendency of engine to stop when throttle is nearly closed.

Another adjustment sometimes needed is that of the valve *V*. If the little set-screw in the counterweight *W* shifts, the petrol level will be too high, and the jet will flood. If, on the other hand, the petrol level is set too low—it should be very slightly below top of jet—the result will be seen in difficulty of starting, though the running when once started may be little affected. A slight adjustment of the spindle *V*, fixing it securely to *W*, by the set-screw will remedy this.

A good petrol strainer should be located under the entrance *X* with this carburettor, as dirt is peculiarly troublesome. This, if not present, is easy to supply. Care should be taken when starting not to flood carburettor too much by pressing on float spindle, as this causes more trouble than with most other carburettors. The screw *Y* with the recess above it gives facility in washing out any dirt that may collect; but it is most important to prevent its entrance.

R. W. BUTTEMER.

A REFUSE motor-wagon has been constructed for the Wellingborough Urban District Council, and is about to be delivered.

MESSRS. EVART-HALL, LIMITED, of Nottingham, are introducing a set of mudguards specially adapted for use on Oldsmobile cars.

A COMMITTEE of six deputies was received the other day at the Italian Ministry of Public Works with a petition that the Minister would consider some scheme for supplementing the local train service in the Roman province by a service of automobiles, both for mails and passengers.

AN accident insurance policy for £500 covering the risks of accident by train—including light railways, over and underground and electric railways; by tram—cable, horse, steam or electric; by omnibus and by cab, and proportionate sums in the event of total or partial disablement for twelve months, together with an exceedingly convenient pocket diary, bound in leatherette or in French morocco, is issued by Messrs. Charles Letts and Company. These diaries for 1903 contain all this and also a self-opening tablet, a patented device which instantly insures the book opening at the place in use, and on which temporary pencil memoranda may be written, a moistened linen rag, or sponge effecting their instant removal. When it is remembered that an average of 18,000 people are killed by accident during a year, it is small wonder that the insurance has proved popular. The publishers have no less than thirty-six different varieties of diaries issued at a cheap rate.

OCCASIONAL NOTES.

RAIN was falling as I drove to Euston. It persisted during the northward journey, the appearance of the low-lying country round Wolverton and Stafford flooding my mind with apprehensions regarding the "forty miles on a motor-wagon," which I had mentioned in my last contribution. After luncheon, in the cosiness of a L. and N.W. saloon, and viewed from a perspective then of some hundred miles, I concluded that it would be most unpleasant. Arrived at Liverpool, the climatic conditions were unimproved, and my anticipations grew positively dismal. I was armed with Mr. Shrapnell Smith's order for a box-seat to Blackburn, per one of the Road Carrying Company's lorries, but decided to call on him in any case. Four o'clock tea at the Company's central offices resulted in temporary abstraction, while I took the opportunity to note down the route—Aintree, Maghull, Ormskirk, Burscough, Rufford, Tarleton, Walmer Bridge, Preston, Samelsbury, Blackburn. All looked comparatively simple as I gazed at the one-inch Ordnance Survey map which adorns one wall of the room. Every main and secondary road in the county of Lancashire is clearly shown in colours, the map having been prepared by Mr. W. H. Schofield,

have on board their loads of cotton from the docks. No, neither of these is my lorry. Where is number eleven?" asks Mr. Rosenheim, the engineer, of Foreman Ambler. "Towing in number fourteen," comes the ominous reply, which makes the thirst for copy liven a little. Shortly after number eleven enters the depot on the low gear, both she and her helpless trailer under full loads. A small connection to one of the pumps had fractured three miles from home. Immediately comes the inspection by the running shed staff, and number eleven is pronounced fit for the night-shift trip to Blackburn. The day driver enters the office to hand in his records, and he of the night has already rung on duty. A reliable and determined-looking man is my judgment, as he goes down to the stores, in company with his fireman, the two re-appearing almost instantly loaded with two oilskin coats and no less than six hurricane lamps. Fourteen bags of coke are certified for, one gallon of engine oil, and sundry oddments. Meantime, number eleven has been backed by one of the depot men to the end of the shed nearest to the departure gate, but without a load. I am growing impatient, two lorries having already started with their loads of cotton. Suddenly the gate is run back, and a waiting horse-drawn lorry is discerned in the street. Sheets fly off, and the vault opens simultaneously.

A SUNDAY MEET OF THE NEW YORK MOTOR CYCLE CLUB.

[Bicycling World.]

Assoc. M. Inst. C.E., County Surveyor. Forty and three-quarter miles! I pondered. How long should we take on the road, and how should I feel at the end of the journey? Picturesque tales of how steam-pipes occasionally broke, of lorries getting off the road into ditches, of their turning over, or of their being lost, were anything but reassuring to a Londoner venturing into the wilds of Lancashire for "experiences."

FIVE o'clock found me at the depot in Vauxhall Road. These premises consist of a spacious single-storey shed with a lofty five-floor warehouse adjoining. The floor of the covered shed is of concrete, with approved slopes and gullies to carry off water from washing operations. An excellent pit, a number of telescopic extractors to the roof to carry off the fumes of each separate motor, a twenty-ton weighbridge, adequate fire appliances, and offices for garage customers, are the chief features which attract notice. Here, too, I was introduced to the special vault constructed for the storage of petrol, having a capacity of 750 gallons.

It is now 5.30. Ting-ting-ting-a-ling go the gongs of the incoming lorries returning from their day trip to St. Helen's and back. Six arrive within thirty-five minutes. Three are to go to Blackburn to-night, but only two of these are yet in. They

Petrol, by Jove! I exclaim involuntarily, with visions of premature cremation. Was I to ride to Blackburn without a smoke? And what were the odds that the ashpans would not have a share in providing a healthy conflagration? "Reject that case," shouted the foreman loader, and I returned to my wits to see a leaking tin sent back to store by the cart, case and all. Row upon row, some off the cart and some from the vault, were the cases built compactly together. "We like the load, it sits well," was the nonchalant reply to my enquiry as to what the men thought.

In half an hour all was on and double-sheeted. A spar-like pole was erected horizontally at the back, above the load, and the tail lamp secured thereto. "Petrol vapour is heavier than air, and the front lamps are never in it," was the only explanation needed or vouchsafed. Four of the hurricane lamps were suspended at the front of the lorry, and a fifth was placed on the footboard, behind the boiler, to show the gauges.

SEVEN-THIRTY, and we are off! I am ensconced on a sack on the top of the tool-box, between the driver and the fireman. As to how we went through the rain and wind, protected by cloth, leather, and umbrella coats, but none the less taking our lives in our hands, must be told "in our next." P. A. M.

HERE AND THERE.

PROGRESS is being made with the movement for securing an automobile racing track in this country.

SUBJECT to the date not clashing with any important fixture, the A.C.G.B.I. will hold a gymkhana at Ranelagh on June 13th next.

MESSRS. HUMBER, LIMITED, have now removed their head office to Beeston, Notts. All matters relating to Humber motor-cycles of Coventry manufacture should be addressed to the Coventry Works, as before, but all other matters should be addressed to Beeston.

LA SOCIETE ELECTRIQUE "HYDRA," of Paris, whose ignition batteries are largely used in France, has lately taken up the manufacture of sparking plugs. Fig. 1 gives a view of the "Hydra" plug, which is said to be unbreakable, the insulating material being mica. The plug is claimed to give a reliable spark at all rates of compression and to be free from the objectionable feature of "sooting." Fig. 2 gives a view of another new sparking plug which the London Autocar Company are putting on the market. It has been designed to overcome the

FIG. 1.—THE "HYDRA" PLUG.

FIG. 2.—THE "L.A.C." PLUG.

trouble frequently experienced by motorists, viz., the constant sooting up, and consequent short circuiting of the current through excess of lubrication or defective piston rings. The London Autocar Company claim that the new plug affords a complete cure for this trouble, and so confident are they that a guarantee is given with each plug, which, if not found satisfactory, will be exchanged within one month after purchase, providing it has been carefully used and is not broken.

THE voluntary liquidation of the Motor Car Company, Limited, has now been closed, and from January 1st, 1903, the business of the company is to be carried on upon a reconstructed basis. Mr. R. Moffat Ford, who resigned office previous to liquidation, has again been asked to join the Board, and has accepted the position of managing director. The business of the company will consist solely of the sale and repair of Decauville cars and the representation of the Societe Decauville, of Paris, in the United Kingdom.

THE Zero Radiator Company, of Simen Street, Pittsburg, Pa., have recently introduced a novel design of radiator. None of its tubes are of a round section, and no radiating discs are employed. It consists of two header castings and flattened copper tubes. The latter are connected in pairs, so that the radiator is virtually a coil. There is but a quarter inch space between the tubes, one-eighth inch between the walls of a tube, and the width (inside) is 4 in. Between the headers each tube is 18 in. long. All the joints are brazed, the cooling surface of a twelve-tube cooler being 1,908 square inches. The manufacturers claim that the radiator is very efficient, because the water in the tube lies in thin sheets. It makes no difference how the radiator is hung so long as the currents of air can pass through the tubes without being deflected from their course.

THE police were extremely watchful on the Crawley road on Boxing Day.

AMONG those who have ordered 1903 Mercedes cars are the King of the Belgians and Prince Soltykoff.

ON Saturday last a banquet was held at the Automobile Club de France, to celebrate the recent successful *Salon*. Over 200 motorists were present.

ALTERATIONS at a cost of about £2,000 are to be made in the Mayfair stables so as to render them serviceable for the British Automobile Club's garage.

COLONEL SCOTT is in communication with the Indian Government with reference to the facilities given for the importation of petroleum spirit into India.

THE Star Motor Company have requested the Automobile Club to retain the cheque they sent in respect to an entry for the Eliminating Race to select the third British representative in next year's Gordon Bennett race.

THE first section of the experimental steel road, in Murray Street, New York, was practically completed on the 11th ult., when the last rail was laid by Major Jones. It is now in constant use by the heavy vehicles which form the greater portion of the traffic at that point.

THE Imperial Tyre and Rubber Company, Limited, have issued a neat circular with regard to their system of repairing tyres, in which they point out that they return all tyres sent for repair that, in their opinion, do not justify expenditure by reason of their condition. Their system of repairing is meeting with much favour among motorists.

THE Lord Chief Justice of Scotland (Sir J. H. A. Macdonald), who was sixty-six on Saturday, is perhaps the most variously accomplished occupant of the Bench in the kingdom. He could append to his name, says the "Westminster Gazette," as many letters as the alphabet contains, and would find it difficult to enumerate the offices he has filled or the activities in which he has been engaged since he became an advocate forty-three years ago.

AUTOMOBILISTS would be wise to periodically examine the tyres of their cars, and if required to be repaired the work should be done at the first opportunity. If the tread has been very much worn, or if the tyre exhibits signs of cuts and gashes, the fixing of a new tread will completely renovate it. The Dunlop Company have perfected arrangements for re-treading the covers of motor-tyres, large or small, only the best materials being employed.

IN addition to the magnificent display of motor-carriages and accessories at the Exhibition to be held at the Agricultural Hall, London, in March, under the auspices of the Automobile Mutual Protection Association, there will be a fine show of heavy vehicles, among the exhibitors being Messrs. Brown and May; the Yorkshire Steam Vehicle Company; Straker Steam Wagon Company; Messrs. Savage Bros.; The Hydroleum Company; Messrs. Coulthard and Company; Mann's Steam Wagon Company, Limited; Lancashire Steam Wagon Company; Brightmore Motor Company; Messrs. Foden's Limited, and Messrs. Haynes and Sons, Limited.

AN interesting combination of literary lore and motoring experience is presented in "Two Thousand Miles on an Automobile"—a desultory narrative of a trip through New England, Canada, and the Western States, by Mr. A. F. Eddy. The work is published by the J. B. Lippincott Company, of Philadelphia and London, and has several meritorious sketches by Frank Verbeck. Much care has been given by the author, and the index is, if not entirely novel in works of this kind, an excellent addition serving to emphasize the varied nature of the contents. The journey comprised some of the most attractive scenery of the States, and the reminiscences of American leaders scattered throughout the volume are characteristic as well as entertaining. All things considered, the automobile is said to have stood the journey well, and Messrs. Lippincott have been well advised in issuing the story of its adventures to the world.

MOTOR-CARS have been adopted for scouting purposes by the Swiss military authorities.

It is understood that the beginning of the New Year will see the issue of a goodly number of writs.

AN automobile club is in course of formation at Oran, Algeria. There is already a large number of motorists in the district.

M. LEON SERPOLLET has left Paris for Biarritz and Spain, to have a preliminary run over the proposed course of the Paris-Madrid race.

THE 10-H.P. BROOKE CAR SUPPLIED TO THE WAR OFFICE.

BARON PIERRE DE CRAWHEZ has proposed to the Belgian Automobile Club that it should next year hold a tour of Belgium on the lines of the 1902 Reliability Trials in England.

MR. CLARENCE GRAY DINSMORE is reported to have purchased one of the three special Mercedes cars the Cannstatt Daimler Company are building for the 1903 Gordon Bennett race.

THE Paris Motor-Car Exhibition closed at 11 p.m. on Christmas Day. By the following Saturday afternoon all the exhibits had disappeared, not a trace of the *Salon* being visible in the Grand Palais.

BOURNEMOUTH has many doctors, several of whom have motor-cars. The ex-mayor (Dr. Frost), Dr. W. Gardner, Dr. A. Mc Call, and Dr. H. Nankivell, are all practical motorists, the two latter favouring steam cars, Dr. Nankivell having a 6-h.p. White car, and Dr. McCall a 6-h.p. Serpollet.

At a recent meeting of the Automobile Club of America, Mr. J. Dunbar Wright delivered an illustrated lecture on an automobile tour which he made last summer through Spain, Northern Africa, and the Island of Madeira. A feature of the entertainment was the hundred or more lantern slides of camera snap shots taken by the lecturer. Views of Gibraltar, Funchal, Tangier, Granada, Cadiz, Seville, and a dozen other cities in the countries visited were shown.

MOTORISTS touring in France should get a copy of the handbooks issued by the various companies supplying petrol. Messrs. Fenaille and Despeaux, of Rue Conservatoire, Paris, the makers of the essence known as Benzo-Moteur, have sent us a copy of their handbook, which, in addition to giving a list of the places in France where Benzo-Moteur may be obtained, contains a large amount of useful information regarding the regulations relating to motor-car traffic in France.

MESSRS. J. A. WILDING AND COMPANY, LIMITED, has been registered with a capital of £15,000 to adopt an agreement for the acquisition (*inter alia*) of the business of Messrs. J. A. Wilding and Company, and to carry on the business of manufacturers, repairers, and vendors of motor-cars, motor-lorries, motor-vans, motor-cycles, and other vehicles. The first directors are Messrs. C. W. Milne, J. A. Wilding, F. C. Haste, and E. A. Nesbitt, and the registered office is at 3, Wilson Street, Drury Lane, W.C.

A MOTOR-CAR service has been suggested between Cheadle and Withington, near Manchester.

THE Llangollen District Council has expressed approval of the Yeovil Council's suggestion for the harassing of motorists.

EARLY in the new year the Beaufort Motor Company will introduce a new four-cylinder car, with mechanically-operated inlet valves, magneto ignition, and honeycomb radiator.

THE Post Office authorities in London are now experimenting with a White steam delivery van, supplied through Messrs. Julius Harvey and Company. We saw the van with a big load of Christmas parcels in the Battersea district the other day, and learned that it was giving very satisfactory results.

A CIRCULAR letter has been issued from the Birmingham Rim Works, Lower Loveday Street, Birmingham, announcing the death of Mr. J. T. James, and also stating that the business will be continued under the same management as heretofore, by Mr. W. S. James (brother of the late proprietor), under the style of "J. T. James."

THE H. W. Johns-Manville Company, of New York, is introducing a special sheet packing for cylinder head joints on petrol engines. The packing, which is known as Mobilene, is made from asbestos yarn, with fine brass wire inserted, the whole being woven into a very dense firm cloth said to possess great strength. It is saturated with a composition to resist the action of water from the cooling jacket, it is pliable, easily cut, and only 3-64 of an inch thick.

MESSRS. ALF. DOUGILL AND COMPANY, LIMITED, Longclose Ironworks, Leeds, have secured the sole agency for this country for the petrol delivery wagons built by Messrs. Rudolf Hagen and Co., of Cologne. They are propelled by a single-cylinder horizontal motor located in the fore part of the frame, and running at the slow speed of only 450 revolutions per minute. The transmission is entirely on new lines, consisting of reciprocating levers, by means of which any speed from zero to twelve miles per hour can be obtained. The wagons are made in a number of sizes to carry from 30 cwt. up to 7 tons. The 7-h.p. vehicle is stated to be capable of hauling a load of three tons over give and take roads on a consumption of half a pint of petrol per horse power per hour.

THE accompanying illustration shows the latest type of "Belle" car introduced by Messrs. E. J. Coles and Company. It is fitted with an 8-h.p. engine, the cylinder and water jacket being cast in one piece. The valves and their seating are so arranged that they may be taken out together, thus facilitating the grind-

ing-in operation. Larger tanks and radiators are now being fitted, while an improved form of water-circulating pump has been adopted. A hand lever controls double-acting band brakes on the hubs of the rear wheels, and a pedal actuates a water-cooled band brake on the countershaft. Three speeds forward and a reverse are provided, the car being claimed to be capable of attaining a speed of thirty miles per hour.

CORRESPONDENCE.

CARBURETTORS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent of last week (Mr. L. P. Mell). I have had the same experience. He will find that the valve is not sufficiently raised into its seating, in the carburettor. Either the leg of the float is bent, is too long, or the float leaks and is full of petrol. It is easy enough, if the carburettor is removed, to adjust the length of leg, and make sure that the valve closes automatically, well before the petrol overflows through the spray holes. I can usually do over 20 miles on a gallon.—Yours faithfully,

HORACE R. WILKINSON.

AUTOMATIC TIMING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was sorry to read in your issue of December 20th another failure of the Mors automatic time recorder, and should be very pleased if you would publish this letter and sketch, which I hope will reach Messrs. Mors. I really think that if they follow my sketch they will not have nearly so much trouble as the breaking wire principle gives. I think the sketch will almost explain itself, but perhaps a description of its action is desirable. As a car passes, it, as it were, treads on or depresses the fine steel wire (a) to the ground; the spring (b), being the weakest, gives first

and permits the switch (c) to close, while the stronger springs (d and e) allow for any uneven working due to, say, a car coming close to the supports (f).—Yours faithfully,

E. BUDD.

THE AUTOMOBILE CLUB BILL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although agreeing in every respect with the objections of your correspondent, "J. H. A. Macdonald," to the scorching motorist, I fail to see that this fact should make me a supporter of the numbering proposals.

I drive a modest little one-cylinder car, and in a way which I hope would entitle me to be classed as a "moderate" man. But I have no special wish to advertise in the highways and byways of this country the facts that I dislike the scorcher, and am a "moderate" man. And, if the "principal reason" of the numbering advocates is indeed, as stated by your correspondent, "that we desire our fellow-citizens to know that we are out of sympathy" with those who, "in a word, display a cynical want of ordinary courtesy and consideration that deserves the strongest condemnation," then, in my opinion, the case for numbering is in a bad way. In fact, your correspondent ought to object to compulsory numbering, because, as soon as it is required of every motorist by law, his carrying a number will no longer be a means of letting his fellow-citizens know his views as to scorches, roaring exhausts, and the dust nuisance.

I note that your correspondent suggests that naming cars would be an improvement on numbering; and refers to the custom of naming yachts, etc. It would be interesting to see what a village constable would make of some such "blessed word" as "Mesopotamia" on a scorcher's "roaring forty" on a dusty road. But this yacht-naming, as a supposed precedent, is fallacious. Your correspondent admits that the present speed limit for cars is "absurd." If there existed some admittedly absurd navigation law for yachts in our three-mile coastal waters—a law enforced by heavy fines on yachts, and not applicable to other navigators of such waters—how many yachts would be voluntarily named by their owners; especially if, by so doing, they were merely supplying the coastguard with means of starting vexatious prosecutions.

I can well understand the eagerness of anti-motorists to see the numbering proposals made law. But what I cannot grasp is that such a body as a Committee of the Automobile Club should be capable of endorsing them. Its members must surely keep themselves posted up with the working and the failure of the similar regulations on the Continent. They must be aware that the local authorities and their police agents welcome the numbers merely as an easily handled weapon in their war against motorists. I believe this Committee to be utterly out of touch with, and in no sense representative of, the opinions of the bulk of motorists; and that the real object to strive for should be: one law for all road-users; and where any-

one drives to the danger of other road-users, let him be made to suffer—whether he drives a motor-car, a horse, or a coster's donkey.

That any fresh legislation at present is likely to give us such a law, I am not simple enough to believe. But give the magistrates a little more time to familiarise themselves with motor-cars, and I feel confident that vexatious prosecutions of "moderate men," and heavy fines for a merely technical offence which harms nobody, will before long—signs of it are even now not wanting—be things of the past. The present law will remain on the Statute-book, but its more reasonable administration will cause it to lose all its terrors to the moderate man, and it will then only be used against the real scorcher. I take this to have been clearly the meaning of those who wrote under such headings as "Let well alone," or over such signatures as "Let sleeping dogs lie." Most laws are capable of being oppressively administered, and as long as the spirit of opposition to motor-cars pervades country magisterial benches, then, whatever be the law, the motorist, as being a motorist, and not only the scorcher, will somehow be made to suffer. Wait for time to effect a change in the views of J.P.s. Do not rush for fresh laws. The early electric lighting legislation did sufficient harm to one industry in Great Britain. Let us hope another is not now to be set back by the hasty and ill-advised efforts of the private member.—Yours truly,

"TIME WORKS WONDERS."

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am a shareholder in motor companies, and otherwise interested in the development of an industry in England which has already done so much for the foreigner; but I am not as yet an owner of a motor-vehicle, and if motor-vehicles are to be ticketed like cabs, I doubt if I ever shall be. I cannot conceive how the A.C.G.B.I. could propose such a madcap scheme. Can you not get up a petition against it? or at least demand that the Club Bill shall include a clause making numbering compulsory for all private carriages, whether moved by animal or mechanical motors? I expect that very many feel as I do.—Yours truly,

VIATOR.

ALLEGED FURIOUS DRIVING.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Our engineer received a summons last Tuesday to appear at Pershore for furious driving of my motor-car, a 20-h.p. Mercedes Simplex. Unfortunately my mother, who was in the car with the two engineers when the policeman stopped it, was too ill to go to Pershore.

In court the policeman took his watch out and made a few paces to show how he measured the speed by the time, and that the car had gone a quarter of a mile in so many seconds. An unprejudiced person must see that it would be impossible to tell how fast a car was going by these methods. Major Evans, before whom the charge was made, gave the extreme penalty of the law—£10 and costs. It is unnecessary to say how outrageous such a fine was considering that nothing has ever happened to the car to justify such prejudice, nor warrant such a fine.

The motor-car industry of England must suffer if the best cars must be put in storage or sent abroad until the law is changed. Judges, who know next to nothing about motor-cars, do not understand that high-powered cars are bought for hill climbing and not for their greater speed. The mere fact that a car is a fast one makes any charge probable. The inducement of paying witnesses seems to me unfair. The lanes about Pershore at this season of the year are very greasy, and they wind about so that we cannot drive any faster with the new car than with an old 6-h.p. Daimler. We have been motoring for five years, and have always been most careful to stop for nervous horses, and help them go by when needed. It seems very hard that we shall be obliged to give up motoring to avoid this petty persecution.—Yours truly,

(MISS) ZULA WOODHULL.

STEAM CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to the letter by "Steam" in your last issue, I beg to state that the valves of a Serpollet car, practically speaking, do not require renewing and grinding only about once in a twelvemonth, which is amply sufficient. I should recommend having this done by an expert, as, after they are on their new seats, the adjustments on the cams must be altered accordingly, and as the play of these should not be more than $\frac{1}{2}$ mm., it is imperative that a careful workman should do the work. The piston rings will last, according to use, anything from one to two years; still, to add new ones about once a year is an improvement, as it prevents steam from passing. The safety valve has no packing glands, as the writer suggests, so the tightening plug only puts pressure on the top spring, and has nothing whatever to do with the packing glands. In fact, the only two packing glands on the whole of the Serpollet car are those on the pumps.—Yours faithfully,

J. W. H. DREW.

In answer to Captain Longridge, the Endurance Motor and Cycle Company write that their letter should have read "Increase of power."

"MEDICUS" writes:—"The Oldsmobile is a car that would appeal to medical men who want a small, handy, quiet, and vibrationless car. Before purchasing one, however, the writer and others would like to know if it is reliable, and would like to hear the experiences of actual users."

NON-ACCEPTANCE OF A CAR.

At the Wolverhampton County Court, Judge Howland Roberts has heard a case in which the Star Engineering Company, of Stewart Street, Wolverhampton, sued Messrs. Wallace Brothers, gunmakers, etc., of Lincoln, for £49 18s., for non-acceptance of a motor-car made by plaintiffs to the order of defendants. After hearing the evidence, his Honour reviewed the correspondence, and said he had come to the conclusion that defendant could not cancel the order without the consent of plaintiffs, and that a definite breach of the contract actually took place on October 2nd. With regard to damages, his Honour quoted plaintiffs' letter to defendant, stating that defendant would have to either take the car or forfeit the £30 deposit. Taking into consideration also the fact that cars were getting more and more out of date every day, he held that a fair market value was £75. He therefore gave judgment for £27 8s., which was in addition to the £30 of the deposit.

AN UNATTENDED MOTOR-CAR.

FRANK JARVIS, in the employment of Messrs. Salmon, Market Place, Reading, was summoned at Wokingham for leaving a motor-car unattended in the Blackwater Road, Sandhurst, on November 20th. Police-constable Mason deposed that he saw a motor-car outside a public-house at Sandhurst. There was no one in charge, and after watching for eighteen minutes witness went into the house and saw the defendant and his companion having their dinner there. Defendant deposed that he was in charge of a motor-car business van. On the day named he was on his way to Aldershot and stopped to have dinner. He drew up his van into the draw-way outside the public-house, shut the engine off, and put a catch on so that it was

defendant. Mr. Steer pulled up right into the hedge on his right side. The car was in the centre of the road. He asked Bennett to back a bit, and give him a chance to pass, but the defendant said "No; you must go back to the crossway." Defendant could have passed all right if he had moved from the centre of the road. To make sure of his case, Mr. Steed sent for a Mr. Trevelyan, who measured the road, and found it 12 feet wide in the clear. He occupied 4 feet with his trap, but the motor-car was 7 feet wide. After they had remained there for an hour defendant backed his car, and Mr. Steer passed. The Bench convicted defendant, and ordered him to pay the costs, amounting to £1 4s.

MR. CAMPBELL MUIR was summoned before Mr. Denman at Marlborough Street Police-court on Tuesday for creating an obstruction with his motor-car by leaving it outside the Bath Club, in Piccadilly, on December 11th. Police-constable Halls said that the car stood outside the club unattended from 1.10 p.m. until 2 p.m. Mr. Muir, for his defence, called a club porter, who said that he was left in charge of the car and was watching it from the doorway. Mr. Denman said that he should deal with the case upon the evidence of the witness called for the defence. He had been treated to some "hall porters' law," and the fact that that individual "kept his eye on the car" did not affect the question at all. The defendant had no more right to occupy a portion of the public highway with his motor-car than a costermonger with his barrow or a builder with his materials, etc. The defendant must pay a fine of £2, with 2s. costs.

THE SUPPLY OF PETROL.

At the Brighton County Court, Judge Martineau has heard an action brought by James Miles against Henry Charles Harris, Castle Street,

TWO EXTREMES OF LOCOMOTION. A SNAPSHOT IN THE NETHERLANDS.

M. CORMIER'S TOUR OF EUROPE ON A DE DION "POPULAR" CAR.

A VIEW ON THE SEMMERING.

impossible for anyone to start it. The magistrates, in dismissing the case, considered that the defendant took due precaution to prevent anyone starting the motor, but thought it advisable that someone should always be left in charge.

PROSECUTING A HORSE DRIVER.

At Barnstaple, John Crocker, a farmer, of Umberleigh, has been charged by Captain Prideaux-Brune with wilfully and maliciously damaging his motor-car to the extent of 30s. Mr. A. F. Seldon, prosecuting, stated that on the 12th ult. Captain Prideaux-Brune was going down Butcher's Row from Boutport Street. The row was full at the time and he brought his car to a standstill behind the defendant's cart. Crocker then took the horse by the head and backed his cart into the automobile, doing the damage alleged. Mr. James, for the defence, said it would appear that Captain Prideaux-Brune thought all roads were made for motor-cars, and drove down the Butcher's Row, which was crowded with market carts at the time. When the car stopped the defendant's horse was frightened. Mr. James was proceeding to call other witnesses when the Bench decided to dismiss the case, as there was no intention, in their opinion, to commit wilful damage. Defendant was granted his advocate's fee, and witness' costs.

OBSTRUCTING THE HIGHWAY.

At Collumpton Sessions a case has been heard in which John Bennett, motor-car driver, in the employ of Messrs. Fox Brothers and Co., Ltd., of Wellington, was summoned for obstructing the free passage of the highway at Culmstock on November 19th. For the prosecution Mr. Martin stated that on November 19th Mr. Steer was driving from his residence at Prescott, and about 200 yards from Lower Cross he met a motor-car belonging to Messrs. Fox Brothers, and Co., Ltd., of Wellington, and driven by

Brighton, and William L. Duck, of York House, Coburn Road, Hove, to recover £42 7s. 2d., balance of account, for petrol supplied.

In opening, Mr. Humphrys, for the plaintiff, said the point appeared to be as to who was liable for the debt. There was no doubt whatever that the petrol was supplied, and the question really was whether defendants were responsible personally or whether they bought the petrol on behalf of a limited company called the Sussex Automobile Company, Limited. Plaintiff stated that beginning in September of last year he supplied petrol to the defendants down to October this year, and the balance of his account due was £42 7s. 2d. Defendants were carrying on business in Western Road as the Sussex Automobile Company, and with every supply witness sent a delivery note. There were altogether forty-one delivery notes, all of which were filled in to Duck and Harris or Harris and Duck, of the Sussex Automobile Company. The credit notes were similarly filled in, and witness never knew until November 5th this year that the company had been turned into a limited liability company. He then got a letter on the subject, which he at once repudiated, and said he should hold the defendants personally responsible. He had never given credit to the limited company, and did not know that it existed until November 5th. Three cheques which he received were made out in the names of the Sussex Automobile Company, Limited, and signed by Harris as director and Duck as secretary, but witness did not notice the word Limited on them.

Mr. Jacobs called the defendant Duck, who said he formerly carried on the business in partnership with Harris, but in 1901 it was turned into a limited company, which was registered on December 21st. Immediately afterwards the words "The Sussex Automobile Company, Limited," were put in three places on the shop fascia. Cross-examined by Mr. Humphrys, witness said the business was a flourishing one when it was turned into a limited company. Witness held 834 shares in the company, Harris 560 shares, and the remaining five signatories one share each.

His Honour said the question he had to determine was one of fact: whether plaintiff had notice that the business was turned into a limited company. He (the Judge) was of opinion that no formal notice of the change had been given the plaintiff, and that defendants remained personally responsible. Judgment was accordingly entered for the plaintiff for the amount claimed with costs.

MOTOR-CAR ACCIDENTS.

AN inquest has been held concerning an accident which recently occurred at Bottisham, near Cambridge, when George D. Wheaton, aged 71 years, was killed. Mr. F. W. Hutchinson, of Cambridge, the owner of the motor-car, said on the day in question he travelled from Bury St. Edmunds to Cambridge, and passed through Bottisham about seven o'clock. He slackened down to between ten and six miles an hour, and blew his horn. Whilst passing the village a man suddenly swerved on to the road and the car struck him. A doctor was sent for, but the man died before he arrived. Mr. A. J. Winship, who rode with Mr. Hutchinson, said they were travelling four or five miles an hour when the accident occurred. The police inspector stated that the deceased was a very peculiar man in his habits, and would swerve in his walk. Proceedings had been taken to get him confined in a lunatic asylum, but the Justices would not certify. The jury returned a verdict of "Accidental death."

BEFORE the Leeds Stipendiary Magistrate (Mr. C. M. Atkinson), Haydn Lee, of St. Aubyn's, Morris Lane, Kirkstall, has been charged with causing the death of Arthur Thackray (25), a tramway conductor, in the service of the Leeds Corporation. The circumstances have already been recorded. The Magistrate said the depositions disclosed a state of things fit for the consideration of a jury, and it was for the Magistrate to determine the weight to be attached to the evidence adduced on behalf of the prosecution. He committed defendant for trial at the Assizes, and admitted him to bail.

MR. TROUTBECK has held an inquest at Westminster with reference to the death of Hugh Duff, aged 72, a bath-chair proprietor, late of 7, Merton Road, Kensington. It appeared that the deceased was knocked down by a motor-brougham in Knightsbridge on the afternoon of December 15th. James Scott, in the service of Mr. Herbert Samuelson, of 19, Pont Street, Chelsea, said he was driving the electric brougham, which contained Mrs. Samuelson and two others. He rang his bell on turning out of Sloane Street, and he did not see the deceased until he was close upon him, and the splashboard struck his shoulder, knocking him down. He was obliged to reverse his gear to avoid running over him, but he stopped in three yards. The jury returned a verdict of "Accidental death."

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Horsham ...	G. B. Tydd, London	25 m. p. h.	40s. etc.
"	S. Bailey, "	23 m. p. h.	60s. "
Barnstaple ...	Capt. Prideaux - Brune, Bideford	—	£5 "
Pershore	A. E. Glantworth, Bredon's Norton	20 m. p. h.	£10 "
Aston	E. J. Banks, Birmingham	26 m. p. h.	20s. "
Hatfield	P. Danneler, Windsor	30 m. p. h.	£7 17s.
Shoreham ...	J. Homfrey, Southwick	22 m. p. h.	45 etc.
London (Marlboro' Street)	J. S. Critchley, Lambeth, S.E.	—	40s. etc.
"	V. Miller, Haymarket, S.W.	—	£2 etc.

Where no alleged speed is given it is understood to be above the legal limit.

POLICE SERGEANT BEACHER was on duty near the Sun Inn, Crawley, on December 14th, when he saw George B. Tydd driving towards Brighton, on the London and Brighton road. The measured quarter of a mile was covered in 35 seconds, and the magistrates inflicted a penalty of 40s., and 6s. costs.

SIDNEY BAILEY, who had driven a car in the same direction at 23 miles an hour, was stated by police-sergeant Beacher to have endeavoured to pass the police officers. Police-constable Trussler, who caught hold of the car to stop it, was carried along by it before it stopped. Mr. Bailey said he had no idea he would have to meet the more serious charge as to endeavouring to evade the police, as stated. The car was incapable of travelling at 20 miles an hour on the occasion in question. Fined 60s. and costs.

J. S. CRITCHLEY, 112, Belvedere Road, Lambeth, was summoned at Marlborough Street for furiously driving a motor-car in Hyde Park, so as to endanger the safety and convenience of other persons. Constable Hilton deposed that shortly after eleven o'clock on the morning of the 2nd inst., while on duty at Hyde Park Corner, he saw the defendant driving a motor-car at a furious rate down the Serpentine Road towards the Marble Arch. Upon seeing him later on, coming down the Serpentine Road, witness stopped him, and asked him if he knew what pace he was travelling at. Defendant replied that he thought he had been ten minutes "going round." Witness informed him that he had been seven minutes by the

clock going round a distance of 2 miles 5 furlongs and 51 yards. Constable Hobbs corroborated. Mr. Staplee Firth, who defended, submitted that there was no evidence before the court to support the summons, which alleged that the defendant drove so as to endanger the safety and convenience of other persons. No other persons were inconvenienced, nor had their safety been endangered. Without the necessary affirmative evidence on those points the present summons must fail. Mr. Denman said that an important point had been raised, and it would be desirable to have it settled. He would be willing to state a case for the higher courts, but considered that the point here was whether the defendant had driven at a pace which must necessarily be a source of danger to the public. Defendant, in his evidence, denied going at too fast a speed, but from the time stated by the constable he (Mr. Denman) thought there had been a breach of the park regulations, and imposed a fine of 40s. and 2s. costs.

A. E. GLANTWORTH, motor-car driver, Bredon's Norton, was summoned at Pershore for driving a motor-car at an excessive speed at Eckington on December 15th. Police-constable Stanford said defendant rode a little over a quarter of a mile (four yards over) in 45 seconds. He was driving through the village, and witness had his watch in his hand and timed him correctly as soon as he came in sight. He had not got a stop watch. Witness had marked the quarter of a mile out previously. Vincent Thornton said the motor was travelling through Eckington at the rate of about 20 miles an hour, and considering the fact that children were leaving school and were all about the road he thought this very dangerous. Defendant gave evidence, and said he was motor driver to Mrs. Martin, of Bredon's Norton, and that day the roads were very slippery, and he was driving very carefully. Mrs. Martin was in the car. She was very nervous and he had to be careful. He denied that he was driving more than about 12 miles an hour. Alfred Tracey, motor-car driver, in the employ of Miss Woodhall, of Bredon's Norton, and who was in the car with defendant, said they were not going more than 12 miles an hour through Eckington. The Bench inflicted a fine of £10 and £1 5s. costs, or a month.

MR. VICTOR MILLER, of No. 6, Bury Street, Haymarket, was summoned before Mr. Denman for furiously driving a motor-car on December 12th in Hyde Park. Constable Strowger said that the defendant dashed over the crossing leading from Knightsbridge into the Park at a furious pace, one of the lamps of the machine being jerked out of the socket. He pulled up directly he got over the crossing. Complaints had been received by the police concerning the speed of cars at that spot. Mr. Denman said he did not suppose there was a spot in London where it was more essential to exercise the greatest possible moderation in speed than at the place mentioned. The defendant would have to pay a fine of £2, with 2s. costs.

THE Bavarian Automobile Club will hold a six-days endurance contest during the coming summer.

THE Motor-Car Insurance Company, Limited, has been registered, with a capital of £100 in £1 shares.

MR. W. E. MOSS has consented to accept the Hon. Secretaryship of the Liverpool Self-Propelled Traffic Association, and a special meeting of the Council will be held on the 14th inst., to confirm the election. Mr. Moss is a partner in the firm of Messrs. Davies Benachi and Company, cotton merchants, Liverpool.

THE value of the exports of motor-cars and parts from the United States during October last is returned at £24,524, as against only £11,146 during October, 1901. For the ten months ending with October the exports attained a value of £194,122 as contrasted with £52,506 in the first ten months of 1901.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JANUARY 10, 1903.

[No. 201.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ROYAL interest in automobilism continues to find expression in additions to the motor stud at Sandringham. The King has recently ordered from the Daimler Company a second 22-h.p. car, which Mr. Percy Richardson, the London manager of the company, informs us is intended for the use of the beaters. Hitherto a lower powered car has been used for this purpose when shooting has been indulged in over the Sandringham estates. Hence the fact that His Majesty is now obtaining a 22-h.p. vehicle is proof of his confidence, not only in the utility of the automobile in connection with sport but also of his belief in the excellence of the Daimler Company's design and construction. Facilities for the conveyance of cartridge boxes will be provided on the car, which will be delivered to its Royal owner in the early days of February.

An M.P. on Numbering.

SUPPORTERS of Mr. Scott Montagu's Bill should be happy, for they have found a sympathetic friend in Sir John Dorington, M.P. Writing to the Winchcombe Board of Guardians that gentleman says:—"I shall support some restrictive legislation. I think it would be best to eliminate any reference to actual speed—it is always very difficult to prove—and insist on conspicuous means of identification and much heavier penalties for 'furious driving.' It is easy to see that Sir John's "conspicuous means of identification" is another way of urging a system of numbering that is objectionable to the great majority of motorists.

The Gordon Bennett Race.

FROM official sources we learn that an attempt may be made at the beginning of the next Parliamentary Session to secure the passing of a special Act, legalising "a specific race on a specific day" in this country. Care will be taken to suggest a road in some sparsely populated district, and the excessive care which the promoters of the attempt propose to adopt should soften the heart of even Surrey magistrates, or, as the London correspondent of the "Manchester Guardian" suggests, cause Hampshire constables to come from behind the hedges. It is pointed out that if the race is held in the United Kingdom it will mean a revenue of quite twenty thousand pounds to hotels and others engaged in trade along the line of route; but, more than that, it will prove a permanent incentive to the industry, and, as such, any attempt to secure the race for this country should have the cordial help of all Parliamentarians.

America and the Gordon-Bennett Cup.

COMMENDABLE promptness has been shown by motorists in the United States in responding to the decision of the Automobile Club of America to compete for the Gordon Bennett Cup. Within three days from the time when the Club declared itself a competitor the necessary complement of three contestants had applied for the privilege of representing

the Club and had posted the money necessary to obtain recognition. The three who have announced themselves are Mr. Alex. Winton, Cleveland; Mr. L. P. Mooers, Cleveland, and Mr. H. S. Harkness, New York. Two others—Mr. Percy Owen, New York, and Mr. C. W. Matheson, Grand Rapids—had, when the mail left, signified their intention of applying for the honour. The Race Committee of the Club has formally accepted the application of Mr. Winton and nominated him as one of the entrants to represent the Club in the race. In view of the probability of there being half a dozen candidates for the team of three, the Race Committee has, states the "Motor World," under consideration a plan to select the two remaining cars by means of trial races. Mr. Winton will drive, not the "Bullet" or the "Pup," but a special Winton car. A Peerless racer is being built for Mr. Mooers, but the details concerning it are not forthcoming yet. The car which Mr. Matheson will drive, if elected, is the product of the recently-formed Matheson Motor Car Company, of Grand Rapids. It is said that it will have four cylinders and develop 150-h.p.

The Balfours as Motorists.

APPARENTLY all the Balfours are lovers of the motor-car. Those who attended the last Club trials at Dashwood Hill (which have apparently been stopped by the foolish conduct of a member of the Club on that occasion), will remember that Mr. A. J. Balfour was not only an interested spectator but also to some degree a participant. The difficulties under which he took his *al fresco* lunch on that occasion convinced us all as to his interest in motoring, and has led some to hope that he may not be loth to afford facilities for the introduction of the proposed Bill for legalising the Gordon Bennett Race in this country. Last week Major Kenneth R. Balfour, M.P. for Christchurch, showed his interest in motoring. On Friday he was married at St. Margaret's Church, Westminster, and later in the day left for Devonshire, whither he and his bride set forth on a motor-car, intending to spend their honeymoon in an automobile trip through Devon and Cornwall. But all the members of the family are not equally fortunate in their experience, for last week Lady Frances Balfour was thrown out of her car in East Lothian, owing to a nasty skid, and received a severe cut on her forehead. She is, however, making satisfactory progress.

Municipal Works.

THE latest municipal authority to consider the adoption of the automobile in connection with its street cleansing work is the Bolton Town Council. At a recent meeting of this body suggestions were made that a motor-wagon should be provided for the use of the sanitary department, and at its last meeting the Council appointed a committee to report as to the advisability of the innovation, and also to gain information. Only the other day the Wellingborough Urban District Council had delivery of a motor-wagon which was ordered some five or six months ago, and its early trips should prove useful in deciding the Bolton sub-committee as to a favourable report to their Council. It is gratifying to see the interest that some of the northern towns are taking in the matter, and as soon as a dozen or so of

them have adopted motor-wagons the conversion of the rest of England should not be long delayed.

Motor Cars as Railway Feeders.

It is reported that a motor-car service from Flamborough town to the railway station of that place will be inaugurated during the coming summer. We understand the town is three miles distant from the station, so that the need for such provision is easily apparent. In thus feeding the railways the automobile will play an important part in the future, and there are scores of places so distant from their railway stations that residents as well as visitors will welcome any efforts to connect them by a regular automobile service. In the New Forest, for instance, the town of Lyndhurst is quite $2\frac{1}{2}$ miles from the station, and, although there is the ordinary horse-drawn 'bus service, there should also be room for a motor-car innovation. Such instances might be multiplied, but private enterprise will probably find them out during the next two or three years, until the railways themselves have to recognise the important part played by motor-cars in the development of their traffic.

An Egyptian Emergency.

"QUADRICYCLING in the Sahara is not an absolute success," says Mr. McMillan Hamilton, who has lately returned from a pleasure trip to Egypt and other ancient countries of universal interest. The sand is so loose and deep in places that the wheels will not take hold. The accompanying picture will show the plight in which Mr. Hamilton and Dr. A. J. Walker, of Cairo,

"STALLED" TWENTY MILES OUT OF CAIRO.
[Automobile Topics.]

found themselves when endeavouring to travel from the Gizeh to the Sakkara pyramid on a motor-quadricycle.

The Recent American 500-Mile Reliability Trial.

THE official report of the Contest Committee of the Automobile Club of America on the 500-mile Reliability Contest, in October last, has just made its appearance. It comprises an introduction, a few general observations on the contest, recommendations for future events, a detailed account of the performance of each car, the causes of stops in percentages, a table of speed averages, and a list of awards and certificates. In the introduction the Committee states that it desired to carry out the contest as nearly as possible under conditions similar to those an individual would meet in touring over the country. "The chief difficulties were on account of ignition and tyre troubles. The tyre question is so important a one that we suggest

the advisability of holding a special tyre contest, giving suitable awards to those manufacturers who shall succeed in producing the best tyres for road use. The results of the contest show that giant strides in all those qualities which go to make for endurance and reliability have been made during the brief year since the last contest. We consider this a matter for mutual congratulation, and believe that the day is not far distant when the signet 'Made in America' will stand for all that is highest and best in automobile construction throughout the world."

A Busy Year.

FROM our "Continental Notes" some idea may be gleaned as to the activity of motorists during the first half of the present year. Competitions, congresses, and exhibitions will occupy much time, and only the most cosmopolitan of men are likely to see a third of the important events that will take place. Every affair will prove a great advertisement for manufacturers; hence the eagerness with which they anticipate the season and, by competition among themselves, cause the list of events to be lengthened almost inordinately. Meanwhile, British makers are preparing for our own national events, and although little is heard of what they are doing, it may be safely said that they have practically decided as to the main lines of their efforts for the Reliability Trial in September next.

Dogs and Motor-Cars.

AT the annual meeting of the Darlington, Durham, and North Riding Chamber of Agriculture, the chairman, Mr. C. E. Hunter, referred to the report which advocated the advisability of agitating for every dog to wear a collar and for every motor-car to be labelled with a number. He did not think they would gain much from those things, and suggested that it would be worth their while to consider whether they could not utilise the motor-car to their advantage. He believed automobiles were capable of being adopted in connection with the conveyance of produce, and that they might prove one remedy for the high railway rates charged for the conveyance of goods over short distances. Sir Thomas Wrightson, M.P., endorsed the chairman's suggestion as to the use of motor-cars. He had no doubt they would be valuable means of checking the high railway rates. If agriculturists would combine to procure motor-cars they would not, he suggested, find them too expensive; they would suffer no delays in transit of goods; and they would be able to show railways they could not charge what they liked.

Co-operative Ownership.

THE suggestion of Sir Thomas is certainly one that should be seriously considered by every agricultural organisation throughout the country. Farmers are scarcely likely to venture on motor-car ownership unless they can find work for the vehicles all the year round. The individual cost, too, would prove a deterrent to their adoption. But with joint ownership, under the control of a representative committee, there is hope that every village may be able to have a local rival to the railway company, and that the automobile may be generally employed to the profit of British agriculture and the prosperity of the nation.

Steam Wagons in London.

ATTENTION is being called to the great development that has lately taken place among the chief distributing and manufacturing firms of the Metropolis in the adoption of steam wagons. Somewhat unwieldy in appearance, these plough their way through the traffic to the wonderment of country visitors and the consternation of cabmen hurrying with fares to the station. In the West End their presence is being regarded with ill favour by Society people, whose horses are not so accustomed to these utilitarian vehicles as to the lighter passenger automobiles. It is hoped, however, that sentiment will not

be allowed to suggest repressive legislation or restrictive by-laws; for it is their novelty rather than anything else that seems so startling.

Motoring in the Snow.

THERE has been a severe snowstorm in Midlothian and the roads have been almost completely blocked to horse-drawn traffic. The storm gave no warning of its coming and in a very short time the whole locality was covered with snow, heavy drifts giving uneasiness to some of the shooting parties that were unprepared for such emergencies. Lord Rosebery and his guests formed one of the parties, and they beat a hurried retreat from his shooting lodge at the foot of the Moorfoot Hills to Dalmeny—a distance of twenty miles. His Lordship, with his son, Lord Dalmeny, led the way in his motor-car with his guests in carriages bringing up the rear. Although they encountered the worst part of the storm the company were but slightly inconvenienced, glad, however, to have narrowly escaped being "snowed up."

Praise from the Chancellor.

WHEN bestowing praise upon the rural magistracy in a speech at Helmsley (Yorks) on Tuesday, the Lord Chancellor (Lord Halsbury) might have added to the force of his remarks by making a qualification so far as automobile cases are concerned. He said he "had had fifteen years' experience as chairman of quarter sessions, and could testify to the careful and impartial manner in which the law was administered in the counties. 'The Great Unpaid' had been subjected to much hostile criticism from time to time. His tenure of the Chancellorship had brought him many complaints, but the majority of them had proved to be groundless. So careful, in fact, was the administration of justice by the county justices, and so great the popular confidence, that even litigants on the losing side were never unhappy or discontented when they felt that they had had a fair and impartial hearing." Either the Lord Chancellor believes magistrates are infallible or he takes a very otiose interest in their doings. A little consideration of the motor-car cases that come before the Surrey Bench would show him that J.P.'s are not always impartial, nor are unwilling litigants on the losing "never unhappy" or "discontented."

H.R.H. THE CROWN PRINCESS OF ROUMANIA WITH THE HON. C. S. ROLLS ON THE LATTER'S 10-H.P. PANHARD. LADY LLANGATTOCK IS SEATED IN THE TONNEAU.

The Steel Road in New York.

SOME trials of the tractive power required to haul a vehicle were made on the 17th ult. on the experimental stretch of steel roadway in Murray Street, New York, recently illustrated in these columns, under the direction of Gen. Roy Stone, Chief of the Bureau of Road Inquiry of the U.S. Agricultural Department. The trial consisted in having a four-wheeled cart, weighing 3,700 pounds, drawn up the road by a number of men, who applied their efforts to a rope attached to the cart, a spring scale being inserted in the rope. The gradient is said to be about 5 per cent. On the Belgian block pavement an average tractive power of 160 pounds was, states the "Horseless Age," required, but on the steel track the average was only 100 pounds. It was found that the tread of the vehicle was slightly too wide for the gauge of the track, causing it to run against one or the other of the two outer ridges at every turn, so that the completion of the trials was deferred to a later period.

Furlous Driving.

MR. W. H. ASTELL was summoned to appear before the Horsham Bench on Saturday last, for having driven a motor-car at Crawley at a greater speed than twelve miles an hour. It was impossible for him to appear, but he sent an account of the incident, in which he said that "Some time ago I arranged my car so that with the levers in a certain position it ran at a speed of 11½ miles per hour. It was a mechanical impossibility for it to exceed this speed. Knowing we were being timed, I placed the levers in this position passing through Crawley, and they remained so up to the time we were stopped by the police. Knowing this I was naturally extremely indignant at the charge. Unfortunately since the date I so arranged my car I have had a new gear fitted which has fractionally raised the speed, and from a careful series of experiments which I have made, I find that it is possible with the levers in the same position for the car to travel at twelve-and-half miles per hour, but not to exceed it. This,

therefore, may have been the speed at which it was travelling. I say 'may,' as out of ten trials only twice have I found it to do the mile under five minutes. Therefore, good case as I have, I do not care to commence by swearing what may be a lie, the charge being exceeding twelve miles per hour. Would you allow me to respectfully submit to your Bench that these charges of going at speeds which are known to car-owners to be absolutely false, and the farce of timing which was here adopted, create in the person charged a sense of injustice and indignation, and which tend to make drivers somewhat lax in their duties to other users of the road; they will cause car owners to travel faster than ever; if one is to be charged with going twenty-three miles per hour when going twelve, it is a natural conclusion to go the twenty-three, the cost is the same and the fun greater." The result of the case was that Mr. Astell was fined.

When the Road is "Up."

OUR comment last week with reference to the course to be pursued by motorists when travelling along roadways that have been newly metalled receives emphasis from a further prosecution for motoring on the footpath. This has occurred at the East Grinstead Petty Sessions, Mr. Loftus Sulter being summoned for driving his motor-car on the footpath at that Sussex town. A boy was called by the police to prove the offence, and the constable said he had measured the wheel tracks and found that the wayward motor-car had travelled 105 yards on the footpath. There was no evidence that anyone was alarmed or that any damage had been sustained by the footpath. It was shown, however, that the road was "up"—a circumstance which led the motorist to offend against the letter of the law. He was fined 10s. and costs 7s. 6d. But surely in such a case magisterial discretion should have been brought into play.

Motor-Car Insurance.

IN these days of insurance against all sorts of undesirable contingencies the special needs of the automobilist are not by any means neglected. Two at least of the leading accident insurance companies make quite a special feature of motor insurance, and Lloyd's, of course, do not exclude this risk from their almost unlimited purview. Several risks have to be considered by the motorist who wishes to safeguard his pocket in all eventualities. The risk of fire, explosion, or self-ignition is reckoned, according to the "Pall Mall Gazette," at some fifteen shillings per cent. on the value of the car, and loss by burglary, larceny, or theft at one-third of that amount. To safeguard oneself in the event of accidental damage to the car by collision a premium of four per cent. on its value is necessary, and this is subject to the proviso that no damage of less amount than fifty shillings will be made good. The personal risk to the driver is evidently regarded as trifling, for the ordinary personal accident policies cover motoring risks as well as others. In addition to all these risks, there is the question of public liability, or "third party" risk. That the motor-car is not, in actual fact, the dreadful car of Juggernaut which it appears to the distorted vision of certain provincial J.P.'s and others is amply proved by the fact that for the sum of £8 per annum one can purchase the privilege of damaging the persons of His Majesty's lieges to the tune of no less than £5,000 in any one year. Clearly the insurance companies do not regard the aforesaid lieges as in imminent danger from the "roaring forties" and other fearsome wildfowl of the highway.

The Metric System.

MR. C. R. GARRARD has been lecturing before the Coventry Steam Engine Makers' Society on the Metric System. He said he was engaged on the plans for a large automobile works in London covering five or six acres, and the only English units used were the money and the weights of incoming raw materials and fuel. Apart from that they were working entirely on the metric system, including the screw threads. The

works would have the Earl of Shrewsbury as chairman. The coming of the automobile was the opportunity for Britishers to adopt the metric system throughout, threads and all. The Automobile Club of France standards were almost universally adopted by all the Continental makers, and the parts of cars were already being standardised, thus facilitating the repair and interchange of parts.

Roads in the West.

◆ IN the West of England, which should be one of the most pleasant touring districts in the country, the roads are in a shocking condition. Of course, there are good stretches here and there, but, generally regarded, the surface is decidedly bad. Mr. T. W. Stainthorpe, A.M.I.C.E., complains that "the roads in lovely Devon are in a wretched condition. A large percentage of the annual expenditure on maintenance is absolutely wasted so far as sound and durable results are concerned. The appointment of any Tom, Dick, or Harry who lacks proper training by the highway authorities results in muddy and slippery roads in winter, dusty and disagreeable travelling in summer, and additional and unnecessary expenditure in maintenance." Our contemporaries in the West all testify to a similar state of things in Cornwall and Somerset, and we would suggest that local motorists should join in the discussion that is now going on, so that the responsible authorities may be roused to action.

A Show at Leeds.

◆ "A NICE little exhibition" will be the verdict of those visiting the Motor and Cycle Show now in progress at the Coliseum, Leeds. The Hall, although fairly large, is, as a matter of fact, inconveniently crowded with exhibits, while the attendance has been of a first-class character. Mr. Rowland Winn shows half a dozen cars, including a 12-h.p. Gladiator, a 10-h.p. Ariel, a 7-h.p. Panhard, a 4½-h.p. Renault and an old and a new pattern 6-h.p. De Dion; Mr. Rice has two cars on view, a two-seated and a four-seated, fitted with 9-h.p. single-cylinder motor and live axle. Messrs. Dougill and Company, Limited, show a Loidis single-cylinder car and a Hagen delivery wagon, which latter is attracting considerable attention. On a number of other stands motor-bicycles are shown.

LORD DALMENY has joined the Automobile Club.

ON the Alexandra Palace indoor track, on Saturday last, Maurice Fournier rode one mile on a 4½-h.p. motor-bicycle from a flying start in 1 min. 40 2-5 sec., beating F. W. Chase's record for the track by a second.

TO-DAY (Friday) a general meeting of the Cycle Engineers' Institute will be held at the Technical Institute, Coventry, when Mr. B. A. Hunt will read a paper on "Important Features in the Scientific Designing of Motor cycles."

A NEW sub-committee of the Automobile Club has been appointed to consider the affiliation of provincial clubs. This will consist of a representative of each of the affiliated clubs, Major Lloyd, Mr. R. W. Wallace and Mr. Mark Mayhew.

AT the first annual dinner of the Motor Cycling Club, to be held on Wednesday next, discussions will follow on classification in handicapping, efficiency tests, the organisation of motor-cycle clubs, fore-carriages and trailers, and the value of pedals.

AT a meeting of the judges of the Tyre Trials of the A.C.G.B.I., it has been decided that the awards cannot be made until the tests on the British Association apparatus have been completed. The purchase of wheels and the hire of a car to expedite the carrying out of the necessary tests have been authorised by the executive committee of the Club.

MR. HOUSE, of the North of England Motor-Car Company, Bradford, will shortly be holding an auction of cars, which will be sold without reserve. On the same occasion he will have an exhibition of a number of the new vehicles he recently purchased in Paris. At the Agricultural Hall Exhibition, in the galleries, three complete cars and a beautiful chassis will be shown by this concern.

THE PARSONS NON-SKIDDER.

SO many reasons for the skidding of pneumatic tyres on greasy roads have been advanced, that to say exactly what is the direct cause of such action is difficult. Probably the main reason for the great tendency of pneumatic tyres to skid, when fitted to heavy cars more particularly, although the same reason would be applicable in the case of lighter vehicles, would be found to be that the surface of the tyre in contact with the ground is so large as compared to a solid tyre that a film of mud really remains between the surfaces which should be in contact, and, acting as a lubricant, prevents adhesion. In this respect solid tyres are not by any means free from blame (although of course less prone to skidding than pneumatics), especially in the case of a heavy car.

Leaving out of the question the result which might be obtained by a differential device, the position of the centre of gravity of the vehicle, the effect of front or rear drivers, or the application of additional mechanical devices, etc., the problem has been attacked in the case of the "Non-Skidder" devised by Mr. Harry Parsons, of the City and Suburban Electric Carriage

two or three consecutive revolutions. With this end in view, it is of the utmost importance that though the Non-Skidder should fit the tyre nicely, it must not be so tight as to cause visible impression on the tyre by any chain. The degree of slackness really regulates the amount of creep. If the Non-Skidder is tight, creeping will not take place, and the tyre may be marked by the chain bearing always on the same spot. Perhaps the best description would be to say that the tyre lays down a non-slipping path, and runs upon it.

In the course of severe tests—such as S curves and right-angle turns on greasy roads—no single case of a skid when using these Non-Skidders has, we understand, been known. It should be remembered that at the point of contact with the road each chain is, so to speak, swallowed into the tyre; the latter has thus a large area of direct contact with the road between any two chains so that the whole of the weight is not taken by the chains. It is claimed that resilience is not effected in the slightest, whilst the speed at which the Non-Skidders may be run has no limit up to that of the car to which they are fitted. The extra weight of a Non-Skidder is about 4 lbs. As regards the fear of extra wear upon the tyre, it may be stated that some dozens of

FIG. 1.—FRONT VIEW OF "NON-SKIDDER" FITTED TO SOLID RUBBER TYRE.

Company, Limited, right at the point which experience would seem to prove to be the weak spot, namely, that of contact of the wheel with the road. Its essential feature is that it is not in any way attached rigidly to the tyre, but is, so to speak, suspended, and fits loosely upon it.

The device itself, although capable of construction in numberless ways and of all varieties of material, consists in its approved form of two flexible wire hoops, one on either side of the wheel—the hoops being connected together by steel chains passing zigzag from one to the other, around the tyre. The hoop on the inside of the wheel is endless, whilst the hoop outside has a right and left-hand coupling, affording means for adjusting the arrangement nicely to the wheel. The diameter of the hoops is such that they cannot pass over the periphery of the wheel in use, and the whole combination centres itself in running, and cannot come off even in the case of a deflated tyre. The chains are each a separate piece, and after excessive wear any chain is easily slipped out and replaced with a new one without disturbing the others. The effect in running is, we are informed, that the Non-Skidder creeps round the wheel so that, regarding for the moment one chain only, this would never press the tyre in the same spot in

FIG. 2.—SIDE VIEW OF "NON-SKIDDER" FITTED TO A COLLIER PNEUMATIC TYRE.

wheels with Non-Skidders have now been running for many hundreds of miles, over every description of road, and in not a single case has the tyre shown any sign of the device having been fitted. If the Non-Skidder becomes loose after use it can be taken up a little at the coupling provided. One of the advantages claimed for the arrangement under notice is that it can be fitted to any make and size of tyre irrespective of whether new or old, and without any alteration whatever.

We understand that a syndicate, having the close interest of Mr. Henry Edmunds, Mr. Paris Singer, and Mr. W. J. Crampton, is being formed to place the device on the market. Referring to the illustrations, Fig. 1 shows a Non-Skidder fixed to a solid tyre on one of King Edward's cars, which he now has in use at Sandringham; while Fig. 2 shows it applied to a Collier pneumatic tyre of the standard pattern.

REFERRING to the article in our last issue on the Sthenos carburettor, Mr. J. A. Ryley, of 23½, Martineau Street, Birmingham, informs us that he has been appointed sole wholesale representative for these carburettors in Great Britain.

CONTINENTAL NOTES.

By "AUTOMAN."

THE banquet which was held on Saturday, December 27th, at the A.C.F., was a fitting apotheose to the Paris Exhibition. It was the first function of the kind in the new "Salles des Fetes," which is a miniature theatre built over the garage at the rear of the Hotel Pastoret. The orchestra stalls which usually cover the floor of this room were removed for the occasion, giving place to long tables leading up to the footlights, and accommodating upwards of three hundred guests. The chair was taken by M. Michel Lagrave, who is the official representative of the French Republic in connection with the Exhibition of St. Louis of 1904. M. Rives gave the following interesting figures relating to the number of paying visitors to the Paris Automobile Exhibitions:—In 1898, 81,400 visitors; in 1899, 83,700; in 1900, 88,900; in 1901, 130,600; and in 1902,

Paris Exhibition. I counted 127 of them altogether, so that everybody went away satisfied and well supplied with advertising ammunition, though the unsuspecting public will be confused when attention is called to the fact that almost all the principal makers obtained "the gold medal."

THIS time last year automobile road racing was in a bad way, and its future quite uncertain owing to the interpellation in the French Chamber made by M. Gautier de Clagny, on the occasion of the accident to a child in the Paris-Berlin race. Wiser counsels have, however, prevailed, and now M. Gautier de Clagny has entered the fold and become a member of the A.C.F. The year 1903 is opening up with a monthly budget of automobile events, which becomes almost difficult to follow. On January 11th the Pioule Cup races take place. This is a competition for a race of 100 miles around Pioule.

FROM 7th to 16th of February the Belgian Exhibition will be

MR. J. B. DUNLOP ON HIS NEW 12-H.P. ARGYLL CAR, WITH MISS JEANIE DUNLOP AT THE HELM (see page 869).

197,454. These are the most eloquent expressions of the wonderful development of the industry in France, and also show how wise it has been of the Government to gradually take the industry under its protecting wing. The exhibition, opened officially by the President of the Republic, was visited by seven Cabinet Ministers, but in order to emphasise the importance of the event a real surprise was prepared in official circles and announced by M. Lagrave amidst thunders of applause. M. Loubet sent a messenger during the banquet saying that he intended to sign pardons for all automobilists condemned to prison for furious driving anterior to the date of the banquet. M. Lagrave also announced that Messrs. Max Richard and Louis Krieger would be decorated by the Government with the "palmes academiques." Towards the end of the dinner a theatrical performance was given.

GOLD medals, silver-gilt medals, silver medals, bronze medals, and diplomas were distributed with pepper-pot impartiality at the

held at Brussels in the "Palais du Cinquantenaire," organised under the patronage of the A.C.B., and with a special section to deal with alcohol. This is the only Brussels automobile show to be held this year. On February 9th there will be a competition in Paris organised by the A.C.F., with the object of comparing the different time-keeping systems. Ten days later comes the fuel consumption trials organised by the *Auto-Velo*, and then the Pau Week. March opens with a trial of silencers under the organisation of the A.C.F. The competition has for a basis the axiom that a good silencer should stifle as completely as possible the noise of the exhaust, whilst reducing the power of the motor as little as practicable, and be small, simple and light. The silencers entered will all be tried on a slow-running, one-cylinder engine which drives the laboratory of the A.C.F. The dimensions of the cylinder of this motor are—140 mm. diam. by 160 mm. stroke, and there are from 400 to 500 explosions per minute, the gases being compressed to four atmospheres. Entries should be in by February 15th, and the entrance fee is twenty francs.

Amongst the prizes is one by M. Darracq of 1,000 francs in cash. March ends up with the Berlin Exhibition, from 8th to 22nd; the Vienna Exhibition from 16th to 30th; the Criterium of heavy traction, organised by *La France Automobile*, and constituting a caravan from Paris to Nice.

THE Nice races begin on 28th March and go on until April 5th. It is there that we shall see for the first time the really new models, which were kept back from the Paris Exhibition for competitive reasons. At some date in March to be fixed later there will be held a new and original competition, organised by the *Auto-Velo*, and run at the Parc des Princes velodrome, over a distance of sixty-two miles. It is for motor-bicycles, and will be called the "quarter of a litre" Criterium. The name indicates the size or rather the internal volume of the cylinder. One litre (nearly a quart) contains 1,000 cubic centimetres, and the competition is for motors whose volume, taking the square of half the diameter of the cylinder multiplied by the stroke and multiplied by 3.1416, does not exceed 250 cubic centimetres or one-fourth of a litre. In thus limiting the size of the motor, the competition will bring into relief the most efficient combination and be a useful lesson to both manufacturers and customers.

In May the Paris-Madrid race will attract attention. Nothing is as yet decided and the official authorisations are not actually given, but they are said to be given unofficially, and it is a sign of the times that a Spanish Automobile Club has just been formed in Madrid, with two counts, eight marquises and three dukes on its committee, and the King of Spain as honorary president. The chosen route will be no doubt from Paris to Bordeaux, though the start will probably be made from d'Orsay instead of Saint Cloud, in order to miss Ville d'Avray and Versailles. The second day's run will end at Burgos, and the third at Madrid.

It is generally expected in France that the Gordon Bennett cup will be run in connection with the Paris-Madrid race—few people credit the possibility of its being run in Ireland. Stockholm and St. Petersburg will have their motor shows in May. June will be a red-letter month for automobiles, and will, no doubt, be a month to remember. The A.C.F. is inviting all the world to a congress and a fete. The congress should properly have been held this year at Lyons, but Lyons has waived its rights in favour of the parent club, and Paris will be the meeting-place. The committee of the A.C.F., mindful of the reception they have had in Berlin and Vienna, and of the reception they will receive in Madrid, will, we may be sure, leave no stone unturned to make the fete in connection with the congress worthy of Paris. The first six months of 1903 will, it will be seen, be busy enough from the motorist's point of view, and there will be, of course, many other events that are not yet even thought of. The second half of the year will begin with the Ardennes race, for which there are already twenty entries, though the date is not yet fixed. Hill-climbing trials galore will, no doubt, finish up what promises to be a brilliant road racing year, if nothing unforeseen turns up to spoil it.

AUTOMOBILE carriages for ordinary railroads are largely occupying the attention of the French manufacturers. The object aimed at is a high velocity with a minimum of weight, for as is well known the speed on the railroad is only limited by the weight of the locomotive on the one hand in comparison to the strength of the track, and the radii of the curves in relation to the length of the train. In an automobile carriage the weight can be enormously reduced, as also the length, so that the existing tracks can be used for a much higher rate of speed. Another advantage is that there is no need to keep the engine under steam as in the case of the locomotive, and much less labour is required to drive the motor train. A few days ago I met M. Leon Serpollet, and got from him a few particulars with regard to the carriage which he is making for the Paris, Lyons and Mediterranean Railway, commonly known as the P.L.M. The P.L.M. is the railway which most English people use in going to Nice for the

winter months, and by the quickest train it takes twenty-four hours to do the journey, and of the twenty-four hours four are spent in reaching Calais, leaving twenty hours to cover the distance of 860 miles, that is to say an average speed of forty-three miles per hour, including stops. M. Serpollet, from experiments he has made, is convinced that the motor railway car will be able to average seventy-five miles an hour without any difficulty, including stops, so that the time occupied in making the journey from Calais to Nice will be reduced by more than nine hours. The first train is to run only on the Paris-Marseilles section of the railway, but if the experiment is successful it will be followed up, no doubt, by other auto-trains. The boiler will be of 250 h.p., and the motor will have six cylinders. Both will be placed in front of the car, where the motor-man will be located. The carriage will hold thirty passengers and will have an observation compartment at the back. The experiments in this direction will be watched with great interest by the travelling public, especially by the rich, for it will open a new field for them, and enable them to travel in special trains surrounded by every comfort and at no very great expense.

AN interesting detail of the "Belgica" cars exhibited at the recent Salon in Paris by the Societe Franco-Belge de Construction Automobile, of Brussels, was the automatic device adopted for the lubrication of the motor. The diagram herewith gives a general view of the arrangement, the regulator being shown

in section. The lubricating oil is carried in a tank inside the motor bonnet so that it is kept as fluid as possible. A pipe leading from the oil tank to the regulator is turned five times round the exhaust pipe E of the engine and delivers the oil into the float-feed chamber A through an opening which is opened or closed, as necessary, by a float-controlled needle valve therein. From the bottom of the float-feed chamber the oil passes to the underside of the crank chamber by the pipe O, so that as soon as the oil level in the latter falls below the desired point the level of the oil in the float feed-chamber correspondingly falls, the needle valve drops, and a further supply of oil flows into the float-feed chamber and thence passes to the crank chamber until the necessary level is restored. The oil in the oil float-feed chamber is kept in a fluid condition by means of a jacket through which a portion of the exhaust gases is caused to circulate. The system is applicable to all motors with closed crank cases and is stated to have given excellent results in practice.

THE COLES UNDER-CARRIAGE FOR MOTOR-CARS.

THE other day we had an opportunity of inspecting a model of a pivoting under-carriage and spring attachment for motor-cars recently devised by Mr. Frederick S. Coles, of Balham, S.W. The object of the arrangement is:—First, to reduce the strain on the frame or under-carriage by

FIG. 1.

allowing the wheels to freely follow any unevenness of the roads and to lessen the liability to overturn the car; second, to reduce the vibration of the top frame, or body, of the vehicle to a minimum, and thereby to ensure easy riding; and, third, to reduce

FIG. 2

FIG. 3

FIG. 4

FIGS. 2, 3, AND 4.

the wear of the motor, gearing wheels, and other parts. Referring to the illustrations, Fig. 1 is a plan of the frame, or under-carriage; Fig. 2 is an elevation of the front axle and springs E; Figs. 3 and 4 are elevations of the pivot bars A and B, while Fig. 5 shows the model car with one front wheel riding over an obstruction. The under-

carriage is constructed in two parts, one portion having a bar A provided with a pivot H; this pivot works in the boss I, formed on the bar B, which bar forms part of the other portion of the frame. The centre pivot may, if necessary, be made so that a shaft can run through the centre for the transmission of power from end to end of the whole frame. At each end of the bar B there is a slot guide L, in which works studs K on either end of the bar A. The studs and pivot pin are secured by nuts to prevent end movement between the two parts of the frame, but which will allow each pair of wheels to describe a sufficient arc to adapt themselves to the irregularities of the road. To the axle E the spring G is attached by means of the pivot F, thus allowing the spring to swing freely. The ends of this spring are connected to links G^3, which carry the car or body by means of suitable rods or bracket-irons connected at N, thus forming a good parallel motion as the other ends of the links G^3 are connected to light controlling springs G^1 and G^2.

The frame is simple in construction, and appears to meet the requirements of a practical and easy-running under-carriage for motor-vehicles. The principal points of advantage claimed for the arrangement are: End rigidity and full support for the body by the frame between the axles, whilst allowing the wheels to freely follow the uneven roads, thus eliminating, on the one hand, all undue dragging and jolting motion of the wheels, with conse-

FIG. 5.

quent slipping and extra wear of the tyres, which takes place when the axles are held directly by the springs to the upper frame or body. In fact, the suspension of the latter is equivalent to a three-point spring support, and whilst the single front pivoting spring supports almost the whole front load it does not influence the "angling" of the upper frame with respect to the back springs, thus avoiding the twists, strains, or shocks on the body which occur in the ordinary arrangement of springs. For the back axle the ordinary double elliptic springs are used. Either tube, channel, or angle steel can be employed in constructing the pivoting frame, and naturally the details may be varied to suit different designs of cars.

THE Igel Engine Syndicate, Limited, has been registered with a capital of £50,000. Included in its object is the building of motor-cars.

THE British Consul at Buenos Ayres has been informed that there is a good local inquiry for motor-cars, preferably electrical vehicles. Already many European and American firms are represented in Buenos Ayres, and the India Rubber, Gutta Percha and Telegraph Works Company, Limited, of 140, Calle Reconquista, Buenos Ayres, is willing to supply British inquirers with information on the subject.

MOTOR-CYCLING NEWS.

HEREWITH we illustrate the chain-driven motor-bicycle recently introduced by the E. M. Bowden's Patents Syndicate, Limited. As will be seen, the frame of the machine is of a special design; it is arranged to accommodate motors of various widths of crank case from 2½ in. to 3½ in. wide, by the use of a patent adjustable cradle placed behind the crank bracket. There

FIG. 1.—THE BOWDEN CHAIN-DRIVEN MOTOR-BICYCLE.

are several other novelties in connection with this machine. The throttle is of new design, being a tubular piston worked by a Bowden wire, and actuated by a twist handle on the right hand side of the bar. The oiling arrangement for the motor is also a new departure, it being a transparent tube with a double valve, which shuts alternately to motor or oil tank. Sufficient

FIG. 2.—THE BOWDEN FRICTION CLUTCH.

- | | |
|---|---|
| A. Hub shell. | G. Grooved pulley actuated by Bowden wire, which, when rotated on H, forces clutch against springs and so releases the drive. |
| B. Fibre friction ring secured to A. | H. Adjustable collar with coarse thread on which G works. |
| C. Metal friction cone fastened to large chain wheel J. | J. Large chain wheel fastened to C. |
| D. Washer carrying six compression springs. | K. Adjustable collar for varying pedal drive from 2¼ in. to 2½ in. |
| E. Ball races to take pressure of springs against A. | |
| F. Ball races to take thrust of G when throwing clutch out of gear. | |

tank capacity for petrol and lubricating oil is provided for a 200-mile run. A new ignition circuit breaker is arranged in conjunction with the rear brake, the slightest movement of the left hand brake lever breaking the circuit, thus doing away with the

usual twist handle. A twist handle on the left hand side of the handle bar works the advance sparking; in fact, the motor can be entirely controlled without moving the hands from the handle bar. The power of the engine is transmitted to the rear wheel by means of a chain and the Bowden friction clutch contained in the rear wheel hub. A section of the clutch is shown in Fig. 2. Not only does the clutch do away with the dangers of chain breakages, etc., due to jerky impulses of the motor, but it enables the rider to disconnect the engine from the road wheel at will, as in descending hills. The clutch is controlled by a small lever on the top tube of the frame and a pair of Bowden wires. The latter are connected to either side of the periphery of a grooved disc which traverses a worm cut upon the axle. When one wire is pulled, the disc travels away from the hub, and towards the fork ends; when the other wire is pulled, the disc travels away from the fork ends and towards the hub. Between this disc and the hub the clutch is fitted, the outer half of the clutch being formed inside a large chain-wheel (over which the chain travels, connecting it to the small chain-wheel on the engine shaft), whilst the other half of the clutch is attached rigidly to the hub of the road-wheel. It will also be noticed that the frame is so designed that the chains pass inside the stays, thus avoiding, it is claimed, all side strains and twist of frame.

As a large number of motor-bicycles fitted with the Minerva motor are in use, the diagram reproduced herewith, showing the correct way of connecting up the ignition wires,

should prove useful. The positive (red) terminal of the accumulator is connected by a short wire with the terminal marked P (+) of the coil, and the negative (black) terminal of the accumulator is connected with the handle passing through the safety interrupter marked A on the diagram. The terminal T on the coil is connected with the platinum screw of the contact breaker. The terminal M is connected by a short wire to the metal of the box through a screw C. The terminal B on the other side of the coil is the one by which the high-tension current passes, and is connected by a thickly insulated wire to the sparking plug.

THE Liverpool Motor Cycling Club will hold a run to Chester to-morrow (Sunday).

THE annual general meeting of the Motor Cycling Club will be held on the 28th inst. On Saturday, March 7th, the opening run for the spring season will be held, the destination being Brighton.

OCCASIONAL NOTES.

THE novelty, not to say apprehension, of being on a vehicle carrying eight hundred gallons of petroleum spirit—for that was our load—quickly wore off. The Vauxhall Road Depot, from which we had started, lies practically in the centre of Liverpool, and it was exactly four miles to the Sefton Arms, Aintree, where we plunged into darkness, leaving both tram-lines and dwellings astern. Never shall I forget that plunge. The lorry slowed down from six to about three miles an hour, and my high opinion of the driver gave place to a sense of trepidation. The man was steering by the line of the off-side kerb, or the hedge, where there was no foot-walk, the object of the extra hurricane lamps being now apparent, as their beams shone out obliquely against the sides of the road. On the near side the fireman kept watch between his intervals of stoking. Ever and anon he shovelled coke upon the concave top of the boiler casing,

slush on the mile of macadam just traversed is as heavy as anything until we get to Rufford. This is interesting. Perhaps we shall stick altogether or go through the crust later on. No, we had not yet been in low gear. The coke is none too good, and quickly forms heavy clinker, in consequence of which we have wasted fuel and steam by having the blast going from the instant we left the setts. I ply the driver with questions, and am quickly reassured as to his ability. The darkness is no longer so oppressive, though the rain is pitiless. The "spark arrestor," a clumsy and cumbersome contrivance of wire gauze, having two layers of 64-mesh to the inch, is removed and stowed away, now that we are in the country. One can readily see how it interferes with the draught on the fire. Clunking over, watering follows. The suction hose is uncoiled, a lid by the roadside lifted, and the rose dropped, to all intents and purposes, into the ground. I unhitch one of the hurricane lamps to assist inspection, the driver meantime explaining that this is one of the company's watering

THE WHITE STEAM DELIVERY VAN EXPERIMENTALLY EMPLOYED BY THE GENERAL POST OFFICE. (See next page.)

where it dried slightly before being dropped down the central shoot by the lifting of the round lid. He was shovelling and lifting as for dear life, and the engine was pulling hard. To keep 200 lbs. of steam was evidently a tussle, whilst less than 150 meant the low gear. The macadam was shocking. The mud squelched and oozed under the six-inch drivers, which had been tripping gaily when we remained on the excellent Liverpool setts. Suddenly the car jumped forward. We were on setts again, and climbing a canal bridge. Bump, bang, smack go the springs on the stop-blocks, and my liver is already less sluggish. These holes in the roads are anguish, but the driver apologetically assures me that he now knows most of them, and avoids them to ensure his bonus for the condition of his w gon.

WE are at the Old Roan Inn, five miles from the Liverpool depot and seven times that from our destination. Time occupied, one hour and three minutes. I am informed that the mud and

stations. Serious troubles and difficulties over the taking of water from canals, streams, and troughs have been solved by the putting in of large tanks underground, securely lagged against frost, and kept full by ball-valve regulators. The supply is by meter, and these tanks are stationed at selected points every few miles on the roads served by the wagons. But woe betide the stranger who seeks to help himself, for the local police and residents are on the *qui vive* to earn the reward which is offered for the detection of any wrongful consumption of the supplies.

NINE O'CLOCK finds us on the road again, prospects being more cheery. We are averaging a mile in eleven minutes—subject to what the driver tells me as to the location of the milestones. Steam is maintained at full pressure, and sparks fly generously enough to cause me to pull down my cap. I watch these sparks; I positively hang my vision on nothing else. Thank goodness they die at once! Two only fall on the sheet in quite a long space

of time; the rain and sheets will save my skin. I feel that I could no more get the driver to replace the spark-arrester than I could drive the wagon myself. There is evidently an aversion to them. Leaving Aughton Church on the right, we climb a long hill, barely scraping up on the high gear, and almost run down into Ormskirk without using steam. There is a reunion at the Talbot Hotel, where Nos. 1 and 8 are found watering, etc., and it is 10.40 p.m. as we bring up the rear of a miniature procession past the Clock Tower and along a dangerously narrow street. The men drive hard. It is six miles to supper. The elements appear to favour us, relatively, for the rain ceases and the roads are less heavy. The crust, may be, contains 30 per cent. of water against 60 further back; but we must be thankful for small mercies when on iron tyres carrying a total weight of over eight tons. I do not want to say that we cover a mile at eight an hour. All the same, we take only fifty-two minutes to travel the six miles to the Hesketh Arms, Rufford, where we arrive some minutes ahead of the cotton lorries. All is darkness, but the men are at home. Their baskets and cans are brought forth, as introductory to an adjournment into a comfortable stable, the key of which is discovered from some hiding-place. There is masonry in the air, but I appear to be a welcome visitor. My sandwiches and a bottle of brandy—brought as a precaution—are partaken of. The “pros and cons” of how far the Blackburn men will get that night are discussed, which reveals the fact that my driver alone is going through, the other two Liverpool drivers having to change when they meet their charges from the other end of the service. This system of relief at some intermediate point is being tried as an experiment, the advantage being that each set of men retrace their own bit of road, and get back to their own homes.

HERE is one. A Blackburn man arrives shortly after midnight, his lorry (No. 7) snugly packed with four tons of baled cloth for shipment to Calcutta. Not a single trailer is out this weather, so the loads are small per unit, but forty tons of this shipment are coming forward, spread over three days. My trusty steed, No. 11, stands by until one o'clock, while I watch the departure of the other three—two to Blackburn, and one to Liverpool. We have been warned to “low-gear it” under the trees through Rufford Wood, and get safely through. A mile on, near Sollom, we are in difficulties. The road has become heavier and heavier, we are below the level of the surrounding country, which I am told is a moss, when, with a crunch and a knock, we stop dead. The four-way cock, plus low gear, is futile. We are going down on the near-side wheels. We are turning over, possibly. I dismount with more haste than decorum, into mud over my boot-tops, to gauge the angle of inclination and to look at my watch. It is 1.28 a.m., and we are stranded in the wilderness.

P. A. M.

THE WHITE STEAM DELIVERY VAN.

AS exclusively announced in the last issue of the *Journal*, the General Post Office authorities are at present making some trials of a White steam delivery van, of which we are this week able to publish an illustration. The vehicle is one of the White Company's standard delivery vans intended particularly for the light retail trade, the total of the load, apart from the driver, not to exceed 500 lbs. The weight of the vehicle is about 15 cwt. The carrying space in the body is 42 in. long by 44 in. in height by 32 in. in width. The road wheels are 30 in. in diameter, and are fitted with 3½ in. Clincher tyres. The wheel base is 6 ft. 9 in. by 4 ft. 6½ in. The engine and steam generator in the car are the same as in the regular White Stanhope; the arrangement is, however, different, the engine being at the rear of the steam generator.

MESSRS. FOTHERGILL AND COMPANY, LIMITED, is the title of a company registered with offices at 53, Victoria Street, S.W., to carry on business as builders of motor-cars, etc.

KNOW YOUR VEHICLE.

IT may not have occurred to some that there is almost as much individuality in a motor as in a horse, but it is a fact which cannot be too highly appreciated. One will show a crankiness in running that will puzzle its builders, and another will run so smoothly and uniformly that it will prove a delight to its owner. Nearly every machine has its weak points, and it is the duty of the driver to find these out and to favour them just as he would a high-bred roadster who possesses some slight defect which otherwise does not affect his standing as a good animal. The amateur and the novice always start and stop a vehicle by a series of short jerks, which is a strain to the mechanism; in fact, many drivers, no matter how much experience they have had, never overcome this novice-like method, simply because they do not understand the nature of their iron steed. If half the accidents and breakdowns to motor-cars could be classified, it would be found that a great majority of such misfortunes were due either to poor driving or to the neglect of some slight derangement. Creaking springs and groaning mechanism are the most common accompaniments of ill-kept motor-cars as they proceed along the public thoroughfares. Oiling does not suffice for this, and the incompetent driver waits for a favourable opportunity to send the vehicle to some repair shop, there to discover the cause of all the noise. A man with a fair knowledge of the construction of his motor-car could, considers the “Automobile Magazine,” find out the cause of the noise in five minutes, and remedy it as quickly. The neglect which ignorance allows to progress means eventually a bill for repairs that astonishes the man who has to pay it. It also means the shortening of the useful life of the car by many months. A fractured axle is more often due to unskilful driving than to faulty construction. When driving over a hard, rough road the axles are strained to their utmost, and if the driver does not know how to negotiate obstructions he is in a fair way to break something. He may proceed in this careless way a dozen times without meeting with accident, but the thirteenth time he may pay for all. Each successive strain has tended to weaken the axle, until finally a slight extra burden cast upon it causes the mishap. It would be hard to convince one ignorant of the reasons for this that he was the sole cause of the unpleasant experience, and that nothing save his faulty operation of the vehicle was to blame for the breakdown. Such experiences rarely happen to the expert motorist who knows the principles on which his machine is constructed, and has gone below the mere surface instructions in his driving of a motor-car.

THE General Auto-Car Insurance Company, Limited, has been registered with a capital of £100.

MR. B. BINGHAM, an enthusiastic motorist, of Cheltenham, has devised a motor-starting arrangement for use on his Argyll car to obviate the chances of injury due to back-firing. Its leading feature is a spring which takes up the force of the back-fire.

THE Duke and Duchess of Devonshire, on Saturday, drove over to Buxton from Chatsworth in a motor-brougham to inspect several additional attractions which have been provided in the town, of which his Grace is Lord of the Manor.

THE Leeds Watch Committee has decided to recommend the City Council to make representations to the Government upon the desirability of easier and better identification of motor-cars and cycles, and for that purpose to make alterations in the law bearing on the subject.

THE Motor Manufacturing Company, Limited, have sent us a copy of their preliminary catalogue for 1903. The contents very briefly describe their five types of cars. In addition to the 8-h.p. single-cylinder, 7-h.p. double-cylinder, and 12-h.p. four-cylinder M.M.C. cars, two new types have been introduced, viz., 10-h.p. and 20-h.p. The latter is a four-cylinder car having three speeds forward and reversing gear, and irreversible-wheel steering of an improved type.

The New Albion 12-h.p. Petrol Car.

THE Albion Motor-car Company, Limited, of Glasgow, who have hitherto confined themselves to cars fitted with horizontal engines, are for the 1903 season bringing out a new 12-h.p. car with vertical motor. As will be seen from the accompanying illustration, the vehicle, in general outline, follows the now well-established lines of automobile-engine in front under a bonnet, clutch and gear-box. At the same time, however, a number of special features have been introduced. The motor is of the two-cylinder vertical type, having cylinders $4\frac{1}{2}$ inches diameter by 5 inch stroke. It is fitted with mechanically-operated inlet valves and an improved system of magneto ignition, the features claimed for which are simplicity and reliability. The engine is governed on the inlet by the Murray patent governor, which combines the features of the accelerator and the throttle lever on the present Albion cars, and carries out their combined functions automatically. The governor is of the centrifugal type and gives a wide range of speed in the motor, from about 250 to 950 revolutions per minute, and can be set to govern the motor from full load to running light at 250 revolutions per minute, or at any intermediate speed between this and 950. In other words, at whatever speed the governor lever is set, the car will maintain this steady speed up and down hill and on the level without any attention on the part of the driver, provided the hill is not too steep for the engine to take on that speed. The lever controlling the governor is mounted immediately below the steering wheel, so that the driver can instantly change the setting of the governor. It is claimed that the arrangement entirely overcomes the objections to the ordinary methods of varying the speed of a centrifugal governor. Relief cams are provided which make the starting of the engine a simple and easy matter.

The power is transmitted to the gear-box by a leather-faced friction clutch of ample dimensions, and also through an improved form of spring drive, the function of which is to introduce a flexible connection between the motor and the gearing, so that no shocks can be transmitted from one to the other. This point is a very important one, as it saves both the engine and gearing from abnormal wear, and helps to make the running of the car smooth and silent. The change gear box contains the necessary gearing to give three speeds ahead and one reverse speed, the top speed being a direct drive from the engine to the bevel gear on the cross shaft. The gear case is mounted on the three-point suspension principle, which prevents any twisting of the frame

or binding of the bearings in the gear case. The lubrication of the gear case and the cross shaft is automatically carried out, the oil being continuously circulated to the various bearings and returning to the bottom of the gear case. The changes of speed are all actuated by one lever, and it is so arranged that the driver can change from any one speed to another without passing through any of the intermediate speeds. From the change gear box the power is transmitted to the rear axle by side chains, the latter being fitted as close to the body as possible and well protected from mud and dust.

On the rear end of the gear case is fitted a double-acting water-cooled brake actuated by a pedal, while the hand-brake acts on the inside of steel angle rings fixed to the rear wheels. The tonneau is very roomy, and the whole car is luxuriously upholstered. It will also be observed that the wheel base is long, thus giving an easy riding motion. The car illustrated is fitted with solid rubber tyres, but pneumatics can be supplied if desired.

MESSRS. HENDERSON AND COMPANY, coachbuilders, of Glasgow, have had a busy year making various kinds of motor-car bodies.

At a meeting of the Institution of Civil Engineers, on the 13th inst., Mr. H. J. Joel will read a paper on "Electric Automobiles."

A CORPS of twelve men and officers have been told off by the German War Office to make some trials with a passenger motor-car and two goods wagons in the snow in the Hartz Mountain district.

MR. HANBURY, the President of the Board of Agriculture, has had a mishap while trying his new motor-car on the Ilam Hills, Derbyshire, the vehicle being upset while going down a steep descent.

THE Oppermann Electric Carriage Company, Limited, has acquired extensive premises in Arlington Street, Camden Town, which are now being fitted with the necessary machinery for turning out electric cars at the rate of one per week.

MOTOR-CARS were more largely used in the East Cambridge election than in any previous contest in this country. That Newmarket was the largest town in the constituency makes the innovation the more suggestive as to the value of the automobile in such work.

IN HERTFORDSHIRE.

FOR the London motorist, tired of the vagaries of Surrey J.P.'s and the watchful vigilance of the police of that lovely county, Hertfordshire may be suggested as an alternative. It is a district of quiet beauty and historical association; while its excellent roads and winding lanes present no difficulties to the trusty automobile, although some of the older towns have awkward twists and turns. "Hearty, homely, Hertfordshire," as genial Charles Lamb called it, is a delightful touring ground. To the east Hertford, Ware, Buntingford, Braughing, and Priory

COWPER'S BIRTHPLACE, BERKHAMPSTEAD.

present their charms; while in the north Baldock, Wilbury Hill Camp, Hitchin, and Stevenage are attractive centres. In the south-west corner of the county the motorist can spend a pleasant day, starting from any convenient point reached from the counties of Bedford, Buckingham, or Middlesex. With such a book as that on the "Highways and Byways in Hertfordshire," which Mr. Herbert W. Tompkins, F.R.H.S., has written, and Messrs. Macmillan and Company, Limited, have published, the journey can be made all the more interesting and instructive. This work is one of the best of the kind that has come to our notice. The illustrations are good, and the descriptive matter both accurately and entertainingly written; specially noticeable being the chapters on St. Albans, Berkhamstead, and the Baldock region.

With Mr. Tompkins' book in hand a pleasant motor-car trip for an afternoon can be made from almost any point and we would suggest one that can be easily traced on the excellent map accompanying the volume, and starts from Rickmansworth. This stands in a valley of streams, the Colne, the Gade, the Chess, and the Grand Junction Canal threading their course through its immediate vicinity. On towards Sarratt "the road twists and turns in a most surprising fashion. Sarratt should be one of the healthiest habitations in Hertfordshire. Most of the houses are detached, and there seems ample room for everything and everybody. The place affords as pleasing a contrast to the congested London suburb as heart can wish. The broad green common that stretches from end to end of the village is swept by a most delightful breeze, and I throw myself on the cool turf, beside the drumhead well, with the feeling of the Indian chief who struck his spear-head in the ground at an approved spot, exclaiming, 'Here we rest.' It was said in old times that he who bought a home in Hertfordshire paid two years' purchase for the air; the youngsters who are chasing butterflies across the green, or throwing bread to the geese upon the pond, look as though disease never crossed their doorway. As you pass up the village, keeping the common on your left,

you will notice that before the doorway of the Old Boot there stand four lime trees in a row, and that before the Red Lion, a few steps farther on, four lime trees stand 'four square.' The trees are of great age, and several generations must have come and gone since the two neighbours, perhaps in a spirit of friendly rivalry, planted these limes before their doorway and watched them grow. Let me go down to the little Norman church. The tower has a roof unlike that of any other church tower in Hertfordshire. It is a 'saddle-back' roof, and runs north and south, whereas the nave, as customary, runs east and west." This may be taken as a fair specimen of the easy style of this pleasant guide.

King's Langley has associations with Piers Gaveston. At Abbots Langley is a church of great antiquity, portions of the structure being as old as the memory of Nicholas Breakspear, who was born in the vicinity of the village at the close of the eleventh century. The two Langleys are as closely associated with Hertfordshire minds as Scylla and Charybdis. Journeying on to Chipperfield is a fine old manor house, "so spacious and so inviting that you can hardly observe it and keep the tenth commandment." Berkhamstead is one of the most considerable towns on the itinerary, and notable as the birthplace of Cowper. From the east end of Great Berkhamstead to the west end of Northchurch—where the parents of Maria Edgeworth lived a century and a-half ago—is one long street of shops and residences. The church at Northchurch has some good brasses, and attracts many artists, who go to sketch its low and massive embattled tower. Journeying on, Hamstead will be found a quiet little

A SCENE IN RICKMANSWORTH.

village with ancient almshouses—not far off the main road from St. Albans to Dunstable, the old road, changed by the Romans from a rude track for man and beast into a wide and durable highway. Westward is Harpenden village and common. Its church was a chapel of ease to Wheathampstead prior to 1859.

Wheathampstead will have to be passed through on the way to St. Albans, and the lych gates of St. Helen's Church there will warrant a passing glance. And then to St. Albans. "Perhaps the best view of the city," says Mr. Tompkins, "is that which lies spread out before you from the footpath between St. Stephen's Church and the village of Park Street." The old Abbey Church carries us thoroughly back to old English days, and the general aspect of the place will delight those who love the historical when combined with the picturesque. Through Colney to Watford the journey is nearly complete. Watford is the busiest town in the county; in 1891 its population numbered 17,000; now it is nearly 30,000 and—here is another instance of the practical character of much of the information in this excellent guide book—has, at the north-west end of the High Street, a sign-post with four arms as well covered with information as we have seen anywhere. Mr. Tompkins quotes all the distances set forth thereon, "if only," as he says, "to encourage other towns to erect sign-

A VIEW NEAR MARKET WEIGHTON (YORKS.)

boards of such exemplary completeness." This is the information thus set forth—and other towns might be spurred to similar enterprise:

THE Danish Automobile Club proposes to organise a race between Copenhagen and Stockholm, to be run off in May next.

THE Express Motor and Vehicle Manufacturing Company, Limited, has been registered to adopt an agreement with Mr. T. Clark, and to carry on the business of manufacturers of and dealers in motor carriages. The office is at 180, Stockport Road, Manchester.

SOME pigs frightened a horse at Lincoln on Tuesday. The animal dashed on to the pavement, where its wagon overturned a child's perambulator. The little one, who was thrown out, fell under the wagon wheels and was killed. Had a motor-car been within sight the driver of it would probably have been held responsible for the accident.

SOME USEFUL NOTES.

THE fuel tanks of both petrol and steam cars should be made with the greatest possible amount of care to prevent the slightest chance of leaks. They should preferably be located a considerable distance from the motor, so that if a leak does occur the petrol will run directly on to the ground.

By carefully following the instructions issued by the makers of the various types of cars in use to-day, good results can be secured, and if care is taken to keep the vehicle and parts clean and up to "concert pitch" the mechanism will not only run well, but will last longer than a dirty and neglected vehicle ever can.

Do not omit to keep the dustcap on a Michelin valve. Nearly all these valves leak more or less, but the dust-cap will stop the leakage, as it has a rubber washer inside.

WHEN reversing, be very careful not to put in the forward gear before the car has stopped travelling backwards; several people do this, but it is extremely bad for the gear.

IT is a very good plan to fix light leather guards inside the front wheels; most cars splash a good deal of oil up from the engine, and the oil bespatters the wheels and tyres.

A THICK piece of rope has often been suggested to put on a rim in place of a burst cover when everything else fails, but there is usually some difficulty about securing the rope; a very good method of effecting this is to measure the rope round the rim to get the length, and then to unite it by a short splice. The short splice will take up about three inches or more of the rope, and it will then have to be forced on, but when this is done it will not readily come off.

IT should be remembered that cars with low-compression engines and trembling coils do not need a very small spark-gap. Panhards and similar cars work very well with a spark-gap of about one and a quarter millimetres.

NEVER continue running a car when a suspicious squeak or knock is heard; many pounds' worth of damage may be done in this way; investigate any unusual sound at once.

THE great secret of hill-climbing is not to change speed too late; change on to the third speed while the car is still running at a fair speed on the fourth.

SIDE-SLIPPING is an occurrence which largely depends upon the design of the car, and the capability of the driver. Never select a car which has a body projecting far over the chassis; it will be certain to slip badly, owing to the unequal distribution of weight resulting in bad balance. If one is travelling slowly, very slowly, on treacherous surfaces with a properly designed vehicle, there is no fear of side-slip.

IN pressure-fed cars, where the lubrication is pressure-fed and magneto ignition is used, it is always advisable to let off the pressure when the car is stopped; otherwise the oil is liable to get on the igniters and cause trouble in starting.

IF one aspires to fit a gas-throttle to a car, where such is not already fitted, it will be found that a much better one will be made if it works in conjunction with the ignition; that is, when the engine is slowed down by the throttle, the ignition is also retarded. It will be found that, with this arrangement, the engine will pick up much better when the throttle is opened.

IF solid tyres are decided upon, make sure of two things: (1) that the springs are good and thoroughly adapted for their purpose; (2) that the speed of the car is not much more than twenty miles an hour.

HERE AND THERE.

THE York City and County Garage has been opened in Stonegate, York.

THE Weston Motor Syndicate is the new title of "Weston Motors."

THE next quarterly 100-miles Trial of the A.C.G.B.I. is to be held on the 24th inst.

A NOVEL feature of the vehicles now being turned out by the Pan-American Motor Company, of Mamaroneck, N.Y., U.S.A., is the silencing arrangement illustrated herewith. It may be mentioned that the motor is a four-cylinder one and that the general arrangement of the car is on Panhard lines. To silence the exhaust two cylinders attached to the frame of the car towards the rear are employed. According to the "Horseless Age," the forward and smaller one of the two acts as an expansion chamber and the other one as the silencer proper. The former consists of a cylindrical chamber with an interior con-

centric "horn" or sheet metal cone. The smaller end of this horn is fastened to the head of the expansion chamber, and has the exhaust pipe from the engine communicating with it, while the larger end is just sufficiently less in diameter than the inner diameter of the cylindrical chamber to leave a liberal passage all round. The exhaust gases pass through the horn and back on the outside thereof, and then by a pipe to the silencer proper. The latter consists of concentric tubes, the exhaust being led into the inner one and passing through perforations in the tubes into the successive concentric spaces and out into the atmosphere.

WE wonder what is the record as regards the life of a sparking plug. According to a French contemporary, La Société Cannoise d'Automobiles, of Cannes, has had one in use for four years, and, like "Charlie's Aunt," it is "still running."

THE Antwerp Automobile Club is searching for a straight road on which motor-car mile and kilometre record trials may be run off. A road on the estate of Baron de Caters, at Westwezel, near Antwerp, is suggested as being suitable.

THE Continental Caoutchouc and Gutta Percha Company is manufacturing two new sizes in Clipper Continental motor tyres, viz., 100mm. tyres, which fit the same rims as the 90mm. size, and 125mm. tyres, which fit the same rims as those used for the 120mm. size. Both these new tyres are of a stronger type than the 90 and 120mm. tyres.

MR. J. W. STOCKS intends driving a 6-h.p. De Dion car to Glasgow and back in four days, averaging 200 miles per day. The other day he drove the car from London to New Holland via Lincoln—a distance of 177 miles—the only incident being the failure of a temporary lamp bracket. The low gear was used but three times on the outward journey—the first time being at the hill just north of Grantham, the second time at the hill out of Lincoln past the Cathedral, and the last time at Elsham Hill, north of Brigg.

THE New Automobile Company, Limited, has been registered with a capital of £10,000.

TRADE reports from Coventry tell of a buoyant spirit in the local motor trade, with good prospects of employment during the year.

MESSRS. HUMBER, LIMITED, are bringing out a 20-h.p. car for the 1903 season; the engine will be fitted with mechanically-operated inlet valves.

THE Sloan Electrical Company, Limited, of 15, Fore Street Avenue, E.C., has been appointed agent for the Hydra Werke Electrical Company, Limited, of Berlin, for its dry batteries for ignition purposes on motor-cars, etc.

THE annual meeting of the Progress Cycle Company, Limited, was held at Coventry last week, Mr. W. E. Dalton presiding. The chairman announced that the directors had arranged for a debenture issue of £6,000 to enable the company to develop the motor branch of the company.

FOR the forthcoming season Messrs. John Child Meredith, Limited, are introducing a new vibrator on the G.O.M. coil, which will make 450 ruptures per second or 27,000 per minute. They are also introducing a new accumulator which is claimed to be impossible to spoil by short circuit. The accumulator can, it is said, be charged or discharged at any rate without fear of injury, and without getting warm.

ON page 860 we are able to reproduce a photo of Mr. J. B. Dunlop, the inventor of the pneumatic tyre, on his new 12-h.p. Argyll car, Miss Jeanie Dunlop being at the wheel. According to the "Irish Wheelman" Mr. Dunlop has fitted the car with an improved silencer of his own design, which renders it exceedingly quiet in running. Another new feature is a carburettor designed by Mr. Dunlop, junr., its weight being only seven ounces. In shape it takes the form of a rectangular chamber $2\frac{1}{2}$ inches wide and one inch deep outside measurement; the spraying nozzle is practically in the centre of the float, is automatic in action, and both the quality of the mixture and the quantity of petrol reaching the spraying nozzle are properly proportioned to the speed of the motor. If the engine is running above the normal, the quantity of air and petrol taken in are both increased, and when it is running below the normal they are both reduced.

OFF TO THE MEET.

[Das Schnaufferl, Munich.

THE Board of Trade have received a Customs circular which has been recently issued by the Government of India, under which the import duty in India on petroleum, having its flashing point at or above 150 degrees Fahrenheit, is reduced to 5 per cent. *ad valorem*, provided it is proved to the satisfaction of the Customs collector that it is intended to be used exclusively as fuel.

THE motor-car figures incidentally in the "House" Annual for 1903 which Mr. W. A. Morgan has compiled and Messrs. Gale and Polden, Limited, have published in the interests of the "Referee" children's dinner fund. Miss Marie Corelli ushers in one of the characters in her story on a motor-car, and Mr. Fred Burdett has a story wholly devoted to an automobile run. Other well-known authors also contribute to this interesting volume.

THE "Collier" tyres for motor-cars are about to be introduced into France, Belgium, and Germany.

MESSRS. L. R. OSWALD and J. R. EVANS have opened motor-repair shops in Golden Lane, Stephen Street, Dublin.

THE annual dinner of the Automobile Club of America will be held on the 24th inst., at the Waldorf-Astoria, New York.

MOTOR-CARS belonging to the Cambridge Autocar Company, Limited, have played a part in the recent Parliamentary election.

THE stock of the Bexhill Motor Car Company will be sold by auction by Mr. Charles Friswell, on the premises at Bexhill, on Tuesday next.

AMONG the firms in India dealing in petrol are Messrs. Turner, Hoare and Company, of Bombay, and the Assam Oil Company, Clive Street, Ghat Street, Calcutta.

IS Surrey reforming? The other day the mayors of Guildford and Godalming rode to a civic function at Richmond on a Dennis motor-car. Sergeant Jarrett did not call upon them to stop.

HEREWITH we illustrate one of the 1903 model Peugeot cars, in racing trim. Messrs. Friswell, Limited, the agents in this country, inform us that it is fitted with a four-cylinder motor developing 24-h.p. The engine is built in accordance with

the latest practice, having mechanically-operated inlet valves, throttle governor, and magneto ignition. It will also be noticed that the honeycomb type of radiator has been adopted. Four speeds forward and a reverse are provided, the control being by means of a single lever.

AT the Leeds Coliseum, a cinematograph exhibition is being shown, in which the garden party of the Yorkshire Automobile Club, at Mr. H. R. Kirk's residence, last summer, figures conspicuously.

THE Automobile Club is offering a reward of £25 for the identification of the driver of a motor-car who recently drove off from Reigate after assisting a dying man into a house. The man had been fatally injured through his horse shying at the automobile.

FROM the Motor Car Company, Limited, comes a catalogue dealing with Decauville cars, for which the company acts as British agents. It is splendidly got up, the cover being an excellent example of printing. Detail drawings and descriptions occupy much of the space.

M. LOUBET, the French President, has pardoned all convictions against motorists for offences committed prior to midnight on December 27th. One day's imprisonment is the usual penalty. But the offenders are allowed to work it off whenever it suits them within a certain number of months. As everybody puts off the evil day until the last moment, M. Loubet's clemency affects a large number of motorists.

IMPORTS OF MOTOR-CARS, MOTOR-CYCLES, AND PARTS THEREOF.

THE Board of Trade figures for the month of November relating to the imports of motor-cars, motor-cycles, and the parts thereof, have already appeared in our columns. Below, however, we give the official details showing the importations from the different countries of origin.

BELGIUM.

Antwerp	Goo'le	Motor car	1	£

CORRESPONDENCE.

A SUGGESTION *RE* HEAVY MOTOR VEHICLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In glancing over the descriptions of several heavy motor vehicles—steam and electric—that have recently made their appearance in the United States I have noticed that the vehicles have, among other advantages over horse-drawn lorries, the ability to furnish self-contained power to assist the loading and unloading. Here is a matter which has not been given the attention it warrants by builders of heavy motor-vehicles in this country. The loading and unloading of freight is as important as its transit, and the fact that any form of heavy motor-wagons provides means for accomplishing this more rapidly than it can be done with the simple forms of hand mechanism which are used with horse-drawn vehicles will, if properly set before commercial houses, have as much influence as anything in promoting the general adoption of the motor-wagon for freight haulage.

A heavy steam-wagon equipped with power windlasses and other apparatus for handling the loading and unloading of heavy goods has two distinct and indisputable advantages that urge its general adoption. It will haul goods faster, farther, and cheaper than the horse-drawn lorry, and it will load and unload the goods more rapidly and more safely than is possible by the latter.—Yours truly,

BLACKBURNIAN.

THE AUTOMOBILE CLUB BILL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Norman D. Macdonald seems to think that those who are in favour of means of identification are "mad to get out on the roads to rush around in hot blood, regardless of the twelve miles an hour nightmare." It is exactly the opposite. Those who favour the providing of means of identification consist to a large extent of automobilists who object to the conduct of men who now "rush around" in a manner that is dangerous, discourteous, and offensive to other users of the road.

He asks whether we "cannot wait and go more slowly, till the sense of the nation asserts itself." But the question is not what we will do. It is whether certain automobilists will cease to use the roads at railway-express speeds. If Mr. Macdonald will arrange to get all automobilists who now drive at speeds of 35, 40, 45, and 50 miles an hour to "go more slowly," we shall be most grateful to him.

He should remember that at whatever reasonable speed other automobilists may go, the general public will class them with the worst offenders on the road, and ultimately deal with them accordingly.

Although your correspondent, "Time Works Wonders," thinks he sees a clear meaning in such signatures as "Let Well Alone," and "Let Sleeping Dogs Lie," he does not tell us, what I ask again may be told to us, who are the dogs, and what is it that is "well," and therefore to be left alone. In the meantime I can assure him that it is absolutely certain that things will not be left alone, and that he will find that the Government will deal with the matter in next Session, not because automobilists desire it, but because the conduct of many automobilists is creating a pressure on the Department from justly-incensed members of the public, which cannot be ignored.

The automobile press and many of its readers may shut their eyes to this if they will, but I trust they will not do so much longer, as the consequences cannot but be evil.—Yours truly,

J. H. A. MACDONALD.

IS MOTORING FOR THE FEW?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me, through your columns, to protest against the idea entertained by many people, and even by some motorists, that the sport is one to be indulged in only by the wealthy, and that it is presumption on the part of anyone who cannot afford to keep a mechanic to attempt to maintain a car.

In the Badminton motoring reminiscences, an authoress is very hard on a presumably mythical village parson—that never-failing butt—because he has the audacity to buy a 3-h.p. Benz Ideal without keeping a mechanic to superintend it; in the exuberance of her imagination she even declares that he was surprised to hear that water was not an efficient substitute for petrol as a motive power. Now if a man spends, say, £80 on a second-hand car, how can he be expected to also lay out £2 a week, the interest on an investment of £2,000, for expert assistance? If he could afford the latter, he might surely spend £800 on his car. Even in these go-easy days, the charge of one 3-h.p. motor-car, used in occasional leisure intervals, will hardly constitute employment for a man; and surely a man of mechanical tastes and fair theoretical knowledge of motors may be pardoned if he attempts, with occasional expert assistance, to overcome the difficulties inseparable from motoring. When the demand for small cars at £150 is so great, each buyer must be expected to do small repairs himself. I trust that many with "neither poverty nor riches" may, with the aid of the hints in your excellent journal, and the various technical works on the subject, venture to join the ranks of automobilism, undeterred by the cavils of the few or the jeers of the *profanum vulgus* on the occurrence of a hitch.—Yours, etc.,

W. COOMBE.

THE GORDON BENNETT CUP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Judging from the attitude the Automobile Club is adopting in drafting the rules for the eliminating tests for the Gordon Bennett Cup, I fear it is permitting itself to be laid open to the suggestion that it is inclined to be biased in favour of one particular firm. Out of the three cars which are to represent England in the great race, the Committee have, I take it, decided that the Napier is allowed to enter two out of three without trial. This certainly presents the appearance of unduly favouring the winner of last year's race, especially as the Automobile Club was careful to point out that it must not be taken as a precedent for future occasions. If it is not to be the rule for the future, what argument is there in commencing with so doubtful a precedent?

I do not stand alone in holding a firm conviction that it would be infinitely fairer and more satisfactory if the second and third places in the representation should be open to competition.

I understand that the Star Engineering Company is the only other firm that has paid its £5.0 to compete in the eliminating tests against the Napier. Now having regard to the fact that the issue is of national importance, surely all trade considerations should be secondary. The object of the Automobile Club should be, and I hope will be, to ensure that England shall be represented by the three best cars in the great race, but if the club persists in the arrangements as at present submitted, is there not a possibility that the only other entrant in the eliminating contest may be second to the Napier it has to meet in the tests (which one naturally concludes will be the best of the three Napiers), whereas it may possibly be superior to the other two against which it will not be permitted to compete.

I have not the slightest personal interest in the matter, but having formed the opinion that the Cup holder must be a good sportsman, it occurred to me that the few minutes spent in writing this letter would not be wasted in making the suggestion that the two Napiers should compete in the eliminating tests, and so ensure the popular desire that on the day of the race England shall be represented by the very best cars available.—Yours truly,

U. STRATTON.

THE LESSONS OF THE PARIS SHOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is generally granted that grave obstacles surround British motor manufacturers if they are to regain lost ground and overtake, let alone outstrip, our Continental rivals. It is not my purpose to write here of these obstacles, but so grave and growing a danger has made its appearance lately, that I feel no great apology is required for drawing straightforward attention to it. In a recent article on the Paris Motor Show, a racing man wrote of "The lessons to be learnt, etc.," but on careful perusal it is not evident what those lessons are, unless it be that manufacturers and agents, or, rather, agents and manufacturers, are admonished to "pull together." The rest of the article deals with certain phases of construction which are identified with the Mercedes design and an expression of self-satisfaction on British manufactures as they appear to-day against Continental.

It is my purpose within the narrow scope of this letter to endeavour to show that some of our British papers are unwittingly injuring the British manufacturers by leading them to believe that we are occupying a position in motor manufacture which we do not hold. It has been said that "all the French makers are being lured on in the direction of complications because of the Mercedes." Can it mean that this advice to British makers is "be careful that you do not do likewise?" Let us inquire whether the advice is sound. The outstanding features of the Mercedes copied by the leading French makers are, roughly speaking, three in number. (1) The *Chassis Embouti* (pressed steel under carriage of channel section). (2) Mechanically-operated inlet valves. (3) Multi-tubular radiator of special design and construction. As to (1): The new steel frames are a very great advance indeed on the old L section iron and wood frames; they are lighter, stronger, and, when sufficient quantities have been produced out of the tools for making them to cover the cost of those tools, will be greatly cheaper than the old style. (2) Making a comparison between mechanically-operated inlet valves and the valves worked by suction there is still only one valve, one spring, one washer and one cotter. The only possible disadvantage (?) is the adding of a cam to a shaft which is already in existence, so that by mechanical operation it is possible to get a positive time of opening and closing irrespective and independently of any of the conditions which may cause the suction induction valve to vary its work from time to time. When, over and above this advantage, the means to run an engine extremely slowly without bringing it to a standstill is added, is it difficult to find a reason for changing? (3) The Mercedes type of radiator, or something similar, and which is not at present generally fitted in this country, is more efficient than the radiators which we are still requested to adhere to by our friends. The proof as to whether this advice is sound is a short one. No radiator ordinarily fitted in this country will keep the water cool enough so that a car does not require refilling for say 500 miles, whereas it is claimed that the other type of Continental radiator will do very much better than this. Any way, it will be readily granted that the last mentioned is at least as efficient as the other, and there is no argument about the one fact that it does not require a great water tank somewhere at the back of the car with all its attendant complication of pipes to and from. Moreover, such a tank and its contents are very heavy, while the Mercedes radiator requires no separate tank, being in itself tank and radiator combined.

I am conscious that in approaching this matter I am performing a thankless, though self-imposed task, and I expect to be greeted from certain quarters with howls of derision. I am, however, encouraged to go on in the belief that the purchase of British motor-cars depends so much on broad-minded intelligence that there is more prospect of the British upper classes being weaned from cars of foreign manufacture, if they become conscious that there is at least a section of British makers who are alive to our shortcomings and who are willing to learn from those who can teach, and to copy, if need be, from those who at present lead, instead of feeling all the time that by supporting home industries they are being called upon to put up with the defects which may, and at the present time do, exist through drawing our cloak of insular exclusiveness around us, and falling into the good old British error of holding our enemy too cheaply. It is all nonsense to argue from a visit to the recent Paris Exhibition that we are regaining lost ground; it was only too painfully evident that we are doing nothing of the kind, and that we are farther behind than ever.

One personal explanation is necessary before I close. I am sure to be accused of calling "stinking fish," especially as I am interested in the sale and manufacture of an English car, the name of which it is not necessary to mention here. No claim has ever been made for that car that it is perfection, and no claim is now made that the car at present embodies in its construction the technical points which have been touched upon above. I may say, however, that after deliberation I am determined to avail myself of some of the improvements which I saw at the Paris Show.—Yours faithfully,

CHAS. SANGSTER.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Kingston ...	*W. Batchelor, Kingston	—	£2 etc.

" ...	H. Sidney, Northumberland	36 m. p. h.	40s. "
" ...	W. Astell, Twickenham	22 m. p. h.	40s. "
" ...	C. E. Curtis, Wandsworth	21 m. p. h.	20s. "
" ...	G. Baker, Horley	20 m. p. h.	40s. "
Hull	W. Newcombe, Hull.	—	20s., etc.

Where no alleged speed is given it is understood to be above the legal limit.
*Motor-cycle cases.

In the case against T. G. Reville, at Barnsley, police-constable Davis said he saw the defendant flash past on a motor-tricycle at a speed of 35 to 40 miles an hour. Police-sergeant Newrick thought he was going 30 to 35 miles an hour. Tested as to his idea of speed the sergeant said he was a cyclist, and had ridden at a speed of fifteen miles an hour on the road, but he added that was before he joined the force.

At the Kingston County Bench, Wallace Batchelor and J. E. Barker, of Acre-road, Kingston, was summoned, at the instance of the Duke of Cambridge, the ranger of Richmond Park, for driving light locomotives there on December 20th at a greater speed than twelve miles an hour. Frank Gadrell, a park-keeper, said the defendants were racing on motor-cycles along the main avenues between the Kingston and Richmond Gates. Defendants denied that they were going more than twelve miles an hour. Batchelor said they were only testing the motors, and as they were not allowed to do it on the highway he thought it should be permitted in Richmond Park. Defendants were fined £2 each, or fourteen days' imprisonment in default.

ADOLPHUS PEARD, 20, of French nationality, living in Old Compton Street, Soho, was charged, before Mr. Kennedy, at Marlborough Street Police Station, on Saturday, with furiously driving a motor-car in Hyde Park. Constable Hawkes deposed that the prisoner drove a motor-car at a "terrific pace" over the crossing at Albert Gate, Hyde Park, and he (the witness), some ladies, and nurse girls had to jump out of the way to avoid being knocked down. After going about 20 yards he stopped, in response to his (the constable's) signal. When asked for his name and address, he replied, "Me won't give name and address, me belong to Lord Beresford." Through Mr. Fahrni, who interpreted the evidence, Peard said that owing to the slippery state of the roads he had to travel on the second speed, which was rather fast, owing to fear of the car skidding. Mr. Kennedy: He had better stop at home, then. This is a dangerous crossing. He must pay a fine of £3, with 5s., the cost of the interpreter's fee, or, in default of distress, go to prison for a month.

At the Horsham Petty Sessions, George Baker, auctioneer, of Horley, who pleaded not guilty to covering a quarter of a mile in 46 secs., or 20 miles per hour, said he knew when he was approaching the "happy hunting ground of the police," and he shut the engine down and had his foot on the brake the whole journey. When he saw the police he said, "You

have not got me to-day, Sergeant." The officer replied, "Yes we have. You were going 20 miles per hour." Witness was perfectly astounded. He questioned the accuracy of the watch. The Chairman said the Bench were of opinion that defendant was travelling at the rate stated. No doubt he was trying to go slowly. He would be fined 40s. and costs.

THE EDINBURGH AUTOCAR COMPANY.

A GENERAL meeting of the Edinburgh Autocar Company has been held for the purpose of having an account laid before the shareholders showing the manner in which the winding up has been conducted and the property disposed of. Mr. W. A. Middleton, C.A., liquidator, who presided, reported that the cash balance in bank and in hand at the date of liquidation was £154 3s. 4d. The cars in hand—seven in number—realised £965. The whole charge was £1,359 5s. 9d. A first dividend to creditors of 4s. in the £1 had been paid on claims amounting to £3,016 17s. 9d. At the close of the account there was a balance of £476 15s. 11d. The statement was adopted.

NO LIGHT.

J. G. BULTEEL, of Sefton Park, Stoke Poges, has been summoned at Slough for not having a light on the off side of a motor-car in the Stoke Road, on December 14th. Defendant said the lamp was alight a few minutes before he was spoken to by the police. He had only just come through Slough, and the lamp was burning then. The chairman said he would be fined 10s. inclusive.

WE hear that the Leeds Forge Company, of Leeds, is taking up the manufacture of stamped steel frames for motor-cars.

At a recent meeting of the Automobile Club of America, Mr. G. O. Shield gave a lecture, illustrated with lantern slides, on "Snow Slides in the Canadian Rockies," and also related some of his big game hunting experiences.

A RUMOUR is current in New York that the Winton car which will compete for the Gordon Bennett Cup will have four-cylinder engines and that they will be of the vertical type.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JANUARY 17, 1903.

[No. 202.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

BARON HENRI DE ROTHSCHILD had a warm welcome from those who attended at the Automobile Club on Friday, the 9th; but it would have been more gratifying to the organisers of the event had the attendance been larger. As it was, several notable faces were absent, and we could not refrain from contrasting the scene with some of the gatherings that took place in past years at the old rooms in Whitehall Court. Perhaps the sense of novelty in the new surroundings had not sufficiently worn off so far as the *habitués* were concerned. Anyhow, the evening was well spent, and the Baron must be felicitated on the excellence of his paper, his delivery, and his English. His amiable manner and quiet humour were alike delightful; and the readiness with which he

responded to an invitation to give his views on certain points was much appreciated.

Himself a Victim.

PERHAPS it was hardly to be expected that he would be drawn into a reference to the Bill which the Club has fostered with regard to the labelling of motorists—like so many auction lots—but more's the pity. In view of the fact that on the same day he was reading his paper he was being fined and sentenced to imprisonment for alleged contravention of the Parisian motor-car regulations, he would probably have been able to have declared against numbering—as have so many of his French *confreres*. Anyhow, he did utter a word of warning against reckless driving that, coming from so distinguished a motorist, should re-assure the public as to the humane character of those who ride on vehicles propelled along ordinary roads by other than animal power.

The French Industry.

THE figures he gave concerning the commercial altitude reached by the French automobile industry were not new—but their frequent reiteration is necessary in seeking to convince the utilitarian Britisher as to the worldly wisdom of encouraging automobilism. Whereas the importation of motor-cars into France only rose from £15,520 in 1900 to £31,200 in the first ten months of last year, the exports rose from £290,360 in the former period to £1,062,040 in 1902. In Paris there are fifty-three firms manufacturing under-frames and motors, while in the provinces there are seventeen. Twelve thousand cars were made last year and 45,000 workmen were employed in their construction. There are, however, three times that number engaged in other departments of the industry.

Basis of Calculations.

In reading the foregoing figures it should be remembered that the value is calculated on the basis of 10f. (or 8s.) the kilogramme (of 2·2046 lb. avoirdupois), which is often greatly inferior to the selling price. Thus, a car weighing 500 kilos. would cost 5,000f. (or £200), and one of 750 kilos., 7,500f.

(or £300), and so on. The cars weighing 1,000 kilos. and the racing vehicles are often sold on the basis of 15f. to 20f. (or 12s. to 16s.) the kilo.

Motoring and Health.

HAVING practised as a medical man in France, Baron Henri de Rothschild was able to speak as an authority when he recommended a moderate enjoyment of automobilism as a powerful aid to good health. Taken in moderation, motoring can banish insomnia, revive jaded spirits, lessen the danger of nervous breakdown, and generally act as a "tonic" upon the system. But the violent driving in which many Continental motorists indulge for several hours at a stretch is inimical to healthy spirits and good mental order. Fortunately, in England we prefer catching sight of the country as we speed along, and the intervals of refreshment provide a break in the monotony of long and wearying rides.

The Midland Club.

ON Saturday the Midland Automobile Club held its first annual dinner at the Grand Hotel, Birmingham. Mr. J. Broughton Dugdale, the president, was in the chair, and after the health of "The King" had been honoured, proposed "The Midland Automobile Club." The object of the Club was for social enjoyment, and the mutual exchange of ideas between users and makers of motor-cars. At this time of the year they did not make such use of their cars as in the summer months, but it was the time when they endeavoured to correct some of those little failings they had noticed in the past; it was the time when they went about seeing what the world was doing in the matter of motor-cars. There were many present that evening whose faces he saw at the Paris Exhibition, studying what our competitors across the Channel were doing. He thought they would agree that our French neighbours took the lead in the matter of originality, while we showed them the way so far as good workmanship and strength were concerned. It was the desire of every member of the Club that he should make no enemies on the road. In the county of Warwick they were not so much troubled as to speed limit as motorists in other counties; but, assuming that there was a speed limit, he took it that the right speed at which one should travel on the road was, not the highest speed at which safety could be secured, but the speed at which there would be no annoyance to any other person using the road. This was what they should encourage as a Club concerned in the welfare of automobilism. Another thing which was to be aimed at was silence in the driving of motor-cars.

French v. English.

WITH the toast was associated the name of Mr. Frank Lanchester, who, in replying, said they had got through their first season successfully, and they might consider they had a long and useful life before them. Mr. C. Vernon Pugh proposed "The Visitors," coupling with it the name of Mr. Shrapnell Smith. Referring to the chairman's remarks anent the Paris Exhibition, Mr. Pugh said that what struck him as remarkable about it was not the originality of the French makers, but their faculty for copying, and he returned with a very high opinion of the exhibits of the English makers. The other toasts were

"The Press" and "The President," the latter being submitted by Mr. J. D. Siddeley. During the evening the medals won in the hill-climbing competitions at Gorcott Hill and Weatheroak Hill were presented.

Sprags.

IN turning over some papers the other day we came across the interesting photograph reproduced herewith. It represents one of the early Peugeot cars which formed the pioneer stud of Sir David Salomons, Bart. The photo was taken in 1895; at that period the Peugeot Company employed *cliquets* or ratchet wheels on their cars to prevent them running

back on a hill, owing to the motor stopping or the driving missing the gear in changing speeds. At that time no other maker used a device of the kind. Sir David met with a slight accident due to melting snow on a steep hill when the "*cliquet*" did not act. As a result he devised the arrangement shown in the illustration to avoid such troubles in future. It was the first application of the *bequille* or sprag to a motor-car and resulted in its adoption by French motor-car builders universally. It is curious to observe that though this was the first attempt, the system is better and safer than that one now usually sees.

Motor-cars in Sleet and Slush.

NEW YORK has just passed through a severe sleet storm lasting for several days, which greatly impeded traffic of all kinds. One morning a few days ago the streets were completely covered with a layer of ice an inch or more in thickness. The elevated electric railway system was completely paralysed and the tramcar traffic much delayed. A few days later, when the streets were covered with several inches of snow and still very slippery, double teams were generally employed on all horse-drawn wagons. This occurrence reminds us, remarks the "Horseless Age," that horse traffic is not nearly so immune to weather conditions as is usually supposed. Extreme heat and extreme cold both impede such traffic, sometimes rendering it almost impossible. Whatever may be said in regard to the limitations of the automobile in cold weather, the average motor-car in use on city streets is at present much more independent of blizzards and sleet storms than the horse. This has been quite conclusively proved on one or more occasions during each of the last several winters. Again, in the late storm, when horse traffic was much reduced, in quantity as well as in speed, motor-cars could be seen running about at their usual speed and in the same numbers as customary at this time of the year without apparent difficulty. The electric cabs continued their service and were

patronised more than usually, owing to the uncertainty of horse cab service under such conditions. No doubt many of those who still regarded the motor-car as a fad and a toy somewhat changed their opinion when they saw these vehicles glide along as on a summer's day under conditions that proved almost fatal to horse traffic.

Where to Slow Down.

NOTICE boards, indicating where slow speeds are necessary, are to be placed on certain portions of the Portsmouth road by the Automobile Club. In granting permission to this innovation, the Surrey County Council has shown a wisdom that may some day permeate the members of the county bench. Messrs. A. Harmsworth, Campbell Muir, and C. Johnson have been appointed a sub-committee to make recommendations as to the points where the provision of such boards is desirable, and we understand that suggestions from local motorists will be welcomed, while members of the Club living in the neighbourhood of the Portsmouth road will be co-opted on the sub-committee.

Ireland's Welcome.

THERE is no doubt that a hearty welcome would be given to automobilists should it be found practicable to run the Gordon Bennett race in Ireland. Already the County Councils are bestirring themselves with a view to the improvement of the main roads, and at a meeting of the Westmeath County Council a resolution has been unanimously adopted to the effect that "should the International race of 1903 take place in Ireland, and a route be selected embracing any portion of the County Westmeath, this Council will gladly facilitate the promoters in every way in its power." Mr. W. P. Kelly, who proposed the motion, said it had been suggested to him that it would prove of great advantage. Though it might so happen that it could not be held in the vicinity of Mullingar, still it would be an advantage to the whole country, no matter where it was held.

Railway Policy.

ALTHOUGH the dealers in motor spirit have agreed "under protest" to conform to the regulations of the railway companies with regard to the carriage of petrol, the matter must not be considered as finally closed. We have received a report of the conferences held between the trade and the companies, together with the reply of the latter to the former, and cannot fail to recognise how unsatisfactory has been the result—according to the view of those engaged in the business. But the companies, must not be too severe, for the automobile industry is a growing one, and the day is approaching when it will probably rival the railway interests of the country. To make that progress difficult may be a policy that is good for a season; but it cannot be to the ultimate interests of the shareholders.

Electrical Automobiles.

At a meeting of the Institution of Civil Engineers on Tuesday evening last, Mr. H. F. Joel, Assoc. M. Inst. C.E., read an interesting paper on the subject of "Electrical Automobiles." The rules of the Institution preclude us from publishing the paper *in extenso*, but we give an abstract of it in another part of the present issue. Those interested in the question of the electrical propulsion of motor-cars should endeavour to obtain a copy of the paper, as it contains in a condensed form a vast amount of useful information. Especially does this remark apply to the appendix, which gives, in tabulated form, particulars of early and recent electric vehicles; the great progress made during the five years 1896-1901, in the use of electricity for propelling carriages on roads; recent examples of long distance runs on one charge; the results of tests and trials; and a comparative statement of the working costs of various methods of propelling road-vehicles—including a London horse-drawn "growler," and petrol, steam, and electrical carriages. The table showing the progress

of the latter is exceedingly interesting. For example, Mr. Joel shows that whilst in 1896 the weight of a battery to give 2-b.h.p. for six hours was 21 cwt., it is now only 7 cwt., the efficiency, too, having increased from 70 to 90 per cent. Motors have been reduced in weight, as has also the total weight of the vehicle, while the annual cost of maintenance and the charges for current have been materially reduced—all points in favour of an impetus being given to the use of the electrical motor-car.

University Clubs.

ALREADY we have chronicled the formation of an automobile club in connection with the University of Cambridge. Now comes news of a similar development at Oxford, and as the name of Mr. W. L. Creyke, who purchased M. Serpollet's famous car, renaming it the "Easter Egg," is associated with the matter, its progress should be rapid. In thus popularising the automobile at the great Universities good work will be done and we wish well to both clubs. Possibly an inter-University automobile race meeting will be one of the results of the new enthusiasm thus being awakened at Oxford and Cambridge.

Educating our Rulers.

DURING the last few days the Automobile Club has issued to members of the Houses of Parliament, and of the County Councils, a Blue book containing speeches by Sir Francis Jeune, K.C.B., the Rt. Hon. the Earl of Onslow, G.C.M.G., and the Rt. Hon. Henry Chaplin, M.P., at the Club's dinner in 1901. The results of the brake trials at Welbeck Abbey a year ago and the memorial of manufacturers of motor-cars to the County Councils some time ago are also given. Thus continuing its educational work, the Club is rendering useful service in demonstrating to influential people the absurdity of the legal limit—necessary, perhaps, at the time it was adopted, but which has since proved a means of handicapping the development of the industry.

A Legal View.

LEGAL authorities are awakened to the difficulties under which motorists travel, and the "Law Times" thinks "that the time has come when the limit should be largely extended or abolished altogether in the case of light locomotives, provided due safeguards were forthcoming." Then our contemporary, unfortunately, advocates the "identification of motors by means of a number." But it is not altogether in favour of the official view urged from Piccadilly, for it describes the proposal of the Automobile Club to give a right of appeal to the High Court in the case of a conviction as "such a drastic innovation upon the whole of our criminal procedure that it is hardly likely to become law." In fact, it is, according to our contemporary, "in no way desirable. An appeal lies to quarter sessions upon the facts and to the High Court upon the law, and this should be sufficient even for the most ardent motorist."

The "Globe" Against Numbering.

WRITERS in the general press are now joining in the crusade against the labelling of motorists, and the "Globe" writes:—"The supporters of the proposal to number all motor-cars are wont to point to the fact that the system has been adopted in France, where, of all countries in the world, the automobile movement most flourishes. It is, therefore, instructive to note that the editors of the 'Auto Velo' and 'La France Automobile,' the two most influential automobile journals on the Continent, have both declared that the system has proved a failure. In an article in the *Motor-Car Journal*, M. Georges Prade, the editor of the 'Auto Velo,' after describing the system and the frequent injustice that it entails, sums up the situation by saying: 'Thus it is that numbering in France has had the result of making reasonable law-abiding drivers suffer and scorchers go scot free, with the result that numbers of the former have decided to give up motoring rather than subject themselves to such trouble, risk, and annoyance.'

Motor-Car Imports and Exports.

THE returns now available relating to the British imports and exports of motor-cars and cycles during December last show a decrease as regards the imports, and, on the other hand, an increase in the case of the exports. To deal first with the imports, 170 cars and cycles were imported into this country last month, the value of the same being returned at £57,292. The value of the "parts thereof" is given as £5,181, so that we get a combined total of £62,473, as compared with £91,462 in November last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised thirteen vehicles, amounting in value to £5,376, and £1,072 of parts, bringing down the net imports in December to £56,025. During the whole of the past year the imports of foreign automobiles and parts into Great Britain reached a net total of no less than £1,045,689, representing over 3,700 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to the respectable total of eighty-three vehicles of a value of £29,747. Of parts, the exports attained a value of £3,648, making a combined total for December of £33,395, as compared with £15,635 in November last. It is satisfactory to find that during the past year no less than 414 British-built motor-cars and cycles were exported, their value being roundly £155,000.

WHAT HAPPENED IN THE INTERVAL?
Das Schmaufert, Munich.

Eastern Counties Automobile Club.

SIMULTANEOUSLY comes the news of the formation of an automobile club for the Eastern Counties, and the decision of the Essex County Council to urge upon the Government the necessity of giving immediate attention to the present state of the law with regard to automobiles. We regard the formation of the East Anglian club as a matter of necessity and importance. Hitherto there has been no local organisation to watch the interests of automobilists in the counties east of the Metropolis: but now we hope the new society will watch the proceedings of local bodies and do what is possible to convert the prejudiced attitude of many county people into a recognition of the advantages of the motor-car. The inaugural meeting of the proposed new Club was held at the Great White Horse Hotel, Ipswich, and upon the resolution of Mr. E. C. Sayer, seconded by Dr. Moseley, it was decided to form the Eastern Counties Automobile Club and to confine the membership to motorists in Norfolk, Suffolk, Essex, Cambridgeshire, and Huntingdonshire.

The Preliminary Meeting.

AT the preliminary meeting Mr. F. L. Bland presided, and Mr. W. T. Pretty, in pointing out the utility of the proposed new Club, said it might do much useful work in looking after the roads—in which direction there is much room for improvement in the Eastern Counties. Among those who wrote express-

ing agreement with the project and regret at inability to attend the meeting were Mr. Stuart Ogilvie, J.P., the owner of the splendid touring car recently described and illustrated in our columns; Mr. Lindsay Scott, Major Carthew, Major Howey, Rev. H. Wilkinson, Dr. Whitwell, and Dr. Rowe. Mr. J. R. Egerton consented to undertake the secretarial work of the club, to which we wish all success. Local motorists interested in the matter should address him at 80, Christchurch Road, Ipswich.

The Lessons of the Paris Show.

was a time when Mr. Sangster was more sceptical as to the future of the motor-car than he is to-day. Unfortunately, considerations of space prevent us giving publicity to all these letters, which necessarily cover the same ground; but Mr. Bidlake's reply, published on another page, serves to confine the subject to its original limits.

Horses' Loads and Gradients.

A CASE heard at Greenwich, in which two carmen were summoned by the police for cruelty to horses, is not an isolated one. The Rev. A. E. King, vicar of Sydenham, said he passed two coal drays on an incline at Forest Hill. The drays were overloaded, there being, he calculated, three tons of coal on each. The horses were greatly distressed, and they appeared to be too exhausted to pull the loads up the incline. One dray had broken down, and the horses in the other were being severely beaten about the neck. Mr. John Bell, F.R.C.V.S., said he knew the horses well and considered there was nothing improper in loading them as described. They ought to be able to draw four tons, and three tons would be an easy load. The gradient at the place in question was 1 in 20, and they ought to take a load up 1 in 14. The question of the capacity of horses for drawing heavy loads has rarely been considered in ordinary distributive methods. In such heavy work there is ample scope for the automobile; and its general adoption will prevent the possibility of such incidents in the future.

Look After Your Car.

periods of keen frost. The constant care to drain tanks, pipes, radiators, etc., of the last vestiges of water when the car is put away for the night—all have been omitted for a long time. But now that Jack Frost is about they will have to receive attention again, and it will be the part of wisdom to make preparations in ample time. As regards the prevention of burst pipes, etc., glycerine added to the water in the proportion of about 20 per cent. is the preventive against freezing chiefly recommended, while chloride of calcium has also its advocates. The latter is a solution of calcium chloride in the proportion of 5 pounds dissolved in each gallon of water. There is no danger of clogging the pipes with this salt if pure water is added for that evaporated.

The Church and the Car.

VERILY the possibilities of the motor-car are endless. In the United States popular evangelists employ the automobile when on revivalist tours; English bishops have reached distant churches in good time by its aid, and army chaplains have preached from behind the steering-wheel of a motor-vehicle. Now the motor-car is suggested as likely to solve some of the difficulties of the Church in the sparsely-populated and poorly-conditioned rural districts. Often the livings are poor, and horse and carriage are beyond the imagination of the incumbent. But with the

motor-car, what will he not do? Here is a hint to a new way of helping the clergy.

Petrol Motors for Industrial Purposes.

A NOTICEABLE feature of the recent Salon in Paris was the growing use of petrol motors for industrial purposes, such as driving dynamos, pumps, and small workshop plants. For such purposes the petrol motor is especially adapted, and we consider that more attention might usefully be devoted to such applications in this country. One or two firms have, we are glad to note, already made a start in the direction named, among them being Messrs. Merryweather, the fire engine builders, who send us particulars of a combination petrol motor and fire pump recently installed at Hollybush Hall, near Burton-on-Trent. It is employed for filling the water tank for service to the house and to the gardens, and can also be used for throwing powerful jets for fire extinguishing. The pump and motor are bolted to a rigid base plate, so the whole machine is self-contained, and a friction clutch is fitted so that the motor may be started and the pump subsequently put into action. Motor-cars are now becoming so popular with country gentlemen that the employment of an engine such as is used on a motor-car offers an attraction on account of its being readily understood, and, what is more important, on account of the quickness with which it may be put into action on the discovery of a fire.

The Gordon Bennett Race.

SPEAKING at the annual dinner of the Motor Cycling Club on Wednesday evening, Mr. S. F. Edge made the important announcement that it now only remains for Parliament to pass a short measure to enable the 1903 Gordon Bennett Race to be run in the United Kingdom. Mr. Edge had returned from Ireland that morning, after driving over the proposed course. As a result he was able to report that there could be no objection to the course, it being in every way suitable. The suggested route is a circular one of about 137 miles—from Naas via Kildare, Maryborough, and Stradbally, to Athy; then via Kilcullen and Carlow to Athy again; and back to Naas, through Kilcullen.

ON Monday the Wolverhampton Automobile Club held its second annual meeting.

THE Mercedes Daimler Motor Company, Limited, has been registered with a capital of £2,000.

THE Swansea Corporation has decided to obtain tenders for the supply of a motor-wagon for municipal work.

THE Coupe de Pioule, which should have been run off on Sunday last, was at the last moment forbidden by the Prefectural authorities of the Department of Var.

THE PRINCE OF WALES has ordered a 22-h.p. Daimler car similar to the King's car which was exhibited at the last automobile exhibition at the Agricultural Hall, London.

MR. PIERPONT MORGAN, junr., has been to Coventry during the past few days, and has visited several places of industry in the city, including some of the motor works.

M. SERPOLLET is back again in Paris from his trip to the South of France. The last day's journey was from Brive to the capital, a distance of 317 miles—not a bad day's work at this time of the year.

IN connection with the Reliability Trials to commence on September 4th, the classification will be as follows:—Class A, up to £200; Class B, £300; Class C, £400; Class D, £550; Class E, £700; Class F, £900; Class G, over £900.

MESSRS. SHIPPEY BROS. call our attention to an error in the price of the Toledo cars in their advertisement last week. This should have read Doctor's Ideal at £220, instead of £235. If fitted with removable hoods, the price is £245. They also inform us that they have appointed the Victoria Carriage Works, of 24-26, Long Acre, W.C., as sole agents for London and a twelve-mile radius for the Toledo steam-cars.

The Velox 12-h.p. Four-Cylinder Car.

FIG. 1.—GENERAL VIEW OF MOTOR—INLET-VALVE SIDE.

FIG. 2.—GENERAL VIEW OF MOTOR—EXHAUST-VALVE SIDE.

IN designing the Velox 12-h.p. four-cylinder car, illustrated herewith, the Velox Motor Company, Limited, of Coventry, inform us that the main objects in view have been to obtain a thoroughly reliable and fast car, of ample wheel base and with full and commodious seating capacity. In order to diminish the wear and tear on the tyres, the weight has been reduced to the greatest possible extent consistent with safety and durability. The frame of the car is of the company's special design, giving absolute rigidity and strength combined with lightness. The main frame is of tubular construction. The upper portion is

which are held in position by one nut. The whole of the moving parts are completely encased, being thereby both dust-proof and oil-retaining. The crank case is of aluminium and is carried direct on the outer tubes of the frame, no false *chassis* being employed. The usual form of electrical ignition is adopted the contact breaker being driven by a chain, which can be adjusted without affecting the timing of the engine. The radiator is fitted with header plates and is arranged like a water-tube boiler, the radiating tubes being of the latest pattern. It is fitted in front of the bonnet and can be

FIG. 3.—SECTION OF VELOX FRICTION CLUTCH.

rectangular, with four cross members in the same plane as the two side members. It is stiffened at each side by stays, which brace its two ends to short downwardly-projecting tubes.

The vertical motor (Figs. 1 and 2) has four cylinders, $3\frac{1}{2}$ in. bore by 4-in. stroke, and, while nominally rated at 12-h.p., develops 16-h.p. on the brake at a speed of 900 revolutions per minute. It can be accelerated to 1,500 revolutions per minute without causing undue vibration, owing to the manner in which the balancing of the reciprocating parts has been carried out. A governor acting on the throttle is fitted, a hand-accelerator being also provided. The cylinders are cast in pairs, the dome tops of

FIG. 4.—THE CHANGE-SPEED GEAR.

instantly detached by the removal of the two water connections and the two holding bolts. A fan, driven by the motor, is provided behind the radiator; its use renders the cooling more efficient, as it induces a strong current of air even when the car is stationary whilst the motor is working. The pump for circulating the cooling water is gear-driven. The water tank forms the front apron of the car, and, being immediately adjoining the radiator, only short lengths of piping are required.

The clutch (Fig. 3) which connects the engine with the gear box is of aluminium covered with leather; it is self-contained in the fly wheel, and by a special device the whole of the end thrust is

D

claimed to be removed. Between the clutch and the gear box a universal joint is provided, which affords special facilities for alignment. The speed-change gear (Fig. 4) gives four speeds forward and one reverse, all operated by one lever, the drive being direct on the highest speed. The gear is on the well-known lines of sliding pinions, the teeth being rounded for engagement and case-hardened. The frame to which the gear box is attached is of a special design, permitting the universal joints between the engine and the axle gear box to be detached with the least possible trouble, after which it is only necessary to remove four nuts to lower the whole of the speed gear to the ground. From the gear box to the rear live axle (Fig. 5) the power is transmitted by a universally-jointed

FIG. 5.—THE REAR AXLE.

shaft and bevel gear. The universal joints are of special design, in which cross pins or similar devices have been dispensed with. Each end of the longitudinal shaft is fitted with a dust-proof and grease-retaining universal joint. A further improvement is a patented "spring and pin" drive, which it is claimed absorbs all shocks to the transmission teeth and threads; the spring does not take the whole of the drive but simply the first shock, after which it is thrown out of action. The hubs of the road wheels are not keyed on to the rear axle but fixed by large squares and held in position by castle nuts. The axle is fitted with a torque box on either side, which prevents excessive strain being thrown on the springs and on the universal joints when the clutch is suddenly

FIG. 6.—THE PEDAL-OPERATED BAND BRAKE.

thrown in for starting the car. In addition to this, the design of the frame controls the moving of the axle by means of the rods. The torque boxes are fitted with large rubber pads, admitting of the employment of exceptionally light springs without fear of the mechanism bumping against the upper portion of the car when being driven over rough roads.

The steering (Fig. 7) is of the worm and segment type, enclosed in a tight box and affixed to the frame by a patented method, whereby not only the inclination of the steering column can be adjusted but the steering wheel itself can be raised or lowered like the handle bar of a bicycle. Two road-wheel brakes operated by a hand lever and one foot brake (Fig. 6) are provided, all being double-acting. There are three pedals, one to operate

the clutch, one for the brake on the longitudinal shaft, and one for accelerating the speed of the engine. The latter works in conjunction with a hand sector whereby any engine speed can be obtained. The road wheels are of the artillery pattern, all being 32 in. in diameter by 3½ in., and shod with pneumatic tyres. The petrol tank has a capacity sufficient for a run of 150 miles, the average consumption of the motor being one gallon per 25 miles, on ordinary roads. A special feature is made of accessibility, the body being divided about 12 in. behind the dashboard, and as this is hinged at the rear portion of the frame, it can be easily swung for the purpose of gaining access to the whole mechanism of the car. The following are the principal dimensions of the vehicle:—Extreme

FIG. 7.—SECTION OF ADJUSTABLE STEERING PILLAR.

length, 12 ft.; width, 4 ft. 9 in.; height without hood, 4 ft. 6 in.; wheel-base, 8 ft. 6 in.; track, 4 ft. 3 in.; height of frame from ground, 2 ft.; clearance of lowest portion of mechanism from ground, 9 in. The total weight, with the standard *tonneau* body to carry four passengers, is about 16 cwt. The motor develops 16-b.h.p., which gives one brake horse power per cwt., and as the car is not excessively geared, excellent hill-climbing capabilities are ensured.

WHILE Thomas Adams, of Hamilton, was driving a motor-car on the Tollcross Road, Glasgow, he accidentally drove into the foremost of four carts loaded with sand. One of the shafts of the cart struck him on the chest, and the force of the impact was so severe that he was killed almost instantaneously.

SOME USEFUL NOTES.

WE shall be glad to receive contributions for this column from motorists of experience. Suggestions and hints, briefly expressed, may prove valuable not only to novices, but also to many who have passed the early stages of practical automobilism.

THE brakes of a motor-car may in various respects be compared to the safety valve of a steam boiler. Both are safety appliances, and must, to be reliable, be adjusted perfectly and kept in perfect repair. In stationary steam plants the safety valve is periodically lifted off its seat by the engineer or fireman to insure its not sticking to the seat by rusting, and thus giving a false sense of security. Similarly the brakes of automobiles, especially those running in hilly districts, should be examined periodically by their owners.

Now that the bad season has set in, motorists have to resign themselves to stabling their car for a longer or shorter period, and should follow the advice given by Messrs. Michelin as to the care to be given to pneumatic tyres during the winter. As a rule, towards the end of the season motorists are less particular about the condition of the tyres on their cars, and less anxious as to sending them to be repaired directly they show any signs of wear. In fact, many delay sending them to the manufacturers until they cannot run any longer. Others take off the tyres, wrap them up carefully, and put them away according to all the rules for good preservation laid down by makers. And when the fine weather returns and they wish to "motor" again, they are surprised to find that the tyres cannot be used till they have undergone some repairs; and consequently they have either to wait till these repairs are executed or buy new tyres. It is much more simple, in order to prevent this contingency, to send all faulty tyres to the repairers at once. The repairs will be done much quicker now than in the spring, when motor tyre repairers will be overwhelmed with orders, and besides, the tyres will be preserved just as well during the bad season after they have been repaired.

ALWAYS look at both sides of a punctured inner tube, to ascertain whether the puncturing object has penetrated the under as well as the upper portion of the tube, and thus perhaps save yourself a second dismantling of the tyre.

THE admission and exhaust valve should work freely, and need very little attention. Through too free oiling or too rich a mixture they may become clogged with soot, when the valve should be removed and washed in paraffin or petrol. The spring should be freed, and the valve turned several times on its seat by means of a screwdriver, adding a drop of paraffin. Should the seating of the valve show a bright ring all round its circumference, the valve and seat may be replaced, but if this bright ring does not show, the valve must be ground in with the finest emery flour and oil, and the whole carefully wiped clean and replaced.

WHEN a punctured inner tube is removed for repair, pass the hand round inside the cover in order to feel whether the puncturing object remains imbedded in it. If it can be found, it serves at once as a guide to the position of the hole in the inner tube, and by removing it you escape the risk of the same object inflicting a second puncture at or near the former place.

IN California, which is at the present time "a land of sunshine and flowers," more than 600 motor-cars are at present in use, two-thirds of which are in San Francisco. In the annual floral fete, the Tournament of Roses, held at Pasadena, on New Year's day, decorated automobiles played a prominent part.

FOOTWARMERS FOR WINTER USE.

WHILE a spin on one's car during the winter is most exhilarating, there are many motorists who suffer from cold feet. To overcome this difficulty, M. J. Ramel, of Fismes (Marne), has, states *La Locomotion*, fitted to his car the arrangement shown in the accompanying drawing. As will be seen, it consists of an extension of the water-circulation pipes, the water heated by the motor being made to circulate under the floor of the car. Small grids are provided at the places where the passengers' feet rest, and to increase the heat radiation, the portions of the pipes under the grids are provided with radiating fins. Suitable valves are fitted, so that the water circulation under the body portion of the car may be opened or shut off as desired.

Since the above was written, we learn that a similar arrangement has been fitted to a number of cars in this country by Messrs. Hewetsons, Limited, the agents for the Benz cars. A tap is inserted in the water pipe leading from the engine to the tank; a branch is taken from this pipe on one side of the tap, and is led to a grid, made of copper tubing, placed on the footboard of the car, thence returning to the other side of the tap above referred to. By shutting off this tap the water is made to travel through the copper pipe forming the grid, the heat given off from this keeping the feet of the passengers warm. If it is required to

M, motor. R., water tank. P, pump. R, Radiator. r1, and r2, taps.

throw the footwarmer out of action it is only necessary to turn the tap, when the water will return direct without passing round the grid. Messrs. Hewetson inform us that they have found from experience that the best position of this grid is a few inches from the floor of the car, so that the feet can be placed, not on it, but beneath it, the feet being kept warm from above and not through the soles of the boot, as is generally the case. The arrangement, in conjunction with a rug or apron, will keep the occupants on the front seat of the car perfectly warm, even during severe weather. Of course, a similar grid can be provided in the tonneau at the back of the car. The arrangement can be fitted at a very small cost, and has also the advantage of helping to keep the water cool, acting as a radiator as well as a footwarmer. The device has been fitted on several cars by Messrs. Hewetson, and has been much appreciated.

THE MOTOR TRUST, LIMITED, is being wound up voluntarily, with Mr. W. H. Alexander, of Liverpool, as liquidator.

MESSRS. F. A. HENDY AND CO., LIMITED, of Southampton, are now getting supplies of petroleum spirit down from London by means of a traction engine.

THE motor-car movement is making slow but steady progress in Portugal, returns just issued showing that sixty-nine cars were imported into the country during the last six months of 1902.

THE ROCHET LIGHT CAR.

FOR the 1903 season the Rochet Company, of Paris, are introducing a new light car, of which we are able to publish a general view (Fig. 2) this week. The frame is constructed of U steel; it carries in the fore part a single-cylinder Aster motor developing 6-h.p., the diameter of the cylinder being 88 mm., and the stroke 100 mm. The usual form of electrical ignition is adopted, while the mixture is furnished by a spray carburettor of the company's own design. The water circulation for the cooling of the motor is on the thermo-siphon system. The engine is provided with a governor acting on the admission; an "accelerator" is also fitted, by means of which the speed of the motor can be regulated as desired.

Coming now to the transmission, three speeds forward and a reverse are provided, these being all actuated by a single lever. The engine is connected to the gear-box through a cone clutch, the power then being conveyed to the rear live axle by a universally-jointed shaft and bevel gear. A section of the change-speed gear is given in Fig. 1, from an observation of which it will be seen that on the top speed the power is transmitted direct, none of the gear wheels being in action. E is the male portion of the clutch connected with the motor fly-wheel; it is mounted on the end of the shaft F, which also carries a sliding train of pinions. On the side shaft G is a second sliding train, the object of which is to unmesh all the pinions on F when driving on the top speed. The fork which controls the sliding train, AB, is rigidly connected to the lever H; on the latter is loosely mounted

FIG. 1.—THE ROCHET CHANGE-SPEED GEAR.

a fork, which controls the train B', DR; it is, however, kept in contact with the fork J by a spring, which tends to force B' DR' to the left. The gear train B' DR is limited in its movement to the left, first by the piece I, the position of which is determined by that of the train AB, and secondly by the end of the square portion of the shaft G. When in the latter position the pinion DR is in mesh with that marked DR', which is mounted on a sleeve on the shaft. To give the first speed, pinion A is connected with A' and DR' with DR; for the second speed, B meshes with B', DR' still being connected with DR. The third, direct, speed, is obtained as shown in Fig. 1, the sliding train on the shaft F being moved to the right until the jaw clutch K is brought into contact; the train B' DR' is simultaneously moved to the right, and all the pinions disconnected, so that the shaft G no longer rotates. To obtain the reverse motion, the upper sliding train is moved to the extreme left until the pinion A meshes with that marked A'; at the same time the side of pinion B is brought into contact with the small gear wheel C', and pushes it to the left until it meshes with A'; the power is then transmitted in a reverse direction through pinions A, A' and C', A', DR' and DR.

Inclined wheel-steering, hand and foot double-acting brakes, and other features of the little car, which is mounted on cycle-type wheels shod with 700 mm. by 85 mm. pneumatic tyres. It weighs about 9 cwt., and can attain a speed on good roads of 25 miles per hour. We may add that the agents for the Rochet cars in this country are the British and Foreign Motor-Car Company, Limited, of Liverpool.

CONTINENTAL NOTES.

By "AUTOMAN."

ON January 1st, 1902, the 1,000-kilogramme limit of weight for heavy racing cars came into operation on the mandate of the Racing Committee, backed up by the full Committee of the A.C.F., and in one short year the automobile industry has been transformed as if by magic. The creation of monsters has practically ceased, and the efforts of experts have been directed into strictly utilitarian lines. The problem has been to find the minimum weight with the maximum horse-power. I leave out of the question the factor of safety, because common-sense dictates that in order to race for hundreds of miles and arrive at the winning-post, safety—that is to say, strength—is of the first necessity. It is quite safe to estimate that without this racing rule it would, in the ordinary course of events, have required ten years to bring about this transformation, and during this time many makers going on wrong lines would have had to face severe losses; whereas to-day the lines are clear and well defined, and those who follow them closely can be sure of success. The days of phenomena are past, the type which has survived all tests is established, and improvements on this type are being narrowed down to matters of detail.

In order to continue the good work which it has begun so well there is another step to be taken by the A.C.F., and that is to fix the dimensions of the motors to be used in the great races. The idea has already been advanced by the "Auto-Velo," whose quarter of a litre contest I explained last week, and now it has been officially brought before the Chambre Syndicale de l'Automobile, and may become a part of the "Circuit" which they are organising for the summer season. No new rule could be more beneficial to the trade, for it will enable one to judge with precision the relative merits of the methods applied by different makers. For instance, in order to have a certain volume in the cylinder, the stroke and bore may be varied almost indefinitely. Some makers claim that equality in bore and stroke gives the best result; some, on the other hand, prefer a long stroke and a small bore, whilst others again adopt a wide bore and a small stroke. It is almost impossible to tell which of the three systems is the best, for in almost every case the volume varies. If, however, in a big race the volume is fixed beforehand, one will be able to judge fairly accurately and choose the best arrangement.

THE Chambre Syndicale de l'Automobile has decided to organise a "Circuit," which is to be run on the lines of the "Circuit des Ardennes," which, it will be remembered, was run late last summer, and won by Mr. Charles Jarrott. The French race is also to be run in the "French Ardennes," which must not be confounded with the Belgian Ardennes. The course will be 400 kilometres long, or practically 250 miles, and the event will take place during the early part of July, without any controls or "neutralisations," on the roads situated between Chalons, Sainte-Menehould, and Vouziers. The idea is to limit the classifications by the volume of the motors, and to use the following rule: 1½ litre for each cylinder of the two-cylinder cars, and 3 litres per cylinder for the four-cylinder cars. The Belgian Circuit des Ardennes will be held in June or July, and there are already thirty-six entries, including Baron Piere de Crawhez (Panhard), Baron Piere de Caters (Mors), Mr. C. Jarrott (Napier), Bertrand (Panhard), Charron, Girardot and Voigt, Count Zborowski (Mercedes), Mr. Mark Mayhew (Napier), and Mr. S. F. Edge (Napier).

THE Criterium of Consumption, organised by the "Auto-Velo," takes place on February 19th, unless its date interferes with the Pau races, in which case it will be held a few days earlier. The course begins and ends at Suresnes, passing through Versailles and Longjumeau to Essoues-Corbeil, and back to Suresnes. There will be four classifications, namely, voiturettes under 400 kilos., light cars under 650 kilos., cars under 1,000 kilos.,

and cars over 1,000 kilos. Alcohol and petrol are to be pitted against each other in this competition from the point of view of monetary economy, so as to publicly test which of the two fuels is the cheapest to employ. Messrs. Thornycroft have written to the "Auto-Velo" asking if they can enter their steam lorries, and their entry has been accepted, with a promise to calculate their consumption of fuel. They cannot, of course, compete against petrol cars, as the comparison would not be possible. There are already eighteen entries. It will be remembered that last year in this competition the car of Messrs. Chenard and Walcker came out so far ahead of all the others that it was thought there was a mistake, and a further competition of the winners was held, in which Chenard and Walcker were again victorious.

M. TAMPIER, the popular timekeeper of the A.C.F., has been requested officially to examine the roads from Paris to the Spanish frontier *via* Bordeaux, in order to definitely fix the route to be followed by the competitors in the Paris-Madrid race; part of his official duties consists in finding a suitable length of road for the Gordon Bennett Cup race. It seems from this, that the A.C.F. has made up its mind that the race will be run in France

received from a date to be fixed to a later one, and when the entries have closed, lots will be drawn for the order of starting, everyone having an equally good chance of the first place, if that is of any advantage.

M. DEGRAIS, who drove one of the Pascal cars in the Reliability Trials last autumn, is a candidate for membership of the German Automobile Club, a preliminary, it is stated, to his driving one of the Mercedes cars in the 1903 Gordon Bennett race.

THE Phoenix Accumulator shown at the recent Salon, employed in most of the electrical carriages, is not altogether new. I remember it being introduced some four years ago by the inventor, M. Phillipart. It was then in a very crude condition, but has since passed successfully through the various stages of experimental work. The system employed in the Phoenix is quite different from that usually adopted; instead of using plates, tube-shaped poles are employed. The positive is, of course, lead, but it is contained in an earthen jar, made of a particular clay which does not offer any electrical resistance. The negative pole is built up round a skeleton of lead, and the material of which it is com-

FIG. 2.—GENERAL VIEW OF ROCHET 6-H.P. LIGHT CAR. (See page 880.)

instead of in Ireland, and will oppose as much as is in its power any proposals which are laid before it by the A.C.G.B.I. The fact that the surface of the road chosen in Ireland by the latter is admittedly bad makes it all the more easy to raise objections. That it is a short-sighted policy of the A.C.F. there can be little doubt, for the race would be magnified considerably in importance if it were run on British soil. Furthermore, a victory obtained there for a Continental car would be of far greater service for advertising purposes than a victory in France. A road race in England would be productive of enormous orders, both for home-made and imported cars. The race in France will be overshadowed by the Paris-Madrid event, and will count for very little in comparison with what it would if run elsewhere and separately.

THE entry list for the Paris-Madrid race is not yet opened, but it is to the A.C.F. that they should be addressed. There is no hurry to send them, for the best places will this year not be secured by those who apply first, as has been the case hitherto. This was obviously unfair, for it gave an advantage to members of the Sports Committee, who had the information before the public, and who, in some cases, are competitors. In future entries will be

posed is held together by a multitude of little rings of vulcanite or fibre finished off by a screwed washer at the top, which keeps them all in place. The poles thus constructed may be combined into a battery of any shape required, either square, oblong, round, or in a thin long line. The cells themselves are most efficient in proportion to their weight, and stand the jolting without any inconvenience.

As already announced, the Bavarian Automobile Club is organising an Endurance Tour of Germany for the coming summer. The start will take place at Leipzig, the programme being as follows:—First day, Leipzig-Halle-Berlin; second day, Berlin-Hanover; third day, Hanover-Cologne; fourth day, Cologne-Frankfort-on-Main; fifth day, Frankfort-on-Main-Stuttgart; and sixth day, Stuttgart-Munich.

THE Holland Park Motor Company, of Princes Road, Holland Park, W., have recently extended their premises, having taken over the building until recently occupied by Messrs. Friswell. They are being equipped to carry out repairs to all types of cars.

MOTOR-CYCLING NEWS.

SIR MARTIN CONWAY believes "the motor-bicycle is the machine of the future." So he told the members of the Metropolitan District Association of the Cyclists' Touring Club on Monday. The first thing on which he desired knowledge was how he was to fall off, as he fell off every machine on wheels some time or other; next, how long it would take a man to understand the parts that were in a motor cycle; then how the thing vibrated, and, finally, which of them did not break down. He was told that the pleasure with a motor-cycle was considerable when it went, and the annoyance even more considerable when it did not. Motoring, he believed, would be the locomotion of the future, and we should reserve railway trains for the carriage of coals, invalids, and other impediments.

THE Automobile Club has appointed Mr. F. Straight as assistant secretary, his special work being to watch the interests of the motor-cycling section.

At a meeting of the Cycle Engineers' Institute held at Coventry on Friday last week, Mr. B. A. Hunt read a paper on "Important Features in the Scientific Designing of Motor-Cycles." The author said that during the last three seasons the motor-bicycle had been in a state of rapid evolution towards the perfection stage. From the comparatively crude mechanical novelty of 1898 and 1899 the motor-bicycle had developed into a machine which closely approached its humbler pedal-driven brother in point of reliability. In the matter of efficiency, too, considerable advances had certainly been made, but much still remained to be done. He thought, indeed, the time was ripe for the trade to make a closer investigation into the phenomena and behaviour of these machines on a scientific basis with a view to increasing their efficiency. Mr. Hunt proceeded to deal with the various features of the motor-bicycle. As regards ignition, he was inclined to favour a very light and compact rotary armature high-tension system, which would operate the standard type of plug. Frame design and motor position were in turn dealt with, and as to carburation, Mr. Hunt considered that the spray carburetor was superior to the sur-

THE FIRST MOTOR-BICYCLIST TO CLIMB THE STELVIO, IN THE AUSTRIAN ALPS.

MAURICE FOURNIER set up a fresh track record of 1min. 38.15secs. for a mile from a flying start on a $4\frac{1}{2}$ -h.p. motor-bicycle on Saturday last at the Alexandra Palace.

OUR Austrian contemporary, "Allgemeine Automobil Zeitung," devotes considerable space in a recent issue to an account of a 1,000 kilometre (625 miles) tour recently made on a Laurin-Klement motor-bicycle. The machine, which in this country is known as the "Hewetson," was only of $1\frac{1}{2}$ -h.p. The rider, who hides his identity under the name "Filius," left Vienna early in September, and, making his way through Carinthia and the Tyrol, succeeded in climbing the famous Stelvio, which is up among the snow nearly 10,000 feet above sea level. Notwithstanding the hilly route, he averaged 200 kilometres (125 miles) a day comfortably.

face type. An interesting discussion followed the reading of the paper.

ON Tuesday a meeting of those interested in the manufacture and sale of motor-cycles was held at the Automobile Club to consider the question of holding a motor-bicycle Trial during the present year. Considerable discussion took place as to the time when the event should take place, and ultimately it was agreed that it should be held immediately after August Bank Holiday. The Trial will include minimum daily runs of 100 miles aggregating not less than 1,000 miles, and is to be completed within a fortnight. Each maker will be allowed to enter three motor-bicycles, provided he does not duplicate any one machine. In order to exclude the entry of "freaks," Professor Vernon Boys and Mr. M. O'Gorman are to be invited to draw up a classification by which the most powerful machine entered will

not be more than a standard size. Representatives of firms willing to serve on the committee are to send their names to Mr. F. Straight, and from these the Executive Committee of the Automobile Club will select ten to act on a Joint Committee to arrange details.

THIS week we give an illustration of the Lamaudiere motor-bicycle, made by Messrs. Lamaudiere and Company, of Levallois-Perret, near Paris, which is being introduced into this country by Messrs. Cheswright and Company. A special feature about it is the motor, which develops $2\frac{1}{2}$ -h.p. at a speed of 1,400 revolutions per minute. It is constructed principally of steel, and is built up as part of the frame, taking the place of the seat tube. A small crank case and large outside fly-wheel are adopted. A spray

carburettor of novel form is used to furnish the mixture, using either petrol or alcohol as fuel; the spirit is delivered on gauze wire, an adjustable drum above the gauze wire operated by a lever on the top bar regulating the air supply. An exhaust valve lift is fitted, and the switch is within the left handle. The ignition is the high-tension system, the accumulator being carried in a compartment of the petrol tank, the latter having a capacity sufficient for about ninety miles. The power is transmitted by a chrome leather belt to a pulley which, unlike the usual method, is riveted direct to the rim of the rear wheel. The underside of the belt passes over a jockey pulley, which can be adjusted from the top bar by a lever with a ratchet stop action. Not only can any stretch of the belt be taken up by this device, but the speed of the machine can also, by its means, be regulated. A fibre shoe brake is fitted in such a way as to act on the inside of the large belt pulley, and a rim brake works on the front wheel. The front forks are strengthened by an additional pair of tubes. The machine has 26-inch road wheels and a long wheel base; its weight complete is 95 lbs., the makers considering it unsafe to build a $2\frac{1}{2}$ -h.p. bicycle that turns the scale at less than this. The Lamaudiere machine has figured prominently at the various competitions in France, and is likely to become popular in this country.

THE "hanging on" of ordinary cyclists shows signs of becoming one of the biggest bugbears of motor-cyclists. If, sooner or later, it does not result in the death or serious injury of one or more of the riders of ordinary cycles, who persist in this undesirable practice, it will be due as much to the watchful care of Providence as to any other agency. The "disease" breaks out whenever and wherever a motor-cyclist appears within reach of a party of cyclists. They rush for the rear wheel of the motor-bicycle and "hang on" as if glued there. On any of the popular routes a motor-cyclist cannot ride a mile without having one or more cyclists behind. The most amusing part of such performances is that the matter of speed is not of consequence to the "hangers on." It appears to be merely the fascination of "riding behind a motor" that is responsible for the "disease"; whether the motor is going eight or eighteen miles an hour appears a minor consideration. The danger of the practice lies in the quickness with which the motor cyclist can cut off power and slacken speed. Unless he is watchful he can, with his machine, upset the "hangers on" without trouble or danger to himself. Only those who have been through it time after time can appreciate how aggravating is

the nuisance to the unwilling pacemaker. Aside from the mental exasperation, the practice has another disagreeable side. The police invariably prick up their ears when a "motor" comes within their hearing, and the sight of one with a crowd hanging on its rear wheel excites suspicion and invites trouble.

WITH the view to the formation of an Ulster branch of the Irish Motor-Cycle Union, a meeting has been held in the Hotel Metropole, Belfast. Lieutenant Young was moved to the chair, and Mr. J. C. Percy stated the objects of the Union. He said they were primarily to ensure a fair and equitable administration of justice as regards the rights of motor cyclists as such; to establish, revise, or alter the rules regulating the sport and pastime of motor-cycling; to control and arrange for race meetings, matches, competitions, or time-trials for motor-cyclists; to endeavour by such means as may seem advisable to bring about the more efficient maintenance of Irish roads; and to protect the interests of motor-cyclists and motor-cycling generally. On the motion of Mr. Thomas Mallon, seconded by Mr. W. Good, it was decided to form an Ulster centre (with headquarters at Belfast) of the Motor-Cycling Union of Ireland, and the following provisional Committee, with Mr. R. G. Wilkinson as secretary, was appointed: Lieutenant Young, Messrs. Wm. Nixon, T. Mallon, T. Sloan, T. Ireland, J. Fetherston, J. Wilson, J. Woodside, P. Brady, James Wilson, S. B. Thompson, J. Stewart, M. Marshall, W. Good, W. B. M'Kee, W. J. Anderson, W. J. Forsythe, J. Denby, and R. Ireland.

A MOTOR-TRICYCLE is being advertised for sale in a condition that is "not worse than new"—a form of expression that points to the unhappiness of the present owner. Apparently many motor cyclists who are "advancing" to light cars are trying to dispose of their machines this month, as a speedy sale will save the cost of the new licence.

THE accompanying illustration depicts Master Carter, who is probably the youngest motor-cyclist in the country, at the side of his Brown motor-bicycle. He is the son of Mr. C. E. Carter, of the Dispatch Cycle Works, Grays, Essex, and is only ten years of age; his machine has an 18-inch frame, and 24-inch wheels.

His sister, who is thirteen years of age, is also an adept rider of a motor-bicycle. She has been riding six months, and has, so far, never had to pedal her machine home, being able to locate the cause of motor stoppages almost as well as the oldest hand.

THE Horsham magistrates in the furious driving cases reported in our last issue were good enough to observe that they modified the penalty with regard to motor-cycles, because they did not constitute so great a public danger as the motor-car.

THE JACKSON SPRING WHEEL.

AT the first of his series of lectures on "Locomotion," delivered at the Royal Institution, Professor Hele-Shaw, LL.D., F.R.S., discussed "The Invention of the Wheel." After explaining at some length the theory of the wheel, the Professor passed on to consider the various kinds of tyres in use. He then observed that there are certain cases where pneumatic tyres are almost useless, and certain kinds of roads over which wheels provided with these tyres will not pass without considerable vibration being communicated to the vehicle to which they are fitted. He then showed on the screen photographs of several spring wheels designed, without much success, to meet this difficulty, and exhibited a model of Jackson's spring wheel, illustrated herewith. He had had the opportunity, a few weeks before, of riding in a car fitted with these wheels, round Regent's Park at a pace at least up to the legal rate. Although the wheels were only fitted with solid tyres, he found the ride a most pleasant one.

Referring to the illustrations, Fig. 1 shows an elevation of the wheel with the covering discs removed, and Fig. 2 an eleva-

FIGS. 1 AND 2.

tion of half of wheel with discs in position. In the annular space between the two rings A and B are arranged a number of springs C, to transmit the load from the inner to the outer ring. These springs act through radial buffers D which are constructed to be pressed outwardly against the inner surface of the outer ring B, by the springs C, the latter being compressed between the heads E of the buffers D and the inner ring A. The buffer heads are shaped to the same curvature as the inner cylindrical surface of the outer ring B, so that contact over the largest possible surface is ensured between the heads E and the ring B. To effect the assembling and disassembling of the parts of the wheel, the shanks of the buffers D are arranged to extend through holes

in the inner ring A, and the inner ends F of the shanks are screw threaded. By means of nuts screwed on the projecting ends F against the inner ring A, the buffer heads E can be withdrawn from contact with the outer ring, and the spring arrangement removed. When the parts of the wheel are assembled, the nuts are removed to allow the springs C to act and press the buffer heads E against the outer ring. The hub of the wheel is formed integrally with the disc I, which bears against the side of the inner ring A, and has a shoulder adapted to fit in the ring. At the other side of the wheel is a similar but removable disc, with a shoulder. The hub is secured in the inner ring by bolts M passing through the two discs and the ring A. The space between the discs serves to hold lubricant, and a dust-proof chamber is also formed. To prevent creeping or rotation of the inner ring relatively to the outer ring B, links O are provided, connecting the two rings, the links being so formed and arranged as to allow free action of the springs. The inventor, who is the gauge maker to most of the leading railways in the country, has devised another means for preventing creeping. These consist of a hexagonal boss formed on the inner side of the disc I, and a flange on the ring B cut away in hexagonal form. The hexagonal boss can turn slightly in the flange, but such turning is limited on account of its angles coming in contact with the flange. By the employment of the buffers, controlled by screw nuts, springs compressed to any suitable extent can be employed.

OCCASIONAL NOTES.

"HERE'S a pretty go, here's a how d'you do!" occurred to me as an appropriate ejaculatory comment on the situation, which feeling was in nowise diminished by the departure of the driver and fireman, who stolidly informed me they would be back in an hour. I listened meditatively to the tramp of their feet on the cindered sidewalk as they stalked back towards Liverpool for assistance, each swinging a hurricane lamp whose adaptations seemed universal. The lights disappearing round a bend, I turned again to my charge. "Keep an eye on the water-gauge," had been the driver's parting injunction after he had pumped the boiler nearly full and dampened the fire. Oh, but it was cold as I clambered on to the tool-box—that "box" seat I had pictured so different from reality—and nestled close to the friendly boiler. There was no fear of capsizing now, for the heeling tendency was checked by two small bottle-jacks under the axle caps, their bases resting on wooden blocks. I soliloquised upon the arrival of relief and the reasons for our apparently being unable to jack ourselves out at once. Meantime the wind soughed through the trees, the rain pelted down as it chose, and I, deserted and alone, but for the boiler, which kept my shins hot and my back, *per contra*, cold as ice, faithfully performed the duties of watchman. I argued the problem with myself, by way of mental gymnastics and to encourage circulation, that the stranded wagon was no longer conveying "petroleum in transit," but was now "a place or store" within the meaning of the Petroleum Act. It clearly was a case of storing, without a licence, for even a hawker's cart requires one, so I must needs dissemble should a curious officer venture forth from the cover of his sheltering lintel to challenge me in the name of the law. Unfortunately, nothing so diverting happens. Instead, I discern a faint rumbling, which grows apace, and suddenly the four headlights of the last lorry from Blackburn, tooled by the home-bound Liverpoolian, appear. I shout and wave a lamp. He, stamping vigorously on his gong, pulls up. Then follows a critical pow-wow on our belated condition. These men have been there before, worse luck, they confess. Why not get out your two jacks, I ask, and lift her free? "No use, guv'nor," they reply; "they're too short a lift for a job o' this sort; you must do it from the frame." Otherwise, they explain, in soft places like our present Slough of Despond—a main road, bear in mind—it is only a game of see-saw; one point up, another down. "Good-night, sir," a

they squeeze past No. 11 tremulously, "the tackle won't be long." I take a long pull at my flask, and dry myself in patches externally by surface evaporation. Another half-hour and I shall be tempted to essay a *locus* on the boiler top, or down the firing shoot. I start the Marsh pump, to replenish the boiler, whose Klinger gauge shows one bare inch, and at least find company in the resonant working of the valves, proving their action by the slowly augmented level in the glass. One and a half mortal hours do I wait for the "tackle" to arrive. It comes on a spring cart at three o'clock. Out come the big lifting-jacks and packings, and out come we. All over in fifteen minutes, with the aid of a little verbal encouragement, which I need not repeat. The "tackle" is driven off by hay-motor, back to Rufford, and a delay which might easily have reached a dozen hours is overcome in less than two.

WE are in low gear for the next mile, then change to high and keep there, moving nicely. The road is apparently fit to admit the use of that designation, and allows our making up for evil times. We drop anchor, or rather stop to uncoil the watering hose, at the Bridge Inn, Penwortham, with the lights of Preston dancing on the waters of the Ribble, the whole forming an enticing contrast to the twenty-six miles of road through which we have toiled, at 4.47 a.m. Shall I, or shall I not? The Park Hotel, Preston, is, I know, a comfortable house, and trebly acceptable to a weary traveller with serious qualms as to the form of spinal trouble that is threatening. The temptation is strong as we mount Fishergate, and even a night on the "sleeper" back to town would be as Paradise. But no, where duty calls I must obey.

WE have slackened to three miles an hour on the setts, to reduce the noise and vibration. Peace be to the slumbers of Preston's hundred thousand odd souls. I envy them and realise the curve of one's nervous centres at 5 a.m. With thirty-one miles behind me, why give in?

WE approach Brockholes Brow, the steep descent to the Ribble on the new Preston-Blackburn road. I recollect the grade as 1 in 13, from the profiles of the Liverpool trials routes. The surface is ghastly, yet we do manage to keep moving, being down hill, by giving her full steam. They evidently believe in sand as a binding material hereabouts, without anything to bind unless it be the traffic. The road is nothing short of a crying disgrace, which would not be tolerated in the South. We jog along, notwithstanding, and reach the Five Barred Gate, Samelsbury, at 6.30 a.m., this being about five miles from home and the last watering station. The men here accept their second "refresher" at my hands, and earn my golden opinions by their abstemious conduct.

INCIDENTS cease. We reach Simmons Street, Sudell Cross, a little before eight, fit and well. The depot here is a disused tramway shed, into which the Vauxhall Road establishment could be fitted twice. No. 11 is taken over by the running-shed men, and I take my departure to the Old Bull Hotel, where the landlord, Mr. H. Burton Berry, had been notified of my requirements and prepared right royally. By nine o'clock I am snugly between the sheets, with a roaring fire and curtains drawn, dreaming of mud, of ditches, of hedges, and of having accomplished forty miles in twelve hours.

MY experiences were obtained under winter conditions, with a new system of goods transport and with initial difficulties not entirely overcome. The national importance of our roads, the more extended uses to which they can be put, and the scope of light locomotives on highways are on trial. It is a commercial experiment. I am convinced that the troubles are far less than those fought against by the pioneers of railways, that they will be overcome with equal success, and that the railway locomotive, the electric tram, and the traction engine will ever leave a wide field for the application of the self-propelled goods lorry on common roads. It may be a question of two, three, or more years, before success is assured and complete, but come it will and must. An increase of the tare weight is the first essential.

P. A. M.

THE WESTON SUPERHEATER.

THE Weston Motor Syndicate send us the following particulars of the new superheater they are fitting to the 1903 models of the Weston steam-cars. After having experimented with super-heaters for several months, they have adopted a device specially made for them by the Albany Manufacturing Company, Limited. Departing from the practice usually adopted, the superheater is fitted between the throttle and the boiler, and not between the throttle and the engine. The coil is therefore always full of steam and does not become too severely heated; the wear and tear being thus considerably minimised. At the same time wet steam is prevented from issuing into an intensely hot coil, and subsequently flashing and causing an undue amount of strain on the engine when starting until the coil has regained a more or less normal temperature through the continual flow of steam. Being placed behind the throttle, the action of the latter is the same as hitherto, the steam being cut off just as sharply. Fig. 1 shows the shape of the coil; the size of the barrel is only $\frac{1}{4}$ inch, and consequently very little heating surface is taken away from the boiler plate. The reason the superheater is built in

FIG. 1.

the form of a circular serpentine coil is that it has been found to be the only one which resists the water priming, and prevent it "bulleting" through in the event of priming. Although steam can easily flow round the reverse bends, the tube offers such a resistance to water, passing on account of the direction of travel being reversed at every turn, that sufficient overplus of steam is generated in the bend to overcome the resistance of boiler pressure, and returns the same back into the boiler, only using that portion which has been transformed into steam. The Weston Syndicate claim that by the use of the device the steaming qualities of the car are increased to a considerable extent. Owing to any tendency of the boiler to prime being practically overcome, the hill-climbing capabilities of the vehicle are also greatly improved, while the fuel consumption is said to be reduced by about twenty per cent.

ONE of the exhibitors at the Agricultural Hall Show is expending over six hundred pounds on his stand.

MESSRS. DELAHAYE, of Paris, have just shipped two cars to Guadeloupe for public service work.

A ST. AUSTELL motorist has been fined 10s. and costs for not having two red lights visible from the rear of the car.

MOTORING has been one of the daily diversions of the distinguished house party at Chatsworth.

THE start of the Paris-Madrid race has been definitely fixed for the 24th May.

ON the 28th inst. the Auction Company will hold a sale of motor-cars at Willoughby Hall, Norwood Road, West Norwood, S.E.

WE hear that the Hon. C. S. Rolls will drive a Mors racing car in the forthcoming Paris-Madrid race.

AT a recent meeting of the Automobile Club of America the evening was devoted to an informal discussion on the subject of "The Personal Equation in Automobiling."

AT a meeting of the Western section of the Scottish Automobile Club, to be held in Glasgow on Monday evening next, Mr. Wm. H. Kingsbury will introduce a discussion on "Tyres."

ONE of the most interesting stands in the basement at the recent Salon in Paris was that of Messrs. De Dion, Bouton and Co., where the manufacture of the De Dion sparking plugs was shown in operation. It is now fairly generally known that the firm have introduced a new plug to take the place of the one familiar to all motorists. The new plug, of which we give a sectional view

herewith, is smaller than the old one and has a coned porcelain to prevent sooting. Indeed, it is claimed that with the new plug short-circuiting is impossible. Another important alteration is that the centre terminal is placed in the porcelain before the latter is baked, so that the chance of the rod becoming loose is exceedingly remote.

ROWLEY'S BOTHWAYS GEAR SYNDICATE, LIMITED, has been registered, one of its objects being to carry on the business of motor-car manufacturers, &c.

THE Manchester Wheelers' Club—the leading cycling club of the district—has decided on the formation of a motor section. There is already a substantial nucleus, with four owners of cars, three riders of motor-tricycles, and more than a score of motor-bicyclists.

THE ELECTRIC IGNITION COMPANY, of Unity Works, Birmingham, have sent us samples of new high and low tension ignition cables. They are of high-grade quality, and particular attention has been paid to the insulation, to ensure which the wire is surrounded by three layers of rubber.

SIR HIRAM MAXIM is leaving England for America, where he expects to remain about two years, to carry out an important series of experiments, with a view to building a flying machine. He thinks there are about 100 different people experimenting at the present time. The greater number of these, however, are experimenting with balloons, which, in the varying nature of things, he believes cannot succeed.

A CONFERENCE between the Cork and Belfast branches of the Irish Road Improvement Association has taken place. Amongst the matters discussed was the distribution of the new pamphlet, "Good Roads: How to make and maintain them," which has recently been reviewed in our columns. It was decided to send a copy to every County Councillor and District Councillor in Ireland, the Cork Branch undertaking to do the distribution in Munster. It was also agreed to approach the Irish Automobile Club and the Motor-Cycle Union of Ireland with a view to inducing both of those bodies to support the association by an annual subscription.

AN important change has been made in the administration of Irish county affairs by the decision of the Local Government Board with regard to the maintenance and up-keep of public roads and thoroughfares. Hitherto the work has been done under contract, but, at the request of the Irish Local Government Board, the Limerick County Council has formulated a scheme for having the work in question done by direct labour, under the supervision of the county surveyor. Whether this will lead to an improvement in the state of the roads in county Limerick remains to be seen.

It is probable that a permanent committee will shortly be formed in London to consider the reports of local surveyors and engineers with regard to the life and wear of the different kinds of paving, and to make experiments.

WE regret to hear of the death of Mr. E. S. Cheel, which took place last week from phthisis. He was on his way to the Cape, and Mrs. Cheel asks us, on her behalf, to thank those members of the trade and of the Automobile Club for the introductions they had given him to friends in South Africa.

NOW that the Panhard Company are introducing a three-cylinder motor a good deal of discussion has arisen as to who was the first to make the innovation. A claim has just been put in for M. Berret, of the Société Cannoise d'Automobiles, of Cannes, France, who is stated to have a car with a three-cylinder motor which has been in use for five years.

As the question of the prevention of skidding is at present attracting much attention, we may mention that a device has been invented in Ireland for which exceptional features are claimed. We are not at liberty to go into the details, but we are told that the principal features of the invention are:—1. It is not attached or connected with the tyre; 2. It has no effect on the resiliency or elasticity of the tyres, and only comes into operation when the car skids, it being automatic in its action; and, 3. It can be attached and detached in a few moments and placed in the car without any inconvenience. We have not as yet had an opportunity of testing the device, but we understand that experiments with it have proved very successful.

ALL over the country small cycle makers are turning their attention to motor-cars, and many are now engaged in building, in small numbers, little cars intended to meet the demands of those requiring a reliable two-seated vehicle at the popular price of about £125. Our illustration shows a voiturette which comes within this category, which is now being turned out by Mr. E. T. Holbrow, of the Cycle and Motor Works, Earlsfield, S.W. The frame is of channel steel, and carries in the front, under a bonnet, a vertical single-cylinder engine developing 4½-h.p. at the slow speed of 750 revolutions per minute.

The usual electrical ignition and float-feed carburettor are fitted, while the water circulation is maintained by pump and radiator. With regard to the transmission, two forward speeds—18 and 8 miles per hour—are provided, as also a reverse motion, these being controlled by a single lever on the inclined steering column. From the engine a single belt, working on fast and loose pulleys, conveys the power to a countershaft at the rear of the back axle, the countershaft driving the latter by means of spur wheels. Cycle-type road wheels of equal size, shod with pneumatic tyres, are fitted, while ample brake power is provided.

NOT often do we hear of motorists forsaking the automobile. Sir John Campbell, who has had a car for at least eighteen months, is, however, giving up motoring.

MISS MANGLES, of Littleworth, Seale, has been fined 1s. and costs at Farnham for allowing steam to be emitted from her motor-car on the highway.

THE London Motor Garage Co., Ltd., are establishing a large new garage at 33, 35 and 37, Wardour Street, W., which will be opened in the early spring.

THE LANCHESTER ENGINE COMPANY, LIMITED, will shortly place a more powerful air-cooled motor than they have hitherto employed on the market.

THE Imperial Cycle Company, Limited, has been registered to carry on the business of motor-car and motor-cycle manufacturers, etc., at the Imperial Works, Hack Street, Birmingham.

THE PENGE MOTOR WORKS, 12B, Southey Street, Penge, S.E., of which Mr. C. J. Paffard is proprietor, have issued a new tariff for the storage, repair, and electric charging of cars. The office of the firm is at 112, Oakfield Road, Anerley, S.E.

THE thirtieth annual issue of "Willing's Press Guide" has just been published by Messrs. Jas. Willing, jun., Limited. Its characteristic is accuracy, and its presence is indispensable to all having frequent communications with the newspaper world.

SIR DAVID SALOMONS, Bart., has had an accident, due to the back firing of one of his motors. In warning others of this danger, he points out "that an apparatus is now made in Paris to obviate accidents should a back fire take place." This was described in the *Journal* on the 27th ult.

AMONG the revised decisions under the Customs Tariff of New Zealand we notice that oil-engines for motor-cars imported separately are admitted free of duty, but oil-engines forming part of motor-cars are classified as carriages, and are subject to a duty of 20 per cent. *ad valorem*.

SPEAKING about his new storage battery for electric motor-cars, Edison is reported to have recently remarked: "I don't intend to let a battery be put on the market for at least three months, or until I have made a 5,000 mile endurance test, and have discovered all the weak points and rectified them."

"ALTHOUGH automobilism is in a very backward state in Cuba, there is an opportunity to do considerable business there." Such is the report of Mr. G. M. Dickson, of the National Vehicle Co., Indianapolis, Ind., who has just returned from a trip to the island. Local conditions, customs duties and lack of charging facilities prevent the extensive use of electrical vehicles in Havana. The entire city possesses but twelve or thirteen motor-cars, several of them being old patterns and out of commission.

A SURPLUS of snow on the streets, combined with a shortage of coal and coal carts, were the conditions that recently made the Hudson Coal Company, of Jersey City, U.S.A., a convert to the motor-wagon. An electrical truck, which was built to carry only three tons, was hired, and loaded with five tons of coal for New York. The vehicle carried its excess load safely, and before the day was over had made three trips between the two cities and delivered fifteen tons of coal. The next day the coal company placed an order for three similar trucks.

At his tailoring establishment in Piccadilly, Mr. Lovegrove has a good show of accessories for motorists, including goggles, ladies' masks, gauntlets, horns, etc. An all-weather motor cap for gentlemen and serviceable hats for ladies are there to be seen, as well as hoods for covering the backs of ladies' heads. These fasten to the ordinary hat, and, to quote a commonplace saying, "supply a long-felt want." On some of the coats made by Mr. Lovegrove we have noticed a special metal button with the imprint of an automobile—a neat and effective symbol of the car. A large leather sheet for throwing on the ground, when the car has to be examined from below on a muddy road, is also among the miscellaneous articles stocked at this establishment.

CORRESPONDENCE.

THE NUMBERING PROPOSALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although the proposal to number motor-cars is universally condemned, the only alternative at present suggested is to retain the *status quo*. In view, however, of the fact (so it is openly stated) that the Government are going to bring in a Bill next Session which will, *inter alia*, embrace numbering, I think it behoves us to inquire whether there is no alternative to numbering which will meet the views of the authorities, and I venture to suggest that there is. I will not occupy your valuable space either by pointing out in detail how or why numbering has been a failure on the other side of the Channel, or by enlarging on the many objections there are to the proposed system of identification by legible numbering.

I take it that the present position is briefly this. Automobilists are restricted to a maximum speed of twelve miles per hour, and must stop when called upon to do so either by a constable or by a person in charge of a restive horse. Automobilists as a rule habitually travel at a greater speed than twelve miles per hour, the majority with due consideration for other users of the road, and a few without any consideration whatever. These latter have obtained for automobilists generally an unenviable notoriety, with the result that the police have in many places had to resort to tactics of all sorts to catch these offenders. The result, as we all know, is that more often than not the real offenders escape while considerate drivers have been caught and made examples of. Consequently a kind of feud has sprung up between automobilists and the police, with the result that many drivers, rather than run the risk of a certain fine, refuse to stop when called upon to do so, and if by chance they are held up give false names and addresses. Hence the demand that is being made on all sides for cars to carry numbers sufficiently large to enable them to be identified when in motion.

Assuming the aforesaid to fairly represent the present state of affairs, I venture to suggest that the requirements of the authorities who are clamouring for numbering can be met, and well met, by:—(1) Making it compulsory that all motor-cars carry in a conspicuous place a small plate bearing the name and address of the owner of the car (such plate being capable of being read only when the car is at rest). (2) Making the owner of a car responsible for the action of whoever may, for the time being, be driving the car; and (3) making the penalty for not stopping when called upon to do so, a heavy fine for the first offence and imprisonment for the second and subsequent offences. In short, make the car self-identifying as regards ownership when the car is at rest instead of when in motion, and enable the severest punishment to be meted out to those who fail to stop on the demand either of a constable in uniform or of a person in charge of a restive horse. Obviously the sign to be made by a constable as a demand for stopping must be an unmistakable one, impossible to misunderstand; such, for instance, as holding up both arms at right angles to the body, and it should be made at least ten yards ahead of the car in the direction in which it is moving.

In addition, all drivers should be required to hold certificates of competency to drive. As a corollary to this scheme all vehicles the property of manufacturers, factors, agents, etc., out on the road for the purpose of trial or otherwise should be required to display an identification plate. It will probably be suggested that this scheme provides no means of identification for those in charge of restive horses. Quite true; but these users of the road are surely in no worse position than others who may have cause for invoking the aid of the law and are unable to identify the party or parties giving the ground for such cause of action.

With the removal of the legal limit the *raison d'être* for police traps will disappear, and consequently the aversion of automobilists to being held up by the police will also disappear, and this the more so when drivers realise that a demand to stop will more often than not be made with the object of testing their willingness to comply with the law than with the object of making a charge against them. In conclusion, this scheme has the advantage that automobilists cannot have charges brought against them for breaking the law without their being made aware of the fact at the time and place of the alleged breach.—Yours faithfully,

ROBERT E. PHILLIPS.

MAIDENHEAD BRIDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you allow me, through your columns, to invite all users of vehicles (motors or horse-drawn) to make a point of protesting every time toll is demanded of them on passing over Maidenhead Bridge, to invite the collector to assert his authority by closing the gate, and to demand a receipt for the amount they pay?

Tolls have been extracted from the public by the Corporation of Maidenhead for over 130 years. The assistance of myself and friends is at the service of any member of the public against whom any action might be commenced. I shall be glad to know the names and addresses of any of your readers who in the past have had to pay 8d. and 6d., as there is no reason why the Corporation should not be forced to refund these sums so freely extorted from the public. Mr. Witt, K.C., and Mr. Danckwerts, K.C., who fought the Windsor Bridge Case, have been retained for the plaintiff in Taylor v. Corporation of Maidenhead, in the action to recover toll paid under protest on December 8th, 1902.—Yours truly,

J. SEPH FULLBROOK.

THE GORDON BENNETT RACE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—Referring to the letter from a correspondent in your last issue, signed "U. Stratton," this gentleman is needlessly troubling himself. Two Napier cars have been chosen by the Automobile Club to represent England in the Gordon Bennett race. These two cars will appear for the race in good time, in accordance with the Automobile Club's regulations, and no departure from what has been settled will be made so far as I am concerned. Not one Napier car will compete for the eliminating race, but several—certainly three.

I am having seven Napier carriages built, all of which will be quite capable of driving with every hope of success in the Gordon Bennett race. Why should he assume that I would deliberately make inferior cars for the race itself, and a superior car for the Eliminating Race? It does not seem to me that such a suggestion is common sense.—Yours truly,

S. F. EDGE.

LESSONS OF THE PARIS SHOW.

To THE EDITOR OF *The Motor-Car Journal*.

SIR.—Mr. Sangster's letter in the last number of the *Motor-Car Journal* contains a very large quantity of debatable matter, which boils down into the suggestion that British manufacturers ought to be copyists. Surely the British manufacturer is able to evolve out of his own intelligence some improvements in motor design, and to have his own very decided opinion on the importance of retaining features which have proved to be efficient. The discourse which Mr. Sangster preaches really amounts to a consideration of whether the three features of the Mercedes, which he enumerates, are at the moment items for immediate acceptance by the British industry, and by the British users of foreign motor-cars.

The chassis *embouti* may be lighter, stronger, and ultimately cheaper than the old form of frame construction. From the point of view of the manufacturer, the question then arises whether the time has come for the standardisation of frames, in view of the fact that so many purchasers of cars wish to have widely differing varieties of bodies unsuitable for a single standard of frame. At any rate for the present, standardisation, like the alleged economy, is out of sight. From the point of view of the owner there is the question of the sequel to accidents. Will the frame resist the fancy manoeuvres of an inexperienced user? Neither type of frame will withstand such abuse, but while the broken portion of a built-up frame can be repaired, the pressed steel frame has to be replaced as a complete whole. This replacement means the complete dissembling and subsequent re-assembling of the car.

As to mechanically-operated inlet valves, Mr. Sangster questions whether these are more complicated than the atmospheric suction valves, and yet he at once admits that there is a complication. He omits, however, to refer to the wear, which alters the power of the engine and spoils the exact timing of the valve, and if the timing be incorrect the alleged superior efficiency disappears. The mechanically-operated inlet valve may be ideally designed for a certain speed, but it has not yet been proved to have a greater efficiency at all speeds for all engines.

The statement that the induced draught type of radiator is more efficient than the old pattern is one not justified by experience, when the car is in motion, whatever may be the heating on a stationary vehicle. Its use reduces the quantity of water carried, but that is not necessarily an increase in efficiency. The old system of radiator has reached perfection so far as efficiency is concerned, and the advantage must be sought in other and secondary considerations. There are authentic cases of the distance of 500 miles being covered without any necessity for refilling the tank, during the whole of which distance the water has kept perfectly cool. That is complete efficiency. Weight may be reduced, but complication and risks of injury inevitably enter when air is induced through a honeycomb by a fan.—Yours faithfully,

F. T. BIDLAKE.

MR. M. F. LYONS writes:—"With reference to the article on 'The Sthenos Carburettor and its Adjustment,' by Mr. R. W. Buttner, I would be glad if that gentleman would say where the good petrol strainer he mentions is to be obtained, and how it is fitted so that it will effectually prevent dirt from getting into the spraying nozzle."

MR. A. ADAMS writes:—"I once saw a motor-car with an attachment for pumping a little paraffin at will into the cylinder for cleansing purposes, without stopping the engine. Is there any objection to this arrangement for a horizontal motor? If not, I should be glad to hear whether any such apparatus is on the market at present, or whether it has to be fitted specially."

MR. S. F. EDGE writes:—"In your last issue a statement is made by Mr. Chas. Sangster that 'no radiator fitted in this country will keep water cool enough so that the car does not want re-filling for, say, 500 miles.' This statement is incorrect so far as the Napier is concerned. In May last I drove in a trial from Glasgow to London, a course of over 400 miles, where it was officially recorded that 'no water was required,' although many miles had to be driven on the low speed to keep within the time limit."

X. Y. Z. writes: "Can any of your readers explain why the inlet valve moves twice—once when taking in charge after exhaust, and again just after compression?"

BARON H. DE ROTHSCHILD ON AUTOMOBILISM.

IN the new home of the Automobile Club in Piccadilly, London, on Friday, the 9th inst., Baron Henri de Rothschild gave a paper on his "Seven Years' Experience of Automobilism." Mr. R. W. Wallace, K.C., presided.

At the outset of his paper Baron Henri de Rothschild expressed his pleasure at coming to London for the purpose, for England was the classic land of sport. The good feeling shown him by English motorists on his visit to Bexhill, and later, when he was permitted to take part in the 650-miles Reliability Trial, made him regard it as a duty to respond to the invitation of the Club. It was in 1895 that, for the first time, he put his foot on an automobile, his experience then being scarcely of an encouraging character. The vehicle was a 6-h.p. Peugeot, which attained a speed of six or eight miles an hour. They were going on a journey to Chantilly, about twenty-five miles from Paris. About six miles out he (the speaker) took the place of the driver and they ascended a hill at four miles an hour. On arriving at the top he decided to let the car go a little, but on reaching the bottom saw a cart a few yards away. It was impossible to stop, and he ultimately picked himself up a few yards away, while the car was overturned and broken to pieces. On that he was asked by his wife to promise that he would never again enter a motor-car. Within three weeks he obtained a De Dion motor-tricycle. Later he became the owner of a 6-h.p. Panhard and also of one of the first cars fitted with pneumatic tyres. It was capable of attaining a speed of sixteen miles an hour. On that he had some striking adventures during a period in the history of the movement when motorists ran the risk of being mobbed. In 1899 he was at Nice with his uncle, Baron Arthur de Rothschild, on an 8-h.p. car. One day on the Turbie-hill they were passed by a vehicle, which his uncle bought at once. It was of German make, having been constructed at the Daimler works. A fortnight later another car passed them when on their new possession. His uncle was in desperation; but another cheque was passed to M. Jellinek. Then they each gave an order for a 24-h.p. car, the price being proportionate to the weight. The Daimler cars not only climbed hills, but nothing ever went wrong with the mechanism. He pointed out to M. Jellinek that if he could build motors of such calibre, it ought to be possible to put them on a light frame combined with an elegant appearance. In 1900 it was decided to modify the underframe and lighten the vehicle, and in 1901 at Nice the first Mercedes car of 35-h.p. appeared, making an average of thirty-seven miles an hour. Then the French makers prepared to take revenge for the defeat they had sustained. In the memorable race from Paris to Berlin a 40-h.p. Mors carried everything before it. Last year the Mercedes went again into the front rank. With regard to motor-car accidents, he said he was one of those who had caused the least number, because he had seen so many due to the reckless conduct of others. In England they had laws to check excessive speed, and he would not attempt to advise them, for he had been too much troubled by English police regulations. Having given some figures with regard to the extent of the automobile industry in France, the speaker went on to say that its present position was due to the encouragement of racing. This had helped to perfect the construction of motor-vehicles. Regarded with moderation, motoring would have a beneficial effect on health. A ride of two hours in the morning and three in the afternoon would be found enjoyable; but to sit five or six hours at a stretch in an automobile, going at more than thirty miles an hour, would often produce a feeling of fatigue which was not healthy. It was not advisable to take journeys—as he confessed to have done—of 464 miles, starting at four o'clock in the morning and arriving at his destination at ten o'clock at night; or leaving Paris in the morning, lunching 150 miles away, and returning to town to dinner. An excess of automobilism might cause nervous trouble, but if taken in moderation it would produce the most beneficial results, and he had known cases of serious nervous disorder cured by motoring at regular intervals. In conclusion he thanked his audience for the reception they had accorded the Parisian *chauffeur* whom they had invited to come amongst them.

The Hon. J. Scott Montagu, M.P., said he was in France two years ago, when their guest of that evening prophesied to him that the Mercedes would prove the best car. The Baron was himself the maker of an excellent vehicle, and the profits thereon were devoted to charity. In this country it was difficult to find the manufacturer who made profits, even for himself. Whatever was done in the future, it was certain that France had shown the way to the whole world in this branch of sport. Most of the improvements that had been made came from France, and Baron Henri de Rothschild had suggested many of them.

Mr. Mark Mayhew, L.C.C., said they had only to remember their early motoring experiences to realise how perfect the modern vehicle had become. He had recollections of once starting in a car from London with the object of getting to a place in Wales. He worked hard, and fought that car for a week before he reached his destination with broken chains and pipes.

Mr. W. Worby Beaumont confirmed the last speaker's view as to the improvement that had taken place. No doubt the experience gained in early trials had led to the present position.

A member of the Club having suggested that the writer of the paper might be willing to give his views as to the respective merits of petrol, steam, and electric vehicles, Baron de Rothschild said he had seen M. Serpollet three or four days before, and that he hoped with his new steam car to attain a speed of nearly 100 miles an hour on a specially-prepared road. At Cannstatt, on the last day of 1902, he had been allowed to see the new engine being built for the Gordon Bennett racer. It was of 100-h.p.

and would probably develop a speed of more than a hundred miles per hour on prepared ground. At a certain place, in one of the great races, Chevalier de Knyff had attained a speed of exactly ninety-eight miles an hour, but was obliged to slow down, as it was absolutely impossible to drive at that speed in open country. Whatever speed the car might be capable of attaining, the driver would not be able to trust himself to drive more than ninety-five or ninety-eight miles an hour. M. Serpollet had said when he could travel ninety-eight miles an hour he would not want to go any faster. With regard to electrical vehicles, up to now they had been only good for town work.

Mr. R. W. Wallace proposed a vote of thanks to the Baron. It was, he said, quite possible to construct an electric car that would go as fast as a petrol or steam car; but after the journey the battery would not be of any use. He hoped M. Serpollet would not risk too much in getting to the maximum of speed. He (the speaker) had never met a braver man—evidence of which was afforded by the way he drove towards the cliffs at Bexhill. They had wondered why the Mercedes had had such a wonderful following in France. It was now perfectly clear, for the Baron Henri de Rothschild had been to the works. French ideas had been given to Germany, therefore the French did not object to copy them.

Mr. A. F. Bird seconded the vote of thanks, and testified to the remarkable cures from insomnia that had been effected by automobilism.

The vote having been enthusiastically adopted, the brief reply of the recipient, closed the proceedings.

ELECTRIC AUTOMOBILES.

At the present time there are, in London alone, upward of 16,000 licensed horse-carriages, apart from private vehicles tradesmen's vans, etc. It is estimated that more than 200,000 horses are stabled each night in London, necessitating the daily removal of at least 5,000 tons of manure and refuse, in addition to what is distributed over the roads. The daily growth of London and of other large cities renders the problem of substituting motor-cars for horse-traction, even from a sanitary point of view alone, of the first importance. Electric automobiles have now become thoroughly practical vehicles, single journeys of more than 100 miles on one charge and tours of more than 1,000 miles having been accomplished satisfactorily. Electrical energy is an economical and readily-applied form of power, which is noiseless in its application, gives rise to neither smell nor refuse, and possesses the advantage that it can be turned on and off at will. It is only since the passing of the Locomotives on Highways Act, 1896, that the problem of motor-cars has been seriously attacked in England, and this country is far behind France, America, and Germany, where no such restrictions had to be fought against as hampered their development here before 1896. In America electric carriages were being made in 1894. It is interesting to note that at that time the limit of a run on one charge was 20 miles. Germany, France, Austria, America, Italy, Spain, Belgium, and other countries are giving earnest attention to the manufacture and improvement of electric vehicles, and in most of these countries makers are assisted directly by Government subsidies, by official trials, as in Berlin, and otherwise. In England it has been left entirely to private enterprise to compete with the foreigner for a share in this new and important industry, which even now gives employment to about 10,000 men in this country. The weight of the earlier electric carriages was out of all proportion to the weight of the batteries carried by them, due to the attempt to utilise existing coach-builders' work strengthened to carry the batteries. Further, the batteries and motors were very inefficient. In the electric cabs used in London a year or two ago, the total weight of the vehicle, battery, motor, and gear, for carrying a useful load of 4 cwt. (passengers and driver), was over 2 tons, a ratio of 1:10. These vehicles may be contrasted with a bicycle, weighing only 26 lbs. and carrying 140 lbs., or five times its own weight. In the electric cabs the weight on each wheel was about 10 cwt.; in a bicycle the weight on each wheel is about $\frac{1}{2}$ cwt.

Dealing with storage-batteries, the author stated that the active agents of the storage-batteries in general use are lead and dilute sulphuric acid. The batteries may be divided broadly into two classes, namely, the "to-be-formed," or Plante kind (1873); and the "pasted," or formed Faure type

*Abstract of Paper read by Mr. H. F. Joel, Assoc. M. Inst. C.E., before the Institution of Civil Engineers, January 13th, 1903.

(1881). The object of both these processes is to produce a couple consisting of a positive electrode of lead oxide, and a negative electrode of lead in a solution of sulphuric acid and water. Peroxide of lead is formed on the positive, and pure lead on the negative, by the process of charging; and energy is stored which is given up on discharging the battery, the electrodes returning to their first state of lead sulphate. The pasted cell is lighter than the other, and is more generally used in electric automobiles. The improvements made in storage-batteries to adapt them to electric automobiles are mostly in mechanical details of the supporting grids, to allow full expansion of the paste and to avoid sulphating; in the increase of the specific gravity of the electrolyte, from between 1.05 and 1.20 to between 1.15 and 1.30, and the consequent decrease in volume and weight and increased output in the chemical composition of the active material, i.e., paste; and in the mixture of the paste with inert materials to make it more coherent and porous. As a result, batteries for traction now give, weight for weight, three or four times the output of batteries used for electric lighting. A zinc and peroxide-of-lead battery of 120 ampere-hours can be charged at 90 amperes for 2 hours, and discharged at 20 amperes to 100 amperes. The output of the various storage-batteries, given by the manufacturers, as is shown in table A:—

A SNAPSHOT AT THE SWISS CUSTOMS OFFICE AT MEUDON.

[Le Chauffeur.]

ton-miles, allowing 10 per cent. loss of efficiency and an efficiency of charge and discharge of 80 per cent. This means that an electric vehicle, weighing, say, 6 cwt., with a battery weighing 6 cwt. and a load of the same amount, could run 10 miles per day for 330 days in the year, i.e., 3,000 ton-miles, taking 100 watts per ton-mile, at a loss of efficiency in the battery of 10 per cent.

The motors designed specially for electric automobiles are of light

weight compared with electric motors used for driving stationary machinery; they are of high efficiency, are capable of bearing very rough usage, and an overload of 100 per cent. for short periods. The author then briefly described the Still, the bipolar single-coil Lundell motor, the Krieger motor and gear, and the motor designed by himself. The latter has eight poles with the armatures revolving outside the fields. The armature has a long sleeve-bearing with a sprocket-pinion at its end, and by means of a chain drives the large sprocket-wheel attached to the spokes of the carriage-wheels. This motor is very light, weighing 112 lbs., and giving 2-b.h.p. at 700 revolutions per minute. It runs sparklessly, and owing to the large surface of wire exposed on the armature it will stand an overload of 100 per cent., while it has an efficiency varying between 80 per cent. and 90 per cent., according to the load.

Many ingenious methods of controlling electric automobiles in regard to direction of travel, speed, braking, recuperation, and recharging, have been devised. The controller is simply a commutating switch, or circuit-changer, and the system in general use is an adaptation of the series-parallel controller used on electric railways and tram-cars, and consists in grouping the batteries in parallel or in series as change of speed is required, or grouping the motors in parallel or in series with the same object, and also in combining the two. The author then described the system used by Jeantaud, Krieger, Northey, and others.

After dealing with underframes, the author went on to describe the size of wheels, which is a question which has recently received special attention. Dr. Luxenberg has shown that for level roads the resistance to traction, and the energy consumed, are, within certain limits, inversely proportional to the diameter of the wheels of the car; and he advises the use of wheels between 3 feet 3 inches and 5 feet, or more, in diameter. He estimates that the use of these larger wheels in place of the 2-foot 6-inch or 3-foot wheels generally used would effect a saving on the level of about 40 per cent. This, however, would not apply to hill-climbing, where the power must be increased almost in proportion to the gradient, necessitating either a lower speed or a large reserve of battery power. Wheels over 3 feet in diameter present difficulties in respect of reduction of speed. It is obvious that wheels of such diameter bridge the ruts and depressions of a bad road much more than 2-foot wheels, and with the heavy weight of electric cars the sinking and re-lifting of the car means great loss of power. As regards air-resistance, assuming that this follows Smeaton's rule, and also that, for purposes of calculation, the irregularities of the surface of a road may be allowed for by regarding the cross-sectional area of the car as forming half the curved surface of a cylinder, the pressure becomes serious at above 12 miles per hour, and has to be taken into account in determining the power required. The electric motor can be made with as high an efficiency as 85 per cent., and the loss in the gearing, especially high-class chain-gear, is about 2½ per cent. Allowing 25 per cent. for all losses, including the friction of the carriage-wheels, 75 per cent. is a fair all-round efficiency, and well within the conditions of practice.

Electric automobiles, when properly designed, possess the unique feature that they can return energy to the batteries when running downhill, the momentum of the vehicle causing the motor to act as a generator, whilst at the same time forming a very convenient automatic brake. At the Chislehurst trials in November, 1900, the highest current recorded for car No. 3 when ascending the steepest hill (gradient 1 in 10) was 119 amperes, and in descending the same hill a back charge of 35 amperes was given to the battery. The total weight of the car, with passengers, was 19 cwt. In many long runs on electric automobiles the author stated that he had not used the mechanical brake at all, stopping and reducing speed solely by the reactive effect of the motor. This makes the control of an electric motor-car simpler than that of any other self-propelled vehicle, and, of course, there is no loss of energy with shunt-wound motors in stopping, but rather a gain.

The ratio of the weight of the vehicle to the weight of the power-giving battery is of great importance. Generally, as the ratio of the weight of the battery to the weight of the vehicle increases, so the distance that such a vehicle can be run on one charge is increased; but of greater importance from a practical point of view is the load-carrying capacity, and the ratio of the weight of the useful load to the weight of the battery and vehicle. The author submits that cars in which the weights of batteries, vehicle, and load are equal, are, all things considered, the most suitable for electrically-propelled vehicles.

The last point for consideration is the cost of electric propulsion on common roads, and in order to put this question in a clear form, the author prepared a table giving the comparative costs of different motor-cars. It is possible to run electric vehicles on a good level road with an expenditure of only 50 watt-hours per ton-mile, at a cost for electric energy of 0.1d., taking the actual cost of generating the electricity, with a fair profit, at 1½d. per Board-of-Trade unit. This cost will compare favourably with any other system of self-propelled carriages, and makes electric propulsion on roads, with its advantages already enumerated, more promising than any other system of motor-carriages. The difficulty of obtaining a fresh charge for the batteries is now being rapidly overcome, owing to the readiness of the electric-supply companies in towns and in country districts to provide motor-houses, and to recharge at all hours of the day and night, at a reasonable cost. Charging can be effected in every district in London, and at Chelsea, Hampstead, Richmond, Windsor, Watford, Stratford, Leyton, Harrow, Chislehurst, Putney, all on main roads leading from London; farther out there are charging-stations at Guildford, Crawley, Woking, Tonbridge, Chelmsford, Luton, Cheltenham, Reading, Maidenhead, and other towns on the River Thames; and still farther afield the like facilities

are afforded at Brighton, Southsea, Hastings, Oxford, Bath, Bedford, etc., and many other towns throughout the country. It appears to be desirable to fix upon a standard for the electro-motive force to be used in electric automobiles; such a standard would be of great advantage to the designer and manufacturer of such automobiles, and of the motors, batteries, etc., used in them. The potentialities of electric propulsion of carriages on common roads are very great. France, America, Germany, and other countries are far ahead of England in regard to the manufacture of motor cars; but the author hopes that England will now take its place in the world with this new industry, as she did in the past with the steam-locomotive.

A CLAIM FOR NEGLIGENCE.

On Monday, at the Wandsworth County Court, Judge Russell tried the case of "Chipp v. Levita," which was an action brought against Mr. Claude Levita, of 27, Ennismore Gardens, Rutland Gate, W., to recover damages for personal injuries sustained through being knocked down by a motor-car in High Street, Wandsworth. Mr. A. Cairns appeared for the plaintiff and Mr. E. G. Mears was counsel for the defendant. The damages were laid at £50, and there was also a claim for £12 10s., special expenses. The facts of the accident were reported in our columns in August last. On a point of law, Mr. Mears contended that the driver took all reasonable ordinary proper precautions to prevent the gear starting. The Judge: Except by leaving someone in charge of it. Mr. Mears said that no principle of law required someone to be left in charge of a motor-car. The Judge said the general principle of law equally applied to horses and carts, and motor-cars ought not to be left unattended, when mischievous boys might interfere with them. The learned counsel quoted from "Bevan on Negligence," which set forth that the general rule of law was that where every precaution had been taken, and injury had been inflicted through the independent act of another person, the owner was not liable. The Judge: Cockle was fined by the magistrate for leaving the car unattended, and the conviction was upheld on appeal. Is it not therefore ridiculous to ask me to hold that there was no negligence? The Board of Trade does not affect the general principle of law. Dr. Dorin, of Clapham Road, S.W., then gave rebutting medical evidence. Mr. Cairns, addressing the Judge, commented on the fact that nothing had been paid into court. He submitted that his client's health had been seriously impaired, having regard to the fact that she was a woman of fifty-four.

His Honour said he had already expressed his opinion on the question of negligence, and he did not intend to say more. He thought this lady had put forward a very inflated claim, and he proposed dealing with it accordingly. He awarded her £8 10s., with costs.

Where no alleged speed is given it is understood to be above the legal limit.

*Motor-cycle case.

JAMES M'DONALD (19), a motor-car driver, was charged at Edinburgh with having recklessly driven a motor-car in Queensberry Road, on the night of the 19th ult., in consequence of which the car collided with a carriage under the charge of Charles Logan, knocking down the horse and breaking a shaft. He pleaded guilty. In reply to the Bench, the accused explained that he put on the brakes, but the car skidded on the wet road, and the back swung round and struck the horse. A fine of 30s., with the option of ten days' imprisonment, was inflicted.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JANUARY 24, 1903.

[No. 203.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

A MEETING of the Liverpool Self-Propelled Traffic Association has been held at the Exchange Hotel, Liverpool, Professor H. S. Hele-Shaw, F.R.S., chairman of council, being in the chair. The attendance included Messrs. A. G. Lyster (engineer to the Mersey Docks and Harbour Board), W. Becket Hill, T. Thornycroft Vernon, Max Muspratt, Thomas Lloyd, W. E. Moss, and E. Shrapnell Smith. Letters of apology were received from the Earl of

Derby (president), Sir A. L. Jones (vice-president), and other members of the council. The principal business of the meeting was to confirm the election of Mr. W. E. Moss as hon. secretary, and Mr. Moss's appointment was unanimously confirmed on the motion of the chairman, seconded by Mr. A. G. Lyster. The programme of the association for the coming year was discussed, and it was decided to invite Mr. Mark Mayhew to give an address at the Royal Institution in March. There will be a Club meet at Easter, and speed trials both as separate fixtures and in connection with the British Association Committee for the investigation of the resistance of road vehicles to traction. It was unanimously confirmed that the entrance fee and annual subscription be each doubled, the latter now being two guineas instead of one.

The 1903 Mercedes Car.

MOTORISTS who visited the Paris Exhibition, no less than those who heard Baron Henri de Rothschild at the Automobile Club a fortnight ago, recognise that 1903 is a "Mercedes" year. Many French makers seemed in a state of uncertainty last month, and all were anxiously awaiting the advent of the new Mercedes car. Hence the interest with which our article on the details of the new model on another page will be read on both sides of the Channel. We are this week able to publish the earliest information with regard to the new features to be introduced in this famous vehicle, and it will be seen at once that the Mercedes firm is determined to do all that is possible to maintain the position already won.

Motor Racing.

THE attendance at last week's meeting at the Automobile Club was somewhat thin, and it occurred to some of those present that in arranging for a paper every week the Committee were attempting too much. Seeing that Mr. Jarrott was dealing with a subject which he has made his own, the paper was one of great interest, particularly to the many recent converts who formed a considerable factor of the audience. There was something exciting in his account of the Paris-Vienna race, and he rightly described his arrival at the Prater in Vienna as "dramatic." When he arrived in Vienna with his governor broken, his throttle gone, no exhaust-box, running on the low gear, unable to change speed through the impossibility of taking out his clutch, regulating his speed by the ignition, the frame of

the car practically in half, no cap, no coat, and no goggles, he must have presented a picture ludicrous to a degree, but indicative in a measure of the effort he had made to get the car through.

Effect in the States.

THAT Mr. Jarrott's eulogy on racing as a factor in the development of the automobile industry was not too highly pitched is proved by the zest which has been infused into the American trade by the decision to send an American team to compete in the Gordon Bennett race. It is strange that the donor of the trophy, an American, should have had to wait until the fourth year of the competition before seeing America represented among the competitors. Sight is often lost of the fact that the motives that actuated Mr. James Gordon Bennett in offering the cup bearing his name were very patriotic and intended to stimulate the automobile industry everywhere. It was expressly stipulated that each competing car should be the actual product in every detail of the country entering it. Not even parts of fittings could be imported. Until the industry of a country had so grown that it could produce every iota of manufactured material that entered into the composition of the car, that particular country was barred from the contest. But it is evident throughout the United States that now there is a definite entry from that country manufacturers are taking up the business with a serious purpose and determined intent.

Why not in the Fen Country?

CARE must be taken in connection with the agitation for the Gordon Bennett race to be run in the United Kingdom, that public attention is kept to one district—to avoid confusion in the public mind and allow the local authorities on the proposed route to make what repairs on the road seem necessary. Hence the suggestion made in the "Lincolnshire Echo" that the race should be run in the Fen country is a little belated; and seeing that a suitable course has been found in Ireland, somewhat unnecessary. There are good roads in Cambridgeshire, Lincolnshire, Huntingdon and Norfolk, along which a course might be found. But now that experts have reported favourably with regard to the proposed Irish route it will be well to focus attention there—at least for some weeks to come.

The Race in Ireland.

MR. ROGER WALLACE, the president of the Automobile Club, is decidedly hopeful as to the prospects of the great event being held in the Emerald Isle. Speaking at the Club, on the 16th, he said some people had been approaching others in high quarters as to whether the race should be run in Ireland or not. But the Club would be very much obliged to those people who had such wonderful initiative if they would control their powers until the whole matter had been considered. Firstly, the Club had assured itself that there was a suitable course, and, secondly, a letter was to be addressed to every Irish M.P. asking him to sign a petition to support the race being held in Ireland. Should the race be held there, automobile tours to

other parts of the country would be arranged, and a hill-climbing competition organised near Belfast, and a race for motor-boats held at Cork. When the Irish members had approved the idea would be the time to go a step further in the matter.

Aluminium.

HAVING thus indicated the policy of the Club with regard to the race, Mr. Wallace made reference to the effect of automobile racing on the industry. During the last few months the consumption of aluminium had increased by nearly 50 per cent., and much of that was to be attributed to the motor-car trade and the conditions regarding weight that had been imposed on racing vehicles.

MR. CHAS. HARDY, OF NOTTINGHAM, ON HIS NEW 12-H.P. DAIMLER.

Automobile Fire-Service Vehicles.

EXPERIMENTS are now being made in Berlin with an electrical motor fire-service vehicle to carry firemen to the scene of the outbreak immediately on receipt of a "call." The vehicle, which carries a reel of hose, ladders, etc., weighs, when loaded, 2,200 lbs. It is driven by a 4-h.p. electric motor, running at a speed of 1,500 revolutions per minute, and transmitting its power to the rear axle through a double reduction gear. The electrical energy is furnished by a battery of accumulators weighing 11 cwt. 88 lbs.; a speed of $9\frac{1}{2}$ miles per hour can be attained. A second and more powerful automobile is, remarks the "Electrical Review," also being tried by the Berlin Fire Brigade authorities, capable of attaining a speed on the level of $12\frac{1}{2}$ miles per hour. It is driven by two electric motors, each of which is rated at 9-h.p., but which can, on occasion, develop 12-h.p. without fear of damage. The vehicle, complete with battery, firemen, hose, ladders, etc., weighs 7 tons. The cost of a car like the second one referred to is stated to be £600; the annual cost of upkeep and energy is put down at £125, this including 5 per cent. interest on the first cost, and 5 per cent. for depreciation and renewal. The average cost per kilometre works out at $2\frac{1}{2}$ marks (a little under 2s. 6d.), which is stated to be less than that of animal traction.

Motor Buses for Eastbourne.

WE have previously mentioned that the Eastbourne Town Council adopted a scheme for the provision of public motor buses to run over various routes in the borough. A clause was inserted in the Parliamentary Bill passed last year entitling the Council to run these buses, and about sixteen tenders were received from different firms for motor buses of all sizes and descriptions. The Electric Light Committee, after considering the tenders, selected about half the number for a sub-com-

mittee to enquire into and report upon. There is likely to be a good deal of delay before the question is finally settled, and some time will doubtless elapse before the committee can bring forward any recommendations for the consideration of the Council. There has been considerable opposition in the town to the provision of tramways, and motor buses have been put forward as a compromise.

At Wolverhampton.

THE Wolverhampton and District Automobile Club has now thirty-four members—an increase of nine during the year. At the second annual dinner, held at the Victoria Hotel a few days ago, Alderman Johnson proposed "Success to Automobilmism," remarking that the three local firms making motor-cars were busily engaged. Mr. S. R. Rhodes, the secretary replied. He said that they as a Club had progressed in more senses than one. It was very gratifying to find that the prejudice against automobilism was passing away. Whilst they wished to extend the greatest consideration to the drivers of horses, he wished they could instil into their minds that the automobilist had as much right to the roads as anybody else. They heard much about certificates for proficiency for drivers of automobiles, but it would be better to have an association on the part of the owners of horses to teach courage to the drivers of horses. The motor industry had progressed very rapidly in the past twelve months, but they still had much headway to make up. He referred to the way in which the municipalities were utilising motor-vehicles, and said that in one case the cost for drivers, etc., had been decreased from £1,300 when horses were used to £500. The Wolverhampton authorities might use fully take the hint. Going on to discuss the proposed new Act, he pointed out that there was now no talk of limiting the speed of automobiles, quoting utterances by Sir William Harcourt, Mr. Chaplin, and Mr. Ritchie. He contended that numbering would not be of any advantage, and exhaustively discussed the objections to Mr. Scott Montagu's Bill. Mr. A. E. Jenks proposed "The Visitors." During the evening a capital entertainment was given by Messrs. G. P. Fletcher, B. Sanders, Willis C. Crisford, and Professor J. T. Wenyon.

"Truth's" Opinion.

HAS not the time come, asks "Truth," when the twelve-mile limit of speed ought to be reconsidered altogether? It seems a stupid, wooden formula which exists merely as a concession to obsolete prejudices. It is irrational because, under many circumstances, it exceeds the reasonable maximum quite as much as under others it exceeds the reasonable minimum. At a crowded spot, such as the Mansion House or Piccadilly-circus at mid-day, six miles an hour may often be a dangerous speed. On many a country road, with a clear course, and no openings from side turnings, there is no danger in twenty-five miles an hour. The mistake of laying down a fixed statutory limit of speed is that the standard of safety must always depend entirely upon the circumstances of the moment. In addition to this, the present maximum limit is absurd, because it takes no account of the fact that a properly-built motor-car is far better under control, and can be stopped dead far more quickly, than any horse vehicle going at the same pace. A motor-car going at twelve miles an hour is therefore far less dangerous in the event of any sudden obstruction of its course than a four-horse stage-coach driven at the same pace.

Earl Spencer's View.

A DISCUSSION on motor-cars has taken place at the Northamptonshire County Council, and a resolution was adopted instructing a committee to take steps to devise further precautions against accidents to the public through the reckless driving of motor-vehicles. In the course of the debate Earl Spencer said the motor-car had come to stay, and he did not suppose they wished to restrict their use. He certainly thought, however, that the public were not sufficiently protected, and he especially

favoured not only the registration of cars with easy means of identification, but drivers should be required to have certificates of efficiency. We are glad to have Earl Spencer's recognition of the automobile as something not to be treated as the fad of a moment, and would wish all our county magnates would be equally tolerant. At the same time it cannot fail to be observed that the Earl was not very definite as to the particular means of identification to be employed.

Numbering.

TOUCHING on the question of numbering, he contended that such provision would not be of any advantage—a conclusion to which most motorists have already come. In fact, the only enthusiastic advocates of labelling motor-vehicles

at the present time are bucolic councillors and prejudiced persons owning horses and disliking automobiles. The fact that feeling has lately grown so strongly against numbering is already having its effect; and the advocates of numbering in automobile circles have become considerably less energetic in their efforts to impose unnecessary and irritating conditions on their *confreres*.

Mr. Ellison (motor-tricycle); and Mr. Chippendale (motor-bicycle). At lunch Mr. Harrison Benn (Vice-President) proposed a vote of thanks to Mr. and Mrs. C. Kirk for extending their hospitality to the members of the Club. This was seconded by Mr. T. Atkinson, and having been enthusiastically adopted was responded to by Mr. C. Kirk. After luncheon the cars were driven to the front of the Hall, and after the usual motor talk and gossip they commenced their homeward journeys. The weather was keen and frosty and the roads were in splendid condition. The annual general meeting of the Club will be held at headquarters on the 29th inst.

For Business Men.

At the annual dinner of the Huddersfield branch of the Commercial Travellers' Association, Sir James Woodhouse, M.P., referred to the value that the motor-car was likely to prove to commercial men. He was talking with one of the delegates who had been over to America from the London Chamber of Commerce; and he told him that one day he was seated at the dinner table, and said to his next-door neighbour, who happened

SCENE AT THE "WILD WEST," OLYMPIA.—COSSACKS AND THE CAR.

[The Biograph Studio.]

Yorkshire Automobile Club.

THE opening run of the season of the Yorkshire Club was to West Huntington Hall, near York, on Saturday last, in response to Mr. and Mrs. Kirk's invitation to lunch. The replies were from all parts of the county, and promptly at noon the cars began to arrive. Amongst those present were: Mr., Mrs. and Miss Benn, and Mr. I. E. King (22-h.p. Daimler); Mr. H. R. Kirk, Mr. Bolton, and Mr. Smith (12-h.p. Gladiator); Mr. and Mrs. Hepper, and Mr. Jones (12-h.p. Belsize); Messrs. T. and T. P. Atkinson (9-h.p. Clement); Mr. and Mrs. Armitage (9-h.p. Clement); Mr. Woolf and Mr. Hey (9-h.p. Clement); Mr. and Mrs. Whitaker (10-h.p. Lanchester); Mr. Wentworth Clark (Clement); Mr. and Mrs. Beevers (8-h.p. M.M.C.); Mr. A. W. Dougill (Hon. Sec.), Mr. Ramsden, and Mr. Braime (8-h.p. Loidis); Mr. and Mrs. Parker and Mr. J. W. Smith (8-h.p. Humber); Mr. and Mrs. Winn (4½-h.p. Renault); Mr. and Mrs. Walker (4½-h.p. De Dion); Mr. Mortimer and Mr. Wilson (4½-h.p. Renault); Mr. Borland and Mr. Nichols (4½-h.p. De Dion);

to be the chairman of a tramway company, that he would like to have gone to a certain place, but that he could not be back to keep an appointment in the morning. The gentleman touched a bell, ordered a motor-car, and he who had expressed the wish went off in it at a rapid rate, and visited the place. There is no doubt that the motor-car is likely to effect a wonderful change in business methods, and in enabling commercial men to be independent of the train that only runs at certain times, will be an indispensable convenience.

An Accommodating Carburettor.

AN account has reached us from the makers of the "Sthenos" carburettor of a trial of the same made during the Paris Show. A 1½-h.p. motor fitted with one of these carburettors, of the cycle type, and without exhaust jacket, was arranged to drive a dynamo for the purpose of testing its output. The carburettor was then supplied in turn with petrol, alcohol, and paraffin oil, and ran well under each of these conditions,

giving a constant output from the dynamo. It is further stated that the exhaust was devoid of smell with all three fuels. No information is to hand as to how near to the inlet valve the carburettor was placed, and in the cars we have seen there is a somewhat longer inlet pipe than the makers appear to favour, which might militate against the successful use of heavy oil. It would, however, be an interesting experiment to make with a car so fitted.

Wider Roads.

FROM the Roads Improvement Association comes a pamphlet giving a brief history of the agitation for securing better and wider roads throughout the country—a national movement that ought to be supplemented by local action wherever possible. A list of M.P.'s favourable to an enquiry into the existing system of highway administration is given, together with some extracts from their opinions. Captain C. B. Balfour calls attention to the better plan which prevails in Scotland, where all the roads in a district are under one authority. The Earl of Dalkeith also directs notice to the Scottish plan, while Mr. C. Eric Hambro points out that "motor-cars and motor-wagons will certainly be the vehicular traffic of the next decade all over the world, and if we do not provide good roads now, we shall be left far behind the rest of Europe."

Roads in Essex.

IN the course of an address on "Our Roads" at Southend, Mr. W. J. Ellis alluded to the lack of a main road between Southend and London, and cited the statement of a gentleman who had travelled all over the country that the roads in Essex were the worst in the kingdom, and that those in the South-eastern part were the worst of all. Their deplorable condition was owing to the wrong material being used. Guernsey granite would be the cheapest in the end. In France the cost of making roads was £37 per mile. In Southend the figure was £103. The chairman mentioned that at Tunbridge Wells the cost had been £411 per mile; at Dover, £1,251; and at Rochester, £564.

Reprehensible Procedure.

OUR correspondence columns this week give evidence of a remarkable state of things which we hope and believe is isolated to only a very few instances. Often it is difficult for a maker to decide how customers are attracted—whether by the arguments of local friends, or by the announcements in the press. But in the case alluded to the claims of the agent who applied for commission seem to have been ruled out of court by the reply of the customer, who introduces the *Journal* as the primary cause of his interest in the particular vehicle he ordered. In giving publicity to this request for commission, we would suggest to agents and to manufacturers the necessity of having very definite arrangements in all business transactions, so that there is no loophole for disagreement.

Some Good Advice.

THE little handbook which the Ohio Motor Company has lately issued with regard to the Packard petrol car contains some useful advice which is well worth repeating, as it applies to motorists on both sides of the Atlantic, and apart from the particular make of car they are using. We therefore extract the following from the booklet in question:—"No piece of machinery was ever made which would run continuously without some care and attention. When you buy an automobile there is formed an unwritten agreement between you and the machine. You expect to receive certain benefits from its possession. It likewise exacts a penalty from you in direct proportion to your own demands. You cannot make it a one-sided proposition, in which everything is your way, and anyone trying to so convince you is a lineal descendant of Ananias. An automobile is almost human. But it is unable to build up worn-out tissue or to recu-

perate in the slightest from the effects of hard usage. We plan and build to the best of our ability and provide means for prolonging the life of the carriage, but the amount of pleasure you receive will depend upon the care you take of it. No matter what we may write on the various kinds of automobile mishaps, it will always be for you to make the diagnosis and apply the remedy. The times when a car stops without warning are rare indeed. There are usually symptoms apparent for some time previous to a complete shut down, which indicates disorder. When you notice that the machine is not acting as usual, do not continue in the belief that the trouble will right itself, but begin at once to check off in your mind those things which you know to be doing full duty, and you will rapidly arrive at the part which needs attention. Don't get discouraged or blame the manufacturer until you know you are not suffering from some simple omission of your own."

American Police Enterprise.

SOME time ago the police authorities of New York supplied bicycles to certain members of the force in order to aid them in their chase after speedy motor-cars. But it has at length dawned upon these wiseacres that policemen in uniform are conspicuous objects which motorists take a special care to avoid. They have now attired their policemen in ordinary garments, with the result that they have had larger hauls of motorists in the police courts. Seeing their anxiety regarding the automobile industry, why do not the authorities of New York go one better and supply the newest types of motor-cars for the limbs of the law, so that they may be thoroughly up-to-date—and thoroughly up to the motorist in the matter of speed?

The Latest about the Race.

WE may point out in connection with the active efforts now being taken to secure the Gordon Bennett contest being run in Ireland, that the race will begin at daybreak—say about 3 a.m.—and conclude within ten hours, so that the stoppage of traffic will not prove irksome to anyone. Representative Irishmen are already expressing agreement with the idea, and the Marquis of Hamilton, Sir Edward Carson, Sir J. H. Haslett, Mr. John Redmond, Mr. T. M. Healy, and Mr. P. J. O'Brien, though differing in most Parliamentary matters, are reported to be unanimous in their approval of the race taking place in their country. The Naas-Kildare-Maryborough-Athy-Carlow road is securing universal favour.

It is announced that M. Fournier has sold his famous Mors racer to Mr. W. R. Hearst, of New York, for £5,000.

THE Norfolk County Council is trying to obtain the support of other county authorities in favour of the numbering of motor cars.

THE Highways Committee of the Bucks County Council has given the Automobile Club permission to erect notice boards on the main roads.

AN International Automobile fete will be held at Paris in June. There will be a reception and banquet on the 18th of the month, a run to the Forest of Fontainebleau on the following day, and a grand fete on the 20th.

At a meeting of the Scottish Automobile Club (Western Section), held at Glasgow on Monday, Mr. John Adam presiding, Mr. W. H. Kingsbury read a paper on "Tyres, their Origin, Preparation, and Use." The paper was illustrated by exhibits of tyres and of sections of tyres. A general discussion followed, after which Mr. Kingsbury was thanked for his interesting paper.

THE three 16-h.p. vans supplied by Messrs. Milnes-Daimler, Limited, to the Motor Haulage Company, of Manchester, and which are used to convey the night mail between Manchester and Liverpool and *vice versa*, are, we learn, proving very satisfactory. The vehicles carry a load of 35 cwt., and have covered close upon 4,000 miles without a breakdown of any kind. Over an extended trial the 16-h.p. engines have been found to use nine gallons of petrol per eighty miles with the vehicle loaded.

The 1903 Mercedes Car.

SO far, little information has been allowed to leak out with regard to the details of the 1903 Mercedes cars. It is known, however, that attention is being given to a 60-h.p. car, which will have engines comprising four cylinders, the diameter being, we understand, 140 mm. by 150 mm., as compared with the 118 mm. by 150 mm. cylinders of the 1902 40-h.p. engine. The racing cars, of which, we believe, six are being built, will have four-cylinder engines, developing 80-h.p. at a speed of from 1,000 to 1,200 revolutions per minute, the diameter of the cylinders being 170 mm. by 150 mm. stroke. The capacity of the cylinders in the 40-h.p. car is 1,640 cubic centimetres, in the 1903 60-h.p. car it is 2,052 cubic centimetres, and in the 80-h.p. racers 3,404 cubic centimetres; it will thus be seen that the motor of the new racer has a capacity more than double that of last year's 40-h.p. vehicle.

The weight of the frame, springs, and axles has been further reduced, and at the same time the strength and rigidity of the same have been increased. The cooling surface of the radiator has been doubled by a new method of arranging the tubes without increasing the volume. There are many other new features

FIG. 1.—VIEW OF CYLINDERS SHOWING NEW INLET VALVES.

about the 1903 motor, which will, if desired, have a double system of ignition. In view of the demand for Mercedes cars, the Cannstatt Company are making preparations for considerably increasing their output, and instead of building fifteen cars a month, as at present, they will soon be able to turn out forty.

Since the above was written some further particulars have reached us of the 1903 models of the Mercedes cars, together with illustrations which, in view of the great interest shown therein, we hasten to publish. In addition to the 60-h.p. car already referred to, an 18-h.p. vehicle is being introduced for the 1903 season; it will be fitted with a four-cylinder engine, developing from 18 to 25-h.p., the car, complete with tonneau body, weighing 750 to 800 kilos (14½ to 15½ cwt.). The parts illustrated herewith are those of the 60-h.p. car, but as the 18-h.p. is a replica in miniature of its big brother, the following brief description will apply to both.

To deal first with the engine. This will, of course, have four cylinders, the latter being cast in pairs. A noticeable alteration is the placing of the inlet valves directly in the centre of the cylinder head. The valves are of unusually large size, as will

be seen by a glance at Fig. 1, in which the valve in one cylinder is shown in place, while that of the other is lying on the ground. The inlet valves are mechanically operated, but the actual details of the arrangement adopted have not yet been made public. The placing of the inlet valves in a central position is claimed to not only concentrate the force of the explosion on the piston,

FIG. 2.—VIEW OF NEW FAN-TYPE FLYWHEEL AND CLUTCH.

but leaves one side of the cylinder free for the magneto-ignition gear. A new carburettor is being adopted; this is smaller than the 1902 pattern, and, while giving a perfect mixture, allows the motor to be run at even a slower speed than last year's type. Owing to the patents not yet being secured, no information with regard to its construction can, states the "Allgemeine Automobil

FIG. 3.—DETAILS OF NEW CLUTCH.

Zeitung," to which we are indebted for the illustrations, as yet be given.

Passing now to the transmission mechanism, we may first of all mention that the clutch has been entirely remodelled. Figs. 2 and 3 show the arrangement so clearly that little description is necessary. The fly-wheel, it will be noticed, is still made

D

to act as a fan to induce a current of air through the water-cooler, which, by the way, comprises no less than 5,000 tubes! A large cylindrical boss X is formed in the centre of the fly-wheel, this boss serving as the female part of the clutch. The male portion is shown at A in Fig. 3: it is of the expanding type, the segments being opened and closed by means of a semi-circular toothed rack. The clutch shaft has formed on its forward end a spiral guide, a corresponding spiral track being provided on the inside of the clutch shaft B. On the end of the outside of the latter is a toothed segment meshing with that connected with the expanding clutch. As the sleeve is pushed forward by means of the clutch pedal it is at the same time, by the spiral guides, given a rotatory motion, this being conveyed through the toothed segments to the clutch, which is thus expanded or contracted as desired.

We now come to the change-speed gear. As hitherto, four forward speeds and a reverse, controlled by a single lever, are available. Fig. 4 gives a view of the gear; the change from one speed to another is actuated by means of a disc E, on which are

FIG. 4.—VIEW OF NEW CHANGE-SPEED GEAR.

formed two grooved cams, each one operating two speeds. On the outer end of the shaft carrying the disc is a small pinion meshing with a toothed segment connected with the change speed lever. The latter is now arranged so that the four speeds are obtained one after the other, by pushing the lever forward in the quadrant. The shafts in the gear box are mounted on ball bearings.

The frame of the cars is, of course, of the pressed steel type: a change has, however, been made in the axles, which are now of T section, instead of round. The band-brakes on the rear wheel are of a new design, intended to prevent any objectionable rattling even after long use; owing to questions of patents no information regarding them can be given for the moment. Fitted with 34-tooth sprockets, and the engine running at 1,100 revolutions per minute, it is expected that the 60-h.p. car in racing trim will be capable of attaining a speed of 128 kilometres (eighty miles) per hour.

In conclusion, just a brief mention may be made of the 1903

Mercedes Gordon Bennett racers, which will have 80-h.p. motors, capable, it is said, of developing 90-h.p. Great secrecy is being shown with regard to these vehicles, but we learn from a reliable source that the motor will not be fitted in the fore part of the frame, but approximately in the centre, the driver's seat being mounted directly over the rear axle.

The foregoing few notes are by no means a complete description of the 1903 Mercedes design; they briefly summarise the principal changes that have been made as compared with the 1902 type, which we feel sure, in view of the prevailing conditions of the industry, particularly in France, will be read with more than passing interest.

SOME USEFUL NOTES.

IN the case of heavy, or very fast light cars, repair patches should always be vulcanised on the tyres. If a patch is applied with solution in the ordinary way it is sure to come off after a time, unless the car is driven at a very moderate speed. Therefore a spare inner-tube should invariably be carried.

WHEN a short stretch of new metal is encountered on the road it should, if possible, be "rushed" with the clutch out. This prevents the back tyres driving on the metal, and is a practice which, when consistently adopted, greatly lengthens the life of the driving tyres.

HAIR felt is the best thing to use for protecting the steam pipes of steam cars from the effects of severe frost. This material, which stands first on the list of combustible insulators, should be wrapped about the piping leading to the steam gauge, the automatic regulator and the water supply pipes from the water tank to the pump.

ALTHOUGH a plug in which the packing is loose may yield a good spark when the car is standing at rest, the current may be short-circuited in the plug under the influence of vibration when the engine is running and misfires result.

DURING very cold weather a considerable amount of trouble is caused by frozen carburettors. In some cars the carburettors are jacketed with a branch from the exhaust or from the water-tank, and in such, of course, no trouble is experienced. The symptoms of a freezing carburettor are: (1) Gradually decreasing power in the engine; (2) little or no response when the throttle is opened. Treatment: (1) Hot rags applied to the carburettor; (2) if there is need for haste a few drops of petrol may be poured on the carburettor (the tap between it and petrol supply being closed) and a light applied. Needless to say this method is only applicable where the carburettor is suitably situated, and should not be adopted by the novice. It requires exceedingly careful handling, or the cure may be worse than the disease.

DR. H. GROOM, of Wisbech, sends us the following "useful note":—"My man, in washing down the car, very frequently found, especially when the roads were muddy, a great trouble in washing the wheels, which receive most of the slush. To assist him I purchased a cheap lifting jack; he can now raise each wheel separately off the ground, greatly facilitating the cleansing, and saving much annoyance and trouble. If this little extra is considered too great a luxury, or too heavy to carry on one's car, a very cheap and simple device to obtain the same result can be made by getting a piece of common board, about $\frac{3}{4}$ in. thick, and cutting it to about 6 in. wide. All that is then necessary is to cut the board about one inch longer than the distance between the car axle and the ground; by placing this slanting against the wheel to be lifted, under the axle, and then carefully pulling back the car, the axle rides on the wood, and when perpendicular it affords a very simple means of raising the wheel; it is not advisable to raise more than one wheel at once. By carrying such a simple thing a great trouble is easily got over, not only in cleansing, but also in repairing a punctured tyre or even when a wheel is taken off."

MOTOR-CYCLING NEWS.

AS briefly reported in our last issue, the first annual dinner of the Motor-Cycling Club was held on Wednesday last week. Mr. S. F. Edge occupied the chair, and the company numbered altogether about sixty. In place of the ordinary after-dinner speeches, the novel feature was introduced of short papers on subjects connected with motor-cycling, the innovation being a great success. Mr. F. Straight read one on "Classification—Handicapping—Weight v. Power," and though his views on the subject did not meet with entire approval, yet the paper was listened to attentively. Mr. B. A. Hunt dealt with the subject of "Transmission and Ignition"; Mr. A. L. Owen, with the "Organisation of Motor-Cycle Clubs"; Mr. F. R. Johns, with "Fore-Carriages and Trailers"; and

THE HUMBER OLYMPIA MOTOR TANDEM.

Mr. G. F. Sharp, with "The Value of Pedals." The feature of the evening, however, was the announcement by Mr. Edge that a suitable course had been found in Ireland for the Gordon Bennett Cup race. For the 1903 season the Motor-Cycling Club has an ambitious programme, including consumption tests, hill-climbing trials, and inter-club runs.

IN view of the bitterly cold weather experienced last week, the performance of Mr. E. G. Young and Mr. J. Kich, two members of the recently-formed Nottingham Motor-Cycling Club, is worthy of mention. These two hardy motor-cyclists came up by road from Nottingham to London on Wednesday, the 14th, on their motor-bicycles to attend the annual dinner of the Motor-Cycling Club.

THE Automobile Components, Limited, of Church Street, Islington, are desirous of matching M. Maurice Fournier (riding a motor-bicycle weighing under 50 kilos and fitted with an "Automotor" engine) against the representative of any other manufacturer for a speed test over any distance from one to fifty miles for not less than £250 a side. The test is to be decided on or before the 21st prox. The weight of the complete cycle whose maker accepts the challenge is not to be more than 50 kilos. A sum of £50 has been deposited with the proprietors of the *Motor-Car Journal*, and acceptances of the challenge should be addressed to the Editor, accompanied by a deposit for £50.

AT a meeting of the Liverpool and District Cycle Trades Association on Thursday last week, Mr. G. B. Mercer, A.M.Inst.C.E., gave a lecture on Motor-Bicycles. No trouble had been spared to make the address as interesting and instructive as possible. He had got together specimens of a number of the latest types of machines, and various motor parts and fittings. After a few remarks on the origin of the gas engine, Mr. Mercer

commented on the invention of the motor-bicycle in 1885, and gave brief descriptions of the principal motor-bicycles which had been introduced between then and now. He then went on to consider the subject from the points of view of the manufacturer and the agent. The manufacturer of motor-bicycles should always bear in mind that nine machines out of every ten would fall into the hands of novices. Simplicity and reliability, therefore, should be the chief aim. The agent should buy and sell carefully, keep a machine for his own riding, and lending it freely to likely customers.

MOTOR-CYCLE races are to be included in the programme of an athletic meeting at Canning Town on Easter Monday.

TO-MORROW, Sunday, the members of the Liverpool Motor-Cycling Club will hold a run to Queen's Ferry.

ONE of the drawbacks to the *avant-trains*, or fore-carriages, now being used with motor-bicycles, is the difficulty of storage, many of them being too wide to pass through ordinary doorways. Mr. J. J. Leonard, of Brockley Grove, S.E., whose fore-carriage we illustrated in a recent issue, informs us that he is now constructing a new *avant-train* with a telescopic axle. With the new arrangement, by simply loosening a couple of nuts, the two wheels can be brought close together, thus not only allowing the fore-carriage to pass through ordinary doorways, but also enabling it to take up less room when not in use.

MR. F. MAY, of the York Hotel, Albemarle Street, W., is about to become a motor-cyclist, having a 2½-h.p. Werner on order.

THE accompanying illustration shows a new exhaust valve lifter lately introduced by Messrs. Stretton, Limited, of the Million Cycle and Motor Works, Cheltenham. The lifter is suitable for use on any motor-bicycles, and its action and principle may readily be seen from the illustration. Among the special advantages claimed for the device are its ease of adaptability to motor-

bicycles. When the valve is lifted it is held in this position as long as desired without the hand remaining on the operating lever. The normal working of the valve is not interfered with, so that the efficiency of the motor is not impaired; while, owing to the extreme simplicity of its construction, there is no fear of any part getting out of order.

THE motor omnibus to run on the St. Just road, between St. Just and Penzance, has commenced running, leaving Penzance at eight and St. Just at nine. The journey between the two places will be done in forty-five minutes.

E

CONTINENTAL NOTES.

By "AUTOMAN."

THE "Passe Partout" seems to have reached its farthest north-eastern point at Nijni-Novgorod; and there, if the correspondent of the *Velo* is correctly informed, the vehicle, in mechanical distress, has been relegated to a garage, where the unfortunate mechanic who accompanied this twentieth-century Baron Munchausen expedition is sadly contemplating the repairs to be undertaken ere he can travel again. The journey is said to have been definitely abandoned, but there remains surrounding the fiasco an idyllic event which brings a happy termination to the enterprise to at least one of its organisers—Dr. Lehwiss having successfully wooed a fair Muscovite, to whom he is to be married in Moscow.

THE frosty weather, if it has not been good for motoring in open cars, has at least had the advantage of being good for tyres, and with little possibility of side-slip. The number of auto-

and to throw the engine out of gear when necessary in riding through traffic. From the countershaft the power is conveyed by a chain to the front wheel. Although the latter serves the double purpose of steering and driving, it should be pointed out that the motor is fixed to the frame of the car, a novel arrangement being adopted to allow the transmission mechanism to move with the front wheel. Ample brake power is provided, the brakes being also so arranged that the action of applying them at the same time throws the engine out of gear with the driving wheel. M. Dumas' object has been to provide a little car to seat two persons side by side at about the price of a motor-quadracycle. Although it has only three wheels, he claims, as a result of long tests, that the stability of the vehicle leaves nothing to be desired.

THE organisation of the two "Circuits des Ardennes," Belgian and French, is proceeding briskly, and in the case of the former, which I think takes precedence in importance from the fact that the course is known and appreciated, and easily accessible from France, England, or Germany, the entries are rolling in and have already passed the half century. Amongst them there

THE DUMAS THREE-WHEEL VOITURETTE.

mobiles to be seen about Paris in every direction has been quite remarkable, but nearly all of them have been closed vehicles—Limousines, Berlines, and cars with what is called in French a "cab" on the back seat. To a Frenchman the word "cab" means "hansom cab," and therefore the covered-in back seat of the motor-car, which has a shape somewhat similar to the top of a "hansom" without, of course, the driver's seat, is called "un cab." It is astonishing the number of ladies who now ride about Paris continually in their covered motor-cars. This reminds me that the other day there was a very singular accident to a gentleman and his wife riding in a Limousine with the windows closed to keep out the intense cold. By some means the exhaust from the motor penetrated the flooring, and gradually the air became vitiated until the couple risked being asphyxiated, and it came on so gradually that they were almost unconscious before they realised what was happening, and knocked on the window for assistance.

THE accompanying illustration shows the novel three-wheel voiturette shown at the recent *Salon* in Paris by M. A. Dumas Fils, of Champigny-sur-Marne (Seine). The motive power is supplied by a 4½-h.p. water cooled Buchet engine located under the bonnet. Two speeds are provided, the motor transmitting its power by a belt to a short countershaft fitted to the steering head, a jockey pulley being provided to take up any slack of the belt

are six Panhards, nine Mors, two Mercedes, three Clements, three Napiers, etc., etc. One thing that makes the Belgian race attractive is the popularity of the chief organiser, Baron Pierre de Crawhez, president of the racing committee of the A.C.B., and also president of the A.C. of Namur. With regard to the French Circuit des Ardennes, it has been decided to keep to the categories with the limit of weight, but at the same time, as a tentative measure, there will be prizes offered for the quickest machines in each class with a given cylinder volume, the particulars of which will be shortly announced.

THE Paris-Madrid race will be commenced on Sunday, May 24th. This day has been chosen for the start for several reasons. In the first place there is a much smaller number of vehicles on the roads on Sunday, especially fewer carts, so that the racers will find less obstruction to speed, and there will be less danger over the most populated portion of the road—that is to say, the stage from Paris to Bordeaux. In the second place, the A.C.F. wants, and has always wanted, to make road racing as popular as possible, and so Sunday has been fixed to give an opportunity to the people to turn out in the largest numbers possible and take a glimpse of the competitors as they pass. Entries should be sent to the Secrétaire des Services Techniques, Automobile Club de France, 6, Place de la Concorde,

Paris, accompanied by the entrance fee, which is as follows :— Moto-cyclettes up to 50 kilos., 50 francs (£2); voiturettes between 250 and 400 kilos., 200 francs (£8); light cars between 400 and 650 kilos., 300 francs (£12); heavy cars between 650 and 1,000 kilos., 400 francs (£16). After April 15th the entrance fees will be doubled, and at 6 o'clock on the evening of May 15th entries will be definitely and irrevocably closed. M. Tampier started off last week on a little De Dion 6-h.p. car to reconnoitre the route as far as the frontier. He presented a most amusing appearance on setting out, as, in addition to several jerseys, he had donned two "peaux de biques," as the shaggy goat-skins with the hair on the outside, which are the fashion in France, are called. On Friday last week he had reached Bordeaux, where he rested for a few days before setting out again to reconnoitre the roads from Bordeaux to the frontier. Should the Cup race have to be held in France, the route chosen will probably be the old one from Paris to Bordeaux of 1901 (the Fournier year), with a circuit in addition, which will begin

SCOTTISH NEWS.

ALREADY we hear rumours of ardent motorists intending to visit John o' Groat's, starting from Land's End. But we see comparatively few come this way, and a comparison of the books kept at the respective ends of the trip would reveal scores of lost hopes and opportunities. An East Anglian motorist recently commenced his End-to-End journey, but misfortune early overtook him. He has, however, continued on his way, and news is anxiously awaited.

At a meeting of the Lockerbie District Committee, some interesting confessions have been made with regard to the roads in that district, and a letter was read from a resident of Capplegill, concerning the condition of the road between Capplegill and Moffat, in which he declared that it was positively dangerous to life, especially in these days of motor-cars. There were some precipices in places without almost any fencing, and others

THE NEW STIRLING PUBLIC-SERVICE VEHICLES FOR LONDON. (See page 902.)

at Quatre-Pavillons, where the road to Saint-Andre-de-Cubzac and back to Libourne will be taken, and then on to Bordeaux on the old road.

◆ ◆ ◆
The first automobile road in France is to begin at the Arc de Triomphe, in Paris, and end at the Croix de Noailles, in the forest of St. Germain. It will not only be an automobile road, however, as it will be nearly forty yards wide. It will have two footpaths for the pedestrians, two tracks for cyclists, a road eight yards wide for horse-drawn vehicles, a road eight yards wide for motor-cars, and a centre track for an electric tramway. It will have a total length of a little over eleven miles, and it is to be supposed that there at least motorists will be free from the trammels of the law. In this case the beautiful forest of St. Germain will be within a quarter of an hour's run of Paris for the average car—that is to say, if we take it for granted that the speed of motor-cars keeps on increasing as it has done the last few years, which I see no reason to doubt. The cost of construction is estimated at £46,500, and it will be the continuation of the Champs Elysees, the Avenue de la Grande Armee, and the Avenue de Neuilly.

with no fencing at all. A report was also read from the road surveyor, in which he stated that the line of the road was badly designed and of narrow construction, the width being only 14 ft. No matter how the road was fenced, it required to be used with caution and care. If the whole road were fenced it still would be unsuitable for motor-cars. Mr. Rankin suggested that they might put up notice boards warning drivers of motor-vehicles, as has been decided upon in the county of Surrey. Ultimately a Committee was appointed to visit the place and report upon the matter. Other motorists in Scotland might well urge similar action on the part of local bodies.

◆ ◆ ◆
In the Nairn Sheriff Court, Mr. H. J. Mappin, a resident of Surrey, and a member of the firm of Mappin and Webb, London, and William Hendry and Joseph Delmas, motor-car drivers, were charged with having contravened the Light Locomotive Regulations by driving motor-cars over the statutory speed limit. In each case exception was taken to the citations, in respect that the warrants were signed by the Sheriff-Clerk instead of the Sheriff, as required by the Act. The Sheriff upheld the objection, and the complaints were departed from.

FITTED with a 10-h.p. Albion engine, a motor-car has just been built by Mr. A. C. Penman, a Dumfries coachbuilder, which is likely to be seen in London ere long. In designing the body Mr. Penman has followed, to some extent, the familiar lines of the tonneau; the cane panelling gives the vehicle a very attractive appearance. Among other Dumfries residents to become interested in automobilism is Mr. W. Irving, a local posting-master, whose car is now on order, and whose conversion to motoring is significant of the rapid growth of the movement.

A MOTOR-CAR *mecanicien*, of Paisley, has been the hero of an interesting incident unravelled by Sheriff Campion, at Dumfries. He was summoned for driving a motor-car at more than twelve miles an hour. His solicitor pointed out that the complaint should have stated the hour at which the alleged offence took place. The Sheriff agreed that it would have been better if the time had been exactly stated, and "in justice to the accused it should be noted in future cases"—a peculiar piece of reasoning somewhat puzzling to the lay mind.

A CONSTABLE said the accused passed him on the Thornhill road going at a rate of twenty miles an hour. A telegram was sent to the police at Sanquhar, and witness followed on his bicycle. The telegram was received at fifty-two minutes past noon, and three minutes later the car passed ere he could stop it. So he wired to New Cumnock, through which place the defendant drove at 1.30. The telegram was received at 1.45, and was transmitted to Old Cumnock. The car had passed through there when the telegram was received, but a telephone message to Kilmarnock brought the wayward one to bay at that place. The accused declared that he was not the driver wanted by the police, as his route on the day in question was from Paisley, Kilwinning, Troon, and *via* Dundonald to Troon. He produced a certificate of efficiency as a driver from Lord Kingsburgh, under whom he had served at the Volunteer Brigade Camp in 1900. Taking a sensible view of the matter the Sheriff said there was no evidence that anyone had been incommoded by the speed of the car, and he dismissed the case, with the remark that when there was a broad open road with only an open hedge on each side it appeared to him like an excess of zeal to bring up a case of that kind. With our legal luminaries taking such an intelligent view of their duties, Scotland is to be preferred to Surrey for automobile touring.

THE Eastern Section of the Scottish Automobile Club has given its patronage to the Edinburgh Motor Show, to be held in the Waverley Market, Edinburgh, from the 6th to the 14th of February. On Thursday the Section had a discussion on the proposed alteration of the law relating to the regulation of motor traffic, in the Royal Hotel, Edinburgh. The date of the annual dinner of the Club has been fixed for the 13th prox.

SOME time ago it was proposed to utilise the tramway rails and trolleys in Glasgow for the removal of refuse. A sub-committee appointed to make inquiries report that the suggestion is not practicable, and the superintendent of the Cleansing Department says that the scheme which appealed to him as offering great advantages in every way was that of self-propelled vehicles, with movable covers. These might be used for the following purposes:—As dust carts for the removal of refuse; as sweeping machines, by removing cover and attaching a revolving brush; as watering carts, by removing cover and substituting a water tank and spreader; as ordinary motor lorries, by simply removing cover. In this shape they would be available for the conveyance of hay, victuals, and other material, and by the adoption of its official's view the Glasgow Corporation would be maintaining its reputation in municipal matters. The Glasgow Corporation have already adopted a Milnes petrol vehicle, with tipping body for dust-removal purposes.

LORD WILLOUGHBY DE ERESBY is interesting himself in the application of automobilism to agriculture.

A NOVEL AMERICAN MOTOR-VEHICLE.

THE novel motor-car illustrated herewith has lately been put on the market by the Holsman Automobile Company, of Chicago. Power is supplied by a 5-b.h.p. double-opposed-cylinder engine. The cylinders are $3\frac{3}{8}$ in. in diameter by 4 in. stroke; they are air-cooled by forced draught, the fly-wheel being fitted with vanes to act as a fan. The speed of the motor is controlled by throttling the mixture and timing the spark. The transmission device consists of the ordinary vehicle brake beam or shaft suspended on hangers by roller bearings and revolved in a forward direction by a simple chain connection to the motor shaft. This shaft is provided with two deep-grooved pulleys at each end; the larger one is connected by a flexible rope or band with a corresponding pulley attached to the spokes of both rear wheels to turn them forward; the smaller pulley

is adapted to engage with the tyre of the rear wheels by friction to give a reverse motion. The shaft is connected to a ratchet brake lever in easy reach of the driver, so that by setting the lever back the bands are tightened in the revolving grooved pulleys and the vehicle starts forward; by setting the lever forward the bands are loosened and the vehicle is disengaged. At the same time and by the same motion the brake is set, when, by releasing a catch and setting the lever further forward, the brake is released and the friction pulleys are at once applied to the wheels, causing them to reverse. Thus, all movements of starting, stopping, and reversing are performed by means of a single backward and forward motion of a lever. The road wheels are 44 and 48 inches in diameter, shod with solid rubber tyres. It is claimed that the vehicle can attain a speed of eighteen miles per hour.

WE hear that Messrs. F. F. Wellington, Limited, are about to remove to more central premises in Long Acre, W.C.

THE motor fire engine constructed in the workshops of the Metropolitan Fire Brigade at Southwark, has been placed in the fire station in Carmelite Street, Blackfriars.

OIL fuel is to be tried on two British cruisers. Each vessel will carry 300 tons of crude oil, and, although the burners vary in every case, the "spray jet" pattern is the prevailing type.

THE Hewitt static converter is expected to eliminate the present costly sub-stations for distributing electric power, and one of its uses will be in connection with stations for charging the batteries of electric automobiles.

MR. F. HUNT, of Fulham, owing to increasing business, is about to open larger premises at 74, Burnfoot Avenue, Munster Road, Fulham, where cars can be stored, cleaned, and repaired. Mr. Hunt is making a special feature of the repair of Gardner-Serpollet steam cars.

DRAINAGE excavation in progress in Stamford has resulted in a motor-car accident. Mr. W. J. Hornsby, of Grantham, was motoring through the town. A barrier was placed at the bottom of St. John Street, which Mr. Hornsby did not notice until close upon it. He immediately applied the brakes, and turned the car round. Unfortunately, he took the brakes off before the car had restarted its ascent of the hill, and the vehicle ran down the incline, dashing into the window of a shop.

HERE AND THERE.

A MOTOR-CAR service between East and West Hartlepool is in course of projection.

THE Flint Town Council has decided to erect notices at the entrances to the town requesting motorists to drive slowly through its streets.

WITH a capital of £500 in 1s. shares, the International Inventions Syndicate, Limited, has been registered to carry on "the business of motor-car manufacturers, engineers, mill furnishers," etc.

A SURREY horse dealer has expressed surprise at being fined at the Uckfield Petty Sessions for leaving an animal attached to a cart unattended outside a local hostelry. He had done so on market days for many years—a bad habit of which he is now probably cured.

At the meeting of the Clonmel Corporation a resolution was read from the Dungarvan Urban Council requesting the Post Office authorities to substitute a motor bus for the mail car at present running from Clonmel to Dungarvan. The Mayor moved the adoption of the resolution, which was carried.

Two Russian motorists have recently made the journey between St. Petersburg and Moscow, on a 10-h.p. car, in twenty-five hours, stops included. The distance is about 440 miles.

SOME trials have lately been made on the desert in Egypt with a heavy steam wagon built by Messrs. Jesse Ellis and Co., Limited. The wagon was tried in the desert beyond Abbassieh with half a company of Egyptian soldiers on board, and in crossing the sand splendid progress was made, the only difficulty encountered being where the sand was many feet deep; but even this set-back is remediable with special road wheels; those used have a flange in the centre of a broad tyre; this flange, as it sinks into the sand, compresses the latter right and left, making a hard surface for the two flat portions of the wheel to run on.

ACCORDING to one daily paper "the Daimler 22-h.p. car of the Motor Manufacturing Company" is on view at Earls Court—a fact which will be of interest to two neighbouring Coventry companies.

WITH regard to the question of the speed at which cars shod with solid rubber tyres may be run, referred to in our issue of the 10th inst., the Sirdar Rubber Company, Limited, inform us that their Buffer solid rubber tyres are running on cars which were formerly fitted with pneumatic tyres, at speeds up to 40 miles an hour, with every satisfaction.

CAPTAIN G. A. SMALLBONE, of West Kensington, is reported to have perfected an apparatus for steering the ordinary pear-shaped balloon. Between the balloon and the car is fixed a "consolation boom," on the port and starboard side of which are placed two sails. The sails, which can be moved at the will of the person in charge of the car, control the movements of the balloon.

THE "Auto-Velo," the French daily, will in future be known as "L'Auto."

MR. E. W. HART, of Luton, was last week elected a member of the French Automobile Club.

THE Derbyshire County Council has ordered the main road to Matlock to be rolled to allow of the King and Queen going thither by motor-car.

THE Life Saving Association of Budapest, Hungary, have recently made some tests with motor-ambulances. The results have been so successful that a number have now been placed in regular service by the Association.

IN an important decision just handed down by the U.S. Commissioner of Patents it is held that in applications for American patents a division is "required between claims covering a motor-vehicle and claims covering the steam power apparatus for use in a motor-vehicle."

AN invitation dinner was given by the Oxford Automobile and Cycle Agency last week. Mr. W. L. Creyke presided, and Messrs. F. G. Barton and R. Vincent Tapscott occupied the vice-chairs. The loyal toasts having been duly honoured, Mr. Claude Rippon proposed "The Automobile Industry." He said he would

like to see in Oxford some sort of automobile club. They had almost enough automobilists in that district to do something in that way, and if they could not support a club of their own they might do something to amalgamate with the Reading Club. Mr. A. Walsh proposed the toast of "The Oxford Automobile and Cycle Agency." He had been connected with the agency almost from its birth. It was flourishing, with its centre at Oxford and branches at Bicester and Abingdon. Mr. Creyke, in responding, said the agency was started by Mr. Barton and himself sitting down quietly and thinking the matter out. At the present time they had £3,000 worth of orders on hand for cars alone. Their

THE 12-H.P. ADER CAR, WHICH SUCCESSFULLY TOOK PART IN THE PARIS-VIENNA TOUR. (Le Chauffeur.)

employees numbered thirty-five.

BARON HENRI DE ROTHSCHILD is arranging to make an automobile tour in North Africa, with the intention of reaching a point inland further than has hitherto been visited by a motor-car. He will start for Algiers on the 10th prox.

THERE are indications that there will be quite a large number of Americans coming over to Europe to attend the race for the Gordon Bennett Cup. Mr. Percy Owen, of the Winton Company, has already arranged to bring with him a party of friends. It has even been suggested that the A.C.A. should organise a Club excursion across the Atlantic.

SPEAKING of the progress of the automobile industry in Austria, recently, Herr Ludwig Lohner said that by organising the Paris-Vienna race the Austrian Automobile Club has earned the lasting gratitude of the Kaiserstadt. A couple of months' strenuous preparatory labour on the part of the Club had resulted in an influx of strangers into Vienna such as had not been witnessed since the International Exhibition of 1873.

THE president of the Milwaukee Automobile Club has condemned a local municipal proposal to number automobiles.

THE Caledonian Motor-car and Cycle Company, of Aberdeen have been again appointed sole agents in Scotland for the sale of Peugeot cars.

TWO regular motor-car services have lately been established in Peru, one running between Tambo-Colorado and Cerro de Pasco, and the other between Sicuani and Cuzco.

THOSE who have lately been in the neighbourhood of Edgware Road, W., will probably have noticed the new motor-omnibuses which have lately been put in service between Oxford Circus, W., and Cricklewood, by the London Motor Omnibus Syndicate, Limited. We give, on page 899, an illustration showing a couple of the 'buses ready to be despatched from the works at

THE LONDON STEAM MOTOR 'BUS (HANKOCC'S) OF 1834.

Granton, near Edinburgh, of Stirling's Motor Carriages, Limited, the builders of the vehicles. They are provided with engines of 12-h.p. and have, in addition to a reverse motion, three speeds forward, the maximum being about fourteen miles an hour. The main features of the *chassis* are similar to that described in our report of the 1902 Exhibition at the Agricultural Hall. By way of contrast we illustrate the steam omnibus put on the road by Hancock nearly 70 years ago.

THE Automobile Club of America has chosen Mr. Clarence Gray Dinsmore as its delegate on the International Committee of the Gordon Bennett Cup race.

DURING the Christmas rush at the post-office at Detroit three Oldsmobiles were successfully used for the collection of parcels from sub-stations, doing the work of fifteen horses.

THE exportation of American automobiles and motor-car parts continues to show gradual expansion. The returns for November show that the shipments amounted to a value of £11,094, as against £7,876 in November, 1901. For the eleven months ending with November the exports were valued at £205,216, as compared with only £60,384 during the corresponding period of 1901.

THE Hart Accumulator Company, Limited, of Stratford, have sent us a new illustrated price list they have just issued. It gives in neat and clear style the various details, dimensions, and prices of their lighting, traction, central station, portable and ignition batteries, also sundries for use in connection therewith. The particulars have been brought up to date, and several new types of cells are included.

THE Electromobile Company, Limited, of Juxon Street, Lambeth, have just issued a catalogue of the various types of electrical cars they are now supplying—coupes, victorias, landaulets, etc. They are on the Contal system, and are equipped with interchangeable batteries, the capacity of which is sufficient for a run of forty to fifty miles on one charge. The catalogue also gives the terms for the storage and maintenance of electric cars. For the sum of £15 per month the company will house, clean, oil and keep in working order any of its vehicles; will keep its batteries in good condition, and replat them when necessary; will give a supply of current at all times to the car at any of its depots, or will exchange a fully-charged battery for an exhausted one; and will insure the vehicle against fire and damage, and provide indemnity for third-party risks.

RUMOUR is rife to the effect that the Automobile Club has abandoned the Parliamentary Bill relating to numbering, etc.

THE Automobile Club of Lombardy has just been formed in Milan, with Baron Franchetti, an enthusiastic motorist, as first president.

MESSRS. LINLEY AND COMPANY have just opened works at Hills Place, Oxford Street, W., where they intend to make a speciality of motor-car repairs.

THE Belgian Automobile Exhibition, which is to be held in the Palace du Cinquantenaire, Brussels, from the 7th to the 16th February, promises to be a big success.

WHAT is stated to be the largest heavy motor-wagon ever built has lately been completed by the Morgan Truck Company, Worcester, Mass. Its capacity is placed at 10 tons.

MESSRS. JONES AND COMPANY, of Talbot House, Lichfield, are handing to all motorists calling at their establishment a useful little card giving the distances of various resorts from their city.

THE death of Miss Helen Blackburn last week reminds us that her father drove an automobile of his own construction in Regent's Park twenty years before the advent of the modern motor-car.

A NEW steam van belonging to Messrs. Bryant and May is engaged in the delivery of matches in the eastern suburbs of the Metropolis, and Messrs. Allsopps are also using motor-wagons in their London trade.

WE are officially informed by the London, Brighton, and South Coast Railway that they cannot undertake the delivery or collection of motor-cars in connection with the forthcoming show at the Crystal Palace.

THE New Automobile Company, of Cambridge Circus, W.C., have on hand two 10-h.p. Miesse steam cars intended for the carriage of the mails in Demerara. The cars will, it is expected, be ready to be shipped to their destination in March.

MESSRS. THOMAS SLACK AND COMPANY, LIMITED, is the title of a company registered with a capital of £6,000 to acquire the business of motor-car and cycle manufacturers, etc., carried on at the Wellington Works, South Stockport.

THE FARM WAGON OF THE FUTURE.

Das Schnaufert, Munich.

A ROAD is being constructed from the Persian Gulf to Teheran, which will, according to a news agency, be most suitable for the inauguration of a system of motor-wagons, to deal with the heavy goods traffic.

A LONDON morning newspaper having just discovered that electric motor-cars can be hired in London, informs its readers that these vehicles are "capable of attaining a speed of seventy or eighty miles an hour"—quite sufficient for City traffic.

MR. D. M. WEIGEL, in the unavoidable absence of the Earl of Shrewsbury, presided at a dinner given at the Hotel Cecil, on Monday last, to the English agents of the British Automobile Commercial Syndicate. A pleasant and social evening was enjoyed.

THE STANLEY AUTOMOBILE SHOW.

DURING the week the Stanley Automobile Exhibition has been in progress at Earls Court, S.W.

Mr. L. A. Beckett introduces a new type of motor vehicle to the English market. The cars are made in two sizes—9-h.p. and 16-h.p.—and are to be known as the "Beckett and Farlow." They are built by a Belgian firm of engineers to the designs of M. E. Mathieu, who has had a long experience with motor-cars. The vehicles comprise a number of special features, which for the moment can only be briefly alluded to. In outward appearance they follow the now generally accepted design. Under the bonnet in the fore part is set, in the smaller car, a single cylinder vertical motor, rated at 9-h.p., the cylinder being 110 mm. diameter by 130 mm. stroke, and the normal speed 1,000 revolutions per minute; and in the larger vehicle a two-cylinder engine developing 16-h.p. The usual type of electrical ignition by means of trembler coil and accumulators is employed. The explosive mixture is furnished by a float-feed carburettor. A special form of centrifugal governor is employed, this working in oil in an extension of the crank case; it is adapted to act on the supply of mixture to the explosion chamber by means of a butterfly valve in the admission pipe; a small handle on the steering column is provided to enable the motor to be instantly throttled down and consequently run slowly and quietly when passing through traffic or when leaving the car for a short time. Coming now to the transmission, the motor transmits its power through a friction clutch of the progressive type to a gear box and thence by a universally-jointed shaft and bevel gearing to the rear

Messrs. Brown Brothers, Limited, exhibit one of the Brown tonneau cars, which have already been described in these columns; they are fitted with an 8-h.p. governed motor. The vehicle is gear driven, and has three speeds forward and a reverse, all actuated by one lever; radiator and pump circulation; and inclined wheel steering. They also stage one of the latest Brown motor-bicycles, in which the motor is now placed in a vertical position and attached to the frame close to the bottom bracket. It is not, however, built into the frame, and is easily detachable. The engine is of 2-h.p., and is fitted with exhaust valve lifter. The tank is located inside the frame, and contains lubricating oil with pump feed, ample petrol capacity, and leaves sufficient space to carry accumulators and coil, so that every part is covered and protected from wet.

The New Automobile Company have an interesting array of the latest types of Rochet petrol cars. First we may mention the new 6½-h.p. light car, of which an illustrated description was given in our last issue. The change-speed gear on these vehicles is exceedingly ingenious, three speeds and a reverse controlled by one lever being available, the power of the engine being transmitted direct on the high gear. Another car on the stand is the 11-h.p. vehicle, which is fitted with a most comfortable body, the production of Messrs. Whitlock and Son, of Kensington. The power is supplied by a two-cylinder engine, governed on the inlet, and fitted with Grouvelle and Arquembourg "cloissonée" radiator. Four speeds and a reverse motion are provided, the gear-box being connected to the rear road wheels through a differential countershaft and side chains. The largest and probably the most interesting car on the stand is the new 16-h.p. Rochet, fitted with a four-cylinder engine, governed on the inlet, new style radiator, and a change-speed gear, giving a direct drive on the fourth speed.

FIG. 1.—THE 9-H.P. BECKETT AND FARLOW TONNEAU.

live axle. Three speeds forward and a reverse motion are provided, all controlled by a single lever. The change-speed gear is of the usual shifting pinion type, but in the method of effecting the changes much ingenuity has been displayed. Without a drawing, however, it is impossible to clearly indicate the action of the gear, and it must suffice for the moment to state that the operation of changing speed can be effected by mere finger pressure on the side lever, and that the gear is remarkably silent. Steering is controlled by an inclined hand-wheel, and to render it absolutely irreversible, a worm and threaded nut are provided at the upper as well as at the lower end of the steering post, provision being made whereby any wear can be readily taken up. Great care has been taken to reduce losses by friction, it being claimed that from 85 to 90 per cent. of the power developed by the motor is given off the rims of the wheels.

The Duryea Motor Company display four or five 10-h.p. cars, one being a two-seated phaeton illustrating the Duryea system of "one hand control," and the other, a tonneau, having a separate lever for the change speed gear. A novel car on the stand is a phaeton fitted with a detachable brougham top. It is entirely enclosed, and has been designed for winter use, particularly by doctors. The Duryea cars have been described in a previous issue of the *Journal*, but it may be mentioned that the principal mechanical features are a triple-cylinder balanced motor developing 10-b.h.p., one piece nickel steel live axle, direct chain transmission without countershaft, throttle control, irreversible steering without worm gear, two powerful brakes supplementary to the engine, magneto ignition, natural water circulation without pumps, and one hand control. The changes in the latest models comprise a new condensing tank, with projecting ears at the rear of the body, a new detachable exhaust-valve seating, and an improved silencer.

Before leaving the Rochet Company's productions, we may briefly mention the motor-bicycles. It has already been stated in these columns that the Rochet Company had acquired the rights in, and had taken up the manufacture of, the Chapelle motor-bicycles, which are now being introduced into this country by the New Automobile Company. Three types are shown, a 2½-h.p. ordinary machine, a 2½-h.p. bicycle with two-speed gear, and a special two-cylinder racing machine developing 16-h.p. We pass now to the Miesse steam cars, of which examples of both the 6-h.p. and 10-h.p. types are staged. Since these vehicles were described in connection with our report of the 1902 exhibition at the Agricultural Hall, a number of improvements have been effected in them. The steam generator has been modified, and the pedal actuating the throttle is now arranged to work similar to the clutch pedal of a petrol car—that is to say, the pedal is depressed when it is desired to shut off the steam. Paraffin is used as fuel, but the burner is now adapted to be started by means of petrol. The 6-h.p. car carries 16 gallons of water, which is stated to be sufficient for a run of 70 miles; the fuel capacity is sufficient for a run of nine hours, at an average speed of 20 miles an hour. We are informed that in the case of a 10-h.p. car, one gallon of paraffin has sufficed for a 25-mile run.

A big display of Benz cars is made on the stand of Messrs. Hewetson's, Limited, these comprising several examples of the 6-h.p. single-cylinder vehicles, with the engine under a bonnet in the fore-part of the frame. Three speeds forward and a reverse motion are provided, the transmission being by means of a single belt and a gear box. A 16-h.p. car on similar lines, but having a two-cylinder motor and four forward speeds, is also shown. The details of the Benz cars have already been dealt with in these pages, so that no lengthy description is necessary. For the 1903 season,

the Benz Company are introducing a car with vertical engine and gear transmission, but Messrs. Hewetson inform us that they have no intention of discontinuing the manufacture of cars with horizontal motors and belt transmission.

The Velox Motor Company, Limited, have on view a 12-h.p. chassis, and a complete 12-h.p. car fitted with a most luxurious tonneau body by Mulliner, painted white with brass edging, and upholstered in red leather. As the details of the car were fully described in our last issue, no lengthy

pressure reduced, the regulator will again admit petrol to the burner, and the steam pressure is once more raised to the cutting-off point of the regulator. So efficient is this combination of pilot light and main burner that it is claimed that steam has been raised up to 150 lbs. from cold water in five minutes. The engine, which is placed as usual under the front seat, is of the ordinary two-cylinder type, with cylinders 3 in. diameter by 4 in. stroke, piston valves being fitted in place of the usual slide valves. The crank-shaft bearings are of large diameter and have ring lubrication, while the cross-heads

FIG. 2.—THE VELOX 12-H.P. CAR.

reference is necessary. We may add, however, that the vehicle shows signs of having been most carefully thought out, the chassis and the carriage work being of the highest grade. The tonneau is exceedingly roomy, and has ample accommodation for three persons. Useful drawers are placed under the rear seats, while under the rear floor board is ingeniously contrived a long, shallow drawer to carry spare tubes, etc.

Relatively new to this country are the Toledo steam cars, a couple of which—a two-seated vehicle and a four-seated *dos-a-dos*—are to be seen on the stand of the London agents, the Victoria Carriage Works, Limited. In general appearance the vehicle closely resembles the familiar light American steam cars, but the details comprise a number of new features. The steam generator is 19 in. diameter and is a happy combination of the shell and flash type generators. Two innovations enter into the make-up of the boiler—first, that of a centrifugal separator within the shells, and secondly, the addition of a superheating coil. The centrifugal action causes the entire body of water contained between the walls formed by the inner and outer shells to horizontally circulate. The rotary movement thus established throws the water against small dams or scoops placed at the mouth of each tube, which direct the water into the lower ends of the tubes, thus promoting rapid steaming. A mud-settling drum is also provided below the line of the fire action, wherein dirt may settle, and then be got rid of by a blow-off

and cranks are enclosed in oil-tight casings, the cranks working in an oil bath. A self-acting lubricator provides for the lubrication of the cylinders. A boiler feed-pump worked off the cross-head pumps water through a feed-water heater placed in the muffler, and raises it to a temperature of 208 deg. before it passes to the boiler. An auxiliary water pump ingeniously fitted to the base of the steering lever is provided as a reserve should the engine pump get out of order. An automatic air-pump is worked from the engine cross-head, and a water-lift is also provided. The frame, which is specially strongly constructed, is of seamless steel tube of large diameter, and possesses several commendatory features. Two powerful band brakes are fitted—one on each side of the differential gear—and these are applied by a pedal with pawl and ratchet, which hold the brake on in any desired position, being released by pressure on a trip on the upper portion of the pedal. The throttle and reverse are controlled by one lever, while an Albany condenser is carried below the body. The water tank has a capacity sufficient for a run of from forty-five to fifty miles; nine

FIG. 3.—THE TOLEDO DOS-A-DOS.

cock placed at its lowest point. The boiler is tested to a pressure of 600 lbs. per square inch, and the working pressure is 200 lbs. to 250 lbs. The burner is a special bronze casting, and is provided with a pilot light which, after once being lighted, maintains a steady, small flame, irrespective of the regulator. The latter acts on the main burner, and either cuts out or admits gas to it automatically. The automatic regulator action is such that steam being raised to within a few pounds of a predetermined pressure the flow of petrol is cut off. Should the carriage be started and the steam

FIG. 4.—SECTION OF TOLEDO STEAM GENERATOR.

A, Boiler. C, Water tubes.
B, Firebox. D, Burner Space.
E, Steam pipe to engine.

gallons of petrol are carried, which quantity will, we are informed, run the car a distance of from eighty-five to ninety miles.

The Haarlemsche Motorrijwielafabriek of Haarlem, Holland, show a new motor-bicycle, which is mainly noticeable for its X-frame. The motor (of 2-h.p.) is located in a vertical position just forward of the bottom bracket. Magneto ignition is adopted, the machine being entirely controlled by twisting the two handles on the handle bar. The power is conveyed by a belt to a wood pulley attached to the rear road wheel. M. Lepape, of Rue Demours, Paris, exhibits the Bichrone two-cycle motor as applied to a

bicycle. This is an ingenious idea, the motor having two cylinders, one of which, however, serves only for the compression of the charge. Without a sectional drawing, it is difficult to explain how one impulse is obtained every revolution. The $1\frac{1}{2}$ -h.p. motor is exceedingly light, weighing with carburettor only 16 lbs.

The Speedwell Motor Company have an extensive show of the latest types of Serpollet steam cars, the features of which were described in our report of the recent Paris Salon. Interest has been centred on the 1903 40-h.p. chassis, which is fitted with a new type of motor, the cylinders of which are cast separately. The 1903 40-h.p. car only weighs 920 kilos for the touring model. The pump which supplies water to the boiler as

FIG. 5.—THE SPEEDWELL CO.'S SERPOLLET LANDAULETTE.

the steam is required is operated in a new manner. In the old model a series of cams on a shaft driven by the engine gave the pump more or less lift, so that more or less water was forced into the boiler to increase or decrease the speed of the car, as the case might be. This system has been replaced by an eccentric link and a slide valve, which gives a more gradual and easier regulation to the feed water. The second principal improvement is in the lowering of the boiler and the reduction in the number of the elements, which at the same time retain the same heating surface as before. The lowering of the boiler of course lowers the centre of gravity of the car, gives it a smarter appearance, and makes it easier to mount the carriage work. Other modifications include new lubricators, throttle valve, and a self-starting device. The cars on the stand include a 20-h.p. fast touring car on similar lines to the 40-h.p., a 6-h.p. tonneau, and a 6-h.p. car with a special body designed by the Speedwell Company. This is illustrated in Fig. 5, and takes the form of a landulette, which can be opened and closed at will.

Mr. C. R. Radcliffe is the agent for a car new to the English market. It is made by the United States Long Distance Automobile Company of New York, and in general arrangement is somewhat on the lines of the Oldsmobile. It appears, however, to be more powerfully built, being fitted with a 7-h.p. horizontal engine, the cylinder being 5-inch bore by 7-inch stroke. Three speeds forward and a reverse are obtained by a system of Crypto gears, held by hand brakes, on the engine shaft, a single chain conveying the power to the rear axle.

A new Automatic Boiler-feed Regulator is shown by the Fleuss Patent Automatic Boiler Feed and Motor-Car Syndicate, Limited, which can be fitted to any boiler or steam-car; it is a simple mechanical device, and is said to keep a constant level of water in the boiler under all conditions of running, without any attention from the driver. On the stand is a Milwaukee steam-car having this feed regulator fitted to it, which is stated to have run over 1,000 miles, during which time the water level has entirely taken care of itself, the hand regulator having been removed from the car. It is claimed for the device that the steaming power of the car is much improved, as the pressure is never lowered by the intermittent pumping in of a quantity of cold water. The feed is constant and regular, and the water is heated before it enters the boiler.

Two handsome cars are to be seen on the stand of the London Motor Garage Company, Limited—a 15-h.p. Pipe with tonneau body, painted in red and black, and a 20-h.p. Magnet tonneau, painted white, and fitted with a canopy. The Pipe car is the production of La Compagnie Belge de Construction d'Automobiles, and, generally speaking, closely follows the lines adopted in the Panhard vehicles. The motor is of the four-cylinder, vertical type, with the cranks set at an angle of 90 degrees. The valves are accessible by unscrewing a single bolt and without removing any tubes. The carburettor is of the ordinary float feed variety, but with the addition of a throttle controlled by a centrifugal governor. Transmission is by gears and chains, four speeds forward and a reverse being available, all controlled by a single lever. The brakes are two in number; the one on the differential is put in action by a pedal, whilst those acting on drums on the back wheels are brought into play by means of a hand lever. All hold equally well backwards and forwards; while when either of the brakes is in action the engine is put out of gear with the transmission. The 20-h.p. Magnet car is con-

structed on similar lines, the power being supplied by a four-cylinder motor fitted with the latest system of throttle governing, regulated from the steering pillar. The "cut out" is regulated to give intervals of 30 seconds between the explosions, thus making the engine practically noiseless when the car is at rest. Transmission is by gear and chains, four forward speeds and a reverse being available. The London Motor Garage Company also stage one of the Oldsmobile cars.

Among the exhibitors of motor-bicycles are the Borham Engineering Company, who show $2\frac{1}{2}$ and 2-h.p. motor-bicycles, with the Minerva motor placed below the lower main tube of the frame. The Longuemare carburettor is fitted to the $2\frac{1}{2}$ -h.p. machine, and that of 2-h.p. has a mechanically-operated inlet valve. To avoid loss of compression the combustion chamber and cylinder is cast in one piece without joint. The tank capacity is sufficient for a run of 100 miles. The "Hamilton" motor-bicycle is exhibited by the Hamilton Motor Company, Limited, in two sizes, viz., $2\frac{1}{2}$ -h.p. and $4\frac{1}{2}$ -h.p., the latter having a double-cylinder engine. The position generally adopted by the makers for the engine is practically vertical at the rear, but it is also fitted in the front inside part of the frame, on the down tube from the ball head to bottom bracket. The machine is belt driven, and the large size of the valves is a notable detail, the valve chamber being also separate from the combustion chamber. The East London Rubber Company direct attention to the Kerry motor-bicycle.

One of the largest exhibits is that of the Lanchester Engine Company, Limited, who have on view no less than a dozen of the Lanchester cars, including a chassis, which, in view of the novel arrangement of these vehicles, has been closely examined. The leading features of the Lanchester type of motor-car were dealt with in our issue of May 31st last. We may mention, however, that the engine, instead of being placed in the front of the car, is located under the front seat, one cylinder being on each side of the driving shaft, which is parallel with, and runs down the centre of, the car. The motor has two opposite cylinders, $5\frac{1}{2}$ in. bore by $5\frac{1}{2}$ in. stroke, developing 10-h.p. at a normal speed of 700 revolutions per minute. There are two crank shafts revolving in opposite directions, and connected by a pair of gear wheels at the rear end, a short spur wheel meshing on the under side of the lower one transmitting the power through worm gear to the rear live axle. The cylinders are air-cooled, two fans, driven by frictional contact with the fly-wheel, forcing air to the radiating fins on the cylinder walls. A governor which acts on the exhaust valves is fitted. Two fly-wheels, rotating in opposite directions, are carried—one on the upper crankshaft and one on the lower. The current for the electrical ignition is produced by a special form of magneto, the forward fly-wheel carrying two permanent magnets on its inside face, which rotate round a fixed armature set on a sleeve carried on the lower engine shaft. All the connections between the magneto and the plugs are of solid steel, no ignition wires of the ordinary form being used. A wick-type carburettor is employed to furnish the mixture. Three speeds forward and a reverse are provided; the power on the high speed is transmitted direct from

MR. C. DIXON AND MR. C. PEROWNE ON 10-H.P. LANCHESTER CAR.

the engine to the rear live axle through a friction clutch and worm-gearing; an ingenious form of epicyclic change gear for the lower speeds is provided, this running in oil. Tiller steering, located on the right side of the driver, is employed. The frame of the car is of channel steel; the body is supported on the front and rear axles by short plate springs, while between it and the frame are interposed rubber buffer springs, with a view of reducing vibration. The body is most comfortably designed and upholstered; it takes the form of a roomy tonneau. Two of the cars shown are provided with detachable brougham tops, forming an excellent covering for use in bad weather.

The latest types of Peugeot cars, ranging from a handsome 12-h.p. vehicle down to the Baby Peugeot, form the attractive exhibit of Messrs. Friswell, Limited. As has already been recorded in the *Journal*, the popular "Baby" has undergone a number of improvements for the 1903 season. The 5-h.p. vertical motor has a single cylinder 94 mm. diameter, by 100 m.m. stroke, and at a speed of 1,000 revolutions per minute develops $6\frac{1}{2}$ h.p. The water circulation is maintained by a centrifugal pump driven off the fly-wheel, with large radiators in front. There are three speeds forward and reverse, running in oil. On the top gear the power is transmitted direct to the differential on the rear live axle, which is of particularly strong construction. The new Peugeot 8-h.p. has a two-cylinder engine. The governor is of the ordinary ball type acting upon the admission of the gas; in conjunction with it is an "accelerator" lever on the steering column. The lubrication is automatically maintained by the water circulation, all the "greasers" being placed on the dash-board. The water circulation is of the latest type, with honeycomb radiators and ventilating fan, located in the front opening of the bonnet.

There are three speeds forward and reverse, actuated by one lever at the side, the top speed being direct on to the differential gear without intermission. Considerable interest is being shown in the new 12-h.p. Peugeot car, the main features of which were described in our report of the recent show in Paris. The car has a four-cylinder motor (100 mm. cylinder diameter by 105 stroke), running at a maximum of 1,200 revolutions per minute; four speeds and reverse, and stamped steel frame. Both electric and magneto ignition are employed. The admission valves are mechanically operated, the same as the exhaust valves, placed opposite each other, and are interchangeable, being of exactly the same dimensions. The governor is centrifugal, acting upon the inlet; in conjunction with it are provided a pedal "accelerator" and a hand "moderator" acted on by a lever on the steering column. The water circulation is of the latest type, with a honeycomb radiator in the front. The change-speed gear is of the usual type, with one sliding sleeve carrying three gears; the fourth speed being direct to the differential. The transmission from the countershaft is by side chains. There is a compensating brake on the hind wheels. It is operated through a bar placed across the car and pulled at its centre; at each end of the bar the brake rod of one wheel is attached, in such a manner that the rod takes a position which compensates the brakes and makes the friction on each one the same. The hand brake on the differential is of the progressive type, and works in oil. The approximate weight of the chassis is 14 cwt. From the foregoing it will be seen that the 1903 Peugeot cars are well abreast of the times.

The only heavy vehicle shown is the five-ton lorry of Dr. A. W. Brightmore, of Egham Hill, Surrey. This is of novel design and construction, the engine, boiler, and transmission being all mounted on a two-wheel tractor, which forms the front pair of wheels of the lorry, these wheels thus serving both for driving and steering; the forecarriage, being self-contained, can be taken out of one vehicle and attached to another. The carrying platform is connected to the forecarriage by a swinging hinge joint, so that each wheel always gets its proper proportion of load, however uneven be the road. By this means any communication of strain from the carrying platform to the machinery is rendered impossible. When unloaded over three-quarters of the weight is carried by the driving wheels. The steering is positive, and, owing to the short wheel base, the vehicle can be manoeuvred in restricted spaces. Owing to the power being always exerted in the direction of motion, there is claimed to be no side-slip. The boiler is of the fire-tube type and works at a pressure of 200 lbs. per square inch, coke being used as fuel. The engines are of the horizontal, compound type, the cylinders being 4 in. and 7 in. diameter by 6 in. stroke; at a speed of 450 revolutions per minute they develop 35 h.p. Provision is made for admitting high-pressure steam to both cylinders, in case of need. The connecting rods and cranks run in oil, a two-speed gear being enclosed in the same case. The differential countershaft conveys the power to the front road wheels by means of Renold silent chains. A novel feature of the vehicle is the steering; this is what Mr. Brightmore calls the "momentum" type, and reminds us of the two-wheel cycle of the early cycling days; each of the two halves of the differential shaft carries a sort of band-brake; by a slight movement of a hand-wheel either of these can be applied, and its half of the differential shaft, together with the corresponding road wheel, held rigid. So long as the two wheels revolve at the same speed the vehicle will take a straight course, but if one of the wheels be held more or less rigidly the other will travel faster than it, causing the vehicle to take a circular course. The Brightmore vehicle contains a number of other special features, and deserves the careful attention of all interested in the transportation of heavy loads.

The Motor Traction Company, Limited, have on view samples of the 15-h.p. four-cylinder and 7½-h.p. two-cylinder Germain cars, the Holden 3 h.p. motor-bicycle, and the "F. N." 1½-h.p. motor-bicycle, the features of which have previously been described in the *Journal*. They also stage two new types of cars, of 7 and 10-h.p., which they have named the "Salisbury." These follow the now generally-adopted lines of engines under a bonnet in front, clutch, gear-box, differential countershaft, and two side chains. One of the 10-h.p. cars has a two-cylinder motor, known as the "Monarque," the other is driven by a Buchet two-cylinder engine. Both vehicles are provided with three speeds and reverse motion, electric ignition, a governor which acts on the inlet, and other up-to-date fittings. The 7-h.p. Salisbury car is on similar lines, but is fitted with a single-cylinder Aster engine. These vehicles appear to be well finished, and doubtless more will be heard of them in the near future.

The Motor Manufacturing Company, Limited, have one of the largest

exhibits, comprising carriages varying in power from 8-h.p. to 20-h.p., two chassis, engines and sundry parts and accessories. Four types of motor-vehicles are displayed. First we may mention the M.M.C. 8-h.p. single-cylinder car, similar to that which gained the gold medal in Class C of the Automobile Club's 650 miles Reliability Trials. This is fitted with three speeds forward and reverse, and has recently been improved as regards the steering, which is now of the irreversible type. The wheel base has been lengthened and extra strong chains adopted. The gear is very easily changed, the pairs of gears being always in mesh. The car is an excellent hill-climber, and is at the same time very fast on the level. One of this type of vehicle is shown fitted with an American buggy top, and is intended for South Africa. The M.M.C. 10-h.p. two-cylinder car is now fitted with a new closed end motor, a patent governing device acting on the induction pipe. In connection with the latter it should be mentioned that when the throttle valve is closed, shutting off the supply of mixture, an auxiliary air valve is opened, thus allowing cold air to be drawn in and assist in keeping the valve chambers and cylinder cool. The vehicle has three gears, being always in mesh, controlled by one lever, equal 32 in. wheels, water-cooled brake, and foot accelerator. The design and finish of the carriage body and upholstery is well up to the M.M.C. standard. The M.M.C. 12-h.p. four-cylinder car is a well-known type. It has electric and tube ignition, four speeds forward and reverse, gravity feed to engine and burners, water-cooled brake, automatic lubrication, and equal 34-in. wheels. The engine in this car is so well balanced that the vehicle when running is practically silent, and no vibration from the pulsations of the engine is felt by the passengers. The largest car on the stand is a 20-h.p. four-cylinder vehicle, with the latest type of closed-end motor, governed on the induction. It has a foot accelerator, which cuts the governor right out; three speeds and reverse (the change gear being always in mesh), water-cooled brake, and mechanically-operated lubricator for the engine. It is geared to attain speeds up to 45 to 50 miles per hour on good roads. The particular 20-h.p. car we examined has been built for Mr. J. Joel, and is fitted with a most comfortable tonneau body, having ample room for three persons at the rear.

The British Automobile Commercial Syndicate, Limited, have two very large stands, on one of which are staged several Panhard cars, with Clement-Rothschild bodies, including 10-h.p., new long frame 7-h.p., and 15-h.p. vehicles. It is on the stand devoted to the new Clement cars that attention has, however, chiefly been centred, these ranging from a 5-h.p. voiturette to a 24-h.p. car. In the brief space at our disposal this week a full description of the new features of the 1903 Clement cars cannot be given. It must, therefore, suffice for the moment to state that they are being made in three sizes—9-h.p. two-cylinder, developing 11-h.p.; four-cylinder 12-h.p., working up to 16-h.p.; and 16-h.p. four-cylinder, giving 24-h.p. To merely tabulate the new points, these comprise a throttle on the inlet by means of which the speed of the engines can be varied from 120 to 1,200 revolutions per minute; the coolers are of the Beehive type, there being no water tank other than the cooler; behind the cooler is a fan to induce a draught through the tank; all valves are mechanically actuated, all the valve stems being operated off one cam shaft. The ignition is by magneto, driven by spur gearing. The chassis is of hydraulic compressed steel; the clutch is a new one, of the expanding and contracting type, the surfaces being metal against metal. Four speeds and reverse are provided, the top speed being direct, without the intermediary of any gear wheels. The transmission shaft runs on a phosphor bronze bearing the whole of its length. Any type of body can be fitted to the chassis, including tonneau, double phaeton, limousine; a novel one for England takes the form of a luxurious coupe, built by Clement-Rothschild. The B.A.C. Syndicate also show a useful little 5-h.p. delivery van, suitable for tradesmen; it is intended to carry loads up to 17 cwt.

The Burlington Carriage Company, Limited, display one of the latest De Dietrich cars—a 16-h.p. tonneau on the Turcat-Mery system, and also a chassis. Although combining many of the best points of the latest Panhard and Mercedes practice, the new car exhibits much originality in detail. Broadly, it follows the standard arrangement of vertical motor in the fore part of the frame, friction clutch, change-speed gear, and two side chains. The motor comprises four cylinders and develops 16-h.p. The governor runs in an oil bath case, and magneto ignition is employed. The cooling system is so arranged that, should the pump fail, natural circulation proceeds in a manner sufficient to allow the motor to be still driven. The carburettor is fitted with a regulator or throttle, by means of which, and the firing control, the motor is claimed to be as flexible as a steam engine. The various details have been carefully thought out, this being especially noticeable as regards the friction clutch, which can be adjusted with very little trouble.

Messrs. Stern Brothers' specialities are so favourably known to motorists that it is a matter of general interest to mention that their lubricating oils, etc., are now being put up in smaller quantities. The Sternoline spring-pressure lubricators and sight-feed lubricators for cylinders are also on view.

A good show of accessories is made by Messrs. Steiner and Company, who make a special feature of motor horns, one of the novelties being a combined lamp and motor horn. The blowing of the latter part of the device does not put out the light, thus providing a useful combination. Messrs. Joseph Lucas, Limited, have a varied collection of "motoralities," including lamps of every description for automobiles, horns, lifting-jacks, tyre repair outfits, valves, pumps, grease injectors, the Wells-Lucas "motoil," etc. "The King of the Road" head lamp occupies a conspicuous position on the stand.

CORRESPONDENCE.

NUMBERING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Under the present Act a speed of fourteen miles per hour is provided for, and would be the legal limit, were the twelve mile regulation imposed by the Local Government Board withdrawn. This might well be done at once, and thus allow the working of the extra two miles allowed by the Act being tested in practice.

How any reasonable person can advocate that motor-cars should be disgraced by having to bear a prominent official number passes my comprehension. A properly-used and well-conducted motor-car should rank exactly as any other variety of gentleman's private carriage; it has an equal right on the road, and to be treated as any other vehicle. Because coal carts and railway goods luries, etc., never travel over four miles an hour, have they any right to claim that gentlemen's carriages, which rush by drawn by high-stepping and excitable horses at eight or ten miles an hour, etc., should bear identification labels, etc.?

Then why should these two classes unite and urge that motor-cars, which are under far better control, be subjected to the numbering indignity because they can, and do, travel at a higher rate of speed, and, as has often been tested, with perfect safety and under superior control?

If anything should be required when the speed is considerably extended or withdrawn, I would suggest that in cases of reckless driving "to the common danger," which, when brought before the authorities, were adjudged proved, and the driver convicted, fined, and cautioned, a second conviction (should the case appear serious) might, in addition to the fine, required the carrying an official identifying number for three months, and on a third conviction a fine and six months' numbering. This would speedily weed out reckless men, and all considerate users of the road would enjoy the same rights and privileges as other carriage owners.—Yours truly,

SAM'L. OKELL.

REPREHENSIBLE PROCEDURE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We send herewith some interesting correspondence that has taken place between certain purchasers of our cars and ourselves, relative to bogus claims put forward by certain motor agents for commission on imaginary introductions. As this is a growing evil, it should be at once put down by manufacturers. The *modus operandi* is as follows:—An agent gets to know who is buying a car in his neighbourhood, and then, ascertaining the maker's name, writes to the latter to the effect that, after a lot of trouble, he has persuaded the purchaser to buy the said car, and expects commission on the sale. In one case we have had applications from no less than four agents. We do not say all agents are the same, far from it; but it behoves manufacturers to avoid those guilty of such practices, and to warn their clients from placing repairs in their hands.—Yours truly,

THE BEAUFORT MOTOR COMPANY.

[COPY.]

FROM AGENT TO COMPANY.

"GENTLEMEN,—We had hoped to have called on you with our client, —, but, owing to having been laid up for a few days, we could not meet him at your place. We shall be glad if you will kindly reserve us the usual introductory commission on the car he has ordered from you—12-h.p. car, to be delivered first week in January; and we also understand from him that you are supplying a driver. He has already on order from us a 12-h.p. of another maker, and we have also to get him a mechanic for this car. We may be in London to-morrow, and will call if we have time.—Yours faithfully,

FROM COMPANY TO CUSTOMER.

"DEAR SIR,—We are exceedingly sorry to trouble you, but we have had applications from three local agents for commission on the car sold you.

"Would you kindly say if our cars were introduced to you by an agent, or if such an agent persuaded you in your choice of a car?—Yours faithfully,

THE BEAUFORT MOTOR COMPANY.

[COPY.]

FROM CUSTOMER TO COMPANY.

"DEAR SIR,—In reply to your letter of yesterday, saying that you had received applications from three local agents for commission on car sold me. I wish most positively to state that your cars were not brought under my notice by any agent, firm, or private individual, and that every application to you for commission should be treated as an attempt to extort money under false pretences. I have only had dealings with one agent, who sold me a car, and cannot even guess who the other two are. I may add your car was brought to my notice by an advertisement in the *Motor-Car Journal*.—Yours faithfully,

PETROL STRAINER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. M. F. Lyons, the strainer I use consists of two discs of fine brass gauze separated by a washer, placed in the union of petrol

pipe to carburettor. The particular sample of gauze I used was the kind adopted in paper-mills for running paper pulp on, and of very fine mesh; in fact it was some "scrap" from a local paper mill. If such fine gauze is unobtainable from an ordinary metal warehouse it can be got from scientific instrument makers.—Yours truly,

R. W. BUTTEMER.

AN UNIQUE EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Saturday afternoon I started with a friend on a 40-h.p. Panhard for Cobham, the afternoon being perfect, and the roads dry and very dusty. We arrived at Cobham, and having had tea got ready for the return journey. It was raining heavily and freezing at the same time. We waited some little while in the hope that the rain would cease, but, after finding that it did not do so, started for London. The road was slightly slippery at that hour, 6.30 p.m., and I proceeded with caution, but finding that the car did not slip much, increased the pace a little. Having traversed the Cobham Fair mile, I descended a hill, and up another, when, upon descending the next steep hill, I turned completely round three times, and the front of the car stopped right upon the bank, very quietly, and with the vehicle completely across the road. I got off the car, immediately falling down. When I got up again, I noticed that the car was gradually slipping sideways down the hill. I then reversed, and when I let in the clutch the car commenced to slide down the hill, broadside, and there we were unable to move, on a steep hill; not even able to start the engine, because the vibration made the car slide. After waiting an hour, and only seeing two cyclists, we had the luck to find a man with a cart, who helped

THE INDIAN CHIEF "WALK-UNDER-THE-GROUND" TRIES THE 12-H.P. DAIMLER.

[The Biograph Studio.]

us to push the car to the wrong side of the road, with the tonneau against the opposite bank, and we three actually pushed the front of the car into the gutter. The roads were completely covered with a layer of ice $\frac{1}{2}$ -inch thick. Having got into the gutter on our wrong side, my friend just pushed the car very slowly down the hill, no engine working, and the next hill took us exactly twenty minutes to ascend: down another hill with the motor not working, and the last hill into Esher took us over half an hour, all the wheels flying round at a tremendous pace, and the car moving about 6 feet in four minutes; at last I called out to my friend to place one of the rugs under the off-side wheels. He did so, and the flying wheel sent the rug back quite ten yards. At last we arrived at Esher, and decided to place the car at the Bear Hotel, which stands slightly higher than the main road, but to get there was another question, and, after cutting very many circles, and waltzing about in the middle of the road, with the old "40" roaring like a bull, we got some rope and tied it round the back wheels. At last we crawled into the yard, having taken three and a half hours to go from Cobham to Esher, a distance of about three and a half miles. Hundreds of people came round at Esher, and many laughed so much at our capers that they fell down. I think that this is an unique experience, and I shall not forget for many a day the car sliding gradually down the hill, like a sleigh, and being quite powerless to assist her, if she had once got away.—Yours truly,

JOHN D. HILL.

OFFICIOUSNESS REBUKED.

At the Croydon Borough Bench, George L. Warsop, of Croydon, appeared to answer a summons for acting as conductor to a metropolitan stage carriage, on December 12th, without a license. Police-constable 321 W said on December 12th he saw the motor 'bus, owned by the Bromley Autocar Company, in North End, with defendant riding behind and assisting passengers out. He had no badge, but admitted that he had collected the fares of the people inside. Defendant explained that he was a motor expert, and when the 'bus was brought down to Croydon he was employed to keep the mechanism in order. On the day in question he collected the fares of the two or three passengers, to help the driver. He had no conductor's licence, nor had he been instructed to perform a conductor's duty. The Bench, under the circumstances, dismissed the case.

A similar course was adopted in the summons issued against Jas. Ernest Carter, of 3, West Street, Bromley, secretary of the Bromley Autocar Company, Limited, for allowing Mr. Warsop to act as conductor without a license.

MR. C. JARROTT ON MOTOR RACING

MR. MARK MAYHEW, L.C.C., presided at the Automobile Club on Friday, the 16th, when Mr. Charles Jarrott read a paper on "Motor Racing: Sporting and Educational." Having given a history of the important motor races held since 1895, when M. Levassor drove a 4-h.p. carriage in the Bordeaux-Paris race—732 miles in just under forty-nine hours—Mr. Jarrott went on to speak of the value of motor racing to the manufacturer and to the public. It had been contended that the expense to the manufacturer of entering vehicles for the big races had grown to such enormous proportions that he lost more than he could possibly gain by having a racing programme. Of course, it followed that the longest purse had the best chance of winning, and the most moneyed firm might derive the greatest benefit from racing, yet the general benefit to the trade and the good derived by the industry more than compensated the many manufacturers for their outlay. They all remembered the consternation which was occasioned through the interpellation of M. Gautier de Clagny in the French Chamber of Deputies, brought about by the incidents which occurred in the Paris-Berlin race. The edict of the Government that in the future racing would not be allowed caused the greatest consternation among the French manufacturers and others interested in the business, as they foresaw the harm the French industry would sustain if racing were permanently stopped by the Government. The case set out by the various French papers was so strong, and the interests at stake so great, that it was impossible for the Government to fail to appreciate that it was to an enormous extent owing to the fact that France had organised and run the big motor races that she owed her position in the motor world. The claims of the manufacturers, the claims of the users, and the claims and large interests of the allied trades, were too great, and it was interesting to observe that the first race of last year was organised by the Government itself as a part of their programme for encouraging the use of alcohol in motor cars, thus making another source of income for the agriculturists of the country. It could not be doubted that the rapid evolution which had taken place in the automobile industry had been due to the French races. Instead of the unstable, short wheel-base cars which might have been used even to the present day, the increase of speed attendant upon the fitting of more powerful engines, built originally by the manufacturers solely with the idea of winning races made the building of much more stable cars an immediate necessity, and the comfortable touring cars they were using at the present day owed their inception to the racing cars of two or three years ago. The necessity of fitting wheel steering, longer springs, stronger axles, larger tyres, and the thousand-and-one improvements that could be mentioned in comparing an up-to-date car with one constructed five years ago, owed their origin to the consideration of these points by the manufacturers when constructing their racing models. It was only when they started to decrease the weight of their cars that tyre difficulties became somewhat less troublesome. He had heard it said that tyres to-day were much better than they were before, and that stronger tyres were used. Possibly they were; but there was a day when to drive out on a car fitted with pneumatic tyres was to make it more than a certainty that one would be repairing one or all of them before one could get back again. Cars were heavier, tyres were lighter, and it was from racing models the lesson was so quickly learned. With the enormous engines that were now being fitted to racing cars, and the construction and devices employed to crowd as much horse-power as possible into the 1,000-kilo. limit, the margin of safety was non-existent. Nevertheless, it followed without question that, if certain forms of construction would go through the trials attendant on a long and arduous race, and undergo strains far more trying than would be the case with ordinary use, they might be fairly certain they were right. Of course they knew perfectly well that the English manufacturer was rather inclined to allow his foreign brethren to do the racing, and then, when certain results had been obtained, make use of the knowledge so gained. But this always entailed being at least twelve months behind in England, and, although twelve months might not seem a very long time, nevertheless the importance of keeping right up-to-date must be apparent to all. He was not suggesting that it would be policy on the part of the English manufacturers to build cars for Continental racing; but, at the same time, it was well for them to realise the value gained in the participation in competitions with foreign competitors. Having given some personal experiences in Continental races, Mr. Jarrott concluded with some advice to those who would like to race,

yet did not like to participate because they could not win: "Race first, obtain the necessary experience, and, provided you have the necessary amount of skill and judgment, *that good luck* which at one time or another visits all of us who take part in competitive sport will visit you, and your turn as the winner of one of the big events will come!"

At the conclusion of the reading of the paper Mr. R. W. Wallace made an announcement as to the procedure to be adopted in securing that the Gordon Bennett race should be run in Ireland, and a hearty vote of thanks accorded to Mr. Jarrott closed the proceedings.

FURIOUS DRIVING CASES.

*Motor-cycle case.

ALLEGED NEGLIGENT DRIVING.

At Brompton County Court (London), on Tuesday, before Judge Stonor and a jury, William Wilkins, a painter, of West Kensington, brought an action against Captain Kenneth Campbell, Queen's Gate, W., claiming £25 in respect of personal injuries and damage to plaintiff's bicycle and clothes, said to have been caused through the defendant's negligent driving of a motor-car. Mr. E. G. Mears appeared for the plaintiff, and Mr. Staplee Firth defended. The plaintiff stated that on November 15th last he was riding his bicycle along High Street, Kensington, towards Earl's Court Road. When near the new Cathedral, riding steadily on his near side, the defendant came along on his motor-car, and without giving any warning whatever "bashed" into him from behind. His (plaintiff's) machine was smashed up; his clothes were all torn to shreds, and his left wrist was badly injured. Next day the defendant offered to give him £2 and an old suit of clothes to settle the affair. Captain William Greig, of Kensington, stated that he saw the motor-car, without any warning whatever from the driver, "run down" the plaintiff. Witness asked defendant why he did not turn out to avoid the cyclist, and defendant said that the road was too slippery for him to do so. The defendant in evidence said that the plaintiff was riding his bicycle along the middle of the road, and as witness rode his car behind the man swerved suddenly to the left, in spite of witness shouting, "Look out." The offer which he made to the plaintiff was clearly explained to be without prejudice. The jury returned a verdict in favour of the plaintiff, assessing the damages at £7. His Honour gave judgment accordingly, and allowed costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JANUARY 31, 1903.

[No. 204.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AT a meeting of the Literary Society at Auchterarder, the Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice-Clerk of Scotland, has delivered a lecture on "The Development of Power Traction on Roads," dealing particularly with the history of the motor-car and its development. He spoke of the difficulties and obstacles which had been placed in the way of the pioneers of motor traction, humorously referring to

the placing of large stones on the roads, the digging of cross trenches, and the imposition of prohibitive tolls, which had killed the movement in the beginning of the last century, and said that even yet much of the opposition to be encountered was due to ignorance and prejudice. He enumerated a large number of points in which the automobile was superior to the horse carriage, and prophesied a great and useful future for the former. The lecture was illustrated by limelight views of cars ancient and modern, a number of which were highly amusing. Mr. W. S. Haldane, W.S., of Foswell, presided over a large attendance. On the motion of the Rev. W. S. Muir the lecturer was accorded a hearty vote of thanks, while a similar compliment was paid to the Chairman on the motion of Councillor Campbell.

Motors for Men of Moderate Means.

IN the course of his paper at the Automobile Club last week, Captain Kenneth Campbell said he had found, since taking up motoring, a considerable saving in train fares and the attendant cabs in going to and from stations, tips, &c. On a touring car one went from one's own door to that of the friend one was to visit, and, at the same time, had the additional advantage of travelling rapidly through the beauties of English country scenery, instead of the boredom of being boxed up in a railway carriage. Upon long journeys, to Scotland for instance, 150 miles might be taken as a comfortable day's run. Many towns and charmingly-situated villages were passed through and comfortable inns visited. There was room for improvement in some of the inns, but as the motor industry grew in England more cars would be put on the roads, and the inns throughout the country would improve and derive benefit from increased business. Unfortunately a discussion such as that which followed can hardly be of practical value, so many factors entering into the conclusion of the matter.

A Vague and Hazy Discussion.

MUCH depends upon the way the car is driven; upon the character of the roads traversed; upon the weight of the car and the speed usually indulged in. Then again there is the necessity for accurate comparison of the horse powers of the cars as well as for an accurate system of book-keeping and of counting the mileage. If speakers could make definite statements upon all these points there might be something of a practical nature evolved; but, in the absence of any such general classification, we are afraid the outcome of the debate must be as vague as the notion of what constitutes "a man of moderate means."

Motor-Cars and Elections.

MR. HENRY NORMAN, M.P., writes to the *Westminster Gazette* a useful article on elections and motor-cars, mainly based upon the experiences of the successful candidate in the recent Newmarket election. In an ordinary rural constituency, he says, a candidate with a good car can make a round of the district during a morning—a saving of time that makes a material difference in a short campaign. There is, however, apart from the mere matter of convenience, another striking effect of the automobile at elections:—"A motor-car evokes enthusiasm—quite apart from the political issues of the fight. As it goes flying along, with its huge placard in front displaying the name of the candidate in letters a foot high, with its merry hum and the rousing blasts of its horn, everybody cheers it and waves his hat, the occupants cheer and wave back, and the train of enthusiasm it leaves behind is as evident as its own two broad tyre-marks in the mud. Enthusiasm on polling-day means victory." But the point occurs to us, what will happen when all political candidates, recognising the necessity of the motor-car, become possessed of such vehicles? Will he who reverts to the ancient coach and four be placed in a more favourable position?

Dismissals.

OUR list of cases of alleged furious driving is notable this week from the fact that no less than five dismissals are recorded. Evidently magistrates recognise that there are limits even to their own prejudiced feelings, and that common sense must be respected. At York, the Lord Mayor has expressed the view that the Act under which these cases come before the Bench "might, to some extent, be considered obsolete." At Cardiff, too, the stipendiary has said, "it was of the essence of the offence that someone must be in danger," and in the case against Mr. Thomas, of the South Wales Motor Company, "nobody was in danger, and the summons would therefore be dismissed." Verily a Daniel come to judgment!

Driving in Towns.

MR. HOPKINS, the magistrate at Lambeth, had a case before him on Tuesday which served as an opportunity for him to rebuke those motorists who ignore the police regulations in crowded places. They should discriminate between the city and the village, and remember that a pace which might be perfectly safe in the open country becomes an intolerable nuisance, if not an actual danger, when indulged in along a busy thoroughfare in a town. Fortunately the majority of motorists recognise this distinction, and we must confess to no feeling of sympathy towards those impatient drivers who disregard the safety of pedestrians and of horse-drawn traffic in crowded districts.

The Eastbourne Tenders.

CONSIDERABLE curiosity is being felt as to the development of the movement for instituting a service of motor-omnibuses in Eastbourne. Already we have mentioned that tenders have been received from various firms, and of these nine have been referred to the Electricity Committee for further consideration. The tenders for petrol cars, which are to be fully considered, are those of the Motor Manufacturing Company, Limited, Stirling's Motor Carriages, Limited, G. F. Milnes and Co., the Thornycroft

Steam Wagon Company, and Messrs. Karminski and Co. The claims of a petrol-electric vehicle on the Fischer system are also to be examined, as well as tenders for electric vehicles by Messrs. Salmon and Sons, the City and Suburban Electric Carriage Company, and the British Schuckert Electric Company.

A Novel Combination.

As we mentioned in a recent issue, the internal-combustion motor is steadily being adapted for other purposes than that of driving motor-cars. We were, however, hardly prepared for the novel application which has been discovered by an agricultural engineer at Nîmes, who was called upon to devise some means of spraying insecticide in a large vineyard in the wine-growing district of France. The land being of a hilly nature, the use of an instrument on wheels was not possible, so he hit upon the novel idea of mounting a petrol motor and sprayer on a horse's back. The motor is a horizontal one running

at a speed of 800 to 1,000 revolutions per minute. We give an illustration of this novel combination of horse and petrol motor, which, according to "La Locomotion," has been found to answer the requirements most satisfactorily. Our contemporary does not tell us what the poor horse thinks of its unusual occupation!

Look after the Car.

MR. HATHERLEY WOOD, son of General Evelyn Wood, V.C., is a motoring enthusiast, and although he has used an automobile constantly for four or five years, has never been late for an appointment through a breakdown. This immunity from trouble is attributed to the fact that he never starts on a journey without making absolutely sure that everything is in running order. If every motorist would take this precaution much delay on the road would be saved, and the character of the motor-car for reliability substantially advanced in popular estimation.

A Change for the Better.

WHILE our neighbours across the Channel have thoroughly appreciated the importance of clearly explaining the exact mechanical construction of their cars, with working drawings, British builders, except in a few instances, have not hitherto shown any marked tendency to reveal their methods of construction and the operation of the various working parts. The purchasers of automobiles are rapidly becoming educated in what may be called automobile mechanics, and are quick to appreciate a well-designed piece of mechanism. We are quite aware that pending patents and the like have in some cases restrained manufacturers from properly describing their cars, but these restrictions are not permanent ones, and every maker should endeavour to give the fullest and clearest information to the prospective user. A marked improvement has, we are glad to say, taken place in this direction during recent months. Whereas it was formerly, in the majority of new English cars,

only possible for us to publish pictures giving views of the outward appearances of new vehicles, drawings of the various parts being practically refused, the latter are now being furnished as a matter of course when any details of new automobiles or of improved models are sent us.

Useful Manuals.

ANOTHER change for the better on which we may congratulate several of our motor-car builders is the step they have taken in compiling manuals, giving clear descriptions of the various parts and methods of adjustment, etc., for the use of purchasers of their cars. Although in large centres motor-vehicles are generally purchased of agents or manufacturers' branch houses, many cars are despatched to residents of small towns and country districts. These purchasers in many cases must learn for themselves the way to operate their cars, a task which may be simple enough when properly undertaken, but for a man who does not know the exact difference between a four-cycle engine and an eight-day clock it is no easily self-tutored task. It is not possible for the maker to send an expert with every vehicle despatched from the works, hence the need for a clearly written manual which may act as a silent instructor. If properly written and compiled it should be sufficient to furnish the embryo automobilist with practically all the information needed to enable him to take to the road for the additional knowledge which experience alone can teach. The production of a really successful manual is not an easy task; it is almost habitual with many technical writers to forget that the elementary reader may know little or nothing of the elementary facts concerning the subject at hand. It is not enough to tell the prospective motorist what to do to certain elements of the car in order to start it. It should be assumed that he does not even know them by name. He should be told what they are for and why they are on the car. It is easier for him, knowing what their function, to determine what to do with them than it is for him to know what they are for by simply being told what to do with them. As we have said, the necessity of instruction books has now been recognised by several concerns, among these being the Wolseley, Duryea, and the Lanchester, the latter's book being referred to elsewhere in the present issue.

A Large Northern Show.

THE Liverpool Seventh Annual Cycle and Motor Show is not unlikely to compare favourably with some London exhibitions. There has been an unprecedented demand for space, the largest being that taken up by the Light Car Department of the Road Carrying Company, Limited. There will be an inaugural luncheon in the library, St. George's Hall, Liverpool, on Tuesday next, when it is hoped that Lord Derby, president of the Liverpool Self-Propelled Traffic Association, will be present and subsequently declare the Show open. The exhibits will include up-to-date examples of automobiles, and those of our readers in the North-Western, Northern, and Midland counties who may be unable to visit London should attend the Liverpool Show.

American Reliability Trials.

AMERICAN manufacturers are considering the question of future endurance contests in the United States, and they are being asked to consider the advisability of holding a Reliability Test from New York to Chicago in October, or a series of tests starting from a central point, and conducted somewhat on the lines followed in this country last year. Questions of appearance and comfort are hardly likely to be seriously considered in the contest, these being matters of individual preference. The one thing which the purchaser has difficulty in arriving at is how a vehicle will withstand in continuous service, and the object of a reliability contest should be to throw as much light as possible on this point. That the Americans are recognising the value of long trials as opposed to short runs is proof of the

advance that is being made on the other side of the Atlantic. The institution of endurance trials on British lines will probably influence the constructors of cars to modify the present light types and give their vehicles the stronger appearance associated with the automobiles of other countries.

Against Numbering.

ALTHOUGH they did not come to any resolution with regard to the numbering of cars, it was very evident at the last committee meeting of the Sheffield Automobile Club, that they considered the present state of affairs better than having automobiles labelled, as has been suggested in influential quarters. Already so many of the provincial clubs have declined to be associated with the agitation for numbering cars that we really think the time has come for the central organisation to reconsider its position in the matter. From our Correspondence columns this week it will be seen that Colonel Magrath—who will be remembered as one of the prominent participants in the 1,000 Miles Trial—has been communicating with the Club,

chairman of the general council of the Scottish Automobile Club, opened the discussion by explaining the draft of the proposed Bill. An animated criticism of the various points followed, and after a discussion of nearly two hours, in which the following took part—Messrs. John Wilson, Oliver, Connell, Dunderdale, Sleigh, Hunter, Croall, Townsend, and Hawkes—a resolution was proposed by the chairman of the Eastern Section, and seconded by Mr. Macmillan, honorary secretary, as follows:—“That the Eastern Section of the Scottish Automobile Club are of opinion that while they are in favour of the removal of the speed limits, they consider that it is a mistaken policy for the Automobile Club of G. B. and I. to introduce any Bill into Parliament; that the true policy for the Club to pursue is to act on the defensive and watch jealously any attempt to alter the present regulations; that the A. C. of G. B. and I. should continue its splendid work of impressing on motor-car drivers the necessity of not only driving with care, but with consideration for the safety of other users of the road, as well as of educating Parliament and other authorities as to the safety and convenience of motor cars.” This resolution was passed unanimously,

THE LIVERPOOL FIRE BRIGADE'S MOTOR CHEMICAL FIRE ENGINE (see page 1924).

suggesting that all members should have an opportunity of expressing their opinion on the subject. In answer it has been pointed out to him that this would mean communicating with two thousand people, while only those who can be present at the meeting would be competent to express an opinion on the contemplated Bill. This, however, seems rather an absurd position to assume, considering the matter has been so long before automobilists that practically every one of them has made up his mind on the subject. If the Club would institute a plebiscite of the members, there is no doubt that a general idea of the strength of the opposition could be obtained, and the Committee would be able to recognise how little it represents the opinion of motorists on this important subject.

Scottish Opposition.

EMPHASIS to our view of the matter comes again from north of the Tweed. Last week the Eastern Section of the Scottish Automobile Club had a discussion on the Hon. Scott Montagu's proposed Bill for the identification of motor-cars by numbers or otherwise. Mr. Norman D. Macdonald,

and the secretary was instructed to send a copy to the secretary of the A.C. G.B. I.

The Motor-Car to the Rescue.

ONE of the dangers inseparable from horse-drawn carriages, and at the same time the better control of the motor-vehicle, received illustration at Chorley last Saturday. A horse, frightened by a brass band, rushing madly along Preston Road, drawing a dog-cart with two alarmed and almost helpless passengers, knocked down and ran over a boy who happened to be playing in the road. The unfortunate youth was quickly taken to the local hospital on the steam car of Mr. G. T. Brown, J.P. (Ex-Mayor of Chorley and a member of the North East Lancashire Automobile Club), who happened to drive up just after the accident. Frequently have incidents occurred of the automobile coming to the rescue in most expeditious fashion. If an accurate census of the accidents due to restive horses could be made, it would probably prove a great factor in allaying the prejudice against the automobile.

The Derby Club's First Run.

THE opening run of the members of this newly formed club took place on Saturday afternoon, when twelve cars and a motor-cycle participated in a trip to Loughborough. The meet was held outside the gaol, and despite the extremely unfavourable weather there was a large attendance of the public. The members present were Mr. C. J. Allin (hon. sec.), 8-h.p. Rex; Mr. C. Turner Leech (hon. treasurer), 8-h.p. Deauville; Mr. G. F. Smith, 12-h.p. Gladiator; Mr. C. L. Schwind (vice-president), 10-h.p. Daimler; Mr. R. A. Wilson, 6-h.p. Gladiator; Mr. E. V. Clarke, 16-h.p. Panhard; Mr. C. H. Guest, 8-h.p. De Dion; Mr. F. H. Collumbell, Excelsior cycle; Dr. W. G. Copestake, 3½-h.p. Benz; Mr. W. P. Duncombe, 8-h.p. Daimler; Dr. R. J. Arundel, 8-h.p. Argyll; Mr. E. C. Clarke, 8-h.p. Progress, and Dr. Vaudrey (vice-president), 3½-h.p. Benz. Forty-two passengers were carried. The Bull's Head at Loughborough was made the termination of the run on the outward journey, and the repast provided there was presided over by Mr. Schwind.

Side Slip Competition.

WE understand that, in connection with the proposed side-slip competition, it has been decided to have an eliminating test for devices obviously unworthy of further test. Runs will be made on tracks prepared with a coating of slippery clayey or similar material, and longer trips will be arranged on limestone or other natural greasy roads—preferably in the Peak district of Derbyshire. More details have yet to be considered, but the foregoing suggestions will probably be made the basis of the competition.

Cordingley's Exhibition.

IN view of the short time that will elapse before the opening of the great Motor Car Exhibition of 1903 at the Agricultural Hall, London, it had been the intention to give a list of exhibitors this week; but the pressure on our space and the urgency of a page advertisement coming at the moment of going to press has prevented its fulfilment. The list will, however, be published next week, and will reveal the fact that the display will not only be the latest but also the largest of the three London shows for the present year. As has already been intimated, the space on the ground floor of the large hall and in the minor hall has been allotted; and the only vacant stands are to be found in the gallery, where many prominent firms will be located, and electric, steam, and petrol cars—the latter including Panhard, Prunel, and Pieper—will be shown. The staircases leading to the galleries are numerous, wide and easy, while the two-ton lift enables cars to be conveyed thither without trouble or delay.

Display by the Aero Club.

IN addition to the splendid show of automobiles, an attractive feature of the Exhibition will be a display of models of airships, balloons, etc., by the Aero Club of Great Britain and Ireland. A similar section at the Automobile Exhibition at Paris was a popular department, and the addition of aeronautical matters to the Agricultural Hall exhibition should prove equally acceptable in this country.

The Tyre Trials.

AFTER having inspected the competing tyres, both on the road and in the garage, travelled upon the cars, watched their running over a piece of road selected on account of its unevenness, examined the diagrams obtained by Professor Hele-Shaw with the British Association apparatus, witnessed the removal and refitting of an inner tube of each type of tyre, and devoted time to the examination of the covers and damaged inner tubes when removed from the cars, the judges appointed by the Committee of the Automobile Club have made recom-

mendations as to awards as follows:—First prize, £100.—The set of tyres (T. 2) entered by the Dunlop Pneumatic Tyre Company. Second prize, £50.—The set of tyres (T. 7) entered by the Collier Tyre Company. Third prizes of £10 have been awarded to each of the remaining four sets which satisfactorily completed the 4,000 miles test, and are, in the opinion of the judges, in order of merit, as follows:—Dunlop (T. 1), T. 3, and T. 4; Maison Talbot Tyre Syndicate, T. 6.

The Reliability Trials

THE sub-committee recently appointed to draw up formulae for the trials to be held by the Automobile Club has recommended that: (1) Marks shall be given for "Accuracy of advertised h.p.," which is to be taken from the best performance of the car on any one hill. (2) Three marks per mile are to be awarded for each day's run as Reliability marks; deducting one mark per minute for stoppages as before. 1500 marks allotted for "Cleaning, adjustments, and replenishing," deducting one mark per minute as usual, to apply to Crystal Palace deductions only. (3) Marks:—

3000 for Reliability.	500 for Speed.
1500 " Cleaning, etc.	250 " Dust.
1500 " Hill Climbing.	250 " Restarting on hill.
500 " Condition.	250 " Vapour or smoke.
250 " Brakes.	250 " Appearance.
250 " Steering.	250 " Accuracy of h.p.
250 " Silencer.	250 " Fuel Consumption.
250 " Vibration.	

(4) Fuel consumption marks to be:—Full marks for thirty miles per gallon for car weighing one ton laden: marks for ten miles per gallon for car weighing one ton laden. Full marks for forty-five miles per gallon for car weighing half a ton laden: marks for fifteen miles per gallon for car weighing half a ton laden. (5) For price deduct from the grand total one mark for every £1 sterling above the minimum of the class at which the car is entered. (6) Hill climbing formula =

$$\frac{S \times (P + 6)}{(\mathcal{L} + 2000)} \times \frac{A \times C}{N}$$

S = speed in miles per hour on hills; P = number of passengers carried; £ = price in pounds; N = the number of hills on which Trials are held. A = the average gradient in percentage; C is a constant (117). (7) Formula for speed:—

$$\frac{S \times (P + 6)}{(\mathcal{L} + 2000)} \times 3000$$

THE motor-cars taking part in last Saturday's 100 mile non-stop trial of the Automobile Club were a 12-h.p. Gardner-Serpollet, a 12 h.p. Humber and a 12-h.p. Farman.

WE hear that Messrs. Thornycroft and Company are building a heavy motor-wagon for the War Office. It will have a capacity of 5 tons, and be driven by a 45-h.p. heavy-oil motor.

THE Peninsular and Oriental Company are considering the question of establishing a motor-car service to convey the staff between their works at the Albert Docks, North Woolwich, and Tilbury.

THE proposed automobile racing track is about sixteen miles from London and will have a six and a half miles circuit. A financial scheme in connection with the matter is shortly to be considered by the executive committee of the Automobile Club.

THE Vulcan Motor Manufacturing and Engineering Company, Limited, has been registered with a capital of £10,000, to take over the business of motor-car makers and repairers, etc., carried on by Messrs. T. Hampson, J. Hampson, and E. Hope at the Drill Hall, Southport.

THE War Office has decided as a tentative measure to grant allowances to officers employing privately-owned motor-cars on duty, the rates being as follows:—For a four-seated vehicle 4d. per car mile, three-seated 3d., two-seated 2d., and one-seated 1d., and for a car having more than four seats, in addition to the four-seated rate, 1d. a mile for each passenger in excess of four for whom travelling expenses are allowable.

M. SANTOS DUMONT'S "NO. 9."

SINCE the discovery of the present shaped balloon by the brothers Montgolfier, aerial ascents have always formed exciting episodes to those who have once tasted the pleasures of standing in the car of an aerostat, perhaps watching, on a cloudless day, the earth passing in a panorama before them, listening from aloft to the hubbub of the noisy world; or, should the day be cold and cloudy, ascending into the ethereal regions and basking in the bright warm sunshine, pitying the poor worldlings shivering and suffering on the mere terrestrial sphere. Ballooning, like motoring, is looked upon by the man in the street as dangerous, but statistics prove that, considering the many thousands of ascents, very few fatal accidents indeed have happened. These have mostly been through the use of the obsolete "inflammable air" vessels or through theorists arguing and essaying to prove their arguments, that as birds fly by means of the strength of their pectoral muscles, so could a man perform similar functions by the aid of wings adjusted on like principles. Hence the reason of many so-called flying machines being built.

The ancients, according to all accounts, experimented but little in aviation, although some of the Grecian philosophers appeared to think that there was a similarity between navigation and aerostation, their theory being that the atmosphere was of no great height, and that when the top of this was reached the vessel or airship would float as the ships float on the sea.

Archytas is reputed the father of aeronautics, according to Horace, who states that it was reported that this mathematician had constructed a bird, with internal machinery so nicely balanced, and "air so cunningly concealed," that it would soar aloft and around and return to the same spot from whence the philosopher had caused it to ascend. In the dark ages flying was usually left entirely alone, and only witches, etc., were supposed to use the air, and this for the purpose of carrying on their nefarious practices, for which they usually paid the penalty in some drastic form or other.

The improvements up to the present on the Montgolfier balloon have been relatively but few, the introduction of valves by Mr. Green—the inventor also of the trailing-rope—and the substitution of coal-gas for fire being the chief. Even in the eighteenth century journeys of over 100 miles were not infrequent, while in the earlier portion of the nineteenth century a voyage by Leonardi of over 400 miles was made in this country. And now, with the introduction of the petrol motor, it remains to be seen what the results will be in this twentieth century. Aviation seems a study that seizes people, and for a time becomes a craze, and then languishes; but at the present moment money and brains are being expended in various quarters, and although these experiments have not been altogether so successful as wished, yet the fact that dirigible balloons have been successfully steered round the Eiffel Tower by M. Santos Dumont, and by Mr. Spencer across London, leads us to hope for successful developments in the near future.

The leading builder of air-ships is M. Lachambre, of Vaugirard, on the outskirts of Paris. His mighty sheds and extensive uncultivated grounds are on the top of a hill. Here are invented and made those pneumatic toys of which the Parisians are so fond, and use so freely on *fete* days. Here also the modern dirigible airship is made, and a visit to his manufactory is one to impress the beholder with amazement. Scores of balloons are hanging deflated, from lines, yards high, and the cheerful and skilled guide, recognising each, rapidly runs through the names of their owners. To the amateur they are so many lengths of a light-coloured tarpaulin, but to the professional they are specimens of the finest work in Japanese silk, sewn and varnished as can only be done in this interesting and highly scientific manufactory.

From this hill, among others, has set out, full of life and hope, M. Severo, going to his death with a smile on his face; M. Bradsky with his assistant, to that dreadful fate so fresh in the memory of our readers; and here, lying cheek by jowl with M. Santos Dumont's "Number Nine" is the debris of the wreck—the two

absolutely touching each other. The great four-cylindere petrol motor, cracked and broken, the burnt petrol tank, the twisted piano wire—portions of which many Parisians are wearing as scarfpins—the partially burnt silk, the debris of the cage, etc.; but here the plucky little Brazilian works, not daunted by the evidences of his predecessors' gruesome fate. Beside M. Severo's apparatus M. Dumont's looks but a toy, and to gaze at it imagining a human being ascending to the heavens with such a machine cannot but cause the observer to shudder. The sight caused a feeling of vertigo to the writer, and Colonel Templer, head of the Balloon Department of the War Office, who was present, exclaimed that he would feel a criminal if he sent anyone "up" in such a frail looking thing.

The total weight of the whole apparatus, with motor, spirit and "all on" is 180 lbs.; the shape is like a whale, with the basket near the front, and so narrow as only to hold the slight person of

A SNAPSHOT AT PONTARLIER, FRANCE.

(Le Chauffeur.

the aeronaut; a tin steering-wheel, set vertical fashion, two levers on wheel, one for the sparking and one for the clutch. The motor is a two-cylindere V-shaped, air-cooled, similar to those used on the Clement bicycle, and gives 3-h.p. This is placed at the rear of and on a level with the floor of the basket; the dry batteries being between the two. The petrol tank is in front of the basket, and the silk-lined bamboo-framed propeller at the rear. The motor is hung on slight steel stays, and is held in position by piano wire. It drives an 18-feet hollow shaft, running on bicycle ball-bearings, the whole length of the slight V-shaped wooden frame. The distance from end to end is 27 feet, and the rudder is in the shape of a bamboo screen at the rear of the whole, and is operated by piano wire. The impression given is that it is a beautiful toy—but not a machine to conquer the aerial regions—although M. Dumont is of opinion that the present No. 9 is still too heavy, and he is now at work on No. 10, which will be of a much lighter design. Developments must therefore be awaited, and as the inventor has already been "up" so many times it is to be presumed that he has full confidence in his own skill and is aware of the risk he is running.

D

A SPARKING PLUG "DISCOVERY."

A CURIOUS and interesting feature connected with sparking plugs is described by M. Baudry de Saunier in a recent issue of "La Locomotion." It appears that for some time past the men whose duty it is to test the motors in Messrs. Panhard and Levassor's works in Paris have been in the habit of arranging the high-tension wire from the coil, which is usually attached to the ends of the sparking plug, in such a way as to set the end of the wire about one or two millimetres from, but not attached to the outer end of the central rod of the plug. The men found that this arrangement afforded them two advantages. In the first place they are able to see if the current is passing properly to the plug, and in the second they benefit by the interesting and hitherto unexplained fact that when the circuit is completed a spark jumps across the gap between the end of the high-tension wire and the central rod of the plug, and also across the platinum points of the latter within the cylinder, however much the points may be sooted or covered with oil.

It was quite by chance that this interesting discovery was made. Messrs. Panhard and Levassor conceived the idea of protecting the exposed ends of sparking plugs by means of an ebonite cap C (Fig. 1). Under the top of the cap was fitted a metallic boss K, the cap itself being attached to the sparking plug as shown. A light copper spring connected the boss K with the end of the plug to complete the circuit for the current. One day, upon taking off

FIG. 1.

FIG. 2.

FIG. 3.

the ebonite cap from a plug it was found that the copper spring conductor was absent, but, notwithstanding the change in the cylinder to which the apparently faulty plug was fitted, fired perfectly. This was not particularly remarked at the time, as the spark given off by the coil at atmospheric pressure was about 15 mm. in length, and the distance it was required to jump by the absence of the conducting spring was not more than 2 to 3 mm. It was, however, noticed that, no matter how much the particular sparking plug served by this apparently faulty connection was smothered in oil, it sparked as well as ever, while it altogether failed to spark when connected up in the ordinary way. M. de Saunier leaves the explanation of this phenomenon to electricians, but shows by means of the drawings (Figs. 2 and 3) how motorists may adapt their plugs to permit of the oil-defying jumping spark. A shaped collar E, made in ebonite, or in some substance which is a non-conductor of both heat and electricity, is screwed on to the plug as shown. It carries on its projecting arm a small copper angle piece drilled and tapped to receive the terminal M, to which the high tension wire from the coil is attached; the terminal should be so made that the point N can be brought within 1 to 2 mm. of the rod projecting from the end of the plug.

The new arrangement does not, says M. de Saunier in conclusion, in any way increase the power of the engine, but it certainly causes the plug to spark properly notwithstanding any deposit that may form on it due to over-lubrication, while it considerably simplifies the work of searching for faults in the ignition circuit.

THE 1903 ARGYLL CAR.

FOR the coming season the Hozier Engineering Company are devoting attention to two types of "Argyll" cars, one fitted with the Clement two-cylinder 10-h.p. engine, of which we give an illustration on the following page, and one fitted with a De Dion 9-h.p. motor. The improvements in the 1903 models comprise a self-adjusting friction clutch, claimed to be absolutely free from end thrust. The inner ring which is mounted in the fly-wheel is made to slide, and is held in position by three bolts round the fly-wheel. In this way, after the clutch has worn considerably, the inner conical ring can be forced further into the fly-wheel and so put a greater tension on the clutch spring. The inner ring can also be easily withdrawn from the fly-wheel for the purpose of thoroughly cleaning the leather face of the clutch. The gearing has been considerably enlarged, the depth of the clutches being increased and dovetailed on both sides so that there is no tendency for them to fly out, even when the car is driving the engine downhill. The earlier arrangement of gear wheels is preserved, but the method of actuating the forks has been redesigned, and a link motion takes the place of the old cam system. The lever which operates the second and third change speed fork is made flexible, and should the gear be forced the flexible lever yields and prevents any damage being done to the clutches. The change-speed hand lever moves from a central position in three opposite directions. When it is pushed outwardly across the car the first speed is introduced; when it is pulled towards the driver's seat the second speed is engaged, and when pushed forward the third speed is obtained. In each direction the change-speed lever goes to a full stop, so that there are no notches to find and therefore a mistake cannot be made in changing gear even in the dark. The lid of the gear box is held down by two "dogs," and it is only necessary to unscrew two nuts to remove it. The gear can then be easily lifted out, no pit being required. A separate lever is fitted to actuate the reverse. For the two-cylinder engine a very large cooling bonnet has been designed on the well-known Argyll system. To those who prefer a pump this can also be fitted, and should the pump break down the car can be driven just as well without it, the circulation continuing on the thermo-siphon system. The back axle runs on large roller bearings. We may add that all the Argyll cars are now fitted with an aluminium cover under the mechanism, so protecting the latter from mud and dirt.

A CATALOGUE of the Chenard and Walcker cars has been issued by the Weston Motor Syndicate, in which are specifications of the 10 and 14-h.p. touring carriages introduced by the firm. The illustrations include a chassis and also a sectional drawing of the combination clutch and brake, which is one of the special features of these vehicles.

MR. P. H. SELFE, of Hull, sends us a sheet of drawings illustrating a new spring frame for motor-cycles and cars he has designed and patented. For the car a novel form of central driving wheel is provided. Mr. Selfe claims that his arrangement, in addition to reducing the vibration, entirely gets over the skidding difficulty.

THE New York Telephone Company has just adopted a heavy electric motor-wagon for the hauling and handling of big cables. Hitherto it has been necessary to cart the cables, on their drums, to points of distribution. There manually-worked windlasses were secured in position and six men put to work drawing the cable through the underground pipes. The manholes are approximately 280 feet apart, and it takes the six men thirty minutes to pull a cable through, in addition to the time occupied in setting up and taking down the hand windlass at each point of operation. With the electric wagon and its windlass the cables are conveyed to the point of entering and then the truck moves on to the next opening. Here an electric windlass is brought into action, and the 280 feet are negotiated in seven minutes, this being as fast as the cable can be fed.

SOME USEFUL NOTES.

AFTER grinding in the exhaust-valve the compression is sometimes unaccountably poor. This may be due to uneven grinding, so that part of the valve does not fit closely to the seating. To test this, smear the seating with a thin film of oil coloured with red lead, and place the valve *gently* in position. Now remove the valve, and notice whether the coloured oil is uniformly distributed round it. If any part is left uncovered, this indicates the badly fitting portion, where the leak of compression takes place. The valve must then be reground, the operator's pressure being so distributed as to remedy the defect.

COMPRESSION is never very good when tested immediately after the exhaust-valve is ground in, when the engine is cold. It is only after the engine has run for a time, and the valve and seating have grown hot, that they become thoroughly adapted to one another, and the compression is appreciably improved.

NEVER use rubber tubing in the petrol connections, because (1) petrol is a solvent of rubber, consequently it will become contaminated by the dissolved material; (2) petrol will percolate through the rubber, causing much waste and a possible danger

WHEN the inlet-valve spring is not strong enough, the valve does not close with sufficient sharpness, and some of the mixture is swept back, by the rising piston, through the inlet pipe, towards the carburettor. Great care should be exercised in seeing that the inlet-valve spring is sufficiently strong in cars of the $3\frac{1}{2}$ -h.p. Benz type, in which the carburettor is near the contact-breaker, and has its air-inlet so situated that a draught blowing through the inlet pipe, *away from* the engine, will spray petrol vapour out of this air-inlet on to the surrounding mechanism. When this occurs, the petrol may be ignited by a spark from the adjacent contact-breaker, and a serious conflagration result.

THE water in acetylene lamps is best preserved from freezing by dissolving calcium chloride in it. But if this precaution is not taken and the water is frozen, a little saliva on the carbide will produce enough gas to light it and thaw the water, and so allow of a permanent light to be obtained.

WE have been asked several times for a recipe for removing tarnish from brass when it would not give way to an ordinary polish. We offer the following: Take a strong oxalic acid and rub on freely, let stand for one minute and wash off with water. Polish with an ordinary brass polish.

THE 1903 ARGYLL 10-H.P. CAR. (See page 914.)

from fire; (3) small particles of rubber may become detached from the tube and be swept into the carburettor, where, sooner or later, the symptoms of a blocked spray will develop.

IN cars in which there is much vibration, and in motor-cycles, ignition troubles are sometimes due to shaking loose of the insulation in the coil. This can usually be remedied at the cost of a few shillings, but the job should only be entrusted to a repairer of assured experience.

WHEN the spray-chamber of a carburettor is opened, droplets of water are often found adherent to its walls. This frequently causes needless mental perturbation to the novice, for water in the carburettor is usually held up to him as one of the bogeys of the motorist, and that it is so is true enough, but only if the water is present in the spray-chamber in considerable quantity, or in the float-chamber, and has free access to the spraying nozzle, which it may block. The vaporisation of petrol in the spray-chamber produces a very low temperature, and the presence of water (which should be periodically soaked up with blotting paper) is due to condensation of moisture from the air drawn in. This has no appreciable effect on the running of the motor, unless allowed to accumulate for some time. Water can only reach the float-chamber *via* the petrol-tank.

MR. H. G. CLIFFORD writes:—"When reading 'Useful Notes' in your practical *Journal*, an important hint *re* care of pneumatic tyres when stabling cars occurred to me. It is concerning the weight of the car resting on one portion of the tyres, which are in most cases deflated from gradual leakage. The kink formed in the outer cover by the rim of a heavy car pressing it to the ground can have nothing but a damaging effect on the rubber and fabric at this one spot, and anyone wishing to carefully stable his car, if for only a few weeks, would do well to see that each axle is jacked up so that the tyres are at least half an inch from the ground."

THOSE who purchase motor-cars for use on all kinds of roads will do well to see that the vehicles they purchase are fitted with good brakes. Double-acting brakes are better than single-acting ones, and two brakes much better than one, but the point of greatest importance is that the brake be thoroughly well made, so that the sudden thrust with which it is likely to be applied in an emergency will not strain any of the parts.

If a Michelin valve leaks in spite of the tight screwing-up of the dustcap, remove the central wire of the valve and apply a little grease to its conical rubber extremity. In most cases this will establish a permanent cure.

THE WYDTS ELECTRO-CATALYTIC IGNITER.

THE electro-catalytic igniter was presented to the public for the first time at the 1901 Salon in Paris, where it excited much curiosity by reason of its great novelty, similar interest being aroused in motoring circles in this country by the description which appeared at the time in the *Journal*. In the interval, the device has been the subject of much experiment, and is now being put on the market in a perfected form by Messrs. H. M. Hobson, Ltd. The electro-catalytic igniter, as its name implies, utilises at the same time as electricity the effects of catalysis offered by metals of the platonic series. Certain alloys of these metals, such as iridium, rhodium, palladium, osmium, ruthenium, etc., possess in a high degree the catalytic power. The alloy which enters into the composition of the electro-catalytic igniter is claimed to possess this property of automatically igniting the gases of explosion motors in the highest degree. The igniter (Figs. 1 and 2) consists essentially of a body, B, screwed outside to the thread of the ordinary sparking plugs, with an inside passage C, leading to a chamber H in which is fixed a coil K of a special alloy, producing by its intense incandescence the ignition of the gases driven into the chamber by the compression stroke of the motor. The coil K is supported by the piece A screwed in the body or shoulder B. At E is a milled nut under which the wire *d* (Fig. 3), conveying the electric current to the device, is clamped. The apparatus is entirely of metal, porcelain being wholly excluded, so that there is no fear of breakage. The fitting of the apparatus is extremely simple. It can be effected in a few seconds in the following way:—1. Screw the igniter C in the place of the ordinary sparking plug; 2. fix, by means of a screw, within reach of the driver, at the most convenient spot for operation, the small rheostat P (Fig. 3); 3. place the small accumulator or battery G in its usual place; 4. connect the terminal A of the rheostat P to the igniter C by means of an insulated wire *d*; 5. connect the terminal R of the rheostat P to any one of the terminals of the accumulator G by means of an insulated wire H;

FIGS. 1 AND 2.

6. connect by means of a third insulated wire *f* the remaining terminal of the accumulator G to earth by attaching it to any point of the motor T. To start the motor with the new ignition, after having carefully regulated the carburation, the slide M of the rheostat P is placed about midway between A and R (advance, retardation) and the starting-handle turned. If after a few attempts the motor does not start, the slide M is moved a little more towards A and so on. When the motor is started the

advance or retardation of the sparking is obtained by shifting the slide of the rheostat P towards A or R. After some time, when the igniter is quite hot, if the carburation is perfect, the electric current can be cut off by bringing the slide of the rheostat right over to R, when the ignition will be effected automatically, simply by the catalytic effect. The advance of the sparking will also be effected in this case by moving the slide of the rheostat towards

FIG. 3.

A. The motor is stopped by suppressing the admission either by interrupting the carburation or opening the compression-valve—after first cutting off the electric current by bringing the slide of the rheostat to R. Among the advantages claimed for the electro-catalytic igniter are: 1, entire absence of porcelain; 2, no trembler or induction coil is necessary; and, 3, advance and retardation of the sparking obtained instantaneously. If the electro-catalytic igniter is used on a motor-cycle, the adjusting rheostat can, if necessary, be dispensed with: in its place a simple switch is inserted, which may be the ordinary switch-handle on the handle-bar of the machine. In this case the speed is adjusted either by varying the exhaust, if the motor has such adjustment, or by varying the cut-off of the gas, or by slightly varying the carburation.

FIFTY friends of the Earl of Kinnoull presented a motor-car to his lordship on the occasion of his marriage on Saturday.

A PUBLIC service of motor-omnibuses has just been started between Orvieto and Albegna, Italy, to connect two different lines of railway.

THE DUKE OF SANTO-MAURO, the President of the newly-formed Automobile Club of Spain, has just made the journey from Paris to Madrid by road, covering the 930 miles which separate the two cities in 49 hours.

OWING to increasing business the Wilkinson Tyre and Tread Company, the makers of the Wilkinson non-slipping cover, are removing from Princess Street, to larger premises at Chapel Hill Mill, Huddersfield.

AT the annual general meeting of Friswell, Limited, held on the 20th inst., the balance-sheet was presented to the shareholders. The sales amounted to £68,666, and it was decided to pay a dividend of 6 per cent. on the preference shares and 10 per cent. on the ordinary shares. The balance of £3,260 was carried forward.

THE Lanchester Engine Company, Limited, have sent us a copy of a descriptive manual they have just issued of the Lanchester motor and carriage. It gives a clear description in non-technical language of the various parts of this novel vehicle, together with illustrations of the chassis, motor, and many of the details. A good deal of time and trouble has apparently been spent on the production of the manual which will be found invaluable by all users of Lanchester cars.

The Humber 20-h.p. Car.

FIGS. 1 AND 2.—ELEVATION AND PLAN OF FRAME.

It has been known for some time that the Humber Co., Ltd., were at work on the production of a 20-h.p. car, of which we are able this week to publish a description and illustrations. The general appearance of the vehicle is very striking,

wide, 5 ft. 8 in. high; and the weight about 21 cwt. The frame (Figs. 1 and 2) is of tubular construction; it is constructed to give great strength combined with lightness, and one of the principal features is the method of attachment of the gear box. The

FIG 3.—CROSS-SECTION OF HUMBER 20 H.P. FOUR-CYLINDER MOTOR, SHOWING MECHANICALLY-OPERATED VALVES.

FIG. 4.—PLAN OF HUMBER 20-H.P. FOUR-CYLINDER MOTOR.

on account of its fine body and long wheel base. The centres of the wheels are 9 ft. 6 in. apart, the track being 4 ft. 3 in. The over-all dimensions (with body) are 13 ft. 6 in. long, 5 ft. 4 in.

latter is supported on a cradle, so arranged that, by the removal of the four nuts supporting it, the whole may be lowered to the ground without interfering with the body or the gear. It is

fitted with a transversal front spring at the front, and two semi-elliptical springs at the rear, two horizontal tie rods to the bottom of the gear box taking the shocks of the road from the springs.

The four-cylinder motor (Figs. 3, 4 and 5) has cylinders $4\frac{1}{2}$ in. diameter by $5\frac{3}{4}$ in. stroke, and although nominally rated at 20-h.p., is capable of giving 26-h.p. on the brake at a speed of 900 revolutions per minute. It embodies all the latest improvements in motor practice, including mechanically-operated inlet valves and throttle governor. The valve chambers are placed one on either side of the cylinder, the valves being operated by the usual arrangement of cams and cam shaft, driven off the crank shaft by means of gear wheels. One of these wheels carries the governor, which is connected to a throttle valve located in each of the two inlet pipes. The governor and gear wheels are enclosed in an oil-tight case and placed in front of the crank case in an accessible position. The Longuemare carburettor is carried on the crank case arms and immediately beneath the inlet valve

FIG. 5.—GENERAL VIEW OF HUMBER 20-H.P. FOUR-CYLINDER MOTOR—INLET VALVE SIDE.

box, and contains separate valves for the regulation of gas and air, controlled from the dashboard. The valve covers are so constructed as to hinge in the centre, and all that is necessary to examine either valve is the removal of one nut. The contact breaker, placed conveniently on the dash, is driven by a chain from the cam shaft, and has a neat arrangement whereby the wires remain stationary when the ignition is advanced or retarded. The aluminium crank case is well provided with inspection doors, reducing the work of examining the movable parts of the engine to a minimum.

The ordinary radiator with water tank, or the new honey-comb type radiator, can be fitted, coupled with a fan which sends a strong current of cool air through the bonnet. In either case the radiator is arranged to swing down by the patent Humber method, and the bonnet is being hinged to the dash so that it may be swung quite clear, allowing perfectly free examination of the working parts of the engine. The water is circulated by means of a semi-rotary pump.

The drive is taken through an aluminium conical clutch, so arranged that no end thrust comes upon the shafts. A flexible shaft connects it to the gear box, and thence through a Cardan shaft to a live back axle of special construction. The thrust due to the bevel wheels is taken up by a ball race and an adjustable thrust bearing on the end of the pinion shaft. Four speeds forward and a reverse motion are provided, controlled by a single lever.

The steering is of the worm and segment type, and capable of adjustment, both as regards the position and angle, so that the driver can alter it to suit his requirements.

The body contains several novel features. The front footboards are protected by side doors, which give increased comfort to the passengers and a neat appearance to the body. On either side of the tonneau, and easily accessible from the outside, are special compartments, one of which is used for the carriage of spare petrol, while the other may be utilised as a receptacle for tools, inner tubes, or other useful articles not required regularly. Underneath the footboard of the tonneau is a compartment large enough, and intended for the reception of a spare outer cover, and affording room for a considerable amount of other spare parts, etc.

The brakes are powerful and double acting, both being interlocked with the clutch. Among the other notable details of the car may be noticed the single arm steering wheel, which gives ready access to the mixture and throttle valve levers; and

FIG. 6.—THE HUMBER CHANGE GEAR BOX.

the drain cock, which serves the double purpose of drain cock and oil lever gauge, fixed on the dashboard in such a position as to show at a glance the height of petrol in the tank.

THE Locomobile Company of Great Britain, Ltd., have been appointed agents in Great Britain for the Waverley electric cars.

WE understand that Sir Edward Jenkinson has resigned both the chairmanship and directorship of the Daimler Motor Company, Ltd.

MOTORISTS, balloonists, and others will be pleased to hear that Mr. Frank Butler has safely returned from his trip to Morocco.

WE hear that Messrs. Ewart-Hall, Ltd., of Nottingham, have placed a large order for Charron-Girardot-Voigt cars, for which they have secured the British agency.

IT is announced that Panhard cars for the American market are to be assembled in the United States. The complete motors, gears and parts comprising the chassis are to be imported and put together in a factory near New York.

IT is reported that the Wolseley Tool and Motor-Car Company has been awarded a War Office contract for a number of khaki-coloured motor-cars, each vehicle being equipped with powerful searchlights capable of instant adjustment.

CONTINENTAL NOTES.

BY "AUTOMAN."

WHERE and when will the Gordon Bennett International Cup Race be held? This is the question which is being discussed and re-discussed continually in all its different aspects by the Continental automobile press, in the affiliated clubs, and wherever *chauffeurs* are gathered together. Two countries besides Great Britain wish the race to be run on their roads. As a matter of course, France wishes it. All possible and imaginable arguments are being raked up and the rules of the competition are being read in Paris with a view to forcing the hands of the A.C.G.B. and I. to adopt a French course. It means, of course, a great deal less expenditure to Panhard and Levassor and to Mors to dispute the Cup at home, and in addition to this it will be considerably easier for them if the race is run in a country where their drivers know every inch of the roads, as well as the language and the racing customs. To the average Frenchman it is an awful thing to have to cross the Channel; it is an undertaking. He thinks seriously of insuring his life, and bids a fond adieu to his family and friends in case he

Belgium, which is regarded as a neutral country where England, France, and Germany, at any rate, could meet on nearly equal terms. The Ardennes course would be ideal for the purpose of the race, and the event itself is of sufficient importance now to call for its being run by itself and not in connection with any other event; especially if the Americans, Austrians, and Italians come in as regular competitors, which is quite probable. The A.C.G.B. and I. have communicated with the A.C.B. on this subject, but the A.C.F. are not, however, very likely to agree to the proposal.

WITH regard to the fixing of the course over which the race must be run, Article 12 deals with this question, but it is not quite as clear as it might be. It runs as follows:—"The race should be run in the country which holds the Cup. This club, however, shall always have the right to have the race run in France." The article does not say this club must have the race run in France if it cannot have it run in its own country, but only says it shall have the right to. Now supposing it were impossible to get the French Government's permission to run it in France, and also impossible to get the English Parliament's

FIG. 7.—THE HUMBER 20-H.P. CHASSIS (See page 917).

might not come back. Whether the A.C.F. will be able to succeed in its opposition is a moot question, but there is Article 5 of the Cup regulations to be got over. This runs as follows:—"The cup shall be raced for every year between the 15th of May and the 15th of August. The exact date shall be fixed by mutual agreement between the clubs interested in it, and this date shall be fixed before the 1st of February each year." The date of the race must therefore be fixed by "mutual agreement" practically before these notes appear in print. The rules do not, however, provide in any way whatever for the case of there being no mutual agreement as to the date, and, therefore, should the A.C.F. refuse the date which the A.C.G.B. and I. propose, or should no date be fixed before February 1st, a very awkward situation will be provoked. Nothing in the rules provides for this case, and there is, strange to say, no arbitration clause.

BELGIUM, although not a competitor for the Cup this year, is watching the progress of the negotiations between the English and French clubs with a special interest. Some few weeks ago I communicated the invitation thrown out to the A.C.G.B. and I. by the Baron Piere de Crawhez in a conversation which I had with him at Rheims. The Baron requested me at the time to make known in England the desire of the A.C.B. to have the Gordon Bennett race held not only this year, but every year, in

consent to run it in Great Britain, evidently then it would have to be run in Belgium or in any other country where permission could be had. The English club might, therefore, read this rule not to debar it being actually run in Belgium, though this reading would be perhaps difficult to sustain.

THE first important event of the season is to be the "Criterium de Consommation," which is to take place on February 19th under the organisation of the "Auto." The competition was first held in the year 1900. This year the course will be 100 kilometres (sixty-two miles) in length. There are twenty-nine entries so far. In addition to the prizes offered in connection with the consumption of petrol, and also of alcohol, there is to be a special prize for the car that shall have cost the smallest amount of money for fuel according to the kilometric ton, and in the competition for this prize it will be easy for the public to judge which of the two fuels—petrol or alcohol—is the more economical in use. This is a much disputed question, and one that has as yet never been satisfactorily decided.

THE opening of a new automobile garage is now regarded in Paris as an event of public interest. Invitations are issued and accepted by deputies, municipal councillors, military men, aristocrats, and heads of large automobile factories. An orchestra

is engaged, champagne flows freely, and the manager of the new concern receives his guests with white kid glove covered hands, as if he were the President of the Republic receiving his citizens. Such was the scene last Saturday, when a new garage was inaugurated in the Avenue de la Grande Armée, and literally hundreds of people thronged to the opening, the visitors including the presidents of both the "Chambres Syndicales."

ANYONE who has taken part in or seen a big automobile road race will remember the constant difficulties and mishaps that occur with the various cards and papers which the competitors are obliged to carry with them, and which have to be given up, inspected, or signed at the various stopping-places. The driver insists that the mechanic has them, the mechanic is just as positive that the driver has the papers. Both, with

as La Turbie. One test will be for wheel brakes, and another for an emergency brake acting direct on the back wheels, and unconnected either with the motor or the differential gear. The trial is only open for cars weighing at least 650 kilos., including all accessories, and, in addition, carrying four passengers or their equivalent weight. The wheel brake competition will consist of a sudden stop whilst running ahead, a stop whilst running backwards, and finally an endurance test on a descending course of 8 kilometres at a minimum speed of 15 kilometres per hour. The emergency brakes will be tested running forwards and backwards, and consideration will be given by the judges to brakes which are applicable to all classes of vehicles.

THE Alcohol Challenge Cup, given by Prince d'Arenberg, will this year probably be run off in connection with the Paris-

MR. CLARENCE GRAY DINSMORE ON HIS 40-H.P. MERCEDES, WERNER, THE WINNER OF THE 1901 NICE-SALON RACE, AT THE HELM. Mr. Dinsmore, who represents the United States on the International Race Committee, is reported to have purchased one of the special cars the Cannstatt-Daimler Company are building for the 1903 Gordon Bennett Contest.

[Allgemeine Automobil Zeitung.]

dusty hands, lift up their *parapluies* or other unpocketed garments, and vainly search all the pockets in their several coats and waistcoats, whilst precious time is flying by. Finally, from behind an oil-can, and held down by a dirty spanner in some odd corner of the car, a greasy, disfigured, and smeared bunch of papers is discovered, and a document detached, often the wrong one. All this is to be a thing of the past, and there is to be attached to every car in the Paris-Madrid race a box to carry the documents. A suitable model has been examined by the A.C.F. and definitely adopted, and I feel sure every *chauffeur* who hears of it will heave a sigh of relief and feel that at least one worry has become a thing of the past.

THE Nice Automobile Club is organising a brake competition on the 28th March. It will be held on the hilly road known

Madrid race between Paris and Bordeaux. The cup is offered for French vehicles using a 50 per cent. alcohol mixture as fuel over a course of not less than 300 kilometres in a single stage. The present holder is M. Rene de Knyff, who won it last year in the Paris-Vienna race between Paris and Belfort.

FOLLOWING the example of the "Nice week," the Automobile Club of the Rhone proposes to hold the "Aix week" from the 5th to the 12th of July. The programme includes a tour from Lyons to Aix, kilometre trials on the banks of Lake Bourget, and a hill-climbing competition.

MADAME LE BLON, who accompanied her husband on his record-breaking trials on a Serpollet steam car last season, will, it is reported, drive a car herself in the races at Nice.

MOTOR-CYCLING NEWS.

IN our issue of the 17th inst. we reproduced a photo of Master Carter, the ten-year-old son of Mr. C. E. Carter, of Grays, Essex, describing him as probably the youngest motor-cyclist in the country. This statement has brought us a letter and photograph from Mr. J. Bond, of Bishopston, Bristol, who informs us that he has a son just turned six years of age who rides a motor-bicycle, "managing it with perfect ease." Master Ernest Bond

MASTER E. BOND, AGED 6 YEARS 3 MONTHS, THE YOUNGEST MOTOR-CYCLIST IN THE COUNTRY.

can, we think, safely claim to be the youngest motor-cyclist in the country; the photograph reproduced herewith shows him on his machine, which was built throughout by his father. The engine has a cylinder 2 in. diameter by 2 in. stroke. The bicycle has a 16 in. frame, with 18 in. wheels. The young *chauffeur* made an early start in the wheeling world, for his cycling career dates from the time when he was only two years and nine months of age.

It seems somewhat strange that a firm of motor-cycle builders should find a "talking point" in the steadily increasing weight of their productions. Yet one motor-bicycle concern in the United States is drawing attention to the fact that its 1900 machines weighed only 75 lbs.; the 1901 model 90 lbs., that of 1902 105 lbs., while the 1903 machine turns the scale at 125 lbs. It is, perhaps, only right the fact that a much more powerful motor is now being used should be pointed out, but we think the makers in question are somewhat ill-advised in converting their machines into ponderous monsters weighing over a hundred-weight.

WITH reference to the challenge of the Automobile Components, in last week's *Journal*, Mr. John J. Leonard writes that, "failing their meeting with a firm to take up the challenge. I shall be most happy to accommodate Fournier with a fifty-mile match, no stakes. The conditions to be a stock machine as supplied to the public for ordinary road use *minus* mudguards, and saddle over the back wheel of the machine; the machine to weigh under 50 kilogs. in running order, less petrol, and the event to be run off at the Crystal Palace, Herne Hill, or Canning Town track."

A MEETING of motor-cycle traders will be held at the Automobile Club, on Wednesday, the 11th prox., at 5 p.m., to enable the trade to elect their own representatives on the organising committee of the Motor-cycle Reliability Trials to be held in

August next. Firms who wish to be represented on this committee should make a point of sending a representative to the meeting. In thus arranging for the trade to elect their own delegates, the committee of the Automobile Club have taken a wise course.

MR. S. F. EDGE has accepted the presidency of the Motor Cycling Club.

THE National Cyclists' Union has decided to adopt a proposal as to the institution of motor-cycling sections. Free licenses will be granted to riders in their first year of racing.

ON Saturday, M. Fournier tied his own mile "track" record for the Alexandra Palace track by completing the distance in 1 min. 38 1-5 sec. He also rode twelve laps in 1 min. 23 sec.

THE inaugural dinner of the Motor Cycle Union of Ireland will be held on the 18th prox. Mr. W. F. Peare is interesting himself in the formation of a Waterford branch of the Union.

THE Prince of Monaco has just acquired a 2 3/4-h.p. Humber motor-bicycle through Mr. R. Asbury, of Queen's Road, Bayswater. The machine was sent to the Prince's yacht at Portsmouth, and will probably be first used in France.

THE novel little vehicle illustrated herewith has just been put on the market by Mr. B. E. Dickinson, of the Toledo Engineering Works, Birmingham. It is known as the Morette, and has been designed to carry one person at speeds up to 12 miles an hour, and is likely to become popular with ladies and those who prefer the comforts of a three-wheeler. The frame is built of steel tubing, the front forks being strongly made. The engine is an Ixion two-cycle motor, developing 1 1/2-h.p.; the fly-wheel carries on the inner side a rubber-covered driving wheel in frictional contact with the front tyre. The motor is carried by a bracket behind, and attached to the crown of the front fork. It is carefully balanced on both sides of the wheel, and is lubricated on the drop-feed principle, the oil being atomised as it is carried into the engine with the petrol mixture. The F.N. spray carburettor is used, and sufficient petrol for a run of 70 miles is carried in a tank over the motor. The catalytic system of ignition is employed.

On starting, the ignition is by temporary electric current from small dry battery, but afterwards it is automatic. The engine is started by pulling the lever B towards the seat. This lever operates through clutches on the hubs of the rear wheels, and at each pull impels the carriage forward. The driving pulley being in frictional contact with the front wheel is thereby rotated and the engine started. The carriage is steered by a tiller, which also controls the friction driving roller. By raising the tiller handle the engine pulley is freed from contact with the front wheel. Efficient brakes are provided, and vibration is considerably reduced by the insertion of a vulcanised buffer-rubber at the point where the engine is attached to the bracket, thus intercepting the vibration to the frame. The weight of the Morette is about 90 lbs. When desired the vehicle can be enlarged and strengthened so as to carry two persons, a higher-powered motor being in this case, of course, attached.

THE BEAUFORT 18-H.P. PETROL CAR.

At the Depot of the Beaufort Motor Co. the other day we had an opportunity of inspecting the new double tonneau car illustrated herewith. It is known as the Beaufort Alexandra, and has comfortable accommodation for six persons. The frame is of stout channel steel, no wood being used in its construction. The motor is of the vertical double-cylinder type, running at the moderate speed of about 800 revolutions per minute and developing 18-h.p. Ignition is effected by means of a Bergmann magneto machine, rotated by a chain from the engine shaft. The cooling of the engine is effected by means of a radiator and rotary pump, the latter being driven direct off the fly-wheel of the engine. By an ingenious arrangement the exhaust valve is automatically made to open early or late, as the ignition is advanced or retarded. Silencers of very large size are fitted. The exhaust gases pass three times through annular chambers fitted in the silencer before emerging into the air. The chambers are of ample dimensions, and are claimed to cause a minimum of "back pressure," while they render the exhaust practically noiseless. The speed of the engine is automatically regulated by a governor working in oil, and acting on a throttle valve fitted in the inlet pipe. When desired the governor can be instantly "cut out," while control is also obtained by the driver raising a foot-pedal which closes the throttle

valve on the inlet pipe. As regards lubrication, a pipe from the exhaust is brought into the top of the oil tank; immediately the engine begins to run pressure is automatically brought to bear on the surface of the oil, causing it to rise and drop through sight-feed lubricators on the moving parts of the engine. By this arrangement the faster the engine runs the greater the pressure, the flow of oil being thus adapted to the speed of the engine. When the motor stops the pressure is removed, and the flow of oil ceases.

Four forward speeds and a reverse motion are provided. The power is transmitted through a clutch to the gear box, and thence by bevel gear to a differential countershaft, the latter being connected with the rear road wheels by side chains. The whole of the change-speed gear runs in oil and on ball bearings, which reduces friction to a minimum. The change-speed gear is controlled on a new and simple system, by means of a small lever on the steering pillar. Two independent brakes are fitted, one acting on drums of large diameter and width, fixed to the rear road wheels, and applied by means of a hand lever. This brake is, by a system of rods and levers, made compensating, so that equal pressure is at all times exercised on each of the two brake drums. The other is a foot brake, acting on the transmission shaft. The road wheels are of the artillery type, all being 36 in. in diameter, and shod with $3\frac{1}{4}$ in. tyres. The steering is controlled by a hand wheel, fitted to an inclined pillar, acting through a pinion on a worm. The body is built of aluminium, with a wood frame, the vehicle complete weighing

about 19 $\frac{1}{2}$ cwt. The details appear to have been well thought out, special attention having been paid to the bearings, with the object of turning out a speedy durable vehicle.

IRELAND AND THE RACE.

If the Irish members had the settling of the matter in their own hands, there could be no doubt that the Gordon Bennett race would be run in the Emerald Isle. As we mentioned last week, Parliamentarians who agree on few things are practically unanimous in their eagerness to see the great contest take place in Ireland. Colonel Nolan, M.P., as a member of the Agricultural Board for the country, will "welcome any step which tends to introduce cheap transit," and rightly recognises that the popularisation of the automobile is a step in that direction. Mr. Conor O'Kelly, M.P., the chairman of the Mayo County Council, declares that everyone "appears to be delighted that Ireland has been suggested for the race, and I think you can count on every assistance being given you in removing the obstacles that at present stand in the way." The Kilkenny County Council has also welcomed the suggestion.

Some particulars about the proposed route will be of interest. The start would probably take place outside Naas, the assize town of Kildare, and for many generations the royal seat of the Province of Leinster. The first control would be at Newbridge, on the way to which are five half-mile stretches of "straight" roads. Then a spin of nearly five miles to Kildare would take the cars across the Curragh—a great down of five thousand acres and the military centre of the country. Kildare is one of the most historic towns in Ireland. Thence to Monasterevin prepares the way for a straight run of eight miles to Maryborough, with ample room for the cars to pass. Maryborough was founded in the reign of Queen Mary, and has since been the scene of many fierce contests between the Irish and the English. Fitting, therefore, is it that the people of both nations should meet in the streets to cheer the British representatives in an international contest. Then through Stradbally is another straight road for six miles, up the Windy Gap, and another straight run meets the Athy-Kilkenny road. At the former town, which dates from the thirteenth century, there will be an inward control. Between Athy and Carlow the road is full of turns, and, as the representatives of the Automobile Club who have gone over the course report, "a high speed on it would not be possible." Carlow is one of the most considerable towns on the route. The next four miles are winding; but after they have been negotiated there are several straight courses on the return to Naas—a distance of 90 $\frac{1}{2}$ miles—which should provide good opportunities for high speeds.

Altogether the course is admirably selected. "I know the country parts well," reports Colonel Nolan, M.P., "and I am certain that personal dangers can be reduced below those of the London streets." Such being the case, no wonder Mr. T. M. Healy, M.P., says, "Your committee may rely on the sportsmen being welcome amongst the country people. Don't begin the race at 3 a.m. Give the people a chance to see the start." As it is desirable to have the road surface in as perfect a condition as possible, and as it is also likely that a small expenditure would materially improve the course at certain points, Messrs. John Hutton, Sons and Company, and other Irish firms have expressed their willingness to subscribe to any fund opened for this purpose.

MORE news of Mr. E. J. Pennington, who has been charged with making a trip to Cincinnati in a special car with a dozen attendants, engaging the best suite of rooms at the Nicholas House, running up a 900 dollars board bill at that hotel, issuing cheques for the same, and then suddenly departing.

AFTER much deliberation it has been definitely decided by the Automobile Club of America to hold a contest for commercial vehicles in the spring. The Contest Committee of the Club has prepared a letter and sent it to all known makers of self-propelled commercial vehicles in the United States, asking for their co-operation.

HERE AND THERE.

A PUBLIC service of motor-cars has just been started between Balham and Brixton, S.W.

THE 1903 Mors racer will, it is reported, have a body on the line of the Serpollet "Easter Egg."

THE Maudslay Motor Company, Limited, has been registered with a capital of £15,000 in £1 shares.

MR. REGINALD EGERTON has completed his run from John o' Groat's to Ipswich on a Primus car.

THE carriage work of the Velox car recently described in our columns was by Mulliner's, of Northampton.

THE number of motor-cars in Italy, in respect of which the licence fee was paid last year, is returned at 1,472.

AMONG the entrants for the Paris-Madrid race we notice the names of Mr. Mark Mayhew and Mr. S. F. Edge.

"MORE races, more business and more progress" appears to be the motto of motor-car builders in France.

AT their garage in Tulketh Street, Southport, Messrs. Bell have accommodation for more than a score of motor-cars.

AN Aberdeen engineer has been fined £5 for recklessly driving a motor-car and seriously injuring two women.

ON Thursday, Mr. R. W. Buttemer, M.A., was announced to give a lecture to the Portsmouth Automobile Club on "Ignition."

It is reported that Baron Forest, Count Zborowski, and M. Degrais have been chosen to drive the German cars in the Gordon Bennett race.

THE Mid-European Automobile Club of Berlin proposes to organise a reliability trial from Berlin to Konigsberg and back, to be held during the coming spring.

ANOTHER motor-car depot is about to be opened in Long Acre, W.C., the former home of horse-drawn carriages. The newcomer is the Ariel Motor Company, Limited.

A NEW explanatory circular of the Motor Exchange comes to us from the proprietors, the International Motor Car Company, Limited. This office undertakes the sale and purchase of cars.

THE Benz Company, of Mannheim, Germany, are reported to have decided to enter the racing field this season, and with this view are building a specially powerful car with four-cylinder vertical motor.

MR. J. BAILEY, who has secured the agency for Clement cars in his district, is opening a large new motor-car depot in Market Street, Stafford, where he will be able to undertake repairs of all kinds.

THE contributor of the motor-car notes in the "Globe" is keenly against the labelling of automobiles, and points out "that so far as this paper is concerned the numbering scheme, in its present form, has been opposed from its inception."

THE famous Baker electric racing torpedo, which was the cause of a serious accident at a race meeting in the United States last year, is now in this country. It is probable that the car will be taken over to France, where exhibitions of its speed will be given.

MORE than forty motorists have already expressed their intention of joining the Norfolk Automobile Club, a preliminary meeting of which is being held to-day (Saturday) at the Royal Hotel, Norwich. Mr. G. N. C. Mann is interesting himself actively in the matter.

FROM the Autocar Company, of Ardmore, Pa., U.S.A., comes a copy of their new catalogue, describing their latest production. The car has a double cylinder horizontal 10-h.p. motor under a bonnet on the front end of the frame. They have also sent us an artistic 1903 calendar.

AN Ottawa correspondent reports that there are only three automobiles in that city, which has not an agency of any kind. He considers that if one were established quite a number of vehicles would quickly be sold. Ottawa is, he reports, a wealthy city, being the capital of Canada; and the roads in the district are good.

THE annual dinner of the American Automobile Club was held at New York on Saturday, one of the striking features of the event being an exhibition of the skilful steering of a motor-car around the tables. Subsequently its career was ended by a policeman—for this occasion only—arresting the occupants and marching them from the room in triumph.

AT the request of the Sirdar a steam motor-wagon has been sent to Khartoum by Messrs. Jesse Ellis and Co., Limited, of Maidstone. Messrs. Ellis have also received an order from Sir Horace Pinchin, K.C.M.G., of the Headquarters Staff of the Egyptian Army, for a similar wagon, but fitted with water tank and distributor, and body for sanitary work.

THE new edition of the "London Manual," published by Edward Lloyd, Limited, is a comprehensive guide to the various governing bodies of the metropolis. From the chapter on locomotion in London we learn that metropolitan omnibuses carry 450,000,000 passengers every year—proof of the field there exists for the development of motor-vehicles in the public service.

THE result of kite-flying experiments on a steamship off the west coast of Scotland last summer has just been communicated to the annual meeting of the Royal Meteorological Society by Mr. Dines, who carried out the experiments. The greatest height attained was 15,000 feet by means of four kites on one wire. The temperature gradient over the sea was considerably less than its average value over the land, being about one degree for every 300 feet of height. As a general rule the humidity increased up to a level of about a mile, and then decreased.

GEORGE POLKEY, Limited, has been registered with a capital of £15,000 to acquire the business carried on by Mr. G. Polkey at Hockley Lamp Works, Pitsford Street, Birmingham. The manufacture of a special lamp for motor-cars is included among the activities of the company. In this the oil is contained in the foot of the lamp, and the oil-feeder is outside. There is a circular burner with attachment to prevent the wick from lowering, and the glass has a diameter of $7\frac{1}{2}$ inches. This motor headlight burns paraffin, and has the advantage of being without complicated parts.

SHOWROOMS have been taken at 45, Great Marlborough Street, W., by the Ivel Agricultural Motors, Limited, of which Lord Willoughby de Eresby, M.P., is chairman. Several well-known motorists are on the board of directors, and an advisory board has been formed, consisting chiefly of farmers. Among those interested in the success of Mr. D. Albone's agricultural motor are the Marquis of Tweeddale, the Marquis of Granby, Earl Brownlow, and Lord Alwyne Compton, M.P.

A COMPANY has been formed at Lincoln to carry on the business of automobile manufacture. It is almost entirely a private one, and its pioneer is Mr. J. R. Richardson, who will be the managing director. The shareholders, eight in number, are:—Mr. J. R. Richardson, Mr. W. S. Richardson, Mr. C. W. Pennell, Mr. W. R. Pennell, Mr. Henry Newsum, J.P., Captain H. E. Newsum, Mr. W. J. Cannon, and Mr. F. N. Sherwood (London). Mr. C. W. Pennell and Mr. W. S. Richardson will be associated with Mr. J. R. Richardson on the directorate. The capital, which has been privately subscribed, amounts to £10,000, and is divided into £100 shares. Steps to acquire a site and erect the necessary works will be taken as soon as possible.

NEXT week the King and Queen will probably take a motor-car trip from Chatsworth House to Hardwicke Hall.

THE offices of the Star Motor Agency, Limited, just registered with a capital of £2,000, are at 16, Upper St. Martin's Lane, W.C.

A REDHILL J.P., Major Kingsley Foster, has become a motorist, having on order a 16-h.p. Ariel car with a double tonneau body fitted with seven seats.

H. M. HOBSON, LIMITED, has been registered with a capital of £2,000 to acquire the business of Mr. H. M. Hobson and E. A. H. de Poorter and to carry on the business of motor-car builders, agents, etc.

THE Leeds Motor Car Company has been registered, with a capital of £600, to carry on the business of manufacturers of and dealers in carriages to be worked by mechanical and other power. The registered office is at 5a, King Street, Leeds.

THE White Mail Delivery Van, which was described in our issue of the 10th inst., has given such satisfaction to the G.P.O., that the officials have decided to continue its use for some time longer than the period originally fixed for the experiment.

AN inquest has been held at Westminster on a man who was fatally injured by a motor car at the corner of Ashley Place,

MOTORS FOR MEN OF MODERATE MEANS.

CAPTAIN KENNETH CAMPBELL read a paper on this subject before the Automobile Club on Friday, the 23rd inst., the Duke of Sutherland presiding. The following excerpts will be of general interest:—

The first difficulty is in defining what income constitutes a man of moderate means as opposed to the rich man or the poor one. I do not propose to answer this question, but shall give my own experience, dividing the subject into headings, as follows:—

(1) Cost of car and extras. (2) The ordinary running expenses of the car. (3) Adaptation of ordinary coach-house for the storage of a motor-car. (4) Training a groom for motor work. (5) Cost of groom and coach-house per annum.

The upkeep of motor-cars would be considerably reduced if the "repairer sharks," as they are called in America, were more reasonable in their demands, and in some cases less dishonestly inclined. I shall illustrate my last remark by telling an experience I had with a "repairing shark" in London. My car had just returned from a general overhaul by the makers, but a small adjustment had been left undone. Not having the necessary tool I ran the car to the nearest repairing garage, and pointed out what was required without going into particulars. Presently someone in authority appeared upon the scene, uncovered the engine, and looked very wise. "Your armature is loose," he said. "Fly-wheel not running true. Bearings want tightening up. Gears are not right: they work from side to side." I remarked, "There appears to be a good deal wrong with this car; how long will it take to put matters right?" "Four days," he answered. "When will you let us have the car?" By this time I had put myself into the driving seat and got ready to start. I answered, "Thanks, the car has just come from the makers, where it was thoroughly overhauled. Good morning." His jaw fell. The car did some 2,000 miles of hard work after that without an overhaul.

THE 30-H.P. WOLSELEY TONNEAU—PROBABLY THE FASTEST TOURING CAR YET BUILT IN ENGLAND.

S.W. The vehicle in question was "crawling" at the time, and the deceased was caught in the mudguard while crossing the road. A verdict of accidental death was recorded, the jury exonerating the driver from all blame.

ON Friday, the 23rd, an outbreak of fire occurred in the paint shop of the Wolseley Tool and Motor Car Company, Limited, Adderley Park, Birmingham. The place was full of carriage bodies being got ready for exhibition, and only the promptitude of the works' staff prevented serious consequences. The mishap, however, is very inconvenient coming at the present time.

SEVERAL complaints have lately been published in the Kentish newspapers with regard to the pace that motor-cars travel in that county. Probably this is not due so much to any excessive speed of the motor-vehicles, as, in Kent, express trains rarely exceed the limit allowed by law to motor-cars. A contemporary excuses the fears of the inhabitants on this ground.

ON page 911 of the present issue we reproduce a photograph of the chemical engine, the latest addition to the equipment of the Liverpool Fire Brigade. The engine is mounted on an 18-h.p. Daimler chassis supplied by the Road Carrying Company, Limited. Mr. Thomas, the Chief Superintendent of the Brigade, who is seen in the illustration seated on the box-seat at the side of the driver, has, Mr. Shrapnell Smith informs us, already become an expert chauffeur.

I am basing my statistics upon accounts extending from the time of purchase of my present 10-h.p. petrol car, of the touring type, or for nine months from April until December of last year, and taking the distance travelled, viz., 6,600 miles, as the basis of calculation. This distance is made up of long and short journeys in town and country over every description of road to be met with in Great Britain. Under the first heading, "Cost of car, and extras," I find:—

Price of car	£	s.	d.
Extras, carriage rugs, &c.	525	0	0
Tips, &c., and learning to drive	26	15	2
Delivery of car from makers	3	17	5
	3	18	10

These items are the first cost of the car as opposed to the "running expenses," as follows:—

Petrol	£	s.	d.
Lubricants	21	15	8
Maps			
Sundries			
Repairs to car body, frame, and engine	6	16	7
	0	5	0
	9	17	2
	67	0	5

This works out at about 2½d. per mile, and includes accidents, which resulted in two bent axles—one due to side-slip and the other to running into a ditch to avoid a collision. The side of the car was also kicked through by a horse, the owner of which compromised by paying half the damage done.

£ s. d.
Tyres, including four new tyre covers, one new inner tube, and fitting two old tyres with "treads" 48 6 0
Or 1½d. per mile.

Making a total of £154 0 10
for running expenses of all kinds for nine months, or, at same rate, £205 7s. 8d. per annum. For the 6,600 miles' run it comes to 5½d. per mile.

There are two points under this heading which I have not touched upon, viz. :—Depreciation and insurance.

Economies may be effected in tyres by having those which are too much worn for "drivers" covered with "treads," vulcanised on, and used for front wheels. In the matter of saving in one's ordinary expenses, I have calculated that in travelling by car instead of going by train, taking the cost of railway fares for a number of journeys which my wife and I would have taken in the ordinary course of events during the summer holidays if we had not had a car to carry us, visiting friends, shooting, &c., the saving has amounted to £26 19s. 10d.; tips to railway porters and cabs on these journeys, £5 12s.; or a total of £32 11s. 10d. There is thus a saving in cab and bus fares and the hire of livery stable carriages, which would amount roughly to about £40 per annum. Again, supposing the average Londoner of moderate means goes out of town once a month or so for the week end, he would save a considerable sum in railway fares, tips, and cabs if he goes by motor-car, also he travels more pleasantly, with the additional benefit to his health.

The feeding, clothing and shoeing of a horse in London is about £50 a year. One motor-car will do the work of many horses and never get tired. The cost of coachman or groom, rent of stables, &c., would be, if anything, a little more for the horse than for the motor-car; the first cost of a carriage and wear and tear must also be taken into account.

My stable is situated in mews in South Kensington. The accommodation consists of coach-house and three stalls. The coach-house, without alteration, is all that is required at present for the storage of the car. My man came to me in May last as a groom. He had never seen a motor-car before, except in passing in the street. Engines being a hobby of mine, the groom was not allowed to touch them at all at first. After being with me for about a week I taught him to drive the car, in a short time, well enough, to trust him to bring it from the coach-house to my door, where there is little traffic and the streets are broad. He was then sent for about a week to the makers, who gave him instruction in the care of engines as a matter of courtesy, and he soon picked up quite enough to be competent to take ordinary care of the machinery, i.e., wipe it over and file the igniters, examine for loose nuts, replace broken balls on the wheel bearings, and do the necessary greasing to parts not lubricated by the automatic lubricator. He is now a very trustworthy driver, and can handle the car with skill. Besides his pay, he gets livery, plain clothes, and boots once a year. Light water, and furnished quarters are found, but not coals or food. These he finds for himself while in London; on the road he is found in every thing.

The cost of motor groom and coach-house per annum is as follows :—

	£	s.	d.
Wages of motor groom at 25s. a week	65	0	0
Livery, clothes, and boots	20	7	3
Licence for groom	0	15	0
Licence for motor-car	2	2	0
Rent of stables	30	0	0
Taxes on stables	8	17	4
Light, say	1	0	0
Water	1	12	4
Christmas present	0	10	0

Total £130 3 11

The landlord does the insurance, but it is a condition I do not store petrol on the premises. My motor groom is not employed solely to look after the car. It was understood when he was engaged that he would make himself useful in other ways if called upon to do so, and to be generally willing and cheerful about his work. He performs other duties, such as brushing boots and clothes, and does odd jobs about the house occasionally. These small matters make a difference to the man of moderate means. A handy man about saves a considerable part of his wages to his employer in the course of a year. I figure out that to keep a car running efficiently will cost, all told, about £335 per annum, not including painting and varnishing.

Opening the discussion Captain Bowman-Manifold said he had run a 7-h.p. New Orleans car 7,000 miles at a cost of 2½d. per mile.

Mr. Ashton Jonson had had a steam car which had worked out to a cost of 1s. 9½d. per mile. (Laughter.)

The Secretary read a communication from Mr. J. H. Knight, of Farnham, whose expenses had been £35 5s. per annum, running about 2,000 miles in that time.

Mr. R. E. Phillips pointed out that there were two factors to be considered, viz., the weight of the car and the speed at which it was driven.

Mr. J. E. Hutton having pointed out the differences in drivers,

Mr. W. J. Peall said he had kept a record, and found that he had travelled 3,750 miles at a cost for tyres alone of 2½d. per mile, despite the fact that he drove with every consideration for his tyres. He employed a coachman to look after his car, which in appearance was equal to any horse-drawn vehicle. If motorists would pay more regard for the appearance

of their vehicles, and also stop the motors when the cars were stationary, it would be to the advantage of the industry.

Mr. H. Sturmer believed that the coachman would be found more amenable to reason than the *mecanicien*, who was inclined to think he knew more than he actually did.

Major Lloyd pointed out that little had been said to define "the man of moderate means." He proposed a vote of thanks to the reader of the paper, which was heartily adopted. The proceedings then closed.

THE STANLEY SHOW.

(Concluded from page 906.)

THE well-known Germain cars were well staged by the British Germain Motor Car Company, Limited, the exhibit comprising examples of the 7½-h.p., 10-h.p., 15-h.p., and 20-h.p. types. The two smaller sizes are provided with two-cylinder engines, 95 mm. diameter by 130 mm. stroke in the 7½-h.p., and 105 mm. by 140 mm. in the 10-h.p., the normal speed being 800 revolutions per minute. Four speeds forward and a reverse motion are provided, the countershaft being connected to the rear road wheels by side chains. The two larger cars have four-cylinder engines, governed on the inlet and covered by the latest type of square bonnet with the radiator in the front opening. Four speeds and a reverse are provided. The carriage work of these vehicles is of the highest class; the 15-h.p. car on the stand took the form of a Limousine, painted green with black and white lines. The front seat is hinged to allow of easy access to the petrol tank. The 20-h.p. car had a tonneau body of the Roi des Belges type, painted cream with blue lines. To meet the demand for a "popular" light car, the Germain Company have secured the agency for a little French vehicle to which they have given the name "Staughton." The engine is of the single-cylinder, vertical type, developing 8-h.p. It is placed forward under the bonnet. Three forward speeds and reverse are provided, the transmission being by means of an universally-jointed shaft and bevel gear to the rear live axle. The brakes on the rear wheels are of the internal expansion type. The car itself is designed to hold two persons, a pair of bucket seats being provided. The body is attached to a channel steel frame, and the wheels are of the artillery pattern and of equal size. The water circulation is maintained by pump and radiator, while the steering is controlled by an inclined hand wheel.

Messrs. Haynes and Sons, Limited, have taken up the agency for the Wartburg cars, which are of German construction. Several types are made, one being a little two-seated car, fitted with a 5-h.p. two-cylinder vertical water-cooled motor, located in the rear of the tubular frame. Three speeds forward and a reverse motion are provided, the power being transmitted through a clutch and bevel gearing to the rear axle. The little car is neatly finished, and can, it is stated, maintain an average speed of nineteen miles per hour. A similar car with the engine under a bonnet in the front was also shown. Although a two-seated car, the usual three speeds forward and one backwards are provided; the desired speed is obtained by a hand lever on the left of the steering column, the maximum being twenty miles per hour. The gear box is built in one with the differential case and is made of aluminium, all gears being enclosed and running in oil. The steering is controlled by a hand wheel on an inclined steering post. The brakes are the usual foot and hand-operated, and are very powerful. A novel little parcels delivery vehicle with the same underframe as the first car above alluded to, was also shown; it is adapted to carry a load of from two to three cwt., and is well adapted to the requirements of tradesmen. A useful feature of the Wartburg cars is the free use made of draw-off cocks, these being provided to each coil of the radiator and the cylinder water-jackets, so that there should be little danger of any water being allowed to remain in the radiator or jackets in extremely cold weather.

Probably the first American car built on Panhard lines to be seen in England was that shown on the stand of the Petrol Power Company. It is a 20-h.p. car built by the Peerless Motor Car Company, of Cleveland, Ohio, and that it is up-to-date will be seen by the fact that the motor is governed on the inlet, and that the water-tank is combined with the radiator, which is set in the front opening of a square bonnet. The 20-h.p. motor, however, comprises but two cylinders. Three speeds forward and a reverse are controlled by a single lever, the power being conveyed through a pedal-operated clutch to the gear-box, and thence by an universally-jointed shaft and bevel gear to the rear live axle. The various details appear to have been well thought out, a useful feature being the hinging of the steering column just below the hand-wheel to allow of easy access to the driver's seat. The same firm exhibited the Rambler car illustrated in our issue of the 29th November last. A number of improvements have been introduced in the 1903 models, these comprising the adoption of a 7-h.p. motor, and artillery wood wheels in place of those of the cycle type. The wheel base has been lengthened six inches, and the body brought two inches lower. A new carburettor with float feed has been introduced, while the cooling system has been enlarged so that there are now nearly 400 radiating tubes instead of 200. The axles are heavier, and mudguards to all wheels are now being fitted.

One of the most successful types of electric carriages in France is that of Messrs. Ch. Mildé et Cie., whose system is now being introduced into this country, the Lancaster Motor Garage, which is opening a depot at 1A, Lancaster Gate, London, W., having been appointed sole agents over here. The Mildé Company manufacture electric coupés, single and double landauletts, victorias, omnibuses, and light delivery vans, but confined their exhibit to a well-finished coupe. A compound-wound Mildé motor of the differ-

ontial type, carried at the centre of the hind axle, drives both rear wheels through internal spur gearing, the motor shaft being extended and having pinions on each end which engage with gear rings bolted to the spokes. The battery is carried partly under the driver's seat in front and partly beneath the passengers' seat behind, and is made up of 42 Heinz cells of 115 ampere-hour capacity. It furnishes sufficient energy to drive the car about 40 miles on a single charge. The steering is effected by a hand-wheel fixed to a vertical pillar to which the controller is also attached. The latter is operated by a short lever moving beneath and concentrically with the steering wheel, its different movements giving nine forward speeds, two electric brakes and two recuperation positions, and three speeds backwards. The average speed is 12 miles an hour. The Milde Company are also introducing a new combination petrol-electric car, which we hope to describe in a later issue.

Considerable interest was taken in the Rucker pneumatic vehicle tyres, a transverse section of which we reproduce. In this, *a* is a plano-concave strip of soft rubber, *b* a transversely inflexible, longitudinally flexible and compressible band, and *c* is a thickening of soft rubber; *d* is a longitudinally inextensible band, which materially compresses the tyre circumferentially, and *e* is an outer layer of rubber which can be renewed when necessary. The "Rucker" air tube embodies a principle of construction that deserves a wide trial among motorists. Around the tubes is wound transversely a layer of very strong thread, which may be either embedded in the rubber before vulcanisation, or applied to the surface of a completed tube. The thread is creased by a special process, so that, when inflated, the tubes readily expand till the creased threads are pulled straight, after which, when inside an open cover of a tyre to prevent elongation, they will withstand a high air pressure, the limit of expansion being about

TRANSVERSE SECTION OF RUCKER TYRE.

- | | |
|--|---|
| a.—Plano-concave strip of soft rubber. | d.—Longitudinally inextensible band, materially compressing the tyre circumferentially. |
| b.—Transversely inflexible, longitudinally flexible and compressible band. | e.—Renewable outer layer of rubber. |
| c.—Thickening of soft rubber. | |

25 per cent. above the normal transverse circumference of the tube. When a tube is inside a tyre and inflated, the cover is distended and grips on the rim in the ordinary way, but, should it burst when in use, the result is not a burst tyre as hitherto, but only a tyre with a burst cover. This is due to the fact that the air tube only expands a little beyond the inside size of the cover, and then itself withstands the pressure of the air within it, maintaining the efficiency of the tyre till the cover can be conveniently repaired.

A glance at the stands occupied by tailoring firms showed the advance that has been made in motorists' clothings since the days of the grotesque. Messrs. Burberry's were the first to attract attention with a motoring coat known as the "Slip-on." This is easily put on or removed, and is made in five varied ways to suit our changeable climate. For summer wear it is composed of Gabardine lined with silk; for rainy, stormy days the Gabardine is lined with camel fleece. Other special forms include Winter, Blizzard, and Arctic—the latter being a combination of Shetland frieze and camel fleece that might have been used for ordinary walking purposes during the early days of the show. Messrs. Lovegrove and Company had a capital display, the central feature of which was the "Drimosit" rug, which has already been described in our columns. This is for use on motor-cars or when travelling by rail. Its ingenious arrangement protects the seat from dampness in wet weather; while the termination in coverings for the feet withstands the draughts that often occasion so much discomfort. The firm also showed the "Ideal" motor coat, preserving the appearance of an ordinary

coat and giving all the protection needed when riding, and a large assortment of accessories. Leather clothing for motorists was the main feature of Mr. Alfred Dunhill's display, the "Regent Leather" employed for the bulk of the garments having a good surface grain. Wind and rain proof coats, the motorists' patent apron, and the familiar umbrella coats being also on the stand. Among the great variety of miscellaneous exhibits was a silk gauze fan, about a foot square, specially designed for the use of ladies in dusty weather. Garments for ladies were conspicuous on the stand of Mr. C. R. Base, these including pony-skin costumes, fur-lined coats, silk hoods, motor hats with dust protection for the hair, and fur lined capes. A speciality is milled Melton motor coats, absolutely wind and rain proof. Mr. Base appeared for the first time as an exhibitor of accessories, having decided to stock goggles, masks, gauntlets, and everything required by the up-to-date motorist. Clothing for motorists was also shown by the British Automobile Syndicate, Limited, who made a special feature of the new patent combination livery, termed the "Viceroy," and comprising overcoat, jacket, and rug. Automobile coats in various furs were also exhibited by the Furriers' Alliance, Limited.

An attractive-looking 6½-h.p. car was to be seen at the stand of Messrs. Waddington and Sons, Middlesbrough, who made their first appearance at a London show. It is driven by a 6½-h.p. Linon engine, located under the bonnet in the fore part of the frame, driving through the usual system by a gear-box, universally-jointed shaft and bevel gear to the rear live axle. Three forward speeds and a reverse are provided, and on the top speed twenty-five miles an hour can be attained. The car is of large size, having a long wheel base, and with a wide platform at the rear for luggage or a spider seat. The car is up-to-date in every respect, and in view of its relatively low price should meet with a large sale. The same firm also staged a 9-h.p. tonneau with De Dion single-cylinder motor and Lamplugh body, and a new 10-h.p. car. The latter is fitted with a two-cylinder engine, governed on the inlet; it has four speeds forward and a reverse controlled by a single lever, the power being conveyed direct to the rear axle by bevel gear. At the same stand was shown a 3-h.p. motor-bicycle. The motor is fitted vertically in between the main tube and the bracket, the crank case being bolted to special lugs. A wide flat belt, made of two thicknesses of raw hide, conveys the power to the rear wheel. The ignition is by coil and accumulator. A 1½-h.p. machine on the same general lines was also displayed.

The Motor Car Co., Ltd., had on view one of the 20-h.p. four-cylinder Deauville cars, the details of which have already been described in the *Journal*.

The Prunel Company had a two-cylinder chassis on view, fitted with a 12-h.p. Aster motor. A main frame of wood with steel fitch plates supports an angle under-frame for the engine. A 10-h.p. car, with Herald motor and tonneau body, was also on view, the drive in all the cars being by ordinary change speed gear, power being taken by outside chains from the countershaft to the rear wheels. These cars have three speeds and reverse.

Motor roller chains, made with bushes drilled from the solid bar, were the feature of the Coventry Chain Company's exhibit. There was also a patent drive for motor-bicycles, this consisting of a combination of leather and metal.

M. Bardies showed Bleriot lamps, including the Eclairer Elliptique and the Lenticular projector—both have the advantages of solidity and great illuminating power.

Motoral, Elephant motor grease, indiarubber solution, motor-cycle repair outfits, and calcoid specially prepared for motor lamps, formed the varied display made by the Elephant Chemical Company. On another stand the Nugget Polish Company, Limited, had their specialities, including a cycle enamel polish of good grade. The Page Manufacturing Company made a feature of Silvo, a tyre renovator they are introducing.

A varied display was that of Messrs. David Moseley and Sons, Limited, who exhibited inner tubes and outer covers for motor-car tyres. The tubes are jointless, and were shown in various sizes and weights. Rubber footmats and other rubber goods for motorists were also on view at their stand. The Diamond tyres for motor-cars were shown by Messrs. Shippey Brothers. At their stand the North British Rubber Company drew prominent attention to the fact that they have made arrangements with Messrs. Michelin and Co. for the manufacture of the Clincher-Michelin tyres for sale in the United Kingdom.

The West London Cycle and Motor Repository made a feature of the 2-h.p. "Rocket" motor-bicycle, with a vertical engine, fitted to a frame of heavy gauge weldless steel tubing. This has a spray carburettor, and transmission is secured by a twisted rawhide belt. An efficient valve lift is fitted, enabling the rider to start with great ease. This motor-bicycle is said to have a tank capacity for 150 miles.

The Oilmobile was shown by the English Motor Company. This is a two-seated vehicle, similar to the car of somewhat kindred name which is already familiar in this country. The motor is of 5-h.p., the mixture being supplied through an automatic induction valve. The transmission gear is operated by a lever placed to the right of the driver, the drive being conveyed from the countershaft to the live back axle by a chain. Electric ignition is fitted, and there are two speeds forward and one reverse. There are two brakes actuated by foot levers, one being applied by a clutch band to a flange attached to the driving sprocket, and the other being an emergency brake acting directly on the rear axle. The capacity of the petrol tank is five gallons, and the maximum speed is given at 25 miles per hour. Although shown without mudguards, these can be fitted if desired.

Messrs. Ewart-Hall, Limited, showed the Oldsmobile cars and parts, and also their 2½-h.p. motor-bicycle. A spray or surface carburettor is fitted as desired and an exhaust valve lift is provided. The lubrication is by means of a sight feed pump, and the engine can be lubricated whilst travelling at top speed. The machine carries petrol for a 120-mile journey, the capacity of the lubricator being sufficient for 100 miles.

CORRESPONDENCE.

REPREHENSIBLE PROCEDURE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The old plan of sending in bogus claims is easily thwarted. We would recommend our friends, the Beaufort Motor Company, to do as we have always done, viz., appoint a certain firm in each district, and supply only that firm as agents. If a firm holds a good agency, it is soon known to others in the district. We have adopted this plan for the last five years with our agencies, and have never had the slightest trouble. If a trader who is not our agent wants to buy our cars he must go to the appointed agent, and get him to make terms to suit the occasion, a proceeding which no one would object to.—Yours faithfully,

INTERNATIONAL MOTOR-CAR COMPANY, LIMITED.

THE NUMBERING PROPOSALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Herewith copy of a letter I addressed to the Automobile Club. In reply I was informed that the Committee cannot see their way to get the opinion of all the members of the Club regarding numbering motor-cars, and that it is expected that those who attend and hear the reasons will be in favour of numbering. I am informed by a gentleman who was present at the last meeting that, notwithstanding strong opposition, it was recorded that numbering was "passed unanimously." To me it is incomprehensible why the Committee seemingly wants to ride rough shod over all the members.

If the majority of the Club, or of those interested in motor-cars, decided to have numbering, I would loyally accept their decision, but I object to have so important a matter decided by a small number of men, who are led astray through the howlings of a few nervous people. Every one knows that in any supposed danger, one nervous old woman will make more noise than dozens of sensible men and women, but no one heeds the advice given by such a woman. Now, on most county councils, and on some benches, there are nervous individuals, wearing bifurcated garments—though they would be more appropriately clothed in petticoats—who announce that they, or some of their friends or relations, were nearly run over by motor-cars. You never hear of this *actually* happening. Therefore motor-cars must be hampered in every way! These are *not* the stamp of people who compelled the world to call Britain, Great Britain, and made the British name respected throughout the world. We, who pride ourselves on being Britons, should not truckle to such nervous creatures, who ought to be carefully packed in wool, and put away in some safe place where motor-cars cannot get at them. When Rome allowed itself to be influenced and guided by nervous, invertebrate people, its downfall commenced. Is this to be the fate of Great Britain?

Because hitherto speed on roads *could not* exceed twelve or fourteen miles an hour, is progress to be stopped because a few nervous people cannot see beyond their noses? And stopped, or severely checked, it undoubtedly will be, if motor-cars are numbered, for these thoughtful and considerate drivers will be so harassed and fined that they will be forced to give up motor-cars. Again, why should motor-cars, which do not injure roads one-tenth as much as horse-traps, be required to pay five shillings extra tax? I do hope that every member of the Automobile Club, and everyone who is interested in motor-cars and objects to numbering, will give expression to his views.—Yours faithfully,

J. R. MAGRATH, Colonel.

QUERY RE DRIVING SHAFT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Has any owner of a Swift voiturette found a means of improving the plain bearing on the driving shaft, just in front of the gear box?

I find that the bronze bush in it very quickly wears away, and that as soon as it is a little worn the gear box works loose on the back axle. The driving shaft is of mild steel, and is getting very worn also, and as I have to turn it down true each time a new bush is fitted, I shall soon have to replace the shaft.

I have fitted a cup lubricator directly on the bearing, so that it gets sufficient oil, but that does not prevent the excessive wear. Since getting the car I have had to replace the large bronze gear wheel with a steel one, and to bevel the faces of the positive clutch so as always to change speed at the first attempt; in other respects I consider the car has proved satisfactory.—Yours truly,

A. LESTOCK REID.

STANDARDISATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been reading with interest the valuable articles which have been appearing lately in your columns on the subject of the up-to-date

motor-car, and would like to point out the one point that is paramount to me, and that is the lack of standardisation. There is too much copying and guess work in the present day motor-car, whereas, should the experts get their heads together, and discuss and study the vital points of automatic output and interchangeability, we would soon regain our lost ground in a business in which we should now be leading the world.

There is no universal standard of any sort. Of course it will be said that the motor business is still in its infancy, and no standard parts can be set, or agreed on. This is only the case with regard to the most unimportant parts of motor-cars. Bodies, bonnets, etc., are secondary matters, and I will admit, are affected by style, but the essential parts of cars, such as axles, wheels, tyres, springs, coils, etc., need not change any more than the chains, bolts, nuts, etc. However, the most important parts of the motor, as enumerated above, are the main considerations, and are not governed by style, but by laws set down by mathematical calculation. The capricious moods of the non-practical buyer should not be allowed to affect these points.

The lack of standardisation is principally the cause of our falling into the slow pace we seem to be following. In engine building, frames, bodies, etc., we can hold our own with any country, but we forget our attention seems to be arrested there. We are forgetting the means whereby cheapness is effected. Each and every maker has his own idea of motor-car construction, and the result is that there are dozens of useless styles, sizes, and patterns of axles, wheels, tyres, coils, bolts, etc., etc., and they are still changing.

The outcome of it all is plain. The axle maker cannot make up his axles to standards, yet he knows exactly what is best. The wheel maker cannot make up standard sized wheels for stock, which would expedite deliveries. The spring maker, the tyre maker, the coil maker, and others who supply parts to the manufacturers are compelled to make moulds and patterns, jigs and gauges, of peculiar shapes, and in useless sizes, to suit individual makers or concerns.

This sort of business prevents cheapness of output, guaranteed deliveries, interchangeability and satisfactory business relations. On the other hand, it retards progress. It invites the thrifty foreigner to infest our market. It robs us of the premier position in a class of work in which we should lead all others. It also prevents the important study of the point of accessibility. The expert is handicapped in the assembling, and his templates and blue prints become of little use.

When sifted down we find the root of it all seems to be the lack of organisation. We are losing our ground, *not from lack of knowledge* so much as lack of study of means and ways. The Teuton, the Yankee, and the Frenchman seemed to have grasped the fact that *system, and system alone*, gave them their chance, and they have made good use of it.

Standard sizes, interchangeability, and balance can only be got by universal adoption of system. Cheapness is got by use of jigs and gauges, and accessibility is due to arrangement, and balance on lines of theoretical and practical law as already set down, which we have known for years and cannot change. Strength for weight cannot be altered by fashion. On a basis of this sort we will alone be able to produce sound and reasonable work for home and abroad.—Yours truly,

BERNE NADALL.

SIDE SLIP,

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As the question of side slip is now so prevalent, I have pleasure in giving you a recent experience in relation thereto. I drove from the Club, in Piccadilly, one night a short time ago, when the roads were in as greasy a condition as they possibly could be, and I was riding on a car with a short wheel base. We took sharp corners very quickly, and, in fact, utterly disregarded the condition of the road, and the car clung to the surface as if we were on a bone dry road.

I have had a set of "skid knot chains" put on my car, and in driving through South London this week I encountered some very nasty incidents of traffic on the other side of the Thames. The roads were very greasy, and I had been travelling over tramway lines, and took some very sharp turns in going in and out of the traffic, such as I should not have ventured to have done under ordinary conditions.

At one very complicated crossing by Vauxhall Bridge (south side) a tramway car was approaching from one direction, a bus from another, and a brewer's pair-horse lorry coming from still another direction on his wrong side of the road. I was completely hemmed in, and had to do some very quick manoeuvres to save a collision, and so quickly had the car to be turned in three different directions, one after the other, on the greasy surface, and across the tramway lines, that it would have been hopelessly impossible to have negotiated the very awkward predicament unless I had had the non side-slip chains.—Yours truly,

T. W. STAPLEE FIRTH.

DELIVERY VAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if any reader would give me his experience of a motor delivery van, and what kind of van would be most serviceable to me as a baker in Devonshire. The hills around here are rather steep and rough. The daily distance I travel with horse and trap is about twelve miles. I usually take a load below 5 cwt., or with myself and lad

say about 8 cwt. at the most. I have between eighty and ninety customers to call on. These usually take me with horse and trap four hours, one stoppage being enough to serve two or three customers in some places. As the journeys have to be done every day without fail, can a motor be depended on, or would the number of times stopping and starting be too much for the machinery?—Yours truly,

J. M. PRATT.

"X." WRITES:—I shall be very glad if some of your readers will give me their experience of the consumption of petrol in single cylinder 8-h.p. cars.

FURIOUS DRIVING CASES.

Where no alleged speed is given it is understood to be above the legal limit.
*Motor-cycle case.

SQUIRE WILDER, of Stansted Park, Hants, was on Saturday last again summoned before the Havant magistrates for furiously driving a motor car. The alleged offence took place on January 13th, a constable, who was in plain clothes at the time, declaring that the Squire turned a corner in the centre of the town at a speed of at least sixteen miles an hour. After hearing the evidence the magistrates dismissed the case.

At the York Police Court, the Lord Mayor (Alderman E. Gray) referring to a motor-car case before him, said that the proceedings seemed to have been taken under an Act, passed in the reign of the late Queen, which might, to some extent, be considered obsolete; still they had to administer it, and wished it to be understood that twelve miles an hour must not be exceeded in the city.

In a case in Essex, a summons against a motorist has been dismissed because no sealed copy of the Local Government Board regulations had been put in. The Bench had no judicial knowledge that there were such regulations, and the case was therefore dismissed. A fresh summons has, however, been applied for against the defendant.

LEAVING A CAR ON THE HIGHWAY.

At the Wimborne Petty Sessions, Frederick Long, motor-car driver, in the employ of Lord Wimborne, pleaded not guilty to leaving a light locomotive on the highway without taking proper precautions. Police-sergeant Saint stated that on the 12th he saw the motor-car standing outside the International Stores, and the machinery was in motion. Defendant said he took precautions to throw everything out of gear before leaving it, so that no one who did not understand the machine could have started it. The case was dismissed, and the Chairman said in future every precaution should be taken.

DAMAGING THE ROAD.

At the Blackburn Borough Police Court, the Road Carrying Company, Limited, of Liverpool, have been summoned for causing a locomotive to be on the Yew Tree Brow "the tyres of which were not in accordance with the regulations under the Locomotive and Highways Act, 1896." Mr. Holt, assistant solicitor to the Corporation, stated that according to the Act the tyre of the wheel should be smooth and flat, but in the present case it was fitted with a steel stud which could be raised or depressed. When projecting it tore up the macadam road, and smashed every stone sett it passed over. The Corporation had suffered much damage by such contrivances, as it cost 2s. 6d. to replace each broken stone sett. The defendant company's locomotive had sixteen of the studs, but only four projecting, and these tore up the road for about a quarter of a mile. Mr. Carter admitted that an offence had been committed. He reminded the Bench that the

defendant company were engaged in a new industry, and the vehicles were more or less in an experimental stage. The primary object of the studs on the wheel was to enable the cars to get over land covered with snow. The Bench said it was a serious case, and inflicted a fine of £5 and costs, intimating that a similar case in future would be more severely dealt with.

ALLEGED NEGLIGENT DRIVING.

At the Brompton County Court, London, on Friday, the 23rd, before Judge Stonor. Mr. George May, contractor, 29, Red Lion Square, W.C., brought an action against Captain Loeck, 63, Cadogan Square, Chelsea, S.W., claiming £15 odd in respect of injury to a horse and damage to a governess trap, said to have been caused through defendant's negligent driving of a motor-car. In conjunction with this case was tried a cross action, in which Captain Loeck claimed £3 odd from Mr. May in respect of damage to the motor car, alleged to have been caused through negligent driving of the trap. The Judge came to the conclusion that there was negligence on the part of the defendant, yet he could not but believe also that the plaintiff might have stopped and avoided the accident if he had been driving at a proper pace. He thought he ought to have pulled up long before he did. He therefore found for the defendant on the ground of contributory negligence on the part of the plaintiff, and should allow no costs on either side.

LEARNING TO DRIVE.

A CHARGE of stealing a motor-car, value £300, the property of Mr. H. F. Acland Hood, of 10, West Eaton Place, S.W., was preferred at Westminster, on Tuesday, against a young man named Arthur Billings. Prosecutor said he understood prisoner was a brother of his (Mr. Hood's) late driver. Witness had his car stabled at Kensington, and the prisoner got it by the false pretence that he was authorised to take it out. Prisoner: I wanted to get a situation, sir, as a driver, and I thought I would practise on your car. The prisoner drove the car, dirty and damaged, on Monday evening to premises in New Bond Street, where it was purchased. The accused was remanded for a week.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, FEBRUARY 7, 1903.

[No. 205.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

CLEARLY London magistrates are displaying more wisdom in their attitude towards the automobile than are the unpaid justices of the rural districts. These latter have shown a bias against the motorist, which has been almost entirely absent when similar cases have been heard before stipendiary magistrates. This week mention is made in our list of cases of alleged furious driving of two cases heard in London courts where "sweet reasonableness" prevailed. At Marlborough Street Police Court, Mr. Kennedy dismissed a summons against Lieut. L. Walker Munro, reminding the police that pedestrians frequently "lost their heads" when seeing motor-cars. At the City Summons Court an alderman pointed out that a motorist who pulled up "in about the length of his car" could not be driving to the "common danger"—a view that led to the dismissal of the case. Evidently the Metropolis is becoming the only safe place for reasonable speeds on motor-cars.

Irish Approval Extending.

FOLLOWING what we said last week of the interest which the international race is exciting in the Emerald Isle, news comes of the consideration of the matter by various local authorities. The Antrim County Council has decided to do everything possible to assist the matter, and a long discussion on the subject has taken place at Wexford. At the meeting of the latter council several speakers declared that, though the proposed route did not pass through their district, they would do what they could to influence the local authorities on the line of the race in a favourable direction. The Dublin County Council has also been equally gracious.

Benefit to Ireland.

THE enthusiasm with which the Irish people are regarding the proposed contest on their roads suggests the possibility that had the present agitation been fomented immediately after the British victory in the Gordon Bennett race something definite would have been known long ere this. The present uncertainty is hardly pleasant; although the discussions should serve to attract touring motorists to the Emerald Isle whether the international event is run there or not. At the same time the experience gained should urge those responsible for the national prestige to take time "by the forelock"—if motorists may legitimately use such an expression—and arrange everything in good season.

The American Competitors.

REPEATED efforts were made during the recent show in New York to learn what the candidates to represent America in the Gordon Bennett contest are building in the way of racers, but they were all careful not to give out any information of consequence. The "Motor World" states:—Messrs Mooers, Harkness, and Matheson all were free enough to admit that they would use four-cylinder engines, but would give no idea of their horse-power. Winton will use a horizontal engine, but what its horse power or location in the car will be is not known. From whisperings here and there it is believed that Mooers and Matheson will have cars of a very big horse-power, something probably in the neighbourhood of a hundred. Harkness admitted that his car is being built in New York city after designs of his own. It will not be a replica of any particular make, but will embody all the latest improvements. From what he said he does not favour very high horse-power, believing it to be unnecessary. Winton, the most reticent of all, is understood to agree with Harkness about high horse-power being unnecessary. One gratifying thing seems certain, which is that none of the cars will be freaks. From what could be gathered the Winton candidate will probably be the only one with a specially-designed racing shape of body. Harkness will, it is said, enter his car in the Paris-Madrid race, whether he is selected for the Cup race or not. Matheson is very confident about the success of his vehicles. If one of the two cars he is building is selected, he will drive it himself, and if not chosen for the Cup contest will enter for Paris-Madrid.

Result of the Tyre Trials.

LAST week we gave the results of the Tyre Trials organised by the Automobile Club, and must confess that "the man in street" will probably be confused to learn that one firm obtained first prize, while another losing the fewest marks gained the second place. Of course the reason is clear to those who peruse the elaborate report prepared by the judges; but it would have been better had provision been made against the possibility of any such ambiguity. Another suggestion that seems to meet with approval is that the restriction as to limiting the number of types entered by any one maker which has been adopted in connection with the car trials should be followed in connection with tyre contests.

On Pneumatic Tyres.

REPORTING with regard to pneumatic tyres the judges make the following observations:—It is claimed for the pneumatic tyre that by its great resiliency and consequent reduction of vibration, the engine, gear, and carriage work are preserved from the constant succession of shocks from road contract which must arise from speedy travelling over the

highway; and that consequently cars shod with pneumatic tyres are not so liable to breakdown from engine, gear, or frame failure, and the life of the motor and carriage is considerably prolonged; whilst the comfort of riding and facility of steering are greatly increased. It is beyond argument that the reason why motor owners incur the very considerable additional expense which is involved by the employment of pneumatic in preference to solid tyres, and are willing to suffer the delays and annoyance which may arise from puncture of pneumatic tyres, is because of the additional speed and general smoothness of running which result from the property of absorbing obstacles, which is the main characteristic of a pneumatic tyre. It is possible to manufacture a pneumatic tyre which is practically unpuncturable; but if, in order to avoid puncture, the tread and walls of the tyre are so thick and so unyielding, and therefore sluggish, that the tyre fails to absorb concussion better than a solid rubber tyre, nothing is gained by the use of such semi-solid tyres."

The Youngest Motorist.

IN our issue of the 17th ult. we reproduced a photo of Master Carter, the ten-year-old, son of Mr. C. E. Carter, of Grays, Essex, describing him as probably the youngest motor-cyclist in the country. This claim was soon overthrown, for last week we gave a picture of Master E. Bond, of Bishopston, Bristol, just turned six years of age, who rides a motor-bicycle. While he can, we think, safely claim to be the youngest motor-cyclist in the country America has even a still younger motoring prodigy in the son of Mr. D. Ogden, of the Western Union Telegraph Company, at Columbus, Indiana. Master Hubert Ogden, who is only three years and four months of age, is shown on his "car"

in the accompanying illustration, for which we are indebted to the "Horseless Age." The vehicle has a live rear axle carrying the differential gear, with a band brake upon it. The power is supplied by a 1½-h.p. petrol-motor, which is located in front. The body is 38 inches long and 16½ inches wide, and is carried on 20-inch wheels. The speed is controlled by a forward pressure on the lever shown at the left, which operates a friction drive giving a variation in speed from one to seven miles per hour. The brake is operated by the foot, and the steering is controlled by a tiller. The little *chauffeur* handles the levers very skilfully, although, we may add, his father always accompanies him on a bicycle.

The Oxford Club.

MATTERS are moving rapidly in connection with the Oxford Automobile Club. Only a few days ago the idea was mooted by Mr. W. L. Creyke, and already a preliminary meeting has been held, at which Mr. J. E. McPhail was elected hon. sec., with Messrs. Creyke, Biscoe, Rippon and Walsh as a committee to draft rules and prepare other initiatory details.

The headquarters of the club will probably be located at the Clarendon Hotel, Oxford. The promises of membership exceed thirty.

Alien Motor-Garments.

IF the enterprise of British tailors were equal to the skill and elegance for which their handiwork is notable, they would be masters of a branch of trade now largely in the hands of the foreigner. Speaking at the fortieth annual dinner of the West End Foreman Tailors' Society, held on Saturday at the Hotel Cecil, London, Mr. J. W. Lovegrove said that the West End firms nearly all refused to recognise that making motor-clothing was a branch of the trade. "Oh, no," was a common remark, "we are not here to make up leather garments." French, and more especially German, firms had not been slow to seize such a neglected opportunity, and had now nearly the whole of the trade in motor-garments in their own hands. The few English firms engaged in this department were nearly all manufacturers in other lines, who could hardly be expected to turn out the same fit as an experienced tailor. These Continental makers had a great advantage over the English firms, as they were not controlled by trades unions, and so did not have a fixed standard of wages. If they were once allowed to secure the whole trade, with this important point in their favour, it would be difficult for the Britisher to offer any competition at all.

A Motor-Car Service for Ireland.

DURING the coming summer several motor-car services will be established at various seaside resorts, and already we hear rumours with regard to one or two fashionable watering-places on the south and east coasts, while the result of the tenders now being considered at Eastbourne is being watched with considerable interest. In Ireland, too, some important developments are on the way, and a number of influential men in the Midleton district have decided to inaugurate an automobile service between Cork and the seaside resort of Ballycotton. Capt. Donelan, M.P., has placed the matter before the Chief Secretary for Ireland, who has forwarded the appeal for a Government grant to the Department of Agriculture. Seeing that grants in aid have been made to several local light railway projects we do not see why similar help should not be rendered to this motor-car service. Anyhow, it is satisfactory to note that the Department of Agriculture is sympathetically inclined towards automobilism, and the enthusiasm which has grown over the proposal to hold the Gordon Bennett race in Ireland should go a long way towards assisting the establishment of this seaside service.

Affiliation with the A.C.G.B.I.

AN informal conference of representatives of provincial automobile clubs and of the parent body has been held at the Club-house in Piccadilly, when it was agreed: (1) The Motor Union continue to perform work similar in nature to that which it now carries on. (2) All automobile sporting fixtures (other than motor-cycle events) of a national description to be administered by the Automobile Club Sporting Committee. This committee to be of a representative nature, and to consist partly of members of affiliated clubs to be elected on a basis to be considered hereafter. (3) Affiliated clubs to be asked to form committees of a similar nature and construction to perform the same kind of work for local and district sporting events, which must be held under the competition rules of the Automobile Club of Great Britain and Ireland.

Motor Cycle Events.

WITH regard to motor-cycling matters it was agreed that in order to meet the desire of motor-cyclists generally, who wish to belong to some corporate body, a Motor-cycle Association or Union be formed which shall be open for purposes of membership to all classes. This body shall be governed by a

Motor-Cycle Racing Board, to be elected on a basis to be determined hereafter. It was decided that the Motor-Cycle Association should make rules which would govern the sport throughout the United Kingdom; that the Motor-Cyclists' Union of Ireland and the Scottish Cyclists' Union of Scotland should be asked whether they intend to govern motor-cycling in their respective countries; that they should be informed that if they do not intend the Club is prepared to administer motor-cycling there by means of the new organisation; if they do intend, they should be asked if they would be willing to be represented on the central body, with a view of framing rules affecting motor-cycle racing throughout the United Kingdom, on the understanding that the two societies should administer these rules in their respective countries.]

The Eastern Counties Club.

ALTHOUGH only founded a few days ago, the Eastern Counties Automobile Club has already twenty-two members, and now that the meeting has been held to draft rules a great accession of strength should be reported at no distant date. The Club is to consist of members, honorary members, and associates, and is to be governed by a committee of six, with the officers, comprising president, five vice-presidents, hon. treasurer (Mr. F. L. Bland), hon. secretary (Mr. C. K. Moseley), and hon. solicitor (Mr. E. P. Ridley), ex officio. The annual subscription has been fixed at £1 1s. for members and 10s. 6d. for associates. In the original draft of the rules the Club was described as "the Eastern Counties' Branch of the Automobile Club of Great Britain and Ireland," but this clause was struck out at last week's meeting at the Great White Horse Hotel, Ipswich, owing to the question of the amount of the affiliation fee.

Lecture on Ignition.

MR. R. W. BUTTNER has been enlightening the members of the Portsmouth Automobile Club on the subject of ignition. Commencing with a brief description of the early forms of ignition in use on internal combustion engines, and a passing reference to tube ignition and the ingenious variation thereof due to Messrs. Lyons and Whitmarsh, the author proceeded to describe, with the aid of diagrams, the principles of the ordinary high-tension system with accumulators and coil. Elsewhere we give an abstract of Mr. Buttner's useful paper, which concluded with a demonstration of the effect of an outside spark-gap, the points of a dirty plug being separated till the spark took a course over the sooty porcelain; on inserting an external spark-gap in the circuit, the spark returned to its usual path between the points. A discussion followed, in which a member stated that while he had found the external spark-gap effective with an 8-h.p. Deauville, it had failed with a 6-h.p. De Dion. A hearty and well-deserved vote of thanks was accorded to Mr. Buttner on the motion of Mr. Koozens, seconded by Colonel Dawson. Mr. G. C. Vernon Inkpen presided, and there was a large gathering.

An Automobile Track.

WITH reference to certain statements as to the proposed automobile track we may now state that the site is at Purley—a spot familiar to all acquainted with the road from London to Brighton. Mr. Mark Mayhew regards it as a "sporting course," and describes it as follows:—"There are two or three flat stretches and a couple of stiff but by no means impossible hills, and we shall be able to get for timing purposes a flat straight with a good start. It is an extremely pretty piece of country. The course for some distance is almost straight, running along a valley and closely following the railway. Then it climbs up over the railway tunnel and down again into another valley, then mounts again, and finally, after a curve too great to be felt even at high speed, follows the same line back to the starting-point." It is intended that the track shall have a gravel surface, and as the subsoil is chalk, flint, and gravel, it should be

dry going even in wet weather. The lie of the land makes the course an excellent one from the spectator's point of view, and there is one point at which a grand stand would command two miles of double track in each direction. The ground is offered to the Club on rental, the owners to have a share of the money, and a certain number of meetings to be held in the course of the year. According to the "Manchester Guardian" the track is to be sixty or seventy feet wide and about seven miles long.

The Yorkshire A.C.

THE Yorkshire Automobile Club has now a membership of 120, and should the Gordon Bennett race be held in Ireland will send a large contingent of spectators. At the annual general meeting held last week at the Great Northern Hotel, Leeds, officers were elected as follows:—President, Earl Fitzwilliam; vice-presidents, Lord St. Oswald, Mr. Harrison Benn, Mr. T. E. King, Mr. A. W. M. Bosville, and Mr. H. R. Kirk; committee, Mr. A. J. Greenwood, Mr. R. Winn, Mr. E. Faiers, Mr. W. Jackson, Mr. H. A. Jones, Mr. J. Whitaker; hon. secretary, Mr. A. W. Dougill; hon. treasurer, Mr. L. Hey; hon. solicitor, Mr. Claude Leatham. During the past year the receipts amounted to £140, and there is a balance of £20 in hand. At the meeting, Mr. H. A. Jones—who is to describe the features of the Panhard car to the Club on the 19th inst.—drew attention to the proposal to construct a tramway from Keighley to Shipley, and thence to Ilkley. In certain districts in the West Riding the tram-rails were of the same width as the wheels of a motor-car, and in some parts were considerably below the surface of the roadway. He had had a very awkward skid at Dewsbury on a portion of road where the rails were actually 1½ inches below the surface of the roadway. This is a growing evil in the vicinity of many great towns.

MRS. CLAUDE PAINE ON HER CLEMENT CAR, WHICH SHE HAS DRIVEN OVER 5,000 MILES.

"All Motorists Now."

MR. AND MRS. CHAMBERLAIN have become converts to automobilism, and have been visiting some of the interesting places in Kimberley and the district on a motor-car. But for the convenience afforded by the automobile it is probable that their tour of inspection would have had to have been considerably shortened, so that we may anticipate on his return the Colonial Secretary will join the ranks not only of theoretical but also of practical motorists. During last week the King and Queen had several motor-car trips, but the illness of his Majesty

has prevented the carrying out of his projected motor-car programme in Derbyshire. But so rapid has been the conversion to automobilism of those in high places that, to vary a famous phrase of Sir William Harcourt's, we may say "We are all motorists now."

The Norfolk Club.

ON Saturday the Norfolk Automobile and Launch Club was formed at a meeting at the Royal Hotel, Norwich. Mr. G. M. Chamberlain was elected chairman of the committee, which has been constituted as follows:—Baron de Barreto, Messrs. E. T. Boardman, E. Estcourt, W. W. R. Spelman, J. Griffin, G. Sillem, H. R. Fletcher, and the following district representatives—Mr. H. Chamberlain, Yarmouth, Lowestoft, and Beccles District; Mr. Frank Morriss, Lynn District; Dr. Belding, Dereham District; Colonel Eden, Cromer District; Rev. J. A. L. Fellowes, Thetford District. Mr. G. N. C. Mann was elected hon. secretary, Mr. H. L. Clark being associated with him to look after the launch sector. With regard to affiliation with the A.C.G.B.I. it was pointed out that the capitation fee of half a guinea was "beyond all reasonable idea," and the hope was expressed that association with the central body might be possible on more equitable terms. Among those who have already joined the Norfolk Club are Lord Battersea, Dr. F. W. Burton-Fanning, Colonel Eden, Colonel Barclay, the Rev. P. N. Clark, and the Rev. J. A. Fellowes.

Scottish Trials.

THE Scottish Automobile Club has decided to hold 100-mile trials on seven days' notice being given to the secretary. Mr. R. G. Smith, Glasgow has been selected as the starting point, and the route will be *via* Bearsden, Dumbarton, Helensburgh, Whistlefield Hill, Arrochar, Tarbet to Crianlarich, then back *via* Ardlin, Luss, Bonhill and Clydebank, without stopping. No speed in excess of twelve miles an hour will be recognised except on ascending Whistlefield Hill. Controls will be established, within which no speed in excess of eight miles an hour will be permitted, and within these controls a competing car may not pass another vehicle in front of it, providing the leading vehicle is travelling at eight miles per hour. The trial will include a hill climbing trial on Whistlefield Hill, and certificates will be issued by the judges.

A Generous Offer.

THE luncheon which preceded the ceremony in connection with the Liverpool Cycle and Motor Show on Tuesday was made notable by a generous offer by Sir Alfred Jones, K.C.M.G., whose interest in self-propelled traffic dates from pioneer days. Sir Alfred said that the development of the automobile would be a powerful factor in the success of the port of Liverpool, and urged that every encouragement should be given to local industries. With that object in view he offered to give a 20-guinea cup for the best locally built motor-car. Further, to stimulate the makers of vehicles for heavy traffic, he proposed to offer, through the Liverpool Self-Propelled Traffic Association, a 100-guinea cup for the most useful improvement on motor-vehicles suitable for commercial purposes. These generous gifts by Sir Alfred Jones should induce manufacturers to put forth their efforts, and should have a good effect on the future of self-propelled traffic.

The Liverpool Show.

SEVERAL well-known men were present at the opening ceremony, over which the Lord Mayor, Sir W. B. Forward, presided. Mr. J. C. Robinson has acted as chairman of the Show, and his supporters when Professor Hele-Shaw, F.R.S., declared the exhibition open included Mr. G. H. Cox (chairman Road Carrying Company, Limited), the Hon. Arthur Stanley, M.P., Mr. W. E. Moss, Mr. F. Salisbury (Postmaster of Liverpool), Mr. Charles Cordingley, Colonel William Walker,

Chief-Superintendent Thomas (Liverpool Fire Brigade), Messrs. T. Thorneycroft Vernon, E. Shrapnell Smith, T. H. Barker (secretary, Liverpool Incorporated Chamber of Commerce), and Thomas Price (secretary). Professor Hele-Shaw predicted that for the general public the motor bicycle would be the vehicle of the future. The Hon. Arthur Stanley, M.P., proposed a vote of thanks to the Lord Mayor for presiding. This was seconded by Mr. Moss, the newly-appointed secretary of the Liverpool Self-Propelled Traffic Association, and enthusiastically adopted.

"Alas! my Poor Brother."

AN elephantine sort of comedy was enacted at Bexley the other day, when two motor-wagons were in sad distress. A portion of the road was up in order to receive a new main belonging to the local water company. Into this sank the wheels of a motor-wagon belonging to Messrs. Scott and Bratton and engaged in conveying paper from London to Gravesend. There it seemed likely to remain until hope came in the shape of one of Whiteley's motor-vehicles. This was hooked on to the victimised motor-wagon in the hope that the combination of power would extricate the unfortunate. But, alas! the connecting chain broke and the attempt was soon abandoned. The would-be rescuer was in similar difficulties a short distance further, but managed to resist the temptation to delay. The original laggard awaited in sulky mood the arrival of horses to draw it from the trench. Then, being relieved of its load, it was able to resume. Evidently horses are still of some use.

THURSDAY, July 9th, is the suggested date of the Gordon Bennett race.

LAST week we referred to the formation of an automobile company at Lincoln. This has now been registered under the title of J. R. Richardson and Company (Lincoln), Limited.

MR. CHAS. G. GLIDDEN, the well-known American motorist, who last year made a tour of Europe on a Napier car, has just purchased a Pope-Robinson touring car, built by the Robinson Company, of Hyde Park, Mass., U.S.A.

WITH regard to the report referred to in our last issue, Mr. E. M. C. Instone, of the Daimler Motor Company, writes that "I am desired by Sir Edward Jenkinson to request you to give a denial to the report that he has resigned both his chairmanship and directorship of the Daimler Motor Company."

THE sparking plug "discovery," described in our last issue, is attracting considerable attention. The Ariel Motor Company, Limited, have already altered the wiring on one of their motors so that there is a gap between the high-tension wires and the sparking plugs, while Messrs. Gamage have just introduced the "New Idea Spark Intensifier" to give the same result.

ON Tuesday several members of the Chatsworth house party went motoring. In the first car were the Duchess of Devonshire, Lord Rosebery, Lady De Grey, and Lady Howe. In the second and third cars were Lady Norreys, Rear Admiral Lambton, Lady Mar and Kellie, the Duchess of Manchester, Mr. Alfred de Rothschild, and the Hon. R. Lister.

MESSRS. MARSHALL AND COMPANY, of Manchester, have recently completed a motor-van, with which they are carrying the mails between Manchester and Altrincham under contract with the G.P.O. authorities. The van has a four-cylinder 24-h.p. motor and can carry a load of from 25 to 30 cwt. It has been at work for some little time past, and is, we hear, giving most satisfactory results.

THE Mayor of Portsmouth has been re-elected president of the local automobile club for the ensuing year, and the vice-presidents have been re-elected with the addition of Col. Isherwood. Mr. Ernest Sapp, the energetic hon. secretary, and the treasurer, Mr. F. J. White, were again asked to accept the offices which they had so successfully occupied since the Club's inauguration. The committee was appointed as follows:—Alderman G. Ellis, Alderman J. H. Dean, Dr. K. H. Clegg, Councillor Vernon-Inkpen, Messrs. A. Langdale, A. Glasier, A. G. Clark and H. Barnes.

HINTS ON IGNITION.*

PERHAPS the most serious of the troubles experienced with ignition by the average driver is in connection with the accumulators, which, while fairly long-lived under careful treatment (I have some that have been in constant use on a car for over four years), are easily injured by neglect. In the case of a new accumulator being received empty, it should, after examination to see that no fragments of paper, straw, or other packing material has gained entrance, be filled with dilute sulphuric acid, made by pouring one part of pure acid ("brimstone" acid should be asked for, the commercial acid made from pyrites being unsuitable) into about five parts of water, so that the density of the mixture may be 1.190 when tested by a hydrometer. A convenient form of this is sold, enclosed in a pipette, for a few shillings, which enables a sample of liquid to be drawn, if necessary, from the cell. The accumulator should be charged as soon as filled. The method of doing this from an electric light circuit was then explained. A 10 ampere-hour accumulator—small bicycle size—would require the current from two 16-c.p. lamps in parallel on a 100-volt circuit for about

while, if lost by spilling, more dilute acid should be used. Sulphating, shown by whitish patches on the plates, is caused by over-use with infrequent charging, and can only be cured by repeated over-charging, and then only if not serious. The addition of about 10 grains of carbonate of soda to the pint of dilute acid helps to prevent it. The practice of foreign makers in putting instructions and data regarding an accumulator on an indestructible label attached to it should be followed by English makers, who, if they vouchsafe any such, too often put it on a paper label that soon succumbs to the acid.

The successful action of the induction coil and its trembler depends largely on a rapid break, and tremblers on the principle of the Charpentier are being widely adopted. The principle of all these lies in mounting the armature that is attracted by the core of the coil on a weak spring, while the contact points are on another spring separate from the former. The armature, on being attracted, does not touch this latter till it has partially completed its travel, and so is already moving fast. Thus a more rapid break and more powerful spark is obtained. In the Eisemann system a magneto generator is substituted for the accumulators, the current being sent in the ordinary way through a coil. It was not, however, necessary to have a coil, or rather

A PETROL MOTOR WAGON'S NEW OCCUPATION AT HAVRE.

ten hours in order to charge it, with an expenditure of electrical energy of about one unit. In the case of a 200 or 220-volt circuit, the current from three or four lamps in parallel would be required to charge it in the same time, with nearly twice the expenditure, only 1-25 or 1-50 of the energy being usefully employed. This was therefore a wasteful method, though sometimes convenient. The positive pole should, of course, be connected to the positive pole of the battery, and could be found by connecting both terminal wires to strips of clean sheet lead, dipping in dilute acid similar to that in the cell. The positive strip would be indicated by turning brown. More accumulators were injured by running down too low, and then being left for a time without re-charging, than by any other cause.

When the electrolyte is required to be gelatinous, as in cycle cells, it can be made by adding one part of silicate of soda to three of the ordinary dilute acid. The liquid in all cases slowly evaporates, and cells require the addition of a little distilled water from time to time to keep it above the tops of the plates,

the secondary winding, as on breaking the primary circuit a high-tension current was induced in it. To utilise the spark from this, however, the break had to take place in the cylinder itself, and this is the principle of most magneto ignitions, of which the Simms-Bosch is perhaps the most widely known and used. In the reciprocating form of this (an example of which, with its plug, was shown) a coil of wire is alternately screened and exposed to the magnetic flux of a powerful pair of magnets by an oscillating screen of soft iron. The break in the cylinder is adjusted to take place as the screen begins to uncover the coil, the result being a powerful and efficient spark. The advantages of the magneto should be peculiarly noticeable on cycles, where the electrical arrangements are too often cut down to the lowest limit of efficiency, and it is probably in most cases more efficient than the high-tension system as usually fitted. With regard to sparking plugs, a broad surface of insulation inside, whether obtained by grooving the porcelain or otherwise, diminishes trouble from fouling. Sparking across the outside surface, sometimes troublesome in damp weather, may be cured by the application of vaseline.

* Abstract of paper read by Mr. R. W. Buttemer before the Portsmouth Automobile Club, Jan. 29, 1903.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE entries for the Paris-Madrid motor-car race have reached the first hundred, and are still steadily rolling in, leaving no doubt that the field will be larger than either Paris-Vienna or Paris-Berlin, and the struggle far more interesting. To the annual fight between the two giants, Panhard and Levassor, and Mors, has been added a new interest, and more than one foreign country will contest for the supremacy. There are several new French firms which will be heard of before the lists are closed. Between twenty and thirty large manufacturers are combining capital, skill, and labour to produce cars which shall be the best of their kind, and which shall form for future years the model to be copied for pleasure and business cars. The problem to solve is strictly utilitarian, and is regarded as follows:—How can I combine the greatest horse-power and solidity with the least weight, in order to give me first of all the reliability necessary to cover hundreds of miles at full speed over good, bad, and indifferent roads, up hill and down dale, and with all this the speed to enable me to take and keep the first place?

ALREADY the roads from Paris to Madrid are being examined, reported upon, chosen or discarded, and in almost every case the local authorities are vying with each other in their eagerness that the race should pass through their districts. If the roads in their territory are not suitable, or are not in good condition, the unfortunate engineers who are responsible for the discarded road will have a bad time of it. For the gold which follows along the track of the race, and which benefits all the towns and hamlets through which it passes, will have gone into other hands, and the populations will have good cause to call their local councillors to account for having neglected their obvious duty, and thus bringing discredit and distress on their constituents. But to turn back to the manufacturers preparing for the contest. Let us see for a few moments how far-reaching is the result of the coming race. In the first place, there are the steel forges and foundries. The largest of them in the country are at work on the problem, the best solution of which means the victory. Nickel steels, chrome steels, and nickel chrome steels and silico-manganese steels, etc., are being prepared, tested and carefully employed. Cast steels and wrought steels are also being studied and perfected. The iron and brass foundries are busy with both malleable and ordinary castings from the patterns on which the pattern-makers have been busy for weeks and months past. The aluminium founders have their hands full, making phenomenally light gear boxes and base blocks. The wheelwrights are choosing their best seasoned wood for the spokes of the racing wheels. The body builders have also their problem of lightness and strength, the cushion makers, the liners, the trimmers, the painters, all have their part of the work to do. The great india-rubber companies have also their problem, which is not the least important, and they are preparing to spend tens of thousands of pounds—yes, tens of thousands—in prizes, premiums, expenses, repairs, relays, and advertising in connection with the race. Of the organisation I will only say that it is a colossal task and keeps a large staff busy for weeks, not only in Paris, but also in Madrid and all along the route. The makers of all kinds of accessories, such as lubricators, taps, indicators, springs, bolts, nuts, screws, lamps, tanks, gauges, etc., have also their share of work, whilst in the premises of the twenty or thirty competing firms, from the chiefs to the errand boys, all have their interest in the result. When the race takes place thousands of vehicles are requisitioned in Paris alone to enable the crowds to get a glimpse of the start. The boulevards are awake all through the preceding night. The local trains are crowded bringing people in to see the start, or taking them out short distances along the route. The country inns for fifty miles along the road have had all their rooms bespoken for weeks, and every available bed in the villages is requisitioned. At least one special train, crowded to its full capacity,

follows or precedes the race from start to finish. All along the route for twenty miles on each side of the road the population turns out, the school-children are marshalled beside the roads; it is a public holiday, and money changes hands everywhere for food and refreshments and shelter. What shall I say for the winning-post, Madrid?

IF we are to judge by Vienna last year, Madrid will be taken possession of by the French. Vienna is a much larger city than Madrid, has very extensive hotel accommodation, and is accustomed to a sudden influx of visitors from time to time. Yet on that memorable Sunday morning when the special train brought us to Vienna to see the arrival of competitors, the hotels were full to overflowing, and sitting-rooms, and even bathrooms, were being used as bedrooms. Madrid is very badly off for hotels, and will be very hard pressed to accommodate the thousands who will require accommodation for the last week in the month of May this year.

WHEN will the scales fall from the eyes of the powers that be in England, and when will they see that a full share of this prosperity can be brought to the island shores of Great Britain? That the scales will fall from their eyes there is no manner of doubt, but the question is, will it be too late?

THAT Venice is to have its automobile show and races this year seems to be an announcement which, to say the least of it, sounds incomprehensible, seeing that the only roads in Venice are waterways, and that gondolas are the only means of transporting oneself about the city. However, the show is to be held at Udine, which is at the gates of Venice, and the races are to be held over a circuit of 95 kilometres, beginning and ending at Udine. Three times round, or 286 kilometres, will be the length of the race, which is over flat country. Both alcohol and petrol will have their separate classifications, and there will be mile and kilometre speed trials.

LAST week I was invited by M. Leon Serpollet to take a 100 kilometres run in one of the steam omnibuses which were exhibited on his stand at the Grand Palais, and which have now been delivered to the schools of Saint-Dominique and Lacordaire. These have to cover upwards of 50 kilometres every morning, and a similar distance every evening. M. Serpollet has been so satisfied with the economical running that he invited a party of friends to do 100 kilometres with him, on one of them between its night and morning service. The party met at the A.C.F. and proceeded to the Porte de Vincennes, where the tanks were filled, and at 10.30 a start was made for Melun, a distance of fifty kilometres (thirty-one miles). The bus, with twelve passengers, arrived at Melun in an hour and forty-three minutes, and did the return journey with thirteen passengers in within a few seconds of the same time. Thus the 100 kilometres (sixty-two miles) was accomplished in three hours and twenty-six minutes, at an average speed of from eighteen to twenty miles per hour. Fifty-six litres, or a little over twelve gallons of petrol, were consumed. The bus with its living load weighed about three tons and a quarter. The result is so remarkable that it requires no comment. An illustration of the bus is given on page 945.

THE mending of a puncture seems a trying ordeal if one has to do it oneself. This is, however, because we are not experts, or do not get enough practice. In order to demonstrate the above proposition the Continental Tyre Company has made official trials under the control of Monsieur Tampier, time-keeper to the A.C.F. To the first of these references has already been made in these columns. In the last trial it took 5 minutes 53½ seconds to take off and put on again and completely finish a tyre pumped up to a pressure of 60 lbs. to the square inch. It appears that the motorist has only to have a little practice or

give his mechanic a few lessons and reduce the time lost by a puncture to ten minutes at the outside.

THE hill-climbing competitions of last autumn were very much marred by the war between the two Paris sporting papers, the "Velo" and the "Auto-Velo." There was a rivalry for the organisation of the competition at Gaillon, which ended in three competitions or rather three Sundays at Gaillon, for on one of the days announced no competition was held at all on account of the interference of the Prefect, whose consent had not been obtained by the "Auto-Velo." Another stage in the strife is marked by the fact that the "Auto-Velo" has now been constrained to alter its title and leave out the word "Velo," on account of a judgment obtained by its competitor and sustained in the appeal court. It is now, therefore, entitled "L'Auto"; it remains, however, the official organ of the A.C.F. and continues its traditions as before, and pleads with Shakespeare, "What's in a name?"

M. PAUL MEYAN, of "La France Automobile," has furnished me with particulars of the second "Criterium des

MR. W. K. VANDERBILT, jun., has just returned to Paris and has appealed against the sentence of two days' imprisonment passed upon him, in default, for the alleged furious driving of a motor-car along the Champs Elysee in Paris last September. An affidavit was put in by the Duke of Marlborough stating that he was the only other occupant of the car besides the driver on the occasion named, the driver not being Mr. W. K. Vanderbilt, jun. Judgment is reserved.

DURING its examination of the French Army Estimates on Tuesday afternoon, the Chamber of Deputies adopted an amendment for the reduction of the credit for automobiles by 80,000f. General Andre said that he had rather do without the motor-car allowed him than see this, whereupon a member cried, "You will be left 500f. for the purchase of a bicyclette!" which led to much hilarity. In spite, however, of the Minister's opposition, the grant was regarded as a waste of money, so that it was refused. According to the Paris correspondent of the "Telegraph," one great objection to it was that smart soldiers, who would make excellent non-commissioned officers, would be converted into "chauffeurs" for generals and others, to the detriment of the service.

THE CUSTOMS OFFICE AT THE AUSTRIAN-GERMAN FRONTIER AT ZINNWALD.

THE DUTCH-GERMAN FRONTIER AT BEEK.

CONTINENTAL TOURING REMINISCENCES—CROSSING THE FRONTIERS.

Transports Automobiles" he is organising. This is a test for commercial vehicles for both goods and passengers, on the lines of that held last year. The course will be from Paris to Monte Carlo (1,107 kiloms), and this will be covered in nine daily stages, starting from Paris on March 20. The contest is divided into the following seven classes:—(a) Vehicles carrying over 2,000 kilogs.; (b) 1,000 to 2,000 kilogs.; (c) 500 to 1,000 kilogs.; (d) 200 to 500 kilogs.; (e) 12-seated passenger vehicles; (f) 8-seated vehicles; (g) 4-seated vehicles. Careful note will be taken of the fuel and lubricating oil consumption, in order to arrive at the cost per ton-kilometre, and in making the awards the judges will take into consideration the regularity and average speed of the running throughout. About fourteen entries have been received up to the present, including 1 Turgan-Foy wagon, a Daimler military wagon, a Serpollet omnibus, 3 De Dietrich cars, 6 Ader vehicles, 1 Vinot-Deguingand, and 1 Bardon.

THE Austrian Ministry of Railways has issued a request to the directors of the State railways to formulate a concrete programme for the introduction of self-contained motor-vehicles on the Government lines.

MR. TYRER is to read a paper on "The Need of Duty-free alcohol for British Manufacturers," before the Society of Chemical Industry.

THE Bat Motor Manufacturing Company, Limited, has been registered with a capital of £30,000 in £1 shares, to adopt an agreement with Batson's Patent Syndicate, Limited, and Mr. J. B. Burkett, and to manufacture motor cycles.

AT the ordinary general half-yearly meeting of the London, Brighton and South Coast Railway Company last week, the chairman announced that the directors proposed to establish upon one of the country branches a service of automobile carriages.

MOTOR-CYCLING NEWS.

THE first annual general meeting of the Liverpool Motor Cycling Club has been held at the Feathers Hotel, Mr. R. Harvey presiding. A very satisfactory report, which showed the rapid progress of the Club, was read by the secretary. Although only formed in August last, the membership is now nearly forty. The election of officers for the ensuing year resulted as follows:—Captain, Mr. J. Edge; sub-captains, Messrs. Johnson and Hutchison; secretary, Mr. S. Wilkinson; and treasurer, Mr. T. H. Lancaster. Very ambitious plans have been formed for the coming season, the programme including tours, inter-club runs, race-meetings, and hill-climbing contests.

THE HON. LEOPOLD CANNING ON HIS ORMONDE MOTOR-BICYCLE.

THE Automobile Components, Limited, have replied to the reported desire of Mr. F. Chase to race with M. Fournier to the effect that: "We stipulate that the motor-cycle that we will use will not weigh over 110lbs., and also that the competitor's machine must not exceed this weight. If Chase is anxious to have a match, then it is simply for him to send a cheque for £50 to Mr. Cordingley, proprietor of the *Motor-Car Journal*, when terms can at once be arranged."

ONE of the chief causes of trouble with the high tension electrical circuit usually arises, not from the system, but the source of supply—the accumulator. Simply from want of knowledge the accumulator is apt to be overlooked, and when out of use, allowed to stand week after week, with the result that it reaches a low potential, the plates sulphate badly, and the efficiency is considerably affected. On this point the Ormonde Company's booklet is clear and concise, giving the reader instructions to occasionally test with a 4-volt lamp, or voltmeter, and to recharge even if unused, at least once a month. The bare statement often made that the accumulator will run so many hundred miles, or so many ampere-hours is somewhat misleading, as the user, unless specially informed, may consider this result can be obtained spread over an indefinite period without attention.

THE first annual general meeting of the Motor Cycling Club was held at the Frascati Restaurant, London, W., last week. The profit and loss account shows that there are a few pounds to the club's credit on the year's working. The new officers for 1903 were elected as follows:—President; Mr. S. F. Edge; vice-presidents, Messrs. Edward Kennard, J.P., Joseph Pennell, W.

Rees Jeffreys, Mark Mayhew (the last three being subject to the consent of these gentlemen being obtained); captain, Mr. E. H. Arnott; treasurer, Mr. E. March; hon. secretary, Mr. G. E. Roberts. The opening run of the Club will be to Brighton on March 7th.

PROFESSOR JUDIN, of the Young Men's Christian Association, Milwaukee, Wis., who recently completed a run on a Mitchell motor-bicycle from that town to Boston, considers that "for a nervous man the motor-cycle is the greatest relief that I have ever discovered. Gymnasium work under proper instruction is good and far superior to medicine, but, after all, the exercise is only a means to an end, that of furnishing recreation so as to relieve the mind of business cares and supplying the nervous system with pure, rich blood. To ride a motor-cycle is the greatest recreation that one can get, and the exercise performed in riding, while sufficient to furnish the necessary blood to all parts of the nervous system, is not sufficient to be tiresome or overtax the system, and yet causes the most delightful refreshing sleep."

THE contact-breaker on the 1903 Minerva motor is shown in the accompanying diagram; it consists of an aluminium body so mounted as to rotate about the end of the counter-shaft E, which actuates the valve-cam. The cam D has on its edge a conical projection F, which raises the end of the trembler G at a certain moment, whereupon the part of the trembler where is provided a rivet of pure platinum H comes into contact with the platinum screw I (which is insulated by an ebonite sheet L) and thus closes the electric circuit. The conical projection F, turning with the countershaft, passes from under the trembler, and the platinum point H of the trembler ceases to touch the platinum screw I, the current thus suddenly interrupted, pro-

ducing a spark between the two points of the sparking plug. The trembler is fixed against the projection K by the screw M, and the hole in the trembler at the point where the screw is, instead of being round as usual, is oval, so that the trembler can be advanced or withdrawn in a groove of the projection K and adjusted with the two points of platinum exactly opposite each other. After a time the platinum points get slightly worn, and it may become necessary to adjust them closer together by giving half a turn to the screw I. After some hundreds of miles of riding the platinum points may become so worn as to need gently filing down with a very smooth file in order to present clean, flat surfaces to each other.

The Crystal Palace Automobile Show.

(FIRST NOTICE.)

GENERAL VIEW FROM THE HANDEL ORCHESTRA.

[Russell and Sons.

On Friday last week the Automobile Exhibition at the Crystal Palace was opened to the public, and will close to day (Saturday).

HEAVY STEAM VEHICLES.

The Straker Steam Vehicle Company exhibit a standard 5-ton chassis without body, a 5-ton brewers' wagon, a 5-ton steam wagon with hinged, drop-sided body, suitable for the conveyance of general merchandise, and fitted with wooden wheels; and a new wagon constructed to carry seven tons and draw a trailer carrying three tons, thus dealing with a total load of ten tons. The standard 5-ton wagon is approximately 18 ft. long by 6 ft. 6 in. in extreme width. It is designed to carry a net load of five tons at a maximum speed of seven miles an hour, and to be capable of ascending gradients up to 1 in 6 on ordinary roads, and to draw a trailer carrying an additional load of two tons on fairly level roads, if required. The boiler is of an improved water-tube type, and contains seventy square feet of heating surface. The working pressure is 205 lbs. per square inch. No rivets being employed in the construction, it is very easily taken apart when it is necessary to do so for the purpose of cleaning out. The boiler is placed in the centre of the front of the vehicle, the fittings being arranged within easy reach of the driver. A superheater is attached to the fire-box for dealing with high pressure steam, and a reheater for rendering the exhaust steam invisible. Coke fuel is used exclusively, the fire being fed through a central down-take, regulation being obtained by the damper fitted at the base of the funnel. The boiler is fed either by an injector or by means of a gear-driven plunger pump off the engine crankshaft. The engine is of the compound open type, having cylinders 4 in. and 7 in. diameter by 7 in. stroke, fitted with single eccentric reversing gear. A bye-pass is arranged for admitting high pressure steam into the low pressure cylinder when starting, or obtaining high power if required. The engine is easily disconnected and can be run independently from the car. Two gears are provided, giving speeds from three to seven miles per hour. The engine crankshaft is extended in square section and carries a steel sliding double pinion to be thrown in and out as required. This pinion meshes with the steel gear wheels mounted on the countershaft, which is connected with the rear live axle by a strong roller chain. A special arrangement is provided on the end of the back axle, so that a locking pin can be instantaneously inserted for connecting up both wheels in the event of it being required, no matter in what position the wheels may be. The road wheels are made of mild steel, the hubs being cast in iron by a special process. The diameter of the driving wheels is 3 ft. 6 in. by 9 in. wide, the tyres being $\frac{3}{4}$ in. thick. The front wheels are 2 ft. 6 in. diameter by 5 in. wide, having tyre plates $\frac{3}{4}$ in. thick. A galvanised iron tank is provided of the capacity of 140 gallons, with the usual water lifter, etc. The steering is effected by worm and segment, actuated by an inclined hand-

wheel. The frame is constructed of steel channels. A powerful block brake actuated by screw and crank lever from the driver's seat is fitted; a second brake is obtained by reversing the engine. A double bunker is arranged in the front portion of the vehicle, capable of carrying sufficient fuel for about six hours' work. The general construction of the 7-ton vehicle is identical with that of the 5-ton wagon, with the exception that it is heavier and more solidly built. This vehicle has been designed to carry a net load of 7 tons and to draw a trailer with an additional three tons. The maximum speed on the level is seven miles an hour, and it will ascend gradients when fully loaded up to 1 in 8. The total length is 21 ft. 6 in. over all, the wheel base being 11 ft. 6 in. The boiler contains 77 square feet of heating surface. The engine is of a particularly powerful type, giving off about 60 i.h.p.; the dimensions of the cylinders being 4 in. and 7 in. diameter by 9 in. stroke, and the normal speed 400 revolutions per minute. A careful examination of the Straker exhibits shows that all the machines are designed with a view of obtaining readiness of access to every part, and that they are of extremely sound and simple construction.

Another firm devoting considerable attention to the demand for heavy steam vehicles is Messrs. Jesse Ellis and Company, Limited, who exhibit a steam lorry capable of carrying a load of five tons. It is intended for the Obbu Sugar Factory of the Indian Development Company, Limited, at Behar, India. The Ellis wagons have already been described in the *Journal*, but it may be mentioned here that the engine is of the horizontal compound type, with high and low pressure cylinders, and that the boiler is of the fire-tube type, and works at a maximum pressure of 200 lbs. per square inch. The engine and boiler are mounted on a patent expansion frame connected with the front and hind axles. Dr. A. W. Brightmore again shows the 5-ton steam lorry of which we gave a brief description in our issue of the 24th ult. The vehicle is attracting a considerable amount of attention, and we hear that a good many enquiries from probable users have been received. Messrs. W. Tasker and Sons, Limited, have on view a useful miniature traction engine intended to replace horses in the drawing of heavy loads on existing wagons. It is of 15 to 17-h.p., and is capable of hauling a load of three tons at an average speed of six miles per hour.

Three different types of heavy steam wagons are shown by the Thornycroft Steam Wagon Company, Limited—a 3-ton dray for brewers' use, a standard 3½-ton tip-wagon, as supplied to many municipal authorities, and an interesting Colonial lorry, which is provided with a specially large boiler for using inferior coal or wood as fuel. The latter is a relatively new type, capable of carrying a load of four tons, and is throughout built stronger than the standard vehicle. The wheels are made entirely of steel, and are of larger diameter. The tyres are 12 inches wide, and are provided with diagonal cross strips. The gearing is enclosed in

dust-excluding, oil-tight gear case; the engine develops up to 45-h.p. A recent improvement in the boilers, an example of one of which is displayed, is the fitting of hinged firebars, these doing away with the old clinker holes.

STEAM CARS.

The traditional methods of American steam vehicle construction have been swept aside in designing the 1903 touring car of the White Steam Car Company, shown in Fig. 1, and which forms one of the novelties of the show. It bears not the slightest outward resemblance to the White car that has become so familiar during the last year or so, but closely resembles the now standard type of petrol car. It is fitted with a compound engine, developing 10-h.p., and placed in front under the bonnet. The White semi-flash system of steam generating is, of course, employed, and water and petrol tanks of ample capacity—holding fifteen and ten gallons respectively—are carried, the use of condensers doing away with any necessity for frequent refilling of the former. The arrangement of the tanks and other impediments is so made, the bonnet in front especially conducing to this end, that there are no unsightly protuberances to mar the harmony of the lines or be in the way. The engine is mounted in the frame in the same position as the petrol engine of a Panhard car, the power being transmitted through a universally-jointed longitudinal shaft to a rear live axle. The boiler is placed beneath the front seat, and the exhaust gases find their way out on each side of the body. The exhaust steam is led to the condenser in front, and the water from it is pumped back to the main tank. Two side levers are fitted as in a petrol car; one enables the cut-off of the engine to be varied, and its direction of rotation to be changed; the other lever operates band-brakes acting upon the hubs of the rear wheels. A foot-brake, which acts upon the longitudinal shaft, is also provided. The car has a wheel base of 6 ft. 8 in., and a tread of 4 ft. 8 in., 30-in. artillery wheels and 4-in. tyres. The extreme length of the car is 10 ft., the width is 5 ft., and the weight, with tanks filled, about 15 cwt. The car is designed to seat four passengers comfortably, the *tonneau* body being of the roomy high-back type. The White Company also stage a couple of their two-seated Stanhopes, of which a full description

FIG. 1.—THE WHITE STEAM TONNEAU.

was given in our report of the 1902 Agricultural Hall Show, and two of the White delivery vans similar to that being used in London by the G.P.O. authorities, and of which an illustration was given in our issue of the 10th ult.

In addition to the Toledo steam cars described and illustrated in our issue of the 24th ult., the Victoria Carriage Works, Ltd., have on view a 7½-h.p. vehicle, fitted with a Surrey phaeton body, having seating accommodation for four persons.

The Gardner Serpollet Chief Depot make a large display of Gardner-Serpollet cars of British construction throughout. Of these four are of the 6-h.p. type, and are shown in addition to an equal number of the 12-h.p. model. The vehicles displayed are representative of the various forms of body usually supplied by the manufacturers, although they have special facilities by which the wishes of purchasers can be met in this respect. One of the 6-h.p. vehicles is a double phaeton in natural walnut, and has a brass bonnet in front, and a sloping dashboard. The other 6-h.p. car has a handsome Limousine body, and is torpedo fronted. Of the 12-h.p. vehicles one is fitted with a tonneau body with upright tank, and the other is a roomy char-a-banc accommodating nine persons. The char-a-banc has a polished brass upright tank forming the dashboard. Special attention appears to have been paid to the carriage work, and to the accessibility of all parts of the mechanism. We learn that it has not been found necessary to make any important changes in the construction or arrangement of the machinery. Several minor improvements have, however, been made, these including the closing in of the safety-valve on the dashboard, an alteration in the burner, which can now be detached without removing any nuts; and the rendering of the engine absolutely steam-tight. The fuel used is ordinary lamp oil. The engine has four single-acting cylinders, which are arranged in pairs on either side of the crank chamber, and which work direct on to the common central crank shaft. The power is taken direct from the engine shaft to the back axle by a chain, no change-speed gear of any kind being necessary. Although nominally of 6 and 12-h.p.,

the generators and engines are capable of developing considerably greater power. For short periods, such as on bad or hilly roads, they may even be made to give as much as 25 and 35 h.p. respectively.

A large display of steam cars is made by the Locomobile Company of Great Britain, Ltd., including a number of their well-known standard patterns. An interesting vehicle is the 8-h.p. touring car, which has been made much heavier and stronger than the standard type. Both boiler and burner are on the same principle as the other cars; the former is 16 in. in diameter. The car is fitted with specially large water and petrol tanks, also with extra steam, air, and water pumps, and mudguards. We next come to a car seating four passengers, all facing the way they are driving. It is specially finished and upholstered, and is fitted with a 16-in. boiler. A special feature of this car is that it can have a covered-in top fitted, so converting it into a closed brougham. This top can be easily put on and off so that one can have an open car for day work, and a closed carriage for night work. Another car which is attracting attention is a four-seated vehicle, specially built to the order of Mr. Graham Harris, the well-known consulting engineer. This vehicle is fitted with a 10-h.p. engine, 16 in. boiler, steam air, and steam water pumps, special lubricators for the engine, etc. The whole of the running gear has been generally strengthened, and artillery wheels are fitted. The body is painted in white and gold, and upholstered in crimson leather, the general effect being very pleasing. Another new car is of the *dos-a-dos* style; it is fitted with a 10-h.p. enclosed engine, a notable departure being the adoption of wheel steering in place of the tiller. It also has wooden wheels, roller bearings, two independent brakes, and many other special features.

The brothers Stanley, who, it will be remembered by old motorists, were the introducers of the steam car, now known as the Locomobile, have recently again taken up the construction of steam motor-cars, and their vehicles are now being introduced into this country by Messrs. Joseph Cockshott and Co., Ltd. Superheated steam is generated by the boiler, a high degree of superheat being obtained without recourse to intensely heated metallic surfaces. The boiler consists of a copper shell bound by copper-plated steel wire. As the use of the traditional form of gauge glass is rendered almost prohibitive by the high pressures and degrees of superheat employed, the water glass has been discarded and an automatic indicating float has been adopted which instantly shows by the position of a small index on the right hand side of the driver whether the water level is low, normal, or high. This index can be read by the sense of touch, thus rendering a gauge lamp or mirror superfluous. In order to provide against the burning of the boiler by carelessness in the maintenance of the water level, a fusible plug device of a novel character has been adopted. One end of a small pipe is tapped into the boiler at a point near the bottom of the water space, and the other end communicates with the water space at a point a few inches higher. There is a small T in this pipe, which is closed with a plug of fusible metal. In the normal operation of the boiler there is a constant circulation of water through this pipe from its lower to its higher extremity, but if the water level falls below its upper termination the circulation ceases, the water evaporates from the pipe, and the fusible plug, previously kept relatively cool by the water circulation, immediately melts and warns the operator. The plug is accessible and easily replaced. Within easy reach of the driver are the valves controlling the main burner, pilot light, and pump bye-pass. The throttle is of the conventional form, but the reverse is obtained by means of a pedal. A distinct departure from the ordinary practice is found in the engine and transmission. The engine is of the double-cylinder horizontal type, the head being supported by a metal strap from the body, and the crank end being concentrically supported upon the live rear axle. A steel pinion on the crank shaft meshes directly with a phosphor bronze gear on the differential casing on the rear live axle. It is claimed that the combination of steel pinion and phosphor bronze gear secures the minimum of noise and wear. A detachable case completely surrounds the engine, transmission, and differential. The lubrication of the cylinders is effected by means of a mechanically forced-feed lubricator, operated by a ratchet and pawl mechanism. The brake, actuated by a pedal, acts upon an extension of the differential casing. The weight of the vehicle with tanks full is a little over 7 cwt. It is claimed that the Stanley car can cover 15 miles per gallon of petrol under fair conditions, and can travel 2 miles on each gallon of water, speeds up to 30 miles per hour being attainable. Messrs. Cockshott also show a number of specialities for steam cars made by the Locke Regulator Company.

An example of the "Saracen" steam car, formerly known as the "Reading," is to be seen on the stand of Mr. J. L. Sardy. It has the neatly finished *dos-a-dos* body seating four persons. The boiler is of the fire-tube type, 16 in. diameter, while the 5½-h.p. engine is of the double-acting variety, with simple link motion reversing gear. Three brakes, all double-acting, are fitted, the two on the rear wheel hubs being controlled by Bowden wire and independent of the usual differential brake. The throttle, the positive-locking reverse, bye-pass, independent air and water pumps and water lift (these last three being controlled by a single lever) are all conveniently situated under the driver's hand.

Several types of the well-known Weston steam cars are displayed by the Weston Motor Syndicate, among which we noticed one fitted with a canopy and a coolie seat at the rear, intended for use in India. To this end the boiler is fitted with a special burner adapted to use paraffin as fuel instead of petrol. Several modifications have been introduced in the 1903 models, including the introduction of a super-heater between the throttle valve and the boiler. This was described and illustrated in one of our recent issues. The cars are now fitted with an automatic lubricating

pump and with a steam air-pump. The latter is fitted below the scotload, and enables the driver to obtain the required air pressure by merely turning on a tap, thus obviating hand pumping.

The Speedwell Motor Company make an interesting display of the French Gardner-Serpollet steam carriages, amongst which are a 6-h.p. vehicle fitted with latest improvements, including the improved condenser, enabling the standard touring type to run 175 miles on one filling of water; a 10-h.p. car, similar to the 6-h.p., but with larger engine and generator; the 6-h.p. landaulette, convertible to an open or closed carriage, illustrated in our issue of the 24th ult.; a light 12-h.p. carriage, with detachable canopy; a light two-seated "speed" car, and the 40-h.p. chassis which was exhibited at the Paris Salon. The new features of the 1903 Serpollet cars have, of course, already been dealt with in these columns, so that a further lengthy reference is unnecessary. We may, however, refer to an entirely new type of 20-h.p. car which, outwardly, closely resembles a petrol car. The boiler in this vehicle is specially arranged, there being no visible flue or chimney, a system of forced draught to the generator having been adopted.

PETROL CARS.

The display of Messrs. De Dietrich and Company is the same exhibit that shown at the recent French Salon, the stand having been sent over

types of bodies (tonneau, Siamese phaeton, wagonette) are all displayed, in addition to several new forms. Among these we may mention the 20-h.p. omnibus intended for winter use and station work generally; a 10-h.p. landaulette, having seats for four persons, including the driver, one side of the front seat swinging open to give access to the rear seats; a 10-h.p. Siamese phaeton fitted with canopy and glass weather screen, painted white with buff leather upholstery; and the 30-h.p. fast touring tonneau illustrated in our last issue. The driving wheels of this car are covered with the latest pattern of Wilkinson non-skidding treads, to which we hope to refer in a later issue. On the stand is also shown the 45-h.p. racing car which made its appearance last year, and a 4-h.p. combined petrol-motor and dynamo. The Wolseley Company are making a speciality of the latter; it is of the type of which they have supplied a number to the War Office for searchlight work, and is well adapted for lighting up small country houses, its capacity being thirty 16-c.p. lamps. Altogether the display is one which does credit to the Wolseley Company.

A big display of M.M.C. cars is made by the Motor Manufacturing Company, Limited, ranging from the popular 8-h.p. voiturette to a powerful 20-h.p. car. The former has three speeds forward and reverse, and has recently been improved as regards the steering, which is now of the irre-

FIG. 2.—THE DE DIETRICH (TURCAT-MERY) 16-H.P. CAR.

[Das Fahrzeug.]

from Paris. The most attractive item on the stand is the chassis, fitted with a 16-h.p. four-cylinder engine. The important features of the De Dietrich (Turcat-Mery) car are the magneto ignition, the new clutch, the patent throttle governor, and the arrangement adopted in connection with the change-speed gear. Among the complete cars we noticed a handsome 24-h.p. vehicle with Limousine body, by Kellner of Paris; it is arranged to carry six persons, and is specially adapted for station and country work. Close by a 16-h.p. car (Fig. 2), with a Roi des Belges body by Rothschild, is shown, finished in dark green and red. A 12-h.p. four-cylinder standard tonneau, painted in dark green, and a 10-h.p. two-cylinder carriage, finished in dark red, also combine to make Messrs. De Dietrich's exhibit an attractive one.

Considerable interest has been shown during the week in the large and interesting display of cars made by the Wolseley Tool and Motor Car Company, Limited. Prominent among the exhibits is the incomplete chassis of a 50-h.p. four-cylinder car, the frame of which is an exceptionally fine piece of work, being made from one long length of pressed nickel steel, bent at the four corners to form the whole frame, and having only one joint. Altogether close upon twenty cars are shown, ranging from a 5-h.p. three-seated vehicle to the 50-h.p. chassis referred to above. The standard

versible type. The wheel base has been lengthened and extra strong chains adopted. The gear is very easily changed, the pairs of gears being always in mesh. One of this type of vehicle is shown fitted with an American buggy top, and is intended for South Africa. The M.M.C. 10-h.p. two-cylinder car is now fitted with a new closed-end motor, a patent governing device acting on the induction pipe. In connection with the latter it may be mentioned that when the throttle valve is closed, shutting off the supply of mixture, an auxiliary air-valve is opened, thus allowing cold air to be drawn in and assist in keeping the valve chambers and cylinder cool. The vehicle has three forward speeds, the gears being always in mesh, controlled by one lever, equal 32 in. wheels, water-cooled brake, and foot accelerator. The design and finish of the carriage body and upholstery is well up to the M.M.C. standard. The largest car on the stand is a 20-h.p. four-cylinder vehicle, with the latest type of closed-end motor, governed on the induction. It has a foot accelerator, which cuts the governor right out; three speed and reverse; water-cooled brake; and mechanically-operated lubricator for the engine. It is geared to attain speeds up to 45 to 50 miles per hour on good roads. The particular 20-h.p. car we examined has a special designed phaeton body, each of the four passengers being provided with a "bucket" seat.

One of the most striking displays is that of Messrs. S. F. Edge, Limited, who make a big show of Napier cars. The stand itself is quite a departure and attracts much attention, each car being shown in its own glass house, brilliantly illuminated from every direction. The chief points of the Napier car are so well known that it is hardly necessary to recapitulate them, but for those who are not familiar with these carriages some of the chief features to be noted are the following:—All the new types are fitted with adjustable steering, enabling any play which may take place in the steering, after some considerable use, to be immediately taken up. A ball-bearing thrust block is fitted to take the side thrust of the main bevel gear. The system of throttling the admission of the gas is actuated both by hand and by foot, the hand-throttle lever being conveniently situated under the steering wheel, so that the speed of the car can be reduced from top speed down to walking pace, simply by cutting off the supply of gas and without changing the gear, at the same time making the car absolutely noiseless. The change gear-box is made entirely of aluminium, and is oil and dust tight; the method of getting at this gear box is well worth attention, being by means of a taper sliding lid held in position by a small set screw: in a few seconds the whole of the gear can be exposed to view without any part of the body being removed, the foot-boards of course excepted. Four speeds forward and a reverse are provided. The contact-breaker is now fitted on the dash-board, being driven from the half-speed shaft by means of a chain. The present system of radiation is exceedingly simple, con-

FIG. 3.—THE 12-H.P. NAPIER CHASSIS.

sisting of a long coil of thin tubing with radiating gills. The water passes through this with minimum resistance, and keeps perfectly cool. In fact, it is claimed that the engine will run all day without steaming or wasting any water. A forced-draught system can be fitted at an extra cost if desired. A useful device is the fitting of the accumulator boxes with a double interrupter plug switch which enables the driver on getting down from the car to take out the plug, thus preventing anybody from starting the vehicle. The water-circulating pump is of new design, made entirely of aluminium; there is also now an arrangement provided by means of which the clutch can be very easily adjusted if wear has taken place from one cause or other. We now come to the cars exhibited on the stand. First of all may be mentioned a 12-h.p. chassis (Fig. 3), one of the new light types. This is fitted with a four-cylinder motor, developing not less than 15-b.h.p.; one of the great features claimed for this motor is its elasticity, one being enabled to run it from a few hundred revolutions up to a very high speed. This chassis, which weighs 12½ cwt., is fitted with the new Napier forced-draught circulation, doing away with the extra weight of the water tank. Next comes the 20-h.p. chassis, built for a very powerful touring carriage to the order of Mr. Lionel de Rothschild. This motor develops not less than 30-b.h.p., and the carriage is capable of a very high speed, although at the same time it is extremely quiet. Of the finished carriages, the magnificent 16-h.p. built to the order of the Right Hon. A. J. Balfour may be

referred to; it is fitted with a roomy and comfortable body to carry five in the back and two in the front, and extra large wheels to make the car higher and free from dust. A dust hood is also fitted and boxes over the side wings—a departure from the usual practice of fitting baskets. The length of frame in the 16-h.p. car, from the dashboard to the back of the frame, is 7 ft. 6 in. We next come to two examples of 12-h.p. light carriages. The first is finished in green, with blue mouldings picked out with fine white lines, with green upholstery; it is built to the order of Mr. S. H. Pearce, the well-known motorist. The other 12-h.p. car is fitted with a standard tonneau body for four people, and is noticeable as being the vehicle which attracted attention at the recent Paris exhibition. Last, but not least, we come to the actual Napier car on which Mr. Edge won the Gordon Bennett cup last year.

Messrs. Waddington and Co. display the 6½-h.p. and 9-h.p. cars shown at the Stanley Motor Show, and briefly described in our last issue. They

FIG. 4.—THE WADDINGTON 6½-H.P. VOITURETTE.

also have on view a 12-h.p. tonneau car on standard lines. It is fitted with a two-cylinder Herald motor, governed on the exhaust. It has seating accommodation for five persons, and has three speeds ahead and one reverse, the power of the engine being transmitted direct on the top speed. A 3-h.p. motor-bicycle is also shown, while attention may be drawn to the Waddington sparking plug, which sells at an exceedingly low price.

The new Pritchett and Gold petrol car in general arrangement follows the lines of the Panhard type of automobile. The tubular frame carries in the fore part a Blake four-cylinder vertical motor, fitted with water circulating pump and radiator. Three speeds forward and a reverse are available, the power being transmitted from the gear box to the rear axle through a differential shaft and two side chains. The car is shown in an uncompleted condition, but when finished it will have a roomy tonneau body.

At the same time we visited the stand of the Rex Motor Manufacturing Company the car exhibits were confined to two vehicles—a 10-h.p. tonneau (Fig. 5), and a new 10-h.p. brougham. Both have the engine in front

FIG. 5.—THE "REX" 10-H.P. TONNEAU.

under a bonnet, driving the rear axle through a clutch, three-speed gear box, and bevel gear. The vertical single-cylinder motor has a diameter of 115 mm., and a stroke of 115 mm., and runs at a maximum speed of 1,200 revolutions per minute. The road wheels are of the artillery type, shod with 32 by 3½ inch tyres. The brougham has a detachable top which fits on to the tonneau. The top is extended forward so that a detachable glass front can be provided, this converting the car into an all-weather vehicle.

The New Orleans cars have always been a very popular type in this country, and, judging from the latest models, they should continue to stand high in public favour. The New Orleans Company only show two cars—a 9-h.p. double-cylinder vehicle with tonneau body and three speeds and

reverse, and a 14-h.p. four-cylinder car having four speeds forward in addition to one backward motion. One of the chief improvements in this vehicle is in the change-speed gear, the change from one speed to another being made without having to pass through the other two speeds. The 14-h.p. car exhibited has been built to the order of Mr. Mark Mayhew; it has a highly-finished tonneau body, painted green and black, doors being fitted to the front seat to protect the driver from side draughts.

Two types of American petrol cars are shown by the Petrol Power

FIG. 6.—THE 20-H.P. PEERLESS CAR.

Company—the Rambler and the Peerless. The former is shown in Fig. 7 and the improvements in the 1903 model, comprise the adoption of a 6½-h.p. motor, and artillery wood wheels in place of those of the cycle type. Fig. 6 illustrates the 20-h.p. Peerless car, the principal features of which were described in our report of the Stanley Motor Show.

A new exhibitor at the London shows is Messrs. Rice and Company (Leeds), Limited, who have on view a 12-h.p. "Korte" tonneau, which comprises a number of interesting features. The engine is of the twin-cylinder vertical type, the bore of the cylinder being 105 mm., and the stroke 130 mm.; it is provided with extra large bearing surfaces and centre bearing between cranks. The crank shaft is made of nickel steel, as are the connecting rods. The valves are of large diameter and are easily got at by the

protecting them from grit and dust. The frame is constructed of channel steel, strengthened with steel plates. The road wheels are 30 in. diameter, shod with 90 mm. tyres. The steering is of the worm and worm sector type. A band brake is provided on the countershaft, and two powerful inside expanding brakes are fitted to the back hubs; they will act in either direction and are quite clear of the wheels when not in use. The wheel base of the car is 7 ft. by 4 ft. 3 in., and the approximate weight is 15 cwt.

FIG. 7.—THE 1903 RAMBLER CAR.

The exhibit of the Auto-Carriage Company, Ltd., comprises three finished cars and a chassis of the latest 12-h.p. Bardon type. This system has already been dealt with in the *Journal*, and it may be remembered that the principal feature is the employment of a two-cylinder horizontal motor, each cylinder having two pistons, with a central explosion-chamber. A number of improvements have been effected, with the result that the Bardon cars are now claimed to be both silent and vibrationless. The induction and exhaust valves are both mechanically operated by one cam shaft. The speed of the motor is controlled by a centrifugal governor acting upon a specially-designed throttle on the induction pipe. The ignition is effected electrically, the current being supplied by an accu-

FIG. 8.—THE 12-H.P. BARDON TONNEAU.

removal of two nuts. The engine is fitted with Longuemare carburettor and governed by a throttle valve. The contact breaker is mounted on the dash-board; it is constructed so that all loose and shifting wires are avoided. The pump is also mounted on the dash-board; it is of large diameter, driven by spur gearing, and fitted with pressure gauge showing the pressure in the circulation pipes and radiators. A Renold silent chain conveys the power of the engine to the gear box, the driving shafts being parallel. The change-gear is of the usual sliding type and gives four speeds and reverse. All the bearings in the gear box are fitted with large oil wells and ring lubrication. The power is further transmitted from the gear box to the back wheels by two side roller chains; they are entirely encased in leather gear-cases, thus

mulator, or by a magneto machine as desired. All the cars are fitted with an ingenious device whereby "backfires," when starting the motor, are rendered impossible. A foot accelerator and a hand throttle are provided, whilst the timing of the ignition can readily be advanced or retarded by the usual method. These arrangements combined with the perfect balance of the moving parts permit great variations in the speed of the motor, which can, we are informed, be run at any number of revolutions between 200 and 1,100 per minute. The clutch has been modified, and is now arranged to be adjusted by means of only one nut. The cars exhibited include a tonneau seating four persons, the body being painted dark green and upholstered in dark green leather (Fig. 8); a 12-h.p. Limousine seating

five persons, fitted with canopy and wind-screens, and a 12-h.p. tonneau painted dark blue and upholstered in pigskin. To the latter, a novel dust-screen is attached at the rear; the arrangement has the advantage that, while protecting the passengers in the tonneau, the door can be opened and closed in the ordinary way.

The Maudslay Motor Company's exhibit consists of three complete cars and a chassis. One of the cars is fitted with a convertible omnibus body (Fig. 9), of which the firm is making a speciality. It is designed to meet the requirements of country gentlemen whose places are some distance

FIG. 9.—THE MAUDSLAY OMNIBUS.

from the railway; in its wagonette form it serves as a roomy touring car, whilst the omnibus top makes it specially suitable for night work. It is fitted with their Maudslay 25-b.h.p. three-cylinder vertical balanced engine, and the mechanism is in all respects similar to that of the car which took part in the Reliability Trials last year. The car is fitted with a tonneau body of improved design, and is geared high for fast touring work. It has more accommodation for luggage than is usual in this form of vehicle, and two hinged seats are fitted in the front corners of the tonneau, so that six passengers can be carried in an emergency. The mechanism is also of the 25-b.h.p., three-cylinder type. Removable casings of sheet aluminium are fitted which completely protect the whole of the mechanism from mud and dust below the car, a standard fitting on all the Maudslay cars. The third car is fitted with a Lonsdale wagonette body, a useful type when it is not desired to carry much luggage, complete protection from the weather being the object in view. The chassis illustrates the new features of the 1903 type, which embodies the latest developments in English and Continental practice. The inlet valves of the motor are mechanically actuated, and both inlet and exhaust valves are placed in line on the cylinder head, so that they are easy of access. A fan-cooled radiator is fitted, and forced lubrication is provided throughout, the oil being circulated by a special design of geared pump. We notice that the composite frame, constructed of rectangular solid drawn steel tube, into which well-seasoned ash is driven, is retained in the 1903 patterns. The triple cylinders of the engine, together with their combustion chambers, are a single casting, ensuring freedom from leaky joints and allowing the use of a high compression. The water jackets are constructed partially of aluminium in order to secure lightness. The normal speed of the engine is 800 revolutions per minute. With the foregoing exceptions, the details of the car are similar to those described in these columns early last year, they having been found to give satisfactory results in practice. The Maudslay Company operate their change-speed gear by means of a disc with cam grooves, on the lines of that in the new Mercedes cars. This system is one they had in use on their last year's cars, and they, therefore, not unnaturally, feel somewhat pleased at seeing their example followed by the well-known German company. In the Maudslay disc one cam groove gives the four forward speeds, and the second groove the reverse motion.

The General Motor-Car Company, Limited, of Norbury, is one of the newest concerns to enter the automobile industry, and judging from the rapid progress made is likely to attain a good position. Foremost among the exhibits is a special 40-h.p. racing car, which has been built by the company for Mr. W. G. Crombie, who, we understand, intends to enter it for the Nice races. The car has a very long wheel base—7 ft. 6 in.—and the seat is placed much further back than usual. A feature of the car, which equipped for racing only weighs 700 kilos., is the wind-cutter with which it is provided; this extends from a point and is brought well up to the driver's seat. On this stand is also to be seen a neat little tradesman's delivery motor-car, with 4½-h.p. motor, belt and chain drive; this is intended to carry a load over 200 lbs. and two people at a speed of twelve miles an hour. A neat two-seated Stanhope for doctor's use is fitted with a 4½-h.p. Aster motor; it has two speeds, the transmission being by a belt, and a single centrally-located chain. The chassis on the stand is fitted with a 4½-h.p. engine with honeycomb radiator of the latest type, and three speeds and reverse. The price of these little cars is relatively very low, so that they should soon find a large clientele.

The "Victrix" is the name of a neatly designed two-seated car, of which Messrs. Farman Freres are making a speciality. It is driven by a 6-h.p. De Dion engine, located in the fore part of a frame built up of steel tubing and wood. The transmission is by means of a cardan shaft and bevel gear to the rear live axle, and when driving on the high gear the power is not only conveyed direct, but, as in the Mors, the secondary train of wheels in the gear box is entirely disengaged. Three forward and one reverse speeds are provided, all controlled by one lever. In view of its up-to-date character and reasonable price, the "Victrix" should quickly become a popular type. On the same stand are shown a 11-b.h.p. twin-cylinder Clement car, and specimens of the 12-h.p. and 24-h.p. "Victrix" petrol motors. These have respectively two and four vertical cylinders. The details appear to have been well thought out, means being provided for adjusting the tension of the exhaust valve springs, while we noticed that taps were fitted to the cylinder jackets for drawing off the water when necessary, as in frosty weather. The normal speed is 640 revolutions per minute, but the engine can be accelerated up to 900 revolutions. The governor acts on the admission close to the carburettor.

The "Firefly" cars exhibited by the Firefly Motor Company comprise examples of the 6-h.p., 9-h.p., and 12-h.p. models. The 6-h.p. tonneau is fitted with a De Dion engine, water-cooled by pump and radiators. Three speeds forward and one reverse are available, the top speed being direct. The power is conveyed by bevel gear to the rear live axle. A double-acting band brake is mounted on the propeller shaft, actuated by pedal; also internal expanding brakes on the rear hubs, operated by side lever; the application of either brake throws the engine out of gear. The 9-h.p. Firefly twin-cylinder car has three speeds forward and reverse, with a direct drive on top speed. The connection between the gear box and the rear wheels is by a countershaft and side chains. Cardan joints are fitted between the gear box and the sprockets and between the gear box and the clutch, to obviate unnecessary wear in gear box. The frame is supported on the axles by long front springs and a transverse spring at the rear. A 12-h.p. car on similar lines is also shown, while well-finished examples of the 9-h.p. Renault and 9-h.p. Clement cars may also be inspected. The Firefly Company are also introducing a four-cylinder vertical motor with mechanically operated inlet valves, all the valves being actuated by one cam shaft.

The Duryea Motor Company display six or seven 10-h.p. cars, including "Rumble" phaetons, tonneaus, and a phaeton fitted with a detachable brougham top (Fig. 10). It is entirely enclosed, and has been designed for winter use, particularly by doctors. The Duryea cars have already been described in these columns, but it may be mentioned that the principal mechanical features are a triple-cylinder balanced motor developing 10-b.h.p., one-piece nickel steel live axle, direct chain

FIG. 10.—THE DURYEA BROUGHAM.

transmission without countershaft, throttle control, irreversible steering without worm gear, magneto ignition, natural water circulation without pumps, and one hand control. The changes in the latest models comprise a new condensing tank, with projecting ears at the rear of the body, a new detachable exhaust-valve seating, and an improved silencer. One of the phaetons on the stand has a body painted pale green, a replica, so Mr. Sturmev informs us, of one supplied to a gentleman, who specified that the body should be painted the same colour as the cover of the *Motor-Car Journal*.

The stand of Messrs. C. S. Rolls and Company has been the centre of much attention by reason of the fact that on it is shown the new Mors racer, which the Hon. C. S. Rolls may be expected to drive in this year's principal events. It is fitted with an 80-h.p. four-cylinder motor, and has a body of the form of an inverted boat, very similar to the Serpollet racer shown

FIG. 11.—A 10-H.P. PANHARD—LORD DALMENY'S COMING-OF-AGE PRESENT—FITTED WITH DETACHABLE CANOPY AND SLIDING GLASS FRONT, SUPPLIED BY MESSRS. S. C. ROLLS & CO.

at the recent Paris Salon. Side by side with this monster is staged the identical Panhard car which won the Paris-Bordeaux race in 1895. How times have changed, to be sure! On the one hand we have an 80-h.p. car capable of a speed of 80 miles an hour, and on the other a little short-base vehicle with 3½-h.p. engine and tiller steering, which eight years ago startled the world by averaging a speed of twelve miles an hour. The remainder of the stand is devoted to a display of Panhard cars ranging in power from 7-h.p. to 15-h.p. Among these we may note a useful 7-h.p. van capable of carrying a load of 15 cwt. The van top is detachable and readily converted into a brake, thus forming a serviceable double-purpose vehicle for tradesmen's use. Doctors should be interested in the 7-h.p. Panhard phaeton with front hood and glass screen, and a spider seat at the rear. Body designing is receiving much attention at the hands of Messrs. Rolls, the 10-h.p. five-seated 'bus on a 10-h.p. Panhard chassis being well illustrative of this. The 'bus top can be removed by detaching four nuts, the vehicle being thus readily adaptable for town or country use. Finally, we may refer to the 10-h.p. Panhard with Roi des Belges body and canopy, a replica of the one which formed a coming-of-age gift to Lord Dalmeny, and of which we give an illustration in Fig. 11.

Fig. 12 illustrates the "Northern" petrol runabout which Messrs. Cockshoot are introducing into this country. The vehicle, which is of American construction, belongs to the single horizontal cylinder class of cars, with side spring suspension. The bore of the cylinder is 4½ in., and the stroke 6 in.; the normal speed is about 600 revolutions per minute, at which the engine develops 5-h.p. The admission and exhaust valves are both actuated mechanically. The helical gears on the cam shaft and crank shaft are enclosed in a dustproof case and run in oil. The carburettor is of the float-fed type; it is provided with a device to throttle the admission of air, and there is another valve between the carburettor and the inlet port. The water circulating pump is driven off the cam

shaft and forces the water through a radiator. Two forward speeds and a reverse, with direct or "free" drive on the high gear, are employed, the planetary type of variable speed gear being used. The pinions of the change speed device are made of brass and have a width of face of 1½ in. The wheel base is 10 ft. 9 in. All the wheels are 28 in. in diameter, and are fitted with 2½ in. tyres. The control devices consist of a steering tiller, the speed gear control lever,

FIG. 12.—THE NORTHERN RUNABOUT.

an "accelerator" brake pedal and a pedal to relieve the compression when starting. The latter may be employed when coasting down long hills with the motor out of gear. The car weighs about 9 cwt., and can attain a speed of 25 miles per hour.

The Daimler Motor Company, Limited, again confine themselves to the construction of two types of chassis, and these of relatively high horse-power. For the coming season, the two standard types are fitted with four-cylinder engines, developing 22 and 14 h.p. respectively. The reliability of the four-cylinder motor fitted to the 1902 22-h.p. model, has induced the company to retain it for the present season, but they have discarded the use of tube ignition, and fit electric ignition only. A great improvement has been effected in the suspension of the engine, whereby the use of the usual under frame has been obviated, and a considerable reduction in weight secured. Another marked improvement is the new base chamber, the lower half of which can be readily detached when desired. The friction water-pump has been discarded for one driven by chain. The construction of the combined water-tank and radiator has been improved, and the system rendered more efficient than formerly. The wheel-base of the chassis has been lengthened to 8 ft.; the road wheels considerably lightened; and the grasshopper springs at the rear lengthened from 36 in. to 40 in. Special mention may be made of the new double-acting band-brake, which

is fitted at the inner side of the driving pinions on the cross-shaft. This brake is actuated by a pedal conveniently placed to the driver's right foot, and with its adoption the company dispenses with the band-brake formerly fitted to the extremity of the top gear-shaft. Another new feature is that the application of the band-brake no longer withdraws the clutch. another factor of safety being, it is claimed, thereby secured, as the engine can be used as a powerful brake at the same time as the sprocket brakes are applied. The lubrication has been considerably simplified, and now consists only of a small sight-feed lubricator leading to the cylinders and base chambers; the main supply of oil being retained under pressure in a special tank placed under the motor bonnet. The four forward speeds are actuated by a single lever, while a small second lever brings the reverse motion

FIG. 13.—THE 22-H.P. DAIMLER CAR BUILT TO THE ORDER OF EARL FITZWILLIAM, PRESIDENT OF THE YORKSHIRE AUTOMOBILE CLUB.

into play when desired. The most important of the new features in the 14 b.h.p. chassis is the fourth speed, which has been added. Last year this type of vehicle contained three speeds only, but in response to repeated applications the company have decided to provide a fourth speed in the new type. The four-cylinder motor remains practically as before. Its principal features have been dealt with in the *Journal*, so that we need only specify the alterations or modifications which have been effected. First among these is the new cut-out. The original automatic throttle has been improved by the addition of a specially-designed valve, which affords an effective and particularly sensitive cut-out, thereby ensuring the cool running of the engine.

FIG. 14.—THE ROCHET-SCHNEIDER CAR.

The system of water circulation has been modified, and a chain-driven pump substituted for the friction type formerly employed. A new automatic lubricator is attached to the dashboard; the main supply being retained under pressure in a special reservoir placed beneath the motor bonnet. As in the case of the 22-b.h.p. chassis, a new type of band-brake has been fitted on either side of the cross-shaft, thus minimising the strain on the gears when the progress of the car is suddenly arrested. As in last year's model a wooden frame strengthened by rolled steel plates is employed. The diameter of the driving shaft has been reduced, and the size of the bevel gear wheels increased. As in the case of the 22-b.h.p. chassis, special attention has been paid to accessibility, and on this ground alone the new type Daimlers are sure of a prominent position among modern automobile vehicles. As regards the cars on the stand, we may mention a 22-b.h.p. tonneau in grey, lined light blue, with dark blue leather upholstery; it affords accommodation for four people, and advantage has been taken of every inch of space for the conveyance of tool boxes, etc. The body is hinged to the rear part of the frame, so that, if necessary, it can readily be tilted back and retained in that position by two iron rods carried between the body and the chassis, so enabling every part of the latter to be readily inspected. A good deal of interest is being centred on the large wagonette designed and built to the order of the King, and intended for the conveyance of loaders and general estate purposes. The rear portion of the carriage gives ample room for eight passengers, although, should occasion

Fig. 14 shows the latest type of Rochet-Schneider car in racing trim. These vehicles are now being introduced into this country by Captain H. H. P. Deasy, who has on view a 16-20-h.p. four-cylinder tonneau. Its main features, such as honeycomb radiator, mechanical inlet valves, magneto ignition, governor acting on the inlet, were described in our report of the Paris Salon. The vehicle, which in design and construction is a close copy of the Mercedes, makes hardly any noise when in operation, the throttle valve fitted enabling the engine to run quietly at all speeds from

FIG. 15.—PLAN OF ARGYLL GEAR BOX, SHOWING CHANGE-SPEED MECHANISM—THE NEW SECTOR IN WHICH THE CHANGE-SPEED LEVER WORKS IS SEEN AT THE EXTREME LEFT.

150 to 1,000 revolutions per minute. An interesting little instrument, known as the "Criterium," is also to be seen at the stand of Captain Deasy. It consists of an aluminium case containing a watch with chronograph and two small cyclometers. The hand of the chronograph, which splits seconds into fifths, gives on a special division on the dial the speed of the car. A stop button permits the hand to jump back to zero, so that it can be used as an ordinary chronograph. The apparatus is connected with one of the front wheels of the car by an ingenious system of transmission, and as soon as the vehicle is running the hand of the chronograph starts automatically and travels while the car is running 200 yards; it then stops, the indicator showing how much time was taken, and the mean speed the car was travelling at; it then jumps back to zero and starts again, and so on. At the same time the two cyclometers register the distance; the first one can be placed at zero at will, and indicates the distance travelled; the second one totalises the entire distance from the beginning up to 10,000 miles. The instrument can be attached to the dash-board or steering-wheel, and is mounted on rubber, thus preventing any jar. Provided with a "Criterium" the motorist can see at a glance the exact time, the speed that is being made,

FIG. 16.—THE BROOKE NEW 14-H.P. LIGHT CAR.

demand, eleven may be conveyed. Beneath all the seats, which can be dropped down, provision has been made for the storage of cartridge boxes, and the large canopy with which the car is fitted is strongly constructed to carry a certain amount of luggage. The body is in natural varnished wood, and the upholstery in brown leather to harmonise. The car is fitted with a standard four-cylinder motor, developing 22-b.h.p. Another handsome exhibit is the 22-b.h.p. carriage designed and built on the lines of the Baron de Zuylen's Paris-Berlin car. It affords accommodation for seven passengers; the rear seats are placed on a higher level than the driver's seat, space thus being afforded for the storage of tyres, tools, etc.

the distance travelled since starting out, and the total distance travelled since the device has been attached to the car.

We gave a description in our last issue of the principal improvements in the Argyll cars for the 1903 season, and also an illustration of the new 10-h.p. two-cylinder car. It is, therefore, only necessary to briefly mention that the Hozier Engineering Company have on view two well-finished tonneau cars, fitted with 10-h.p. two-cylinder Clement motor, and one fitted with 9-h.p. single-cylinder De Dion engine. The 11-h.p. chassis is well worthy a close inspection, the new methods of operating the change-gear striking us as being a great step in the right direction. The change-speed

lever moves from a central position in three directions. When it is pushed outwardly in the centre of the quadrant (see Fig. 15) across the car the first speed is introduced; when it is pulled towards the driver's seat the second speed is engaged, and when pushed forward the third speed is obtained. In each direction the change-speed lever goes to a full stop, so that there are no notches to find, and therefore a mistake cannot be made in changing gear in the dark.

Messrs. J. W. Brooke and Company, Limited, exhibit three of the 12-h.p. (nominal) Brooke cars, the details of which have already been described in the *Journal*. We first noticed a car fitted with Limousine body, painted green, with primrose underwork and red leather upholstery. It is handsomely finished, the bevel plate glass windows following the lines of

FIG. 17.—DETAILS OF CONTACT BREAKER ON HUMBER 20-H.P. CAR.

the tonneau. The engine is of the three-cylinder type, fitted with Esteourt induction valves and natural circulation cooler. Transmission is on the "Brooke" system, the change-speed gear being operated by chains. All the wheels are of equal diameter, 34 in., and shod with 910×90 mm. pneumatic tyres. The other two cars differ only from the foregoing in that they are fitted with ordinary tonneau bodies. Although it has been found impossible to get one of the new light "Brooke" 14-h.p. cars ready for the show, the engine for the vehicle is exhibited. This motor is of very interesting design, comprising three vertical cylinders, the actual h.p. being 15. It is fitted with mechanically-actuated induction valves, the whole of the valves being in one line and worked from a single cam shaft. The governor acts on the throttle, but is actuated by the suction created by the motor, it being claimed for this arrangement that it obviates all objectionable sharp cutting-out action. Fig. 16 illustrates the new light car to which the above-mentioned motor will be fitted. The frame is in one piece of stamped steel. The drive is by means of the gear system, and the water-cooling is effected by pump circulation and induced draught created by fan blades formed in the fly-wheel on the Mercedes principle. The car has a wheel base of 7 ft. 3 in., and will weigh about 12 cwt. As mentioned last week, Messrs. Frank F. Wellington, Limited, have been appointed sole agents for the "Brooke" cars.

The stand of Messrs. Humber, Limited, is one which is attracting considerable attention, the chassis of the 20-h.p. car being minutely inspected. As we gave a very complete description of the vehicle in our last issue, we need only mention that it fully upholds the reputation of the Humber Company, the completely-finished car having a handsome and striking appearance. Fig. 17 gives details of the contact breaker on this car; it is placed conveniently on the dashboard, is driven by a chain from the cam-shaft, and has a neat arrangement whereby the wires remain stationary when the ignition is advanced or retarded. Of the 12-h.p. cars, a couple are shown with well-finished tonneau bodies. Last year's 12-h.p. type has given such satisfaction that the alterations in the 1903 model are only such as have been deemed necessary to further increase its efficiency. The chief alteration has taken place in the engine, which has been completely remodelled, though preserving its outward appearance. The most noticeable alteration is the removal of the exhaust cut-out governor, and the substitution of the throttle. The throttle valve is in conjunction with the Longuemare carburettor, and is operated by a lever attached to the governor. In addition, the carburettor is fitted with valves for the regulation of the supply of gas and air coupled up to small levers on the steering pillar. The bore of the cylinders has been slightly increased, viz., from 3½ to 3¾ in., to account for the extra weight entailed by the lengthened frames; and the compression has been increased by the alteration of the cylinder head and the substitution of a flat-top piston for the rounded one of last year. The frame has been lengthened in order to allow of a longer flexible shaft being used between the gear-box and the back axle, which is of the same style as that of the 20-h.p. In other respects, such as the gear-box, the steering, brakes, etc., the car is the same as last year. A useful delivery van, fitted with 8-h.p. two-cylinder motor, and three speeds and reverse, is also to be seen on the Humber stand.

Messrs. John Marston, Ltd., stage only two cars—one of the curious-looking Mabley cars, to carry two persons, fitted with De Dion 2½-h.p. engine, and one of the 12-h.p. Sunbeam cars which made its first appearance last autumn, and which was described in our issue of the 29th

November last. The main frame is of ash strengthened with steel plates, the general arrangement being on Panhard lines. The 12-h.p. four-cylinder vertical motor is placed in the front of the frame, and is remarkable for its smoothness of running. A ball governor is placed on the large gear wheel fixed to the cam shaft, and acts on a valve above the carburettor. The working of the regulator is modified by a spring operated by the accelerator pedal, and is set by a hand lever on the steering column. Four speeds are provided, these being divided into two groups, each held, as well as the reverse, by a fork, the whole being actuated by a single lever. Inclined non-reversible steering and three powerful brakes are provided. The foot brake is composed of a steel band working round a metal drum fixed to the differential box. The wheels are of the artillery pattern, with 32 in. × 3¼ in. pneumatic tyres. The lubricators, which are automatic, are placed in sight of the driver. The body is of the tonneau type, and, judging from the care bestowed upon every detail, the car should prove not only reliable, but comfortable and easy to drive. A noteworthy feature of the car is that below the motor gear-box and right up to the water tank, which lies across the rear of the car, is a casing of mild steel bolted in such a way as to make it perfectly mud and water tight from the roads, and oil-tight the other way, that is to say, no oil can drop from the car to the ground. Fig. 18 gives a cross sectional view of the frame just behind the flywheel, showing the casing, which, in addition to the advantages above referred to, also allows for the washing down of the car with a hose-pipe without fear of wetting the wires or tarnishing the bright parts.

ELECTRICAL CARS.

The details of the electrical carriages of the City and Suburban Electrical Carriage Company have already been dealt with in these pages, so that it is only necessary to mention that the vehicles on the stand range from a little two-seated victoriette, similar to the one used by the Queen, up to a fifteen-seated omnibus, suitable for hotel or theatre work, and capable of running a distance of thirty miles on one charge. The landaulettes and broughams of this company are now familiar sights in London, the number in use having increased considerably during the last twelve months. Among the new designs we note a little two-seated runabout, fitted with a battery of forty-eight cells, which will run the car from forty to forty-five miles on one charge, at a speed of fourteen miles per hour, and a four-seated tonneau, very much on the lines of a petrol car. This carries a 64-cell battery and can cover a distance of fifty-five miles at speeds ranging from twelve to sixteen miles per hour. Undoubtedly the chief novelty on the stand is the combination petrol-electric car, fitted with a double plecton body. This is the first trial car, and has a two-cylinder 5½-h.p. petrol motor under a bonnet in the fore part of the frame. This is connected to a dynamo, in place of the usual change-speed gear box. The current generated by the dynamo is arranged to operate the two electric motors connected with the rear wheels, or a battery of accumulators, consisting of forty cells of seventy ampere hour capacity. The petrol motor is kept running at a

FIG. 18.—CROSS SECTION OF FRAME OF SUNBEAM CAR BEHIND FLYWHEEL, LOOKING FORWARD.

constant speed, and in driving through crowded traffic may be stopped, the car then being driven by means of the electrical energy stored up in the accumulators. The controller is adapted to give three speeds ahead, and three reverse. The trials of the 5½-h.p. combination petrol-electric car have proved so successful that the company are now building two others, which will be of 11-h.p.

A new concern devoting itself to the construction of electrical cars is the London Electro-Mobile Syndicate, Limited, who have on view a couple of neat two-seated runabouts. The electric motor is carried at about the centre of a tubular frame, and drives by spur reduction gear a small countershaft, which is connected to the rear axle by a centrally-located chain. The electrical energy is furnished by a 45-cell battery arranged in five groups, and having a capacity sufficient to run the car a distance of about 40 miles on one charge. The controller is adapted to give any desired forward speed from three to twelve miles an hour, and a reverse motion, while in one position an electrical brake is obtained. Steering is controlled by a tiller, while there are two pedal brakes, one acting on the rear axle and one inside the large spur-wheel on the short countershaft. The latter

brake is of the internal expanding type. Artillery or cycle-type wheels, 26 in. diameter and shod with $2\frac{1}{2}$ -in. pneumatic tyres, are fitted. The car, which is neatly finished, weighs in running order about 10 cwt.

Another new electrical vehicle is that to be seen on the stand of Messrs. Pritchett and Gold, Limited. The vehicle, which has accommodation for two passengers, has been designed to meet the demand of owners of country houses who have an electric lighting plant. It is exceedingly simple, and can be safely driven by a lady. The frame is constructed of steel tubing. The motor is specially designed for running for long periods without attention, it being self-lubricating; it is mounted at about the centre of the frame, driving the rear axle through bevel gearing. The controller is arranged to give four speeds forward, ranging from 5 to 18 miles per hour, and two speeds backward. The battery consists of forty cells in ebonite boxes having a capacity of 120 ampere-hours. It is divided, one portion being carried in the front of the car under a bonnet, the other being under the seat; this arrangement gives equal distribution of weight over the chassis. With the battery fully charged the car will on good level roads run a distance of about 40 miles.

MOTOR-CYCLES.

Werner Motors, Limited, display several examples of their 1903 $2\frac{1}{2}$ -h.p. Paris-Vienna and 2-h.p. "Tourist," motor-bicycles; as also a $2\frac{1}{2}$ -h.p. fitted with avant-train, or fore, carriage, and consequently accommodating two persons. Fig. 19 illustrates the method of fixing the engine to the frame. The new carburettor will be noticed at A, the lever on the side nearest the observer being the throttle. On the opposite side there is a corresponding lever for the regulation of the mixture. The carburettor is sheltered to some extent by the main tube of the frame, and by the wide mudguard on the front wheel. Lower down will be noticed the contact breaker B, visible through the transparent mica cover. The lower cross tube of the frame is forked, and the exhaust pipe passes between the branches, terminating in a new double-chamber silencer C. It will be seen that the sparking plug D is now placed behind the engine right under the frame and in the

FIG. 19.—THE WERNER MOTOR.

centre, so that it is well protected from any possibility of accidental knocks. The particular engine shown in Fig. 19 is the 2-h.p. Tourist model; it has a bore of 68 mm. and a stroke of 72 mm.

TYRES.

The "Fisk" motor-tyre, which has lately attained prominence in some of the American automobile trials, is introduced by the South British Trading Company, Limited. From five to eight layers of canvas are vulcanised into the rubber, thus affording a strong foundation for the extra

heavy rubber tread which is provided. The tyre is made in all sizes up to a $4\frac{1}{2}$ in. tread. Having illustrated the Rucker pneumatic vehicle tyres and inner tubes in our last issue, detailed description of this novelty would be superfluous on the present occasion. They are shown in one of the courts, and have attracted considerable attention, the properties of the new "unburstable inner tubes" being naturally of interest to motorists. Near

FIG. 20.—THE WAR OFFICE WOLSELEY CAR FITTED WITH BUFFER SOLID RUBBER TYRES.

to the stand of the Rucker Company is that of the North British Rubber Company, whereon are tyres for all kinds of automobiles, including the Clincher-Michelin motor-tyres. These are to be supplied with a square flat tread, and fitted with new bolts and valves, minimising the trouble of removal or fixing. They draw many visitors to the stand. The motor-tyre department of the Dunlop Pneumatic Tyre Company, Limited, is represented by a complete range of automobile tyres and repair outfits, and patches, as well as by various rubber goods, including matting, brake blocks, &c., manufactured by the company. They also have some of the tyres which secured the award in the Tyre Trials. A new tread calculated to minimise, if not entirely overcome, side slip is a prominent feature of the exhibit, its characteristic being transverse segmental grooves, about three-quarters of an inch wide, at short distances around the tyre. Thus, a more forcible grip of the road surface is obtained. A set of tyres which have been driven 10,000 miles are on the stand. At the Clipper Company's stand are the Clipper-Continental motor-tyres, as well as the Clipper pneumatics. These are made in all sizes, from those for motor-cycles to tyres for heavy cars and to fit any rims. The Martin Pneumatic Tyre Company is now guaranteeing its tyres for a thousand miles, and to ride such a distance without a puncture should be a joyful experience. The features of this tyre are well known, and every care is being taken in the construction, with the result that the company are showing their specialities in various sizes with the utmost confidence. The Collier Tyre Company, Limited, naturally draw attention to the way in which their tyre behaved during the 4,000 miles test organised by the Automobile Club, and the fact that only forty-eight marks were lost on the road finds full record at their stand. Here, too, are shown the inner tubes which successfully went through the ordeal. Inner tubes and tyres of each size as made are shown, and there is also a set of tyres filled with the Parsons non-skidding device, illustrated in the *Journal* on the 10th ult. Solid and pneumatic rubber tyres for motor-car wheels are shown by the Shrewsbury and Challiner Tyre Company, Limited, one important department of the company's operations being securing new treads to pneumatic tyre covers. The "Cup" tyres are well known to all users of the road, and are evidently of considerable interest to motorists. For the present season, the Goodyear Tyre and Rubber Company is offering a motor-car tyre, the section of which is elliptical, a thick tread being a notable feature. The Goodyear pneumatic tyre has a substantial base, and the inflated portion is entirely outside the rim. A new voiturette tyre is being brought out by the company, which is giving an absolute guarantee for 1,000 miles. They extend this to 3,000 miles, making compensation proportionately, according to the wear above the first-named distance. The Self Sealing Air Chamber Company, Limited, are making a special point of their patent self-sealing air tubes. These have long been known in connection with cycles, and in applying them to motor-tyres the "self-sealer" provided is of greatly increased strength, closing any ordinary puncture occurring on the tread. The hermetic "detachable" joint for ordinary air tubes is also shown at this stand. The Sirdar Rubber Company, Limited, are exhibiting carriage wheels in various sizes and patterns for all kinds and weights of carriages, from the lightest buggy to the heaviest coach wheel, fitted with patent Buffer solid rubber tyres. They are also exhibiting wire and artillery motor-car wheels, the latter being cut from the finest selected cleft oak. Some wheels are fitted with pneumatic tyre rims, which they build them into, and others are fitted with patent Buffer solid rubber motor tyres. Large sections of Buffer tyres are shown as used on fast and heavy cars, such as the War Office (Fig. 20) and Napier cars, which run up to nearly forty miles an hour. In addition to these tyres and wheels, the Sirdar Company exhibits an invention relating to pneumatic motor-tyre and bicycle tyre covers made endless, which compress automatically without any foreign substance, both laterally and longitudinally. This, however, cannot be used until next year.

HERE AND THERE.

THE Goodyear Tyre and Rubber Company, Limited, has been registered with a capital of £5,000.

THE Stockton Rural District Council is about to consider the speed of motor-cars along its highways.

IN addition to petrol vehicles the Velox Motor Company, Limited are, we hear, at work on a new steam car.

AGENCIES for French, German, and even Italian-built motor-cars have already been established in the United States. What is England doing?

THE Florence section of the Italian Automobile Club is organising a hill-climbing competition on a hilly 15 kilometre route between Pontassieve and Consuma; it will be run off in May next.

ON Thursday, the 29th ult., a dinner was held at the King's Arms Hotel, Gloucester, on the occasion of the opening of Mr. A. C. Stretton's new motor garage and cycle works in Northgate Street. Sixteen employees and friends sat down to the repast.

MESSRS. DE DIETRICH AND COMPANY are building seven special 40-h.p. cars for the Paris-Madrid race, one of which is to be driven by Mr. Lorraine Barrow.

WITH a capital of £100,000 the Collier Tyre Company, Limited, has been registered to acquire and carry on the business of the Collier Twin Tyre Company, Limited. The first directors will be Messrs. W. Baker, J. Perdie, T. M. Harvard, T. Evans, and A. T. Collier.

A RUMOUR reaches us that a British firm, well-known in the motor world, but which cannot for the present be named, has lately completed a 600-h.p. petrol motor, and is already at work on one of 1,400 h.p. To prevent the idea going forth that a mammoth racer may shortly be expected on the road we may add that the engine in question is intended for altogether another purpose than that of propelling motor-cars.

FOURNIER, who is at present in the United States, is credited with the statement that in event of the Gordon-Bennett race being held in Ireland, he may not compete, and especially so should the contest interfere with the preparations or with the dates for the Paris-Madrid race, to endeavour to win which he will allow nothing to stand in his way.

FRISWELL, LIMITED, had a very successful sale at their Albany Street premises on Thursday last week. The attendance at these sales is increasing, and on Tuesday they held a special sale of steam cars, all of which were shown under steam. In a few weeks' time they hope to hold a special sale of motor bicycles and parts.

IN a recent issue reference was made to a special omnibus which the Gardner-Serpollet Company was building for the use of a school in the vicinity of Paris, for the conveyance of the pupils to and from their homes. Herewith is given an illustration of the vehicle, which is of 20-h.p., and capable of attaining a speed of 19 miles per hour. The feature of the 'bus is that, unlike the usual Serpollet cars, the steam generator is located in the forepart of the frame.

THE Oldsmobile Company are, we learn, bringing out a 10-h.p. tonneau car.

THE Mors Company have just completed a 36-h.p. landaulette for the King of the Belgians.

THE Austrian Automobile Club is organising a competition of heavy motor-cars to be held towards the end of next month.

MESSRS. DAKIN AND COMPANY, the long established tea merchants, employ a light delivery motor-van in their business.

MDME. LOCKERT, of "Le Chauffeur," who went through the Paris-Vienna race (touring section), has entered a 22-h.p. Ader car for Paris-Madrid.

A COMPANY has just been formed in Paris to be known as La Societe Francaise des Automobiles Thermo-Pneumatiques (systeme Girardville et Mekarski).

A CONFERENCE of Manchester merchants and manufacturers to consider the possibility of a further introduction of means of transit for heavy goods by motor haulage on the highways has been held. It was suggested that motor wagons might be used to convey cotton between the Manchester Ship Canal and Oldham.

AUTOMOBILISTS touring through Belgium are now required to fix numbers of identification on their cars, in accordance with the new police regulations.

SCENE, Railway Station. Crowd round touring motor-car just taken out of truck. Old woman from country—"Is that a motor-car?" Knowing porter—"Aye!" Old woman (pointing to some spare tyres strapped on behind)—"An' what are they?" Knowing porter—"Life-buoys."

MR. JOSEPH ATKINSON was the owner of the first motor-car in Lancaster, and his firm is now developing a large automobile business in the district. Messrs. Atkinson have every facility for the repair

of cars, and they are now extending their premises so that they will have storage room for sixty vehicles. It is their intention to build, as well as repair, cars.

A SERVICE of motor-cars from South Croydon to the Sutton corner of Epsom Downs, via Carshalton, has been started. It is possible now to travel from London to the famous race-course by road for ninepence, proceeding by the L.C.C. tramcar from Blackfriars or Westminster Bridge to Streatham, changing on to an electric car for South Croydon, and thence to Epsom by motor-car.

MR. F. C. BLAKE, of Kew Gardens, S.W., has just completed a novel petrol automobile, built for the Richmond Main Sewerage Board for use on their works. The engine, which has been constructed to the specification of the board's engineer, Mr. William Fairley, is intended to supersede horse labour on a system of tram-lines, 33-in. gauge, connecting a private dock and wharf with the precipitation works and pumping station at Mortlake, and is used for the haulage of coal, chemicals, and pressed sludge cake. The weight of the engine, mounted on a steel frame, is 15 cwt., the motor is of the Blake vertical double-cylinder type, 7-b.h.p., with electric ignition. The power is transmitted to the driving wheels by chains, two forward speeds and a reverse being provided. The engine can haul three loaded sludge trucks, each weighing 30 cwt.

THE GARDNER-SERPOLLET STEAM OMNIBUS. (Le Chauffeur.)

CORRESPONDENCE.

USEFUL DEVICE FOR STEERING WHEEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having lately purchased a small car, I found much inconvenience in getting in and out of the driver's seat after my wife had taken her place, the difficulty, of course, being caused by the position of the steering wheel, and the trouble being increased by having to wear a thick fur-lined coat during cold weather. When driving, if I had to get out to attend to any matter in connection with the car, or for any other purpose, much difficulty was experienced, unless my wife got out first, an inconvenient arrangement.

With the aid of a good cycle-maker I have devised a simple method of tilting the wheel vertically in front of the steering column, and by this means obviating the trouble. A small wrought-iron hinge is placed immediately under the wheel. This hinge is three inches square when closed, and is made of $\frac{3}{4}$ -inch iron plate. The pin of the hinge is also $\frac{3}{4}$ in. in diameter, is three inches long, and well rivetted at each end. The bottom part or half of the hinge is secured by screws and nuts to the plate usually fixed on the top of the steering column. The top part of the hinge is fastened in like manner to the wheel itself. In order to prevent any upward movement of the wheel when driving a bolt goes through the top of the wheel, and also through both halves of the hinge and plate on top of the column. This bolt is held in its position by a spring, and both bolt and spring are contained in a socket fixed into the top of the wheel. To tilt the wheel it is only necessary to pull up the brass knob fixed on the top of the bolt. The wheel and bolt fall into their places by the weight of the wheel. I may say that the idea of tilting the wheel occurred to me from a brief statement I saw in your journal a short time ago that an American had contrived something of the kind.—Yours truly,

W. H. GREENHOUGH.

statistics are anything like correct, and I, and I am sure many others, would be very glad of some information from other owners of motor-cars of 10-h.p. as regards their outgoings, especially as regards the enormous item of £125 for "wear and tear" in nine months, or, as I have said before, of about £3 or more a week; a very special item of interest being the tyre expenses.

If anything can be done to dispel the statements in Captain Campbell's letter it will be very cheering, as the only point of interest in it is that it is now clear to the man of "moderate means" that he can afford to keep three or four horses in his stable, and two men, at less cost than a motor-car, as I omitted livery in calculating the expenses of the latter.

I much fear that if Captain Campbell's figures are correct nothing could have been published calculated to do the motor-car trade a greater injury, or to prevent the even semi-wealthy man from purchasing a motor-car—leave alone the man of "moderate means."—Yours truly,

"ONE WHO HAS JUST PURCHASED A 10-H.P. CAR."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The report in last week's *Journal* of the paper entitled, "Motors for Men of Moderate Means" is very interesting, but, as one critic intimated, no definition has been advanced of a man of moderate means, and the expenses totalled up of running a car would exclude many like myself from the pleasure of motoring. My experience, though short, may not be unacceptable. The man who conducts a small country business may be described, perhaps, as a man of *small* means, to whom the expense of over £300 per annum would absolutely preclude him from joining the ranks of motorists. On August 1st of last year a Century tandem, 5-h.p., was ready for delivery, which I went to fetch, driving the same home with the assistance of an expert. Between August 1st and December

CARS FOR MEN OF MODERATE MEANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The paper read by Captain Kenneth Campbell, and published in your last issue, shows a most extraordinary and unexpected state of things as regards the upkeep of a 10-h.p. motor-car. Dealing with his expense columns, No. 1, as regards initial cost of car, is, of course, a matter for the individual purchaser; but column 2 gives "sundries" and "repairs" at just on £77; or £2 a week if we include petrol. Surely this is not a normal state of affairs, followed by a cost of £48 for tyres, or a cost for "wear and tear" alone of £3 4s. a week, or 9s. for each day of the week, calculating for a period of nine months. The next column—No. 3—is again largely optional; but omitting the £39 for rent and taxes of stable, and omitting livery, there still remains roughly a sum of £70 expended. I omit stabling, as many people, especially in the country, have this, and for a motor-car do not put their man into livery. The total, therefore, making a minimum for Captain Campbell, works out at about £200 for nine months, or £270 for the whole year.

If this be the expense of keeping a motor-car for a man of "moderate means," then a man of "moderate means" can as well keep four horses, which has not hitherto been practicable. The keep of four horses in the country works out as follows:—

Keep of four horses at £40 a year	£160
Shoeing	10
Coachman	65
Livery	20
Stable lad at 10s. a week	26

£281

I have, as in the case of a motor-car, omitted stabling rent, so that refers to both calculations. It is a very serious matter if Captain Campbell's

31st I drove it 1,648 miles. Repairs have cost 15s., petrol and lubricating oil £3 11s. 9d., total £4 6s. 9d., which you will find works out at about $\frac{1}{2}$ d. per mile. The tyres, which are Clipper-Continental, appear to be as good as new. They have not given the slightest trouble; in fact, I have only inflated them twice, and, fortunately, have had no punctures. I always examine them frequently, and any cuts are filled with rubber solution, etc. I am my own driver, *mechanicien*, and groom, only calling in expert assistance when absolutely necessary. My car weighs 5 cwt., and as the police authorities in this district do not complain of speed up to 20 miles per hour, I generally avail myself of this privilege.

For motor house a spare room is used, which was made convenient by placing in large doors. The driving wheel is always kept jacked up, and the two steering wheels are raised periodically, so that the weight is not pressing continually in one place on the tyres. I have only had two stoppages, which happened the same day, viz., a broken inlet valve and a broken chain, both of which I repaired, always taking precaution to carry the necessary tools and parts likely to be required. The petrol used was 44 gallons, which works out at about 38 miles per gallon.—Yours faithfully,

T. COXON.

P.S.—It is hoped that the numbering proposals will meet with the fate they deserve. They cannot, in my opinion, serve any useful purpose

THE MOTOR TYRE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The motor-car has now been with us some five years or more, and up to the present time we do not appear to have discovered any satisfactory

method for preventing sideslip or skidding. That being so, it may be asked, are we right in adopting an inflated circular pipe of rubber as a wheel tyre, and whether rubber is the proper material to stand the thrust and drive of the motor? The wheel is a lever, the road the fulcrum. Such being admitted, surely the wheel and tyre should be, to a certain extent, rigid. Experience points to a flat tyre, seeing that the car has to thrust itself along the road, and is not drawn or pushed over it.

There is another matter that would appear to require some consideration with respect to pneumatic tyres, namely, that they are inflated with as much pressure as they can conveniently bear with safety. In addition to the weight of the car, the tyres have an extra load (if four persons are carried) thrown upon them of about 560 pounds per square inch sectional area of the tyre. Again, are we not wrong in endeavouring to obtain resiliency from wheels, whether attached to motor-cars or any vehicles? It is to the springs of the vehicle, whether bow, spiral, or cee springs, that we must turn our attention for resiliency, and not to the tyres. We cannot reasonably expect urban district councils to maintain their highway roads in that state of efficiency resembling garden paths for the special behoof of motorists using these delicate and expensive tyres. The motor-car has undoubtedly come to stay, and the tyres, whatever the design or material, should be so constructed to traverse any roads, be they rough or otherwise. There is hard work for the motor-car in store, later on, other than racing, for which the present system does not appear adequate.—Yours faithfully,

EDWIN E. HILL.

A SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time ago a friend informed me he had heard that if a break was made in the high-tension circuit the motor would fire better, so

I made a few experiments. The accompanying sketch shows the simple little appliance used; it is composed of a flat strip of wood $\frac{3}{4}$ in. wide and $\frac{1}{2}$ in. thick, well boiled in paraffin wax to make it a perfect non-conductor; two ordinary electric bell terminals were fixed on it, and underneath each a short piece of German silver wire was soldered, which met when pressed flat down, but, on being raised slightly with the blade of a penknife, a break of any length could be obtained; one end was connected by a simple loop of wire to the plug, and the other to the high-tension wire. The principal results noted were, first, owing to the resistance produced by the break in the air, the sparks on the plug were "splasy," if I might use the word instead of fat, which would account for the throwing aside of particles of grease and soot; second, on testing with plug in the engine a fuller or deeper explosion was obtained, but apparently with little or no increase of power; and lastly, when connected with an accumulator which showed 3.4 instead of 4.0 volts, the engine fired without missing in the least, but at a much slower speed. The engine used was a $6\frac{1}{2}$ -h.p. Aster, with a perfect compression, and the best results were obtained when the two wires of the interrupter were from $\frac{1}{8}$ in. to $\frac{3}{16}$ in. apart; if more than that, the engine fired weaker, and when the plug was taken out the spark was more thready, but if closer the interrupter did not seem to make much difference.

Perhaps some other motorists will give us their experience.—Yours faithfully,

JOHN R. MARTEN.

"IXION" writes:—Will any of your readers who have solid tyres on Locomobile cars kindly give their experience, as I am thinking of having them fitted? I may say I use my car exclusively for business purposes, in City and suburbs, where the roads are good, and I seldom exceed the legal limit of speed.

ENDANGERING A MOTOR-CAR.

At Cambridge Police Court, Alfred Coteman, cab proprietor, was charged under the Town Police Clauses Act with being the driver and owner of a hackney carriage, he did unlawfully by certain wilful misconduct endanger a motor-car, the property of Mr. T. F. Hooley, student of Trinity College. The magistrates inflicted a fine of 5s., and made an order for defendant to pay £2 damages. The Court fees were remitted.

LUBRICATION AND LUBRICATORS.

On Friday, the 30th ult., Mr. Thomas Clarkson read a paper before the Automobile Club of Great Britain and Ireland. Mr. Worby Beaumont was in the chair. The following excerpts will be of interest.

To appreciate lubrication we may with advantage first study the enemy—"friction." Its laws are few and simple, and may be divided into

FIG. 1.—CROSS SECTION.

two classes—static and dynamic. The first deals with the friction of rest, and is given by some the not inappropriate name of "stiction" (belts and friction clutches come under this heading). The second deals with the friction of motion. The friction of motion may be sub-divided into rolling and sliding friction. The former relates to ball and roller bearings, the latter to plain bearings.

In rolling friction the balls or rollers act in a manner closely analogous to the lubricating medium of a plain bearing by keeping the working

FIG. 2.—PLAN OF VALVE CHEST, SHOWING RADIAL DISTRIBUTING PIPES.

(The valve is indicated by a dotted line.)

surfaces apart. If it was possible to make a ball or roller bearing with absolutely no sliding friction, the use of a fluid lubricant might be safely dispensed with, but there is sliding between the balls or rollers themselves, or between them and the cage employed to keep them in position. The amount of sliding friction is lessened when intermediate balls or rollers are used, but it is not entirely eliminated. The extra complication and cost of these

bearings qualifies their other advantages, and the friction of a well-designed plain bearing, properly lubricated and protected, is very much smaller than many people imagine.

The amount of friction between two surfaces sliding together depends upon several things:—(1) The pressure applied to them; (2) the material of the surface; (3) their smoothness and hardness; (4) their wetness and dryness; (5) their temperature; (6) the viscosity of the lubricating medium.

The lubricant should be clean and free from solid substances. This medium is the only thing that should be permitted to come between the working surfaces. If particles of dust or grit are permitted, their smallness of area and consequent penetration enables them to cut through the film of lubricant, to the detriment of the working surfaces—therefore, intruders must be kept out.

Speaking broadly, there are two systems of lubricating a bearing. In the first the rate of feeding is adjusted as far as practicable to the actual requirements. In the second the bearing is liberally flooded, and the large surplus recovered for use again. It would not serve my purpose to attempt to describe the innumerable forms of lubricators, which come under the first category, all of which depend individually for their action upon human adjustment; since I am entirely opposed to such human adjustment and individual inspection.

I advocate pumping the oil under pressure. A force pump working under the extremely favourable conditions of dealing with lubricating oil will run for years without attention, and its action may be instantly tested, at any time when running, by momentarily pressing a button. The next step is to ensure that the oil which is pumped is going to *all* of the bearings. On an automobile I do not advocate a separate pump for each bearing; one pump for all the bearings is enough, only we must be sure they all get a proper share.

Figs. 1 and 2 show a distributor which I have found to answer perfectly and give no trouble. The oil is delivered by the pump into the pipe A, and fills the box B; the only outlets are the ring of holes C, each of which communicates with a bearing. This ring of holes is covered by a circular disc D, which is slowly revolved by the motor. On one side of the disc a segment is cut out, so as to uncover one hole at a time, and the desired result is accomplished. Care is taken to make the segment wide enough to partially open the next hole before closing the last. Any number of branches may be used. The arrangement works perfectly. After running over 3,000 miles, a Chelmsford engine fitted with it was taken to pieces and examined. The surfaces were found in perfect condition, and there was practically no wear; the engine was as good as new, and would certainly run a distance equal to the circumference of the earth before needing repair. The consumption of lubricating oil is very small, and the relief from attention to lubricators has added a great charm to driving. The oil is strained each time it circulates, and any solid particles are permitted to quietly settle to the bottom of the oil well, where they can do no harm. A drain tap is provided at the lowest point, and replenishing is done through a large inspection hole in the top of the motion case. It is not necessary to carry a reserve of lubricating oil, or even an oil can, except for steering and brake motions. One filling of the well (say a gallon) will last quite a thousand miles on a large car. The same system, with modifications, is applicable to cylinder lubrication. The lubrication of outside driving chains has special difficulties owing to the exposed situation and the impracticability of properly enclosing them. They work remarkably well, considering their dirty and generally neglected condition, and an occasional bath in paraffin and a subsequent soak in a melted compound of fat and black lead does fairly well. It would be a good thing if they too could be provided for by the same lubricating system which does the rest of the car; but I have little hope of this being accomplished.

A MOTOR-CAR DEALER'S FAILURE.

In the Court of Bankruptcy, on Tuesday, before Mr. Registrar Linklater, a sitting was held for the public examination of Dillon Clarence Willoughby, described as of Piccadilly and Long Acre, motor-car dealer. The debtor was an American subject, and was formerly in business at New York. He came to this country in June, 1900, and later on he became a director of the Automobile Manufacturing Company (now in liquidation), and had been employed latterly in buying and selling motor-cars on commission. The debtor returned his unsecured liabilities at £12,716 16s. 9d., and no available assets were disclosed, book debts (£5,380) being treated as unrealisable. The examination was concluded.

ALLEGED NEGLIGENT DRIVING.

MR. JUSTICE KENNEDY and a special jury had before them on Tuesday, at the Berks Assizes, an action in which Mr. Thomas Lester, of Wallingford, claimed £40 damages from the London Motor Garage Company for the loss of a horse and damage to a cart. On the occasion of the Automobile Club run from London to Oxford on November 7th a car collided with the horse and cart, the former having to be shot. The defendants claimed £300 damages to the car and loss of hire, by reason of the car being laid aside for repairs. The jury found that there was material negligence on the part of both parties, and judgment was entered for the defendants in each case. The question of costs was left for the judge to decide.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Romsey	R. Sweetman, Stanbridge (driver to Sir Basil Montgomery)	20 m. p. h.	£1, etc.
Marlborough St. (London)	D. Chapman, Pimlico	—	20s. etc.
Marlboro' St. (London)	L. W. Munro	—	Dismissed.
City (London)	G. Brand	—	—
Eastbourne ..	W. E. Perkins, Westminster	—	£2 2s.

Where no alleged speed is given it is understood to be above the legal limit.

H. M. BIDDINGTON, of Cornwall Terrace, Regent's Park, was summoned at Marlborough Street Police Court for furiously driving a motor-car in Hyde Park on the 14th December. Constable Park, of the A division, said that the defendant covered 2 miles 5 furlongs and 51 yards in five minutes, and that foot-passengers had to jump out of the way. Mr. Staplee Firth told the magistrate that he desired to point out the flimsy nature of the evidence upon which gentlemen were "dragged to court by the scruff of the neck and their noses thrust into crime, whether they liked it or not." A motor-car, being a modern invention, of course went faster than the animals used by Adam and Eve in the Garden of Eden, upon the speed of which no improvement was made until the introduction of the motor-car. Mr. Kennedy ordered the defendant to pay a fine of 40s., with 2s. costs.

BRITISH MOTOR TRACTION COMPANY.

BEFORE Mr. Justice Farwell, in the Courts of Justice, Mr. Douglas moved on Tuesday, on behalf of the plaintiff in the matter of the British Motor Traction Company, Limited—Lawson against the company—for the appointment of a receiver and manager. The company appeared, and did not oppose the motion. Plaintiff was the holder of debentures for £7,750 out of an issue of £50,000. The company was incorporated in August, 1900, and in September following made the issue of the debentures named. By the conditions of the debentures the moneys thereby secured became payable if default were made in payment of interest for twelve months, and this event had, in fact, happened. His Lordship appointed Mr. Baker as receiver, and expressed his unwillingness to appoint a manager under the circumstances; but gave liberty to apply in Chambers for a manager if plaintiff were so advised. The receiver would have liberty to take possession at once on the plaintiff's undertaking to be answerable for the receipts.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, FEBRUARY 14, 1903.

[No. 206.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

Mr. Staplee Firth in favour of a Bill to enable the race to be held in Ireland, and this will be signed by practically every organisation in Ireland. The petition gives the history of the race, pointing out that the Gordon Bennett Cup is to automobilism what the "America Cup" is to the sport of yachting, and shows how the position of France in the automobile industry has been largely won by the encouragement given to road racing.

Points of the Petition.

It is also shown that while sanction for the race would give an impetus to the industry in this country, the transfer of the event to France would still further increase French supremacy, to the disadvantage of the United Kingdom. A suitable route in Ireland has been discovered, passing through a thinly-populated district. Provisions for the safety of the public would be submitted to the Local Government Board for Ireland, and already the three County Councils within whose jurisdiction the race would take place have declared themselves in favour of the race.

Hopes for Success.

THE petition has been drawn up with evident care and the arguments have been ably marshalled. We trust that it will have the success that it deserves and that the month of July will prove a notable one in the history of British automobilism. Not only that, but the influx of visitors from Europe and the United States should do much for Ireland as a holiday centre and inaugurate a period of prosperity for that country such as has not yet been contemplated.

Everyone Can Help.

MR. GOFF and Mr. Johnson have ascertained from the County Surveyors of Kildare and Queen's County that, at places where the road surface on the proposed Gordon Bennett course is not as good as may be desired, it would be possible to have the surface picked up and rolled in by a steam roller at a cost of about £10 per mile. It has been arranged that members of the Races Committee of the Automobile Club should visit Ireland at the end of April and should proceed on motor-cars over the course with the County Surveyors, and point out to them the places on the road which in their opinion should be improved. Before this is done, however, it is necessary that the Committee should be able to state to the surveyors what sum of money there is available for improvements to the road surface. It is believed that automobilists generally throughout the United Kingdom will appreciate the opportunity of subscribing a small amount with a view of providing that the road

on which the race is to be held shall, as regards surface, compare favourably with the roads on which Continental races are run. The Executive Committee of the Club propose that at the outset subscriptions should be confined to ten shillings per head, and they invite all who are willing to subscribe ten shillings or less to send to the Secretary of the Club at 119, Piccadilly, W. We hope our readers will give a hearty response to this appeal, and would suggest that, in order to save delay and avoid confusion, subscriptions should be sent at once to Mr. C. Johnson, Secretary of the Automobile Club, with a clear notification as to the purpose for which they are intended.

The Irish Awakening.

FROM every district in Ireland comes news of the awakening of rural councillors which is resulting from the attention now being devoted to the Gordon Bennett race. At the last meeting of the Bray District Council it was decided to affix the seal of the Council to any petition presented by the Automobile Club to Parliament in support of the Bill legalising the holding of the great event in Ireland. The Town Clerk stated that, in view of the visit of a large number of automobiles during the season, he thought it would be desirable on the part of the Council to see that all the roads of the Urban District were properly steam-rolled. On the motion of Mr. Sutton, seconded by Sir Henry Cochrane, it was decided to have the roads steam-rolled, and on the motion of Councillor O'Carroll it was decided to ask the Rural District Councils, who have charge of the rural districts, to take similar action. The way in which the local authorities in Ireland are recognising the value of the automobile in the development of the tourist resources of their country should be reciprocated by a great influx of visitors this year.

The Edinburgh Show.

DURING the week a motor and cycle exhibition has attracted much attention in Edinburgh. It was hoped that Lord Rosebery would have been present at the opening of the show, but a prior engagement was pleaded in excuse, and a speech that would probably have done something to forward the interest of automobilism was lost. The show was therefore opened without any formal ceremony.

Caution Necessary.

AT an inquest held at Tipton on the body of a little girl who was found lying unconscious on the highway, it has transpired that a motor-car had passed in that direction about the same time, and as death was due to a fracture of the base of the skull, the coroner's jury came to the conclusion that she had been knocked down by a passing vehicle. Of course the motor-car has been held guilty. Unfortunately, the driver of the car has not been identified, nor has any adequate description of the vehicle been given, although nearly all the witnesses agree that it had canvas curtains and that the wheels were red or chocolate colour. A similar kind of accident occurred at Redhill some little while ago, and the hope must be expressed that automobilists will exercise great care in traversing both main and by-roads, for the credit of the movement. A few more such

instances as these reported from Redhill and Tipton would go far to discredit any proposals which may be placed before Parliament for removing the present speed limit.

Automobilism in Tasmania.

AN Antipodean reader of the *Journal*—Mr. A. M. Campbell, of Hobart—sends us an interesting letter on the subject of motoring in Tasmania, from which we take a few extracts. "As to the opening here for motors," writes our correspondent, "there is little to tell; many say they are waiting for the 'perfect motor-car'; they'll probably get a hearse while they wait. There are only a few automobiles in the island, two steam and two internal combustion, and about a dozen motor-cycles, and as one motorist owns one car and one cycle, and another one car and two cycles, you will see the number of motorists is as yet very small. It is not anticipated that many cars will find their way here for some time yet, but motor cycles may be bought in small numbers during 1903. The roads throughout the island are not so good as English roads are said to be, but, for all that, are very fair, and some fine stretches are to be found in the north and north-west. In the south the land is more undulating, but most of the hills can be negotiated with a good machine." Mr. Campbell, who has lately built a motor-bicycle, sends us a photograph, reproduced herewith, of a 7-h.p. steam car he designed and completely constructed in 1901. The car, which

A TASMANIAN-BUILT STEAM CAR.

has an engine on each side, quickly found a purchaser, to whom it has given every satisfaction.

The 18-h.p. Mercedes.

MR. E. W. HART, of Luton, has kindly furnished us with the following particulars of the new 18-h.p. Mercedes:—The motor has four cylinders, 110 mm. diameter by 140 mm. stroke, and runs at a normal speed of 1,000 revolutions per minute. The admission valves are mechanically operated and have a variable lift. Four forward speeds are provided, the change gear box being controlled by means of a single lever which moves only in a forward and backward direction. Eleven litres of water are carried in the Mercedes cooler. The wheel base is 7 ft. 8 in., the road wheels are 910 mm. by 90 mm. at the front, and 920 mm. by 120 mm. at the rear. The car, complete with body, but without water or petrol, weighs 1 ton 88 lbs. We understand that Mr. Hart will be showing one of the 18-h.p. cars at the Agricultural Hall Exhibition next month, and probably one of the new 60-h.p. Mercedes.

The Royal Commission.

A ROYAL Commission to enquire into the means of locomotion and transport in London has been formed by the Board of Trade, with instructions to report as to the measures to be adopted for the improvement of London traffic, by the development and interconnection of railways and tramways, and

increasing facilities by other forms of mechanical locomotion, and generally by better provision for the regulation of traffic. The Commissioners include Sir David Barbour, who has had considerable experience in connection with such work, and the railway interest is represented by Earl Cawdor, Viscount Cobham, and Mr. G. S. Gibb. Sir John Wolfe Barry, the consulting railway engineer, and Sir Francis Hopwood, the secretary for the Board of Trade, will bring special expert knowledge which should be of value to the Commission. We look in vain, however, for the names of Messrs. J. Williams Benn and J. Allen Baker, who, on the London County Council, have shown themselves specially qualified to deal with this problem. Mr. Rees Jeffrey, too, might have been included among the members, seeing that he has been identified with several proposals to relieve the traffic, more especially to and from the suburbs; but perhaps he will be given an opportunity of placing his knowledge at the disposal of the Commission at one of its early sittings.

London Traffic.

As to the necessity of the inquiry there can be no doubt. The enormous traffic of the metropolis and the suburbs is estimated at 1,832,000,000 persons annually, divided up somewhat as follows:—

	Passengers.
Suburban railways	618,000,000
Tube and underground railways	264,000,000
Tramways	390,000,000
Omnibus	530,000,000
Cabs, etc.	30,000,000
	1,832,000,000

It is just two years ago since Mr. Balfour, in a letter to the Warden of the Browning Settlement in Camberwell, drew attention to the urgency of dealing with the problem, and we hope the Commission will not lose sight of one important paragraph of his letter, in which he said, "What I am anxious people should bear in mind is that trams, railways, and 'tubes,' by no means exhaust the catalogue of possible improvements in transit; indeed, I am not sure that they are the means of communication for relatively short distances which some years hence will find most favour. What I should like to see carefully thought out by competent authorities would be a system of radiating thoroughfares, confined to rapid (say, fifteen miles an hour or over) traffic (that is absolutely essential), and with a surface designed, not for carts or horses, but for some form of motor-car propulsion." This is an aspect of the matter that we should have liked to have seen prominently represented on the Commission, and we trust that Sir John Dickson Poynter, Bart., who is himself an automobilist, will see that the claims of motor-cars are not overlooked in any recommendations that may be made.

Motor 'Buses or Horses.

ON Tuesday the general newspapers contained three utterances from officials of leading metropolitan omnibus companies all expressing a desire to dispense with horses, but agreeing that, so far, the satisfactory dividend-paying motor-omnibus had not been brought to their notice. The chairman of the Associated Omnibus Company, Limited, said the directors had been watching carefully the experiments made with various motor-cars, and were of opinion that no motor had yet been brought forward which could successfully compete with omnibuses drawn by horses. The actual cost of petrol was small, but the upkeep was very great, and the expense of maintaining motors would be considerably more than the cost of running omnibuses with horses, even at the present high price of forage. Supposing the company were in a position to place a number of motor-cars on the road, these cars would have to go into "dock" about once a week to be thoroughly overhauled, if they wished to keep them in a perfect state of repair. This would necessitate, say, for 200 cars, an additional supply of about thirty cars to take the place of those under repair. The secretaries of the London General Omnibus Company and of the Road Car Company have

also expressed themselves in similar terms, the latter agreeing that in the future motor power will play a large part in connection with London traffic.

Motor Fire Engines.

THE motor fire engine belonging to the Liverpool Corporation, which we illustrated in a recent issue, is arousing considerable interest not only in the City of Liverpool, but also among municipal authorities elsewhere. Last week a deputation from the Leicester Corporation inspected the machine, and Chief Superintendent Thomas pointed out that by the abolition of horses the fire extinguishing staff became increased by one. In a staff of nine at a fire, each man has a substantial value, and hence the economy of the system is greater than is at first apparent. The motor fire engine now being built for the Leyland Urban District Council will probably be fitted with an oil fuel burning apparatus. Other municipalities and District Councils are making inquiries with regard to the subject, and it

Owing to its greater speed, the motor-car permits physicians to attend to urgent calls more promptly, cases having been recorded in our columns where it was thought lives had been saved through the use of the automobile. A motor-vehicle commends itself more particularly to physicians who have a scattered practice. It may sometimes be necessary to make some slight adjustment or repair on the road, resulting in the doctor's getting his hands and clothing greasy, making him more or less unpresentable. This drawback does not exist if the doctor is always accompanied by a man, which many, who have an extensive practice, have found to be the best plan, although almost everyone prefers to handle the levers himself. At the same time, the motor-car is more cleanly than the horse from a sanitary standpoint, as is well brought out by one doctor, who states that it is impossible to drive a horse, not to speak of cleaning him, without getting one's clothing contaminated with decaying organic matter, which it would be positively harmful to carry into the sick room.

THE F.I.A.T. CAR USED BY THE ITALIAN POSTAL AUTHORITIES.

[La France Automobile.

would appear that we are on the eve of a radical change in our methods of fire extinction.

Motor-cars and Doctors.

ONE of the most important applications of the automobile is as a physician's carriage, and although it is being used by doctors in all parts of the country, we are somewhat surprised that a larger proportion of the medical profession has not taken to the new vehicle. Many physicians spend a large part of their time behind their horses, and where driving is ordinarily considered a recreation it is to them more or less of a burden. With a motor-car they can save much of this time, as considerably higher average speeds are possible. Generally speaking, a certain time spent in an automobile results in less fatigue, probably on account of the pneumatic tyres, more perfect spring suspension, and the perfectly even motion compared to the jog of the horse.

American Doctors to the Fore.

THE foregoing brief remarks are the result of a rapid glance through the special doctors' number just issued by the *Horseless Age of New York*. It is entirely given up to the experience of doctors in all parts of the United States, and shows that the advantages of the motor-car are quickly being recognised by the members of the medical profession on the other side of the Atlantic. Some of the writers may be a little enthusiastic and overlook minor troubles, but this is set off by the record of the experiences of others with pessimistic inclinations who are likely to exaggerate small annoyances. Even the few cases where the use of the automobile in a medical practice was found impracticable and given up after a trial have not been excluded, the aim of our contemporary having been to give a complete view of the situation as it exists, with the hope that a knowledge of the causes of the failures may lead to their avoidance in the future. Striking an

average through the various articles, there can be no question that the motor-car has been found of great service by doctors. Naturally, care must be taken in the selection of a suitable vehicle. Even when this is secured, the cost of operation and upkeep may at first be greater than that of horses and carriage. As the doctor, however, gets through the novitiate stages of motoring and blossoms out into a full-blown *chauffeur*, ready to talk "petrol" with anyone willing to listen, he will be able to take better care of his car, and consequently run it much more economically than when he first purchased the vehicle.

On the Wrong Side.

NOT often are motorists accused of driving on the wrong side of the road. Hence the interest in the case at Wilmslow in which Mr. Alexander Kenyon, of Higher Openshaw, was summoned for driving a motor-car on the wrong side when meeting a carriage at Wilmslow. The coachman to Dr. Johnson said he was out driving, and when near Bank Square, Wilmslow, defendant came round a corner on his wrong side. If Mrs. Johnson, who was driving, had not pulled up there would have been a serious collision. Sergeant Woollam said defendant was on a trial trip, and appeared to be taking more notice of the driving and the machinery than where he was going. Defendant was fined 20s. and costs.

Walsall's Plight.

WHILST some Midland towns are looking to the automobile industry for the reusucitation of prosperity, and others regard its advent with feelings of curiosity mingled with pessimism, Walsall, which has enjoyed a large trade in saddlery, etc., owing to the war, is now contemplating a falling off in its staple trade owing to the growing popularity of the motor-car. The displacement of horses by the motor-car in many country stables is having its effect on the rural saddler, while the substitution of electric traction for animal power on the tramways is another contingency that threatens loss to Walsall. Apparently the town must learn the lesson that the coachbuilders are now beginning to understand, viz., that times are changing and those engaged in industry must adapt themselves to the varying manners and conditions of the age.

Automobiles and Presents.

WHEN automobile weddings cease to amaze the guests, and honeymoon tours by motor-car occasion no surprise, it may be acknowledged that the popularity of the self-propelled vehicle is established beyond dispute. Matters have even got beyond that stage, and the present of a motor-car to Earl Kinnoull on his marriage indicates a means by which people can escape the worry of choosing individual presents. In this particular instance nearly sixty friends subscribed for the vehicle. News now comes that the tenant farmers on the Rothschild estates, near Leighton Buzzard, have joined in presenting a motor-car luncheon basket to Mr. Lionel de Rothschild in celebration of his majority. If the automobile does anything to ease the difficulty of selecting coming-of-age and wedding presents it will have conferred another boon on Society.

The Peasantry and Racing.

ONE of the factors to be considered in connection with automobile racing on British roads is the attitude of the villagers and dwellers in the rural places through which the cars run. It might appear that these would be antagonistic to any suggestions for holding such contests, but the experience of other countries is exactly the reverse. In fact, when the French Government prohibited racing the peasants were loudest in denouncing the authorities, and when the ban was raised great was the joy along the countryside. And already the Irish people are becoming similarly excited over the possibility of a motor-car race being run in the Emerald Isle. Visions of visitors are not

mere phantoms. They have a tangible substance—as hotel proprietors in countries where races have been held can testify.

The Affiliation Question.

THE report with regard to the affiliation of provincial Clubs prepared by Messrs. Siddeley and Johnson has been adopted in principle by the Automobile Club Committee. It has, however, been referred to a committee yet to be appointed upon which the affiliated Clubs may be represented. The matter cannot, therefore, be regarded as settled—although on a fair way to some authoritative decision.

Driving Certificates.

A SERIES of suggestions with regard to the issue of certificates of proficiency to motor-car drivers has been considered by the Committee of the Automobile Club. There are many difficulties in the way of securing anything like a satisfactory settlement of the matter. Until he has had experience of traffic as well as of his car, no man will enter for the necessary examination, and there are others who will not care whether they have a certificate or not. Consequently the provision of certificates—a new undertaking which many consider unnecessary—will have little practical effect, however praiseworthy the objects of the promoters of the scheme may be.

The Wolseley Testing Track.

WE learn that the Wolseley Tool and Motor Car Company, Limited, are constructing a testing track on a large plot of ground they own immediately facing their capacious premises at Adderley Park. This additional area comprises nearly eight acres, and has been purchased with the object of erecting extensive additions to the Wolseley Factory. Until the space covered by the track is actually required for building the company intend utilising it for testing purposes. The course will be an ideal one for putting cars through their paces, as it has all kinds of gradients, one short strip being one in five. The complete track will give two laps to the mile. It is now nearly ready for use, the steam roller having been at work on it for the last few days. The course will also be useful not only for testing Wolseley cars at high speeds, but for teaching clients' servants—of whom there are always a number at the factory—how to manipulate the cars before allowing them to try their skill on the high roads.

MR. J. A. HOLDER has entered for the Paris-Madrid race. AN automobile club for South Wales is in course of formation.

THE Automobile Club is to become affiliated to the Marine Motor Association.

THE Oxford Cycle and Motor Company are lending out motor-vehicles with drivers on hire.

RUMOURS as to the possible early formation of a motor cycle manufacturers' association are current.

THE New Orleans Motor Company have adopted the latest ignition, with external jump gap, to one of their cars.

MR. HONORE PALMER, President of the Automobile Club of Chicago, has placed an order for a 60-h.p. Mercedes car, of the 1903 model.

THE Hon. J. Scott Montagu, M.P., is reading a paper on "Motor-cars as Feeders for Railways," at the A.C.G.B.I. on Friday, the 13th inst.

A REPORT reaches us that Messrs. Vickers, Sons and Maxim's works at Crayford, Kent, are to be devoted to the construction of motor-cars.

THE Barton Air-ship Syndicate, Limited, has been registered with a capital of £15,000, to adopt an agreement with Mr. F. A. Barton, for the acquisition of certain patents relating to navigable balloons and aerial machines, and to manufacture and deal in air-ships.

THE END OF "LE PASSE PARTOUT."

At the 1902 automobile exhibition at the Agricultural Hall, Le Passe Partout excited the public, and drew paragraphs unto itself in the daily newspapers. On one memorable afternoon the huge vehicle sallied forth with Dr. Lehweß at the wheel, to make a peregrination of the world and demonstrate the universality of the automobile. The blowing of horns, the screeching of whistles, and the silent pointing of the camera were three accompaniments that mingled in the farewell as the gates of the busy yard closed behind the caravan.

But it was not to journey alone, for a Scotchman challenged the right to a monopoly of world-travel, and accordingly a 9-h.p. Argyll, with Mr. D. H. Whitehead in charge, was accepted as companion. Le Passe Partout was to journey first to Paris, and when ready to fly its bonnet, telegraphic reminder was to be sent to the Argyll. Punctures delayed the trip to Southampton, and other matters caused a halt in Paris. But at length came the order, and Mr. Whitehead, with his Argyll, arrived in France.

After some preliminary manoeuvring the automobile

party dined in amity and peace on the last day of the tour, are stories of which we have no record.

Mr. Whitehead returned to Europe, leaving Dr. Lehweß and Mr. Cudell discussing matters with Dr. Kennard. Le Passe Partout meanwhile stood ignobly in the snow and ice—as depicted in our illustration—in the village of Clerieo, seven miles from Nijni Novgorod.

From the Continent the news spread to England and, of course, become known on the Holborn Viaduct. The automobile greatness of the Viaduct has nearly departed, but Mr. Charles Friswell remains—at least till next month, when he, too, will shake the dust from his feet and bid him to the new garage in Albany Street, from whence the operations of Friswell, Limited, will be directed. Mr. Friswell heard tell of the hapless plight of Le Passe Partout, and with characteristic promptness decided on a little expedition to find the wayward car. On the night of Saturday, the 24th ult., he left London arriving in Brussels the next morning. On Monday he reached Paris, and at 1.50 in the afternoon he left for Berlin, arriving there at 8 a.m. on the next day. Tuesday was spent in reconnoitring the German capital. He left Berlin at night, and got to Warsaw about

"LE PASSE PARTOUT" ICE-BOUND NEAR NIJNI NOVGOROD.

voyagers set out from Paris on the day of the Grand Prix—a modest proceeding, indeed, seeing that everybody was at the races, and the Caravan on wheels passed beyond the walls practically unobserved. In addition to the tourists already named were Dr. Kennard and Mr. Cudell, who shared in many excitements ere the journey was over.

An interesting trip was made to Berlin, where the party remained ten weeks studying the ways of the people and acquiring some knowledge of the automobile needs of the city. Le Passe Partout departed from Berlin one midnight without any of the trumpeting that heralded its departure from London. Apparently as the distance lengthened the modesty of the leader of the expedition increased, and he recognised that a quiet tour would prove as demonstrative of the powers of the Caravan as one accompanied with much noise from onlookers. Certainly the trip was useful in that respect, and the way in which the Argyll car and its big brother journeyed over the bad roads leading to Warsaw revealed qualities of endurance and strength that should satisfy any ordinary Britisher. On the Russian frontier some negotiations had to be conducted, and then again the trip was resumed to St. Petersburg, where a stay of three weeks preceded the trip to Moscow. There it terminated. Why the tour of the world should end in Moscow, and how the

10 o'clock on Thursday morning. Friday afternoon he was in Moscow, and at 10 o'clock in the evening got to Nijni Novgorod—having exceeded the legal limit of speed as imagined by a Surrey magistrate. The following morning Mr. Friswell went by sledge to Clerieo, where Le Passe Partout was alone. There he enlisted local labourers to dig out eighteen inches of ice, and then seven horses drew the helpless vehicle. Two hundred yards further it subsided into the snow. To get it to the station was a terrible affair, but it was accomplished, after an exchange of language in various tongues that need not be attempted here. His Saturday's work done, Mr. Friswell returned to Moscow, where he motored with Mr. Teffersfelt, the local automobile agent, till the afternoon, when he set face for home, and arrived in London on the night of Wednesday week, having travelled 5,670 miles, and assured himself that Le Passe Partout would follow in a few days.

One result of the trip has been to cause Mr. Guy Lewin to blossom forth as an auctioneer. Mr. Friswell had a sale on the Tuesday, and could not get back in time. So Mr. Lewin took out a licence, and his first sale was a most successful one. And now London awaits the return of the Mighty Wanderer—back again in good time for the Exhibition of 1903.

CONTINENTAL NOTES.

BY "AUTOMAN."

FROM a Government point of view the racing year in France is opening badly, and no one seems yet to understand why, or to fathom the official mind in its vagaries. First of all the Pioule cup was vetoed by the authorities, and now comes the news that the "Circuit du Sud-Est" has been forbidden by the Minister of the Interior, notwithstanding the fact that all the authorities along the route had given their consent and were anxious that the race should take place. The "Circuit du Sud-Est," or the South-Eastern Circuit, was to be the *pièce de resistance* of the Nice races in March, and was to be run from Nice to Aix, Senas and Salon and back to Nice via Aix. Last year it was intended to race from Nice to Abazia, on the Adriatic Sea, and back, and great preparations had been made for this event, which at the last moment was vetoed by the Italian Government on account of the doings of some *chauffeurs* who had frightened the villagers on the route whilst testing their racers over the road. What makes the vetoing of this year's Circuit du Sud-Est the unkindest cut of all is that it was to be accomplished exclusively with alcohol.

THE fifteenth of February, that is to say, Sunday, is the last day for the first series of entries for the Paris-Madrid motor-

M. TAMPPIER, THE A.C.F. TIMEKEEPER, PREPARING TO SURVEY THE PARIS-MADRID ROUTE. [La Vie au Grand Air.

car race. This comprises those who will have their starting places in the race regulated by ballot. After that date and until April 15th, those who enter will have starting places allotted to them in the order of their entries. After April 15th the entrance fee will be doubled, and on May 15th, at 6 p.m., the lists will be finally and definitely closed.

THERE will be four main classes, viz. (1) vehicles weighing 50 kilos (3 qrs. 26 lbs. 4 oz.) or less; (2) vehicles weighing between 250 kilos (1 cwt. 3 qrs. 19 lbs. 4 oz.) and 400 kilos (7 cwt. 3 qrs. 14 lbs.); (3) vehicles weighing between 400 kilos and 650 kilos (12 cwt. 3 qrs. 5 lbs. 4 oz.); (4) vehicles weighing between 650 kilos and 1,000 kilos (19 cwt. 2 qrs. 21 lbs.). The two last classes must carry two persons sitting side by side and weighing at least 60 kilos (9 st. 6 lbs.) or ballast to make up. The cars will be weighed without passengers, fuel, oil, water, accumulators, tools, spare parts, clothes, provisions, or luggage, and minus lamps and lamp brackets and hooters. An allowance of seven kilos (15 lbs. 6 oz.), will be made for cars using an ignition which is driven by the motor. In the last two classes one of the occupants must be a member of the Automobile Clubs of France or Spain, or of an affiliated club.

On the first day the cars will be started in their order at intervals of two minutes. On the second day they will be sent off in the order of their arrival on the first day and at two minutes' interval. On the third day the first five cars will be started

according to a provisional classification made the night before with the object of ascertaining the five leaders, and these will be started in their order, but at intervals of not less than two minutes and not more than fifteen minutes, according to the intervals between them in the provisional classification. The remaining cars will be started in the order of their arrival the day before and at intervals of two minutes. No car which arrives later than three o'clock on the morning of the day after the start for any stage shall be judged to have arrived.

THE race will be held under what is called "le regime des parcs absolument fermés." The meaning of this is that as soon as each car arrives at the "parc" or enclosure destined to shelter it for the night, the occupants are to stop the motor immediately, and no operation of any kind is allowed to be accomplished by them, with the exception of "paraffining the hot cylinders" in the case of petrol cars or blowing off the boilers in the case of steam cars, and in no case must these operations take longer than two minutes, when the driver and mechanic must leave the car and the "parc." On the following morning, when the time for the start of any car has arrived, the driver and mechanic must enter the "parc," start the car, and drive it out without doing any other operation of any kind. At the end of three minutes, if the car is not out it must at once be pushed out by men kept for that purpose by the authorities. All cars will be considered to have started at the moment the driver enters the "parc."

On arriving at a control at the beginning of a neutralised section, each car must stop and the controller will hand to a cyclist a card with the time of arrival and the time of departure, and the car must follow the cyclist slowly to the other extremity of the control, where the second controller will sign the card, put it in the box attached to the car for this purpose, and give the order to start. Should any competitor go through a control in less than the requisite time he will incur one of three penalties. 1. Should he be able to prove that the controllers were not at their post, he will be penalised by the time allowed for crossing the neutralised area. 2. Should he not be able to prove that the controller was not at his post, he may be penalised by three times the time allowed for crossing the neutralised area. 3. Or he may be disqualified entirely from the race.

THERE is to be a new classification "par équipes." It is rather difficult to find an English equivalent for this description. It means literally by "crews," and will be perhaps best understood by translating it into by "series of types." This new classification will be divided into four groups, viz.:—1. Series of types having four cars arriving out of four starters; 2. Series of types having three cars arriving out of four starters; 3. Series of types having two cars arriving out of four starters; 4. Series of types having one car arriving out of four starters. In the first group the classification will be made by the totalised time occupied by the four cars. In the three other groups, the classification will be made by adding up the distances covered by all the four cars taking the last control passed by those that do not reach the end of the journey.

CARS can only be pushed by the driver and mechanic, but a special dispensation has been made from this rule for two contingencies. 1. To get the cars out of the "parcs." 2. To get the cars out of any difficult position, which is not an actual part of the course—for instance, a ditch or a ford. No cars shall be allowed to follow the race to assist any competitor. No competitor shall be allowed to travel over the course before the race at a speed above the regulation speed. On the arrival in Madrid all the cars must be exhibited for two days. If for any reason (which is most improbable), it should not be possible to race over the French part of the course, the meeting will still hold good and the real racing will commence at the Spanish frontier, where the requisite authority has already been given.

THE "Velo" gives an account of interviews with Quinonès de Leon and with Gabriel, who have just returned from Madrid. They have gone over the Spanish roads between the frontier and

the capital very carefully in company with the Marquis de Viana, secretary to the Royal Automobile Club of Spain. Gabriel does not seem to be quite as enthusiastic about the roads as his companions, and says that the last thirty kilometres before arriving at Madrid are in a shocking condition. Anyone who attempts great speed will certainly break down. The rest of the road is fair, and there are some wonderful stretches of dead level straight roads for sometimes seventy miles. The descents of the Pyrenees and the Guadarrama Mountains attain in some places 15 to 18 per cent., and there are some awful curves, one especially where you have got to use your reverse motion before you can get round. There are, however, neither *canniveaux* nor *dos-d'anes*, and very few neutralisations. It seems that it is the Spanish custom to have the villages at some little distance from the main road on one side of it. Gabriel says that it will not be a race for fast cars, and that 70 kilometres (43 miles) is likely to be the average speed.

THE King of Spain is going to be present in person to see the arrival of the cars in Madrid, and this will be a record. I well remember that until the very last moment at Berlin in 1901 it was expected that the Kaiser would turn up. But it was too new a sport, two years ago, even for the progressive Emperor of Germany to publicly patronise. The young King of Spain has not only given a Royal standing to the Automobile Club of Spain, but his presence at the Paris-Madrid race will give a kingly sanction to road racing from the most exclusive Court in Europe.

THE annual Dutch Automobile Show was opened at Amsterdam on the 6th inst., in the building known as the *Paleis voor Volkslijft*. There are about sixty exhibitors, including Panhard, Darracq, Peugeot, Renault, Mors, Hurtu, and Germain Companies.

THE Austrian Automobile Club is organising a "Circuit" for the end of May or commencement of June next, on the lines of the "Circuit des Ardennes." The district selected is the Wachau, in Lower Austria.

THE 2nd annual International Automobile Exhibition, organised by the Belgian *Chambre Syndicale de l'Automobile*, was opened in the *Palais du Cinquantenaire*, Brussels, on the 7th inst. and will continue until the 16th inst. The show is the largest so far held in Belgium, there being about 150 exhibitors. Among the principal cars are Gobron-Brillié, Germain, Passy-Thellier, Vivinus, Hautier, Charron, Girardot and Voigt, Miesse, De Dietrich, Dechamps, Pipe, Renault, Serpollet, Panhard, Belgica, Jenatzy, Linon, and Hurtu.

A NEW steam-car is shown by La Société des Voitures à Vapeur Paridant. The Germain Company display a 30-h.p. car and a new electrical transmission mechanism. La Metallurgique have again taken up the construction of automobiles and exhibit a 16-h.p. car on Panhard lines. Prince Albert of Belgium was one of the visitors to the show on Saturday last.

THE Prime Minister's new Napier car has now been delivered, and on Tuesday Mr. Balfour went for a trial run in it.

THE Continental Automobile Syndicate, Limited, has been registered with a capital of £100, to carry on the business indicated by the title. Registered without articles of association.

WITH regard to the case *Lester v. The London Motor Garage Company*, reported in our last issue, Mr. Justice Kennedy has decided that as the Motor Company asked for the special jury who heard the case they must pay the consequent expense.

THE recently-formed Norfolk Automobile Club has already sixty-one members, Norfolk motorists interested in the movement, but who have not as yet sent in their names, are invited to communicate with Mr. G. N. C. Mann (Hon. Sec. pro tem.) at 2, Redwell Street, Norwich.

THE 1903 EXHIBITION.

WE are now within appreciable distance of the eighth, annual automobile Exhibition at the Agricultural Hall London, and the trade is looking forward to the event as really inaugurating the 1903 season. Already the whole of the ground floor of the large hall has been allotted as well as the Minor Hall, King Edward Hall, and the Arcade. This alone will provide for a representative Exhibition, but when we also state that the wide and extensive galleries are fully let, the comprehensive nature of the forthcoming display may be better imagined. So many have been the inquiries for space received during the last few days that the large Berners Hall and the North Gallery Annexe are being prepared to meet the demands of intending exhibitors, whose requests are being dealt with in priority of application. The Berners Hall is a lofty building, well designed for exhibition purposes, and its capacious area will enable several firms, who would otherwise have missed the opportunity of being represented, to participate in the great International Exhibition of 1903.

To provide accommodation for the comfort of visitors the Grand Lounge is being fitted up, which will be accessible from the Berners Hall as well as from the Main Hall. This will seat over 200 people comfortably and also provide room for promenading. As the band will play there twice daily it should become a favourite rendezvous. To the galleries there is a two ton lift, facilitating the conveyance of cars, of which there will be a large number. In fact, the display of cars in the Gallery will be one of the features of the Show.

Applications for the few remaining spaces are coming in so freely that the proprietors, Messrs. Cordingley and Company, have had difficulty in coping with the situation thus created; but satisfactory arrangements have now been made for the comfort of the public and the convenience of exhibitors, so that no doubt exists as to the success of this year's event. Last year's Exhibition made a record; the 1903 show will prove even greater, the ground floor space alone actually occupied by cars, accessories, etc., being larger than at any previous Exhibition held in this country.

Already plans are in preparation for the 1904 Exhibition, which will be held from March 19th to March 26th.

THE RELIABILITY TRIALS.

IN our issue of the 31st ult. we gave a synopsis of the marks agreed upon in connection with the Automobile Club's Reliability Trials this year. At the last meeting of the sub-committee for formulæ for trials the following calculations were definitely decided upon:—

$$\text{Hill Climbing.—Marks} = \frac{3300}{\text{No. of Hills}} \times \frac{(6 + \text{No. of pass.})}{(1500 + \text{£})} \times \text{average grade per cent.} \times \text{speed miles per hour.}$$

$$\text{H.P. Performance.—Marks} = \frac{(\text{laden weight, lbs.} \times \text{vertical rise, ft.}) + (\text{length of hill, ft.} \times 35 \text{ lb. per ton laden weight.})}{33,000 \times \text{time, minutes.}}$$

$$\text{Accuracy of Advertised H.P.} \\ \text{Marks} = 250 \times \left(\frac{140}{100} \times \frac{\text{H.P. performance}}{\text{H.P. declared}} \right)^3, \\ \text{with a maximum of 250.}$$

$$\text{Fuel Consumption.—Marks} = \left(25 \times \text{distance in mile.} \times \frac{\text{laden weight, cwt.}}{(20 + \text{laden weight, cwt.})} \times \frac{1}{\text{fuel in gallons} \times \frac{\text{pence per gallon}}{12}} \right) - 12,$$

$$\text{Speed.—} \\ \text{Marks} = \frac{\text{speed, miles per hour} \times (6 + \text{No. of passengers})}{1500 + \text{price, £}} \times 2500$$

$$\text{Cheapness.—Marks} = 7 \text{ for £1 per cent. below maximum price.}$$

MOTOR-CYCLING NEWS.

HEREWITH we reproduce a photograph of Dr. Sidney Wigglesworth, of Kirkham, near Preston, on his 2½-h.p. Singer tri-voiturette. The doctor, who is accompanied by his two little sons, speaks very highly of the machine for professional work. "It has," he reports, "been a boon during the recent severe

weather. The way I can tear through mud and slush against a terrific gale is a treat, after bicycling for so many years in all weathers. This morning I rode six miles in just eighteen minutes, over an average up and down hill road. Altogether I have ridden it 2,000 miles."

UNDER date February 11, the Automobile Components, Limited, write as follows:—"With reference to our published challenge, and the acceptance of same by Mr. Fred. Chase, when informed by you per telephone on Friday last that our deposit had been covered, we attended the "Bat" stand at the Crystal Palace, with a view to drawing up conditions, so that the balance of the stake might be deposited. We saw Mr. Chase, who informed us that he would not ride a "Bat" machine, but a special racing cycle fitted with one of our engines. We were not surprised, but nevertheless extremely disappointed, as we were in hopes that the machine he would ride in the contest would be fitted with an engine other than our own. We pointed out to Mr. Chase that the reason of our challenge was not to put two men both riding machines fitted with our engines in competition, as such contest would only be a test of the capabilities of two men, whereas we desired to publicly prove that the 'Automotor' engine was superior to that of any other make. We, however, practically agreed to pit our representative—Fournier—against Mr. Fred. Chase for a stake of £250 a side, to settle the dispute as to which was the best rider, and Mr. Fred. Chase agreed to attend at our offices on the following Monday to fix all arrangements. Instead Mr. Arthur Chase attended on behalf of his brother, but said he must see Mr. Fred. Chase before definitely deciding, and promised to endeavour to call upon us again yesterday (Tuesday). We saw nothing of him, and there the matter stands. Late yesterday evening Mr. Charles Barden (the old racing crack) called upon us and said he would race Fournier on his motor machine, if we would agree to waive the question of weight of machine. This we have agreed to do in this case, as the motor on his cycle is by a rival maker, and Bardon has agreed to race our man on Saturday, March 7th next, at the Canning Town Track, best three matches out of five, providing the track can be obtained, for £250 a side. He has given us the name of his backer, and, in proof of his *bona fides*, has deposited a small sum with us. We informed him that we could not

accept his challenge until we had heard from Chase. We trust we have explained the matter fully."

OWING to the insulation of the wires rubbing through by continual friction with the metal frame, and thus earthing the current, it is desirable in motor-cycles to reduce the length of wiring to a minimum. This point in many instances escapes designers, with the result that the annoying and mysterious short circuit is a frequent occurrence, which, in addition to the difficulty of locating, often results in damage to the accumulator by the sudden and rapid discharge of current.

THE Motor Cycle Committee of the Cyclists Touring Club is arranging a motor-cycle tour for Easter. The daily run will be about 100 miles, the route tentatively selected being from London to Salisbury, Exeter, Bristol, Gloucester, Worcester, and Oxford.

THE Liverpool Motor Cycle Club held a run on Sunday last. There was a good attendance, among others present being Mr. E. H. Arnott. The original destination was Chester, but, on account of the bad state of the main roads, the run was made to Pargate and Heswall.

MR. A. C. DAVISON, the maker of the Davison motor-bicycle, writes:—"Regarding your, note in a recent issue, that bicycle motors must be fitted with continuous lubrication, preferably sight-feed, if possible, I beg to point out that mine is at the present moment fitted with a gravity sight-feed lubricator, and enclose you a small drawing which explains itself. By turning the graduated wheel (A) the drip can be adjusted from two or three drops a minute, and by opening it still more a full charge can be put into the crank case for starting, the amount being measured by noting the fall of the oil in the gauge glass, one of which is fitted to the oil as well as to the petrol tank. One great advantage of this arrangement is that the drip can be altered to suit oils of

different body or changes of temperature. A small ball valve is inserted in the pipe where it enters the crank case to prevent the oil blowing back, while on the other side is a corresponding valve, but opening outwards to relieve the pressure and so help the flow of oil from the lubricator as well as prevent leakage of oil round the bearings."

The Crystal Palace Automobile Show.

(SECOND NOTICE.)

FIG. 21.—THE STRAKER 7-TON STEAM WAGON. (See last issue).

STEAM CARS.

The Albany Manufacturing Company, Limited, showed their radiators, condensers, generators, etc., which are well known to the trade, but fresh interest was given to the display by the presence of a new radiator for petrol cars. This is of the Mercedes type, tubes of 3 in. length being utilised, the edges being expanded hexagonally, and jointed up so that only the minimum of air resistance is offered. But the important feature on the stand was the 24-h.p. Lamplough-Albany steam car illustrated in Fig. 22.

the generator, being of the coil type, is safe from explosion. The boiler works at a pressure of 300 to 400 lbs. The burner is automatic, and constructed to break up and burn both light and heavy hydrocarbons, such as paraffin, petrol, alcohol, methylated spirit, etc. The pumps are arranged to automatically pump fuel and water, the method being to vary the quantity of liquid delivered in preference to varying the stroke. This is done by a single oscillating lever worked off the pump ram and fulcrumed at its centre to a diaphragm-controlled piston; this fulcrum alters its position

FIG. 22.—THE LAMPLOUGH ALBANY STEAM CAR.

The method adopted might be termed the generation of steam within steam—a system advocated, after much research, by Lamplough as far back as 1884. Since then the primary and secondary generation of steam has been the subject of many experiments, demonstrating the value of the plan. In the car shown, the wet steam is generated in the primary generator, and is excessively superheated in the secondary one, being subsequently brought to a workable temperature by the extraction of some of the heat units through "frictioning" the surface of the primary generator. The result is considerable economy with great increase in evaporative efficiency, while

according to the pressure on the fuel tank or boiler, and causes the free end of oscillating lever to hold up a return valve for a more or less portion of the stroke; consequently when the maximum pressure is reached the pumps are doing no work, and at all times doing only what is actually necessary. A four-cylindred engine is provided. The boiler pressure is admitted, and the speed of the car regulated by the cut-off, a single lever performing the operations of stopping, admitting steam, reversing and controlling the speed. By this means great economy is claimed. Lamplough's patent valves are adopted, and the engine is also fitted with trunk pistons, thus reducing

the number of complications. The Albany system of condensing has been adopted, by which means the steam is condensed, and the whole of the water returned to the tank, so that a run of two hundred miles can be obtained on one supply of water. The separation of the oil is done by gravity. The drive is direct by means of a flexible shaft connecting the engine to the gear box. In addition to the foot and compound hand brakes provided, the engine itself can be used as a steam brake. Side tiller steering is adopted, or wheel steering can be fitted if desired. The car has a tonneau body, and with its dark green upholstery presented a bold appearance.

The Motor Construction Company showed a number of light steam cars on American lines, but of English construction, except as regards one or two vehicles, which are equipped with Mason engines. On the stand were a 5-h.p. two-seated car, an 8-h.p. double-phaeton with artillery wheels, a 9-h.p. *dos-a-dos*, and the chassis of a 12-h.p. car, which is intended to be fitted with a double phaeton body and brougham top. This vehicle is provided with a 24-inch fire tube boiler and a 16-h.p. double-cylinder engine, the cylinders being $3\frac{1}{2}$ in. diameter and 5 in. stroke; steering is controlled by an inclined wheel in place of the usual tiller, while the car has roller bearings throughout, a large feed-water heater, and sight feed lubricator, etc. Among the new fittings for steam cars lately introduced by the Motor Construction Company is a condenser, which consists of a

Chelmsford car were also shown, one being fitted with an automatic regulator in which the fuel feed is controlled by the steam pressure, the fire being entirely cut down should the pressure attain 300 lbs. per square inch. Another interesting exhibit was a solid-drawn 20-in. boiler shell, electro-galvanised inside and out. Finally, we may refer to samples of the ingenious pipe joint used on the Chelmsford cars, in which a stout copper washer is placed between the flanges of the pipes to be connected, these being held fast by steel unions.

The Hydroleum Motor Company, Limited, showed a delivery van and an ordinary Loconobile fitted with the Hydroleum fuel system. Mr. W. Worby Beaumont has prepared a report on some comparative tests he has made with this system, which we propose to refer to in an early issue.

PETROL CARS.

A wide range of cars was shown on the stand of the Farman Automobile Company, Limited, these including specimens of the 7-h.p. and 15-h.p. Panhard, 11-h.p. Argyll, 12-h.p. Clement, and 6-h.p. De Dion popular vehicles. In addition specimens of the F.A.C. 12-h.p. and 24-h.p. cars were shown. These have respectively two and four cylinders, and in their general arrangements closely follow the Panhard type.

Considerable interest was shown in the chassis of the $9\frac{1}{2}$ -h.p. Earl car

FIG. 23.—THE CHENARD-WALCKER 14-H.P. CAR.

“header” into which the steam from the engine is discharged. From this header a large number of small tubes lead, just entering the ends of larger horizontal longitudinal pipes; the front ends of the latter are open, while the back ends lead into another header which has a pipe leading up the chimney of the boiler. A strong cooling draught is thus drawn through the tubes, perfect condensation without back pressure being claimed for the arrangement. A brief reference may also be made to the feed-water level regulator, which consists of a patent steam trap, low water alarm, and a special back pressure valve. The apparatus is automatic in action, and maintains the level of the water in the boiler at a practically uniform height. Should the engine pump fail from any cause, the alarm gives immediate and unmistakable warning to the driver.

The stand of the Clarkson and Capel Steam Car Syndicate was one of the centres of attraction. Here was shown the steam touring car, illustrated and described in our issue of the 6th December last, although we noticed that since that time the body has been slightly raised and the front given a lighter appearance. Specimens of a van body and a well-finished covered tonneau designed to fit on the same chassis were also displayed. A Chelmsford 12-h.p. double-cylinder horizontal engine had been provided with glass windows instead of the usual metal inspection lids, in order to allow the Clarkson system of continuous lubrication to be examined. We refer our readers to the illustrated description of this ingenious method given in our last issue. Several specimens of the burner as used with the

on the stand of the Great Central Garage, Limited. The general arrangement follows the now generally adopted lines, a two-cylinder motor being set in the fore-part of a steel-armoured wood frame. The engine runs at a normal speed of 800 revolutions per minute, and is fitted with a governor which acts on the exhaust valves in such a manner that it works very silently. The transmission is on Panhard lines, except that on the top speed the power is conveyed direct; three forward speeds and a reverse, controlled by one lever, are provided. Electric ignition is employed, but everything is in readiness to fit tube ignition if required. Equal size wheels, shod with 800 x 85 mm. pneumatic tyres, Dubrulle lubricator to engine and crank chamber, working automatically, drop feed lubricator to all parts, are other features of the Earl car, which appears to be of sound construction throughout. A complete car was also shown, this having a comfortable body of the Roi des Belge type. On the stand were well-finished specimens of the 7-h.p. Panhard, 12-h.p. Darraq, and 9-h.p. Renault cars.

As has already been announced in the *Journal*, Charron-Girardo and Voigt cars are now being introduced into this country by Messrs. Evart-Hall, Limited. The details of the C.G.V. vehicles, to give them a short name, have already been given in these columns, so that it need only be mentioned that in addition to a 15-h.p. four-cylinder chassis, were shown a 15-h.p. Roi des Belge tonneau, and a 15-h.p. hooded double phaeton by Labourdette. The frame is built of tubes into which ash is driven, while among

the noteworthy features are the hot-water jacket to the carburettor and the expanding band brakes on the hubs of the rear wheels. We expect the C.G.V. cars to become a popular type in this country.

The Roadway Autocar Company were, unfortunately, not able to stage an example of the new Mors car, their exhibit of this type comprising well-finished specimens of the 12-h.p. and 16-h.p. vehicles already fairly well known. In the Renault section, the principal item of interest was

by a hand "accelerator." By its means a great elasticity of power resembling that of steam is obtained, and permits the engine to be run at speeds of from fifty to 1,200 revolutions per minute. The ignition also deserves special notice, since it is obtained by a single contact for both cylinders. A spark is formed in both cylinders simultaneously, one firing a charge, the other being a useless one except in so far as it dispenses with tremblers, a double coil, and facilitates the synchronising of the sparking.

FIG. 24.—THE PANHARD 20-H.P. TOURING CAR.

the identical 20-h.p. racer which won the Paris-Vienna race. The Renault cars are now being made in four sizes, 6-h.p. and 8-h.p. with single cylinder, motors, 10-h.p. double-cylinder, and 14-h.p. four-cylinder, the latter having mechanically operated inlet valves, a new carburettor, and an automatic governor acting on the admission. An illustration of this vehicle is given on another page. One of the 8-h.p. Renault cars was fitted with a hansom cab top and storm apron, for the protection of the passengers.

There are so many novel features in the Chenard and Walcker cars, which are being introduced into this country by the Weston Motor Syndicate, that adequate justice cannot be done to them in the brief space at our

The transmission is on special lines, being through a longitudinal shaft from the gear-box (which gives four speeds ahead and one reverse) to a differential cross shaft supported above the rear axle. On the ends of the cross shaft are pinions meshing with internally-toothed rings bolted to the rear road wheels. Finally, we may refer to the ingenious arrangement of combined clutch and brake, operated by one pedal. Altogether the Chenard-Walcker 14-h.p. car is full of interesting points, with which we hope to deal in a subsequent issue. Of this type a *chassis* was shown as well as a complete car (Fig. 23) fitted with a roomy tonneau body, to which the name Roi d'Espagne has been given.

FIG 25.—THE "WELLER" 20-H.P. CHASSIS. (See page 962.)

disposal this week. Two sizes were shown, one having a 10-h.p. two-cylinder engine and the Panhard type of transmission, and a 14-h.p. double cylinder car, having the Chenard-Walcker patent driving gear. In both cases the motors have mechanically-operated inlet valves with a special form of governing device acting directly on the inlet valves by means of specially-formed cams. The valves are always given a full lift, but the time they are kept open to the full is varied by the automatic governor or

The exhibit of Mr. Harvey du Cros consisted of twelve complete Panhard and Levassor carriages, with motors varying from 7-h.p. to 24-h.p., and a standard finished 20-h.p. *chassis*. The vehicles were shown upon the handsome stand which Messrs. Panhard and Levassor constructed for their exhibit at the Paris Salon in December last. The cars are fitted with specially designed bodies built by Messrs. Rothschild and Messrs. Muhlbacher, of Paris, and by the Regent Carriage Company of London, a special

20-h.p. touring car (Fig. 24) with extra long wheel base, being particularly noticeable. The most interesting features of the exhibit were the many improvements which have been introduced and which were included in the chassis so as to be easy of inspection. Among these improvements is the new automatic carburettor, which permits of the car being driven at any desired

FIG. 26.—THE JAMES AND BROWNE LAUDAULETTE.

speed without change of gear, and by the use of which the speed of the motor may be so reduced that, even when the car is stationary, the engine, although running, is perfectly silent. By the aid of this device the Panhard motor is claimed to be as easily controllable as regards speed and fuel consumption as an ordinary steam engine. The new carburettor is the design of Major Krebs, director of the Panhard and Levassor Company. The admission of air is regulated automatically by the engine, in accordance with the amount of petrol drawn in on the suction stroke, so that, as the mixture is always the same, and only varies in quantity, the motor will run at a low speed without danger of stopping through the admission of poor gas. Other new details in the Panhard cars for the 1903 season comprise an improved method of adjusting the throttle valve and the timing of the ignition by the use of two thumb screws mounted on the steering wheel, which enable these adjustments to be effected without moving the hands from the wheel. The improvements also include a new system of electric ignition, by which the accumulators are maintained fully charged by means of a small dynamo mounted on the car. The gear is now mounted on the framework of the car in such a manner that it is in no way affected by torsional strain or flexion of the frame, consequently the power developed by the car is transmitted to the wheels with the least possible loss and the wear and tear on the running shaft and bearings are greatly reduced. By this system also the gear-box can be more easily removed from the frame. On a special stand in the grounds a 15-h.p. Panhard engine, fitted with the new carburettor, was shown in operation. This exhibit was most

FIG. 27.—THE BRUSH 16-H.P. DILIGENCE.

interesting, as it showed the variation of speed obtainable by the use of this carburettor, and the noiselessness of the engine to which it was fitted.

We were considerably interested in the 20-h.p. car (Fig. 25) shown by Messrs. Weller Brothers, which comprises a number of commendable features. In the first place, the motor, gear box, differential shaft, and exhaust box are all supported on a steel under-frame suspended from the main frame by three connections, one at each end of the differential shaft

and one at the central fore end of the main frame, the latter being made with a swivel joint, so that no give or flexibility in the main frame is communicated to the under-frame, thus enabling the roughest roads to be traversed without danger of throwing any bearing in the running gear out of alignment. The three connections are secured by means of castellated nuts, by undoing which the driving mechanism may be entirely dropped out of the car if necessary. The four-cylinder motor is novel, in that each is complete in itself except that the crank shaft is in one piece; the four cylinders with their crank cases being connected together by long external bolts. The cylinders are 4 in. bore by 5 in. stroke, the normal speed being 1,000 revolutions per minute. Mechanically-operated inlet valves with variable lift, controlled by centrifugal governor and hand accelerator, are employed. Both inlet and exhaust valves can be withdrawn by loosening one nut, while to fit new brasses to the connecting rods it is only necessary to draw one cotter pin. Another good point is that a large inspection opening is provided in each crank-case, enabling connecting rod brasses to be taken up without dismantling the engine. The crank-shaft is of large diameter, with a bearing between each crank. A single camshaft operates the inlet and exhaust valves. The bearings throughout are of large size, that of the main fly-wheel being 6 in. long. The cooling water is circulated by a positive and slow-running pump, mounted directly on the cam shaft of the engine. A new form of combined tank and cooler is fitted in the front of the bonnet, allowing a minimum of water to be carried, a fan keyed on to an extension of the crank shaft of the engine inducing a current of air through the apparatus. The power is transmitted to the rear wheels through a clutch, gear box, differential countershaft, and two side chains. Four speeds forward and a reverse are available. The four speeds are actuated by a cam-gearing controlled by a lever on the steering column, which is connected up to a horizontally-running chain below the gear box, an arrangement which strikes us as leaving room for a little improvement. The change gears are so arranged that the speed may be changed from the fourth to the first without passing through the third and second. The shafts in the gear box are very short and of large diameter. The reverse is actuated by a pedal, and enables

FIG. 28.—THE EAGLE MOTOR CARRIER.

the car to be reversed on any speed without changing gear. The depression of the pedal first puts on the brakes and then reverses the motion of direction. The speed change gear is of the sliding type, the sliding gears being arranged in two pairs. The reverse is obtained by means of an epicyclic train on the countershaft. The sprocket bearings carrying the differential shaft are fixed rigidly with the gear box on a transverse member of the under-frame. These bearings are automatically lubricated by ring lubrication, with a reservoir to each bearing holding about a pint of oil. Inclined worm and segment wheel steering is employed, with provision for adjustment to take up wear at every part. We noticed that the steering pivots are not set vertical, but are inclined. The rear wheel brakes are gun-metal against cast-iron, and are expanded inside the brake drums by means of cams. They are so arranged that, although there is very little movement required to bring them into action, they cannot bind when the brake is not in use. The brake on the differential is gun-metal against steel. Contrary to usual practice, the rear wheel brakes are operated by the pedal, and the differential brake by a side lever. The reason for this advanced by the makers is that the greater part of the braking is done directly on the back wheels, thus saving the strain on the differential and chains. Both brakes act equally strongly backwards and forwards. The road wheels are of artillery type, all being 36 in. diameter. The car has a long wheel base, and with its aluminium body weighs about 24 cwt. Altogether the Weller car is an interesting production, and is likely to be heard of in the near future, as we hear that the company are at work on the construction of a 30-h.p. racer.

The James and Browne cars comprise a number of special points not found in other vehicles. In the first place, it may be mentioned, the engine is of the horizontal type, with the fly wheel set in the centre of the frame rotating in the same direction as the road wheels, while secondly, it runs at a comparatively low speed, normally about 500 revolutions per minute. Perfect control is obtained by the "throttle" governor, enabling the car to be run slowly and at the same time quietly and smoothly without any unpleasant jerking motion. The valves are instantly removed by loosen-

ing two butterfly nuts, the contact breaker being also easily detached. The lubrication has been so arranged that by the use of special relief valves, which maintain a vacuum in the crank cases, it is practically impossible to over-lubricate. The fact that the lubricator is also turned on and off by one tap only should prove a great convenience. Two sizes are made—a 9-h.p. double cylinder and an 18-h.p. four-cylinder—the cylinders being 4 inch diameter, by 6 inch stroke. The transmission is effected through parallel shafts, no bevel gear being used in the main drive, the countershaft being connected to the rear road wheels by two side chains. Four speeds forward and one reverse, actuated by one lever, are provided. The lubrication of all the bearings is obtained by the use of ring boxes, and is entirely automatic.

FIG. 29.—SECTION OF THE EAGLE CHANGE-SPEED GEAR AND DRIVING SHAFT.

The clutch is composed entirely of metal. Of the 9-h.p. type, a *chassis*, tonneau, and a landaulette, (Fig. 26) closely resembling an electrical vehicle in outward appearance, were exhibited. The new 18-h.p. car has a double tonneau body, seating six persons comfortably. The bonnet on this vehicle is hinged longitudinally, instead of to the dashboard, so that it can be lifted up on either side for examination of the motor. Generally it may be said that these cars have been carefully thought out, and built on sound lines.

Five cars and a 20-h.p. *chassis* were shown at the stand of the Brush Electrical Engineering Co., Ltd. The latter is fitted with a motor giving 30-h.p., having mechanically-operated induction valves, honeycomb water-cooler, and commutator on dashboard. The frame is of wood strengthened by steel. A striking car was a 16-h.p. diligence (Fig. 27), the body being of a new type arranged to form two or three kinds of carriage. It is fitted with a movable head carried forward to the dashboard, which gives a completely dustproof and enclosed carriage at the hind part, with access at each side. In this form the car is practically a brougham. At the rear of the car a spider seat can be fixed for a mechanic, or in place of this a large travelling trunk can be fitted. The mechanical parts of the car are of the usual type—that is, the commutator is fitted on the dashboard, forced lubrication, throttle regulator operated from the steering pillar, two double-acting brakes, Loyal multitubular watercooler, etc. We next noticed a 16-h.p. Limousine, fitted with a removable head, specially built for Major-General Paget. A 12-h.p. four-cylinder tonneau with high padded backs and large seating capacity; and a 10-h.p. two-cylinder tonneau, painted white, lined green, and upholstered in dark green leather, were also displayed. Finally, we may refer to a 12-h.p. four-cylinder car, fitted with mechanically-operated inlet valves and automatic oiling device. An

improved quick-acting throttle valve is provided, while we noticed that the pump is in an accessible position, and driven by gear.

The Eagle Engineering and Motor Company had on view the *chassis* of a 9-h.p. car they are now turning out which comprises several novel features. The frame is of tubular construction and carries a 9 h.p. single-cylinder De Dion motor. The method of cooling is by natural circulation, and is effected by means of an air-tube radiator in front of the bonnet, which has $\frac{1}{2}$ in. tubes 3 in. long running through it. There is a rubber tube connection from the lowest point of the engine cylinder to the lowest point of the cooler, and from the highest point of the engine to the highest point of the cooler. About four gallons of water are carried, and as the circulation is natural, no pump is required. The engine is controlled by a throttle

valve, which enables the car to be driven at any speed from 8 to 30 on the high, and 3 to 10 miles an hour on the low gear. A surface wick type of carburettor is employed to furnish the mixture. Two forward speeds and a reverse are fitted; the transmission being on novel lines, the object being to do away with all side shafts, and to drive through 'table shafts' direct, the reducing gear wheels always being in mesh. Referring to Fig. 29 the driving shaft AA is in two parts, the left in connection with the engine, and the right with the live axle. Loosely mounted upon the shaft A is a hollow shaft BB, and upon this is a sleeve C, the former being in two parts, like the central shaft. Keyed upon the end of the axle A, in connection with the motor, is a gear wheel D, which engages with a set of pinions EE revolving on studs fixed to a flange F on the second outer shaft B. These pinions intermesh with teeth cut in the inner face of the gear-box H, which forms part of the sleeve C. The periphery of this gear-box is flanged and turned to receive a band brake on I. To form the necessary friction clutch the gear-box H has a conical face formed upon it, as shown by J, this part making the female cone. The opposite cone

FIGS. 31 AND 32.—ELEVATION AND PLAN OF THORNYCROFT PETROL CAR.

is carried on the first part of the outer shaft B. Fixed upon this shaft is a brake drum K and a cam lever L, by means of which the sleeve C is slid lengthwise upon B, to put the clutch in or out of engagement. A jaw clutch P sliding on the shaft A engages with its opposite members formed on the outer shaft, A and A1 are then connected for the forward drive. When the friction clutch is brought into action the whole line of shafting becomes as one, the gear-box revolving as a supplementary fly-wheel, the top speed being thus obtained. To change to the slow speed the friction clutch is taken out of engagement and the band brake applied on the drum at I. The gear pinions EE on the shaft B are now driven by the gear wheel D with a sun and planet motion, so that the second parts of the shaft AA1 are driven at a slower speed than the first part of A. The slow speed may be regulated by gradually applying the band brake on the drum. The reverse motion is obtained by withdrawing the friction clutch J and bringing the jaw clutch P into engagement with C, and applying the band brake on the drum K. The pinions EE thus become idlers revolving on their studs, which are now held fast, giving a reverse motion through the internal teeth cut in the gear-box H. With the engine running free the clutch J is out and the band brake is free, in which case only the driving part of A is revolving. The change speed, reverse, and band brake levers are mounted side by side in a convenient position. The steering wheel is of the open variety. The arm, which is bent downwards, is cotted on to the steering column, and the wheel can be raised or lowered about 4 in. to suit the tastes of different drivers. The artillery wheels, with which the car is fitted, are complete wheels before the pneumatic tyres are placed on them. They are fitted with metal tyres, similar to those used on horse-drawn vehicles, so that in the event of serious breakdowns with the pneumatic tyres, the latter and the side plates can be taken off, and the car run home on the metal tyres. The flanges holding the pneumatic tyres in their places consist of side plates having beaded edges, bolted to the wheels. Another important feature in the design of this car is the arrangement of the levers and steering column, which admits of the driver mounting or dismounting at his own side. The frame is carried on six springs, which are so arranged that a shock from the road to any one wheel is absorbed

by all the springs, the front and rear springs, instead of being connected by shackles with the frame, being joined to the ends of a third, reversed, spring mounted in the middle of each side of the frame. In addition to the car, several examples of the Eagle motor tandem were shown. These are on the lines of the Century machine; the standard pattern is fitted with 4½-h.p. De Dion motor, but one on the stand had a 9-h.p. engine.

FIG. 33.—THE 9-H.P. DARRACQ CAR.

The mixture is furnished by a wick carburettor, while the steering is controlled by an inclined hand wheel. Two speeds are provided. The front seat is suspended on C springs, while the rear one is of the "bucket" type. The back foot-board is hinged to give easy access to the counter-shaft and friction clutches, which are adjustable. Fig. 28 shows one of the 4½-h.p. Eagle motor tandems adapted as a tradesman's carrier, the capacity being about 2 cwt.

A car on somewhat novel lines is the "Hermes," of the Autocar Construction Company, Limited, which exhibited two vehicles—a double phaeton and a limousine—the two being identical as far as concerns the chassis (Fig. 30). The motor is of the horizontal two-cylinder opposed type, developing 15-h.p. at the normal speed of 700 revolutions per minute. Four speeds forward and a reverse are obtained by means of a special form of change gear and two roller chains. The frame is of channel steel, the motor and gear case being suspended on two large tubular cross stays. The front end of the rear spring is carried on a sliding guide on the frame. A novel feature of these cars is that the body is arranged to slide off the frame to the rear to give accessibility to the motor and mechanism, and to facilitate cleaning. Among other points in the Hermes cars may be noted the ease with which the motor and gear can be removed from the frame, the protected chains, and a device for illuminating the lubricators at night. All the shafts are parallel, no bevel wheels being employed.

The new Thornycroft petrol cars (Figs. 31 and 32) were represented by a 10-h.p. tonneau and a 20-h.p. chassis, having respectively two and four cylinders in the fore part of a pressed steel frame. In both the engine has cylinders 4 in. diameter by 4½ in. stroke, the normal speed being 900 revolutions per minute. The cylinders are cast in pairs, the water-jacketing extending about half-way down from the firing end; the jacket has been carefully designed to avoid "pockets" and allow a free and natural run for the cooling water, which is circulated around the cylinders, radiator, and tank by a gear-driven enclosed pump. The crank-chamber

FIG. 34.—THE DENNIS 12-14-H.P. CAR.

is of aluminium; a special feature of the design is that removal of the crank chamber bottom cover does not affect the crank-shaft, the main bearings being so arranged as to be entirely independent of the cover. The centrifugal shaft-governor is carried on the crank-shaft, and is wholly enclosed; it regulates the speed of the motor by throttling the mixture. Ignition by means of a dynamo and accumulators is employed, the latter

being employed for starting purposes. Three speeds and one reverse are provided, the drive being direct driven on the top speed. The clutch is of the internal pattern, doing away with end thrust. The live axle is driven by bevel gearing, all the universal joints being enclosed. The bevel pinion terminating the fore-and-aft driving shaft is provided with an end bearing, and is not overhung; the rear axle is also trussed, thus forming a very stiff construction. Three powerful brakes are provided, one on the fore-and-aft shaft and one on each rear road wheel; these are all band brakes with V-shaped blocks, and are so arranged as to be quite unaffected by the motion of the bearing springs. Further, the band carrying the brake-blocks is arranged so as to overlap and protect the brake-drum and prevent the entrance of grit.

Prominent features on the stand of Messrs. H. E. Hall and Co. were the chassis of the latest types of 12-h.p. two-cylinder and 20-h.p. four-cylinder Darracq cars, the main features of which were described in our report of the Paris Salon. Both are fitted with mechanical inlet valves, stamped steel frames, Mercedes-pattern radiators, throttle-governed carburettors controlled by a lever placed in the steering wheel, and direct drive on the top speed. Fig. 33 illustrates the new 9-h.p. two-cylinder car, this having the principal features of the 12-h.p. vehicle; the engine is governed on the throttle and fitted with mechanically-operated inlet valves. The frame is constructed of wood and steel plates. The clutch is easily adjustable by one nut. Three speeds and reverse are controlled by one lever carried on the steering pillar, with direct drive on the top speed. On a separate stand Messrs. Hall also displayed a 4-h.p. Oldsmobile, two 6-h.p. De Dion popular cars, a 11-h.p. Clement, a 16-h.p. Clement car, and a 10-h.p. Panhard fitted with tonneau body.

The enterprising firm of Messrs. Dennis Brothers, Limited, evidently mean to keep up with the times. In addition to a couple of their standard 9-h.p. tonneaus, with De Dion motors, they exhibited a four-seater car fitted with the new De Dion 10-h.p. double-cylinder engine and a body on

FIG. 35.—THE DENNIS SPRING DRIVE.

the lines of that very popular in Paris, the rear part being like a hansom cab. The leading novelties were, however, the new 12 to 14 h.p. and 16 to 20 h.p. cars, the former being fitted with a slow-running double-cylinder Aster motor, and the latter a four-cylinder engine of the same make. The frame is built up of wood with steel fitch plate. The motor is located in front, behind a fan-cooled honeycomb radiator of the latest type, the water being circulated by means of a centrifugal pump. The 12 to 14 h.p. car has three, and the 16 to 20 h.p. vehicle four forward speeds, in addition to the reverse. In both the power is transmitted through a clutch gear-box, the new spring drive referred to below, universally-jointed shaft and bevel gear to the rear live axle. The latter runs on four rows of half-inch balls. Four plain brass sleeves are also fitted on the axle, so that if the cones should crack at any time the axle comes on to the plain bearing. Careful attention has been given to the details, a water-gauge and voltmeter, among other things, being fitted on the dashboard. The apron below the front of the frame is hinged at the side to allow of easy access to the contact breaker. The universal joints, it may also be noted, are entirely enclosed. Fig. 35 gives a sectional and end view of the new spring drive interposed between the gear-box and longitudinal shaft, the arrangement, it is claimed, allowing sufficient "give" to entirely do away with any shocks caused by the harshness of the clutch or the changing of speeds. The secondary shaft from the gear-box carries near its end a special driving lug, A. Suitable lugs, to correspond, are fitted on the brake-drum B, spiral springs being interposed between them. The drum has a rearwardly produced collar, which acts as a portion of the forward universal joint E of the longitudinal shaft G. Thus the power is conveyed from the gear-box through the springs to the shaft E. The brake-drum B is water cooled, the water being led to the space H by a pipe, the necessary cock being opened by the depression of the brake pedal. The water is directed on to the inner surface of the drum by centrifugal force.

On the stand of Messrs. Alldays and Onions, Ltd., we found three of the handy little Traveller voiturettes, which have already been dealt with in these columns. A chassis was also shown, while a card on a mud-stained vehicle indicated to the visitor that it had covered 13,000 miles without mishap or repairs. These little cars are fitted with a 4-h.p. vertical motor, and two speeds forward and a reverse. They can carry two or three persons, and attain a speed of 20 miles per hour.

An interesting selection of Gladiator cars was to be seen at the stand of Messrs. S. F. Edge, Ltd., the display being surmounted by the handsome sign used by the Gladiator Company at the Paris Salon. The seven cars and a chassis exhibited comprised the four different 1903 types. To begin with the smallest car, we noticed a 6-h.p. tonneau. This has already been described in the *Journal*, but we may mention that it is now being fitted with a governor, acting on the inlet. The car has three speeds and reverse, and equal sized road wheels. Of the 10-h.p. cars three were shown, one having a brougham body (Fig. 36). Power is supplied by a two-cylinder Aster slow-running engine. The two cylinders are made in one casting, and the normal speed is about 950 revolutions per minute. The water-cooler is of the gilled pipe type, but set in a square frame in the front of the car, a fan driven off the engine inducing a strong current of air through the coil; the circulation is maintained by a rotary pump. Ignition is by accumulators, the tremblers being on the coil, while the automatic governor is arranged to act on the inlet. The engine bonnet is carried straight from the radiator to the dashboard, the sloping front being entirely dispensed with. Three speeds forward and a reverse are provided, two side chains conveying the power from the differential countershaft. A new type for 1903 is the 12-h.p. four-cylinder car with the latest type fan-cooled radiator square bonnet, and a governor acting on the inlet. The motor runs at a speed of from 1,400 to 1,500 revolutions per minute. Four forward speeds and a reverse are available. Large bevel wheels convey the power from the gear box to the differential countershaft, a ball-bearing thrust block being fitted. For the coming season a 16-h.p. car is being introduced, this having a four-cylinder motor, with mechanically-operated inlet valves. There are various other little improvements in the 1903 Gladiator car which should tend to increase the popularity of these already well-known vehicles.

FIG. 36.—THE 10-H.P. GLADIATOR BROUGHAM.

One of the novelties of the show in the way of petrol cars was the "Soames," exhibited by the Langdon-Davies Motor Company, Limited, and illustrated in Figs. 37 and 38. To begin with the frame, or rather frames, there being two, one being intended for the support of the motor and transmission mechanism and the other for the body, each frame being supported on the axles by separate plate springs. By this arrangement the vibration of the engine is entirely intercepted, while, in addition, the body can be swung upon lighter springs, so that the effects of road shock are better taken up. A standard type of two-cylinder vertical engine, developing 11-h.p. at a speed of 800 to 1,000 revolutions per minute, is employed. It is provided with a governor acting on the inlet, an ingenious arrangement being provided for admitting cold air to the cylinders when the throttle is closed. The air inlet valve is coupled up to the gas inlet valve by spring connections in such a way that when the control handle is moved one way it regulates the quantity of gas, and when moved another way additional air is admitted to the combustion chamber for scavenging and cooling purposes. The water circulation is on the thermo-siphon arrangement, no pump being used. The first novel feature in the transmission is that the gear-box is fixed parallel to the rear axle, the bevel drive being *before* instead of, as usual, *after* the gear-box. The clutch shaft carries at its rear end a sleeve, on which are mounted two small bevel pinions, either one of which can be made to mesh with the large bevel gear on the first shaft in the gear-box, a forward or backward motion being obtained according to which pinion is in gear with the large bevel. Four speeds are available; the wheels in the gear-box are provided with very broad teeth, and are always in mesh. One of the shafts has a deep key-way, in which slide special keys, which,

as soon as they come in front of corresponding slots in the different pinions, fall into and are held in the latter by springs. The keys are so shaped that the action of pulling or pushing them along the shafts by the fork of the change-speed lever causes them to be depressed within the shaft, owing to each end of the key presenting an inclined plane. There is no difficulty in catching the gears, and the only parts which are subjected to strain are the keys, which, it should be noted, can be replaced by spare duplicates in a couple of minutes at the outside. The transmission from the countershaft to the live axle is by means of chains, two being employed for the sake of

FIG. 37.—THE "SOAMES" 11-H.P. CAR.

strength, placed close together in the centre of the car. A somewhat novel type of brake is fitted on the clutch shaft, consisting of a slightly-coned gunmetal disc, which can be held by a pair of steel bars pressed towards its axis, while a useful device is provided for locking the clutch pedal when the car is left unattended. The rear wheel band-brakes are of a special double-acting compensated type. The rear axle is provided with long bearings and ring lubrication. In addition to a chassis, a complete tonneau car was shown. Although the bugbear of vibration appears to have been got over, the car strikes us as being of unnecessarily heavy construction, especially in some of the details, while the projection of the change gear case at one side does not add to the appearance of the car—points to which the company, having proved the general lines of their construction to be sound, will now probably devote attention.

The new 12-h.p. car of the Velox Motor Co., Ltd., was so fully described in our issue of the 17th ult. that it need only be mentioned that the company exhibited a chassis and a couple of cars with well-finished and roomy tonneau bodies.

Messrs. Haynes and Sons, Ltd., who have taken up the agency for the Wartburg cars, exhibited the same cars as were described in our report of the recent Stanley Motor Show. In addition they had on view an 8½-h.p. car of the same make, but fitted with a two-cylinder engine. The transmission is on the now generally adopted lines of cardan shaft and bevel gear, three speeds and a reverse being available. A special point claimed for the Wartburg cars, which are of German construction, is that the loss of power between the motor and the driving wheels, due to friction, has been reduced to a minimum.

FIG. 38.—CHASSIS OF "SOAMES" CAR.

Owing to delay in transit the latest types of Beaufort cars had not put in an appearance when we visited the stand of the Beaufort Motor Company, which had on view a 12-h.p. double-cylinder vehicle, an 8-h.p. single-cylinder car, and a chassis showing the mechanism of the latter type, all of which have been dealt with in these columns. We understand that the new models are on up-to-date lines, including mechanical inlet valves, honeycomb radiators, and other improvements. We gave an illustrated description of the 18-h.p. Beaufort Alexandra car in our issue of the 31st ult.

Four cars were to be seen at the stand of the Star Engineering Company, one being a *fac-simile* of the vehicle supplied to the Automobile Club—a 7-h.p. twin-cylinder car, with tonneau body. The motor is governed on the inlet valve, and is water-cooled by means of pump and radiators. The gear is on Panhard lines, giving three speeds forward and one reverse, all actuated by one lever, and the power is transmitted from the countershaft to the road wheels by two side chains. Two independent double-acting brakes are fitted, one on the countershaft and the other on brake

FIG. 39.—THE DE DION 8-H.P. CAR.

drums on the rear road wheels. The wheel base is very long and the wheels are 32 in. equal, fitted with $3\frac{1}{2}$ in. pneumatic tyres. Another noteworthy vehicle was a 10-h.p. car. This car is similar in design to the 7-h.p., but has four speeds. Examples of the 10 and 20-h.p. motors, as well as a 7-h.p. chassis, testified to the progress the Star Company has made in the construction of motor-cars. The 20-h.p. engine has four cylinders, $4\frac{1}{2}$ in. diameter by $5\frac{1}{2}$ in. stroke; it is fitted with automatic governor, acting on the inlet, the normal speed being 800 revolutions per minute.

The new 12-h.p. tonneau car, illustrated and described in a recent issue, found a prominent place on the stand of the Albion Motor-Car Company, Limited. In this car a number of improvements have been introduced, the chief among them being the Murray patent governor, which holds the engine steadily at whatever speed it may be set from running low to full load. It is also fitted with a new system of magneto ignition, and an improved form of spring drive between the engine and the gear case. Special attention has also been given to the protection of the driving chains, the rear sprockets not being bolted to the rear wheels, but mounted separately on the elongated wheel hub. The carburettor is fitted with a hot-air jacket, this having been found necessary as the result of motoring experience in Scotland. Altogether the new Albion car shows that much thought has been expended on its design. The old type of Albion car with horizontal motor fully described in our report of the 1902 Agricultural Hall Show is still being made, but has undergone several modifications. In the first place, a 10-h.p. engine is being used in place of the old 8-h.p. motor; a new carburettor is being used, and the clutch has been enlarged. Of this type a chassis and a complete tonneau were

FIG. 40.—THE DE DION 10-H.P. TWO-CYLINDER MOTOR.

to be seen. The body, by Penman, of Dumfries, was particularly striking; it seats five persons, and is painted black and dark green with imitation cane-work panels.

Perhaps the leading novelty on the stand of Messrs. De Dion and Bouton, Limited, was the new 10-h.p. two-cylinder car. Fig. 40 gives a general view, and Figs. 41 and 42 two sectional views of the new engine, from which it will be seen that the two cylinders are cast together in one piece with their jackets, and that the inlet-valves are held in place by a yoke and a single nut. The novel feature of the motor is that an oil pump is provided for circulating the oil to the crank chamber. The oil supply is contained in a tank fixed to the cylinder casting, and it finds its way to the various parts on the splash principle. The pump is driven through a vertical shaft, S, by spiral gearing from the cam-shaft, and it continues to take the oil from the bottom of the crank-chamber, and to force it back again into the tank. One charge of the oil is sufficient for about 350 miles. The engine runs at a speed of 1,500 revolutions per minute, and is provided with a device acting on the exhaust valve to reduce the compression for starting purposes. The new engine was shown separately, and also applied to a car fitted with a change-speed gear of the Panhard type, giving four speeds and reverse. Of the 8-h.p. single-cylinder cars, several examples of tonneau, double phaetons, Limousines, and a coupe were shown. The latter was probably the most novel one, the frame and wheel-base having been lengthened to give access to the rear seats from either side of the vehicle. The new 6-h.p. voiturettes, with engine in front, have already been fully dealt with in these columns, so that it need only be mentioned that those exhibited were fitted with beautifully-finished bodies, the addition of a hood considerably enhancing the appearance. Other exhibits on this stand comprised an example of the new $1\frac{1}{2}$ -h.p. bicycle motor, and a combined petrol motor and dynamo for electric lighting purposes.

The Dechamps cars were once more to be seen at the stand of the Graphic Motor and Engineering Company. A prominent place was given to an 18-h.p. chassis. The general arrangement closely follows what may be

FIGS. 41 AND 42.—SECTIONS OF DE DION 10-H.P. TWO-CYLINDER MOTOR.

termed Panhard lines, the four-cylinder vertical balanced motor being located in the fore part of the frame. The power is conveyed through a clutch, gear box, and two side chains, four speeds and a reverse, all controlled by one lever, being available. The engine is fitted with automatic governor acting in accordance with modern practice on the inlet. A special feature of the Dechamps cars is to be seen in the band brakes connected with the rear wheels, the band being put in and taken out of contact with the drum by a double-threaded screw actuated by a hand lever. A complete 18-h.p. car was shown. The body work by Hamshaw, of Leicester, was well worthy of inspection; it takes the form of a roomy Lonsdale wagonette. Side by side with this car was a 14-h.p. double phaeton; access to the rear seats is obtained at the sides, instead of having to lift up one half of the front seat, neat steps being fitted for the purpose. The vehicle has a four-cylinder balanced engine (stroke, 115 mm.; diameter, 95 mm.); water-cooled by means of pump and radiators, and three speeds forward and a reverse actuated by the same lever. Finally we may briefly mention a 9-h.p. double phaeton with two-cylinder engine (stroke, 130 mm.; diameter, 100 mm.).

The British Germain Motor-Car Company, Limited, made a big display of the well-known Germain cars, the exhibit comprising examples of the $7\frac{1}{2}$ -h.p., 15-h.p., and 20-h.p. types. The small size is provided with two-cylinder engines, 95 mm. diameter by 130 mm. stroke, the normal speed being 800 revolutions per minute. Four speeds forward and a reverse motion are provided, the countershaft being connected to the rear road wheels by side chains. The two larger cars have four-cylinder engines governed on the inlet and covered by the latest type of square bonnet with the radiator in the front opening. One of the improvements consists of a new carburettor, somewhat on the lines of the Krebs. The auxiliary air admission is automatically regulated according to the vacuum produced in the mixing chamber, so that a larger quantity is admitted when the motor runs faster, the vacuum being automatically maintained at a comparatively constant point. Four speeds and a reverse are provided. The

carriage work of these vehicles is of the highest class. To meet the demand for a "popular" light car, the Germain Company have secured the agency for a little French vehicle to which they have given the name "Staughton." The engine is of the single-cylinder, vertical type, developing 8-h.p. Three forward speeds and reverse are provided, the transmission being by means of an universally-jointed shaft and bevel gear to the rear live axle. The car itself is designed to hold two persons, a pair of bucket seats being provided. The body is attached to a channel steel frame, and the wheels are of the artillery pattern and of equal size.

The Motor Traction Company, Limited, had a varied display of Salisbury 7-h.p., 10-h.p. two-cylinder, and 12-h.p. two-cylinder cars, and Germain 7½-h.p. two-cylinder and 15-h.p. four-cylinder vehicles, the details of which were given in our report of the same company's stand at the Stanley Motor Show.

Mr. C. R. Radcliffe exhibited a car new to the English market. It is made by the United States Long Distance Automobile Company of New York, and in general arrangement is somewhat on the lines of the Oldsmobile. It appears, however, to be more powerfully built, being fitted with a 7-h.p. horizontal engine. Three speeds forward and a reverse are obtained by a system of crypto gears held by band brakes on the engine shaft, a single chain conveying the power to the rear axle.

The novelty on the stand of Messrs. Hewetsons, Limited, was, of course, the new "Benz Parsiful" cars with vertical engines. Their belt-driven, horizontal engine type was represented by a 6-h.p. car with detachable tonneau, and hood fitted to front seat. There was also a 6-h.p. tonneau, painted and upholstered in red. As we mentioned in a recent issue, although the Benz Company are making vertical-engine cars, they do not intend to discontinue the manufacture of belt-driven vehicles. The new car (Fig. 43) is of 10-h.p. The engine and gear-box are mounted on a separate frame, the main frame being built of wood, stiffened by angle plates at each corner. The motor comprises two cylinders, and to permit of easy access to the valve chambers the covers are held on their seatings by box-nuts, which have simply to be loosened to allow inspection. A low-tension

FIG. 43.—THE "BENZ-PARSIFUL" CAR.

system of ignition is adopted, the current being generated by a gear-driven magneto. The latest type of radiator and a spray carburettor are used, the circulating pump being placed in front of the engine. An improved form of lubricator is fixed on the dash, for general lubrication, and a hand force-pump is used to feed oil to the crank chamber and gear-box. The change speed gear is supported by the under frame, and connected by a friction clutch, of the cone type, with spring inside the male cone, to the engine. The thrust is taken by ball bearings. The change speed is actuated by a single lever, which provides a direct drive on top speed, three speeds and a reverse being available. A metal-to-metal brake operating on a steel drum is placed immediately behind the gear-box, and the usual side brakes are fitted. Vehicles of the two-cylinder type are constructed in three sizes, 8, 10, and 12 h.p., and the general workmanship is of that class which has made the Benz cars so popular. We understand that a four-cylinder car with mechanical valves will shortly make its appearance.

The Motor-Car Company, Limited, exhibited a couple of 10-h.p. two-cylinder Decauville cars, and two 20-h.p. four-cylinder vehicles of the same make. The new features of the 1903 Decauville models were dealt with in our report of the Paris Salon, one being the direct drive on the top speed. The 10-h.p. car is similar to that which made the non-stop run from Edinburgh to London last year, while the larger type is on the lines of that which has been "among the records" on the Dourdan speed-trial road in France.

A new departure by the Pick Motor Company, Limited, is the construction of chain-driven cars of 6-h.p. and 10-h.p. The main frame of the Pick vehicles is of tubular construction, the engine, which is of the horizontal, double-opposed cylinder type, being supported on a cast-iron bridge. The pump, exhaust valves, and the contact breaker are actuated from a single shaft placed in an accessible position across the crank chamber. The water-cooling system is maintained by pump and radiators, while the electric ignition is arranged so that the spark occurs simultaneously in both cylinders. From the motor-shaft the power in the chain-driven cars is conveyed to the gear shaft through a Renold silent chain. The gear-box is of the Panhard type, giving three speeds forward and one reverse, a single centrally-located chain connecting the box with

the rear live axle. The belt-driven cars are of similar construction as regards the motor and frame. The transmission is, however, by means of two long belts working on to fast and loose pulleys on a countershaft at the rear, the latter being connected with the back axle by spur gearing. Two speeds forward and reverse are provided, the belts being entirely enclosed and thus protected from mud and wet. The Pick cars are of pleasing design, as will be seen from Fig. 44, which shows the two-seated

FIG. 44.—THE PICK 6-H.P. VOITURETTE.

6-h.p. belt-driven car; inclined wheel-steering is fitted to all, while the band-brakes on the rear wheels are of a special double-acting type, actuated by a cam, to which we hope to refer at length in a later issue.

Of varied interest was the display made by the Anglo-American Motor Car Company, Limited—the name by which the Oldsmobile Company will in future be known. One of the most attractive features of the stand was the 20-h.p. Winton with a tonneau body (Fig. 45). The engine is of the two-cylinder type, is governed by the air pressure system, controlling and varying the opening of the inlet valve, and regulated by a foot button or auxiliary hand operated valve. All parts of the mechanism are completely enclosed, and water, petrol, and oil tanks are arranged under the bonnet. Forced circulation is used with direct-driven gear pump. The contact device is arranged with a vibrating member having a cam surface acted upon directly by a cam on the end of the cam shaft. This contact member is carried in a box having a glass face and revolving with relation to the cam shaft for adjusting the instant of ignition. The Winton planetary gear system is used, controlled by levers, giving three speeds forward and one reverse. One of these levers is connected with an emergency brake acting directly upon a drum upon the main shaft of the engine, and easily applied as the high-speed gear is thrown out. Attention was also directed to the Oldsmobile car, which has now a new carburettor, in which the 'gravity-

FIG. 45.—THE WINTON 20-H.P. CAR.

feed system has been adopted. Many small parts have been strengthened as a result of experience on English roads.

A new petrol car was to be seen in the Kensington, shown by Messrs. Rawlings Brothers. At the time we visited the stand no one was in attendance to furnish us with details, but so far as we could ascertain it follows standard lines, being fitted with a two-cylinder vertical engine, developing 9-h.p. and governed on the inlet. Four speeds and a reverse are available, the power being transmitted through a clutch, gear box, and two side chains.

One of the surprises of the Show was the three-cylinder car exhibited by Messrs. Marshall and Company. Nominally rated at 20-h.p., the motor

develops 24-b.h.p. The inlet and exhaust valves are on the top of the cylinder head on the lines of the Buchet motor, an ingenious arrangement being provided whereby the two valves on each cylinder are held by one nut, thus permitting their removal in an exceedingly short space of time. The governor acts on the inlet and a hand accelerator is provided. The transmission on this car is on new lines; the motor conveys its power through a clutch to the gear box, which gives three speeds ahead and one reverse. The gear box drives by bevel gear a short countershaft, from which the power is conveyed to the rear axle by a central chain, which is entirely enclosed in a gear case. The new car, which has a wheel base of 7 ft. 9 in., and is fitted with a tonneau body, was well worthy of inspection. Of the Marshall 12-h.p. type, two tonneaus (one having seating accommodation for six persons) and a chassis were shown. The main features of these double-cylinder cars have already been dealt with in these columns, but we may mention that the 1903 models are being fitted with an improved irreversible steering gear, and a positive clutch; they are driven through bevel gear on to a live axle, a lid being fitted to the case on the latter to enable the gear to be readily inspected. The pump is so arranged as to be quickly detached when necessary. Other features that we noticed which, while small in themselves, are useful "refinements," are a small bracket on the motor on which to rest the sparking plug for testing purposes, and the hinging of the steering wheel at the upper end of the column, so that it may be tilted up, and so give freer access to the driver's seat.

The London Motor Garage Co., Ltd., had two large stands, one of which was devoted to an array of Lanchester cars, included amongst them

fact, it is built throughout on the lines of large cars, and should soon become a popular type.

An interesting show of the Cottureau cars was made by Messrs. McNeil, Hutchison, and Borthwick, who have acquired the agency for this country. These vehicles, which are very popular in France, are made in four sizes—5-h.p. single-cylinder, 7-b.h.p. and 10-b.h.p. double-cylinder, and 16-b.h.p. four-cylinder. An illustration of the 10-b.h.p. tonneau is given on page 977. The frame is of tubular construction, with the motor under the bonnet in the fore part. The two cylinders are the V-shape, the piston rods working on to a central crank shaft. The cylinders are 90 mm. diameter by 115 mm. stroke, the normal speed being 1,200 revolutions per minute. The automatic governor is adapted to act on the inlet, a foot "accelerator" being also provided. Three speeds forward and a reverse are obtained by means of a train of sliding pinions of the Panhard type, the power being transmitted through a clutch and gear-box to a cross shaft which is connected to the rear axle by a single centrally-located chain. The car, which is provided with hand and foot brakes, wood wheels 760 mm. by 90 mm., and inclined wheel steering, weighs without body about 10 cwt. The 7-b.h.p. car is on identically similar lines, the only difference being in the motor, which has cylinders 85 mm. by 110 mm. stroke. It is fitted with a comfortable tonneau body. The largest car on the stand was a 16-b.h.p. covered wagonette, this comprising all the latest features, including combined honeycomb water-tank and radiator. The motor, one of which was shown separately, comprises four vertical cylinders, 92 mm. diameter by 120 mm. stroke, the normal speed being 900 revolutions per minute.

FIG. 46.—THE RENAULT 14-H.P. CAR. (SEE PAGE 960.)

L'Avenir de l'Automobile.

being a chassis, which was the centre of attraction all day long. On the other stand we found a number of Pipe and Magnet cars. The Pipe car is the production of La Compagnie Belge de Construction d'Automobiles, and, generally speaking, closely follows the lines adopted in the Panhard vehicles. The motor is of the four-cylinder, vertical type, with the cranks set at an angle of 90 degrees: it is made in two sizes, 15 and 20 h.p. Transmission is by gears and chains, four speeds forward and a reverse being available, all controlled by a single lever. One of the most handsomely finished cars in the show was a 20-h.p. Pipe tonneau with canopy, the body being painted in pale blue and most luxuriously upholstered. The Magnet car is made with 12-h.p. two-cylinder and 24-h.p. four-cylinder motors, fitted with the latest system of throttle governing, regulated from the steering pillar. Transmission is by gear and chains, four forward speeds and a reverse being available. The cars on the stand of this type comprised a stylishly finished Limousine and a tonneau. Reference must not be omitted to a fine example of the 20-h.p. Mercedes Simplex, with white tonneau body.

Under the name "Napoleon" Mr. Bernard Neave, of Richmond, is introducing a neat little car. In general arrangement it follows the now usual lines, but is noticeable on account of its low build. The car has a tubular frame, in the fore part of which is set a 6-h.p. De Dion motor. This drives the rear axle through a longitudinal shaft and bevel gear. Three speeds forward and a reverse are available, the power being transmitted direct on the top speed, which is about 25 miles an hour. The little vehicle, which is illustrated on page 976, is neatly finished, with tonneau body; in

Accumulator or magneto ignition can be fitted, the particular engine we examined being provided with the latter. The governor acts on the inlet, the connection being such that a quick action is obtained. The valves are mechanically operated, they are all interchangeable, the inlet valves being on one side and the exhaust valves on the other. The transmission is on the same lines as that adopted in the Panhard cars, four speeds and a reverse being available, the power on the top speed being transmitted direct. The car, which without body weighs about 16 cwt., can attain a speed of thirty-eight miles per hour on good roads.

The exhibits of the Ariel Motor Company, Limited, consisted of two 16-h.p. "Ariel" cars, two 10-h.p. cars, one 16-h.p. chassis, one 10-h.p. chassis, and an assortment of shafts mounted on a stand, which, with the chassis, gave visitors a good insight to the workmanship embodied in "Ariel" cars. The most striking feature of the exhibit was undoubtedly a 16-h.p. car, painted blue and yellow, upholstered in dark blue, built specially to the order of Major Kingsley Foster, J.P., of Redhill. It is a seven-seated car of the double tonneau type, fitted with a detachable brougham top enveloping the five rear seats, lit up by electric light. The seats behind the driver are reversible, enabling all the occupants of the brougham to sit *vis-a-vis*. The vehicles have undergone considerable improvement for 1903, both the 10-h.p. and the 16-h.p. models are fitted with four forward speeds and a reverse, the wheel base has been increased, and the road wheels are all of equal size. The frame is built up of steel tubing, stiffened by an underframe, to which the engine is bolted. The

10-h.p. motor has two cylinders, $3\frac{3}{4}$ in. bore, 4 in. stroke, cast in one piece with combustion chamber and water jacket complete. The crank-shaft is built up with two fly-wheels, which are inside the crank case. The fly-wheels carry balance weights opposite the crank-pins set at 180 degs., perfect equilibrium thus being ensured. The engine is of the high-speed type, developing 10 b.h.p. at 1,700 revolutions per minute. The 16-h.p. engine has four cylinders, $3\frac{3}{4}$ in. diameter, by $4\frac{1}{2}$ in. stroke. A point worthy of mention is that the exhaust pipes are of flexible metallic tubing. A small additional air inlet is fitted on the inlet pipe, which automatically comes into operation as the admission of gas is throttled by the governor. The latest type of radiator is fitted in front below the frame. The ignition is electrical, and on the 16-h.p. chassis we noticed that the new external jump sparking had been ingeniously fitted. From the engine the power is transmitted to a friction clutch and gear-box, and thence by means of bevel gear and cardan shaft to the rear live axle, the latter being mounted on rollers and balls. A double-acting, metal-to-metal band brake is fitted to the secondary shaft outside the gear-box, and actuated by foot lever, which, when applied, immediately releases the clutch. Double-acting band brakes are also fitted to each of the rear wheels, actuated by a hand lever. Altogether the exhibit of the Ariel Company was one deserving close attention.

In addition to a couple of motor-bicycles, the Kitto Automobile Company had on view a new American light car with the engine under the bonnet in the front part of the car. The frame is of angle steel, while the motor comprises two cylinders and develops 8-h.p. The power is transmitted through a clutch and gear-box to a counter shaft, and thence by a single chain, although we understand two chains will be used on future vehicles. The car is neatly arranged, with ample petrol and water capacity.

a friction grip, which enables them to be set to a nicety. While building cars, the company are not neglecting their popular Century motor-tandem, of which a couple, with 5-h.p. Aster engines, were shown. Although the general features are unchanged, we notice that the wick carburettor has been replaced by one of the float-feed spray type, and that a large friction clutch is being used.

The Elswick cars shown by the Elswick Motors, Limited, were of 6-h.p., with single-cylinder Aster engine, the transmission being of the familiar change-speed gear and propeller shaft type. Three speeds and a reverse are supplied. A long wheel base is a characteristic of these vehicles.

Mr. O. C. Selbach showed the single cylindered "Regal" cars, fitted with 6-h.p. De Dion engine of the water-cooled type. This is on similar lines to the Rigal car described in our report of the Stanley Show. An interesting display was completed with a full assortment of mechanically-operated valves, axles, frames, radiators, &c.

The English Motor Company showed the Oilmobile, to which we made reference in our report of the Stanley Automobile Exhibition, and also the 64-h.p. two-seated Lipscombe car. The engine is a water-cooled De Dion. There is the usual transmission through a gear box, and universal propeller shaft to the differential. There are three speeds forward and one reverse, the third speed driving direct on to a geared axle without chain. On the rear wheels, the internal expansion type of brake is provided, and a band brake on the main shaft. Wheel steering is adopted. The two seats are of the bucket type, and have a comfortable appearance.

A three-wheeled carriage for two people was shown by Messrs. Chas. Peacock and Co. This is the "Carpevien," fitted with a 24-h.p. air-cooled engine. A simple type of friction-clutch and chain gearing, controlled by a

FIG. 47.—THE DE DIETRICH (TURCAT-MERY) DILIGENCE, WITH MONTEL BODY. (See last issue.)

Roller bearings are used on the back axle, while we noticed that the band brakes are of the metal-to-metal type.

The Century Engineering and Motor Company, Limited, are now devoting considerable attention to the construction of cars up to 16-h.p., and judging from the excellent specimens they had on view, the Century cars should quickly become a popular type. In general arrangement they follow what may be termed standard lines, four sizes—6½ h.p., 9 h.p., 12-h.p., and 16-h.p.—being shown. To deal with the 6½-h.p. car first, this is the company's latest production; it is a two-seated car, with a 6½-h.p. single-cylinder Aster motor set in the fore part of the frame; three speeds forward and reverse, and a governor acting on the admission. The 9-h.p. car has a double cylinder Aster engine (88 mm. diameter by 110 mm. stroke), running at a normal speed of from 900 to 1,000 revolutions per minute. The 12-h.p. cars are made in two forms, one having three speeds and a fast-running double-cylinder Aster engine, and another with four speeds and a slow-running Aster motor having twin cylinders, 105 mm. diameter by 130 mm. stroke. One of the finest cars on the stand was a 16-h.p. brougham, fitted with four-cylinder Aster engine and four forward speeds and reverse. In all the foregoing vehicles the power is transmitted through a friction clutch, gear-box, differential countershaft, and two side chains. The water radiators are on the latest lines, with continuous plates from tier to tier, thus giving a stronger construction than if the plates were all separate. Among other details to which we may refer are the use of planished steel bonnets; a small electric light on the change-speed lever to facilitate changing gear in the dark; as the driver moves the lever from notch to notch the circuit is completed, enabling him to make sure of setting the lever in the correct position, upon which the light is automatically switched off. The control levers on the steering column have

lever, has been provided, there being two speeds. The steering is of the tiller type. Electric ignition, two band brakes and a weldless steel tube frame are other features of this little car. The "Brutus" engine of 1, 1½ and 2 h.p. was also shown, the weights of these types being 17½ lbs., 25 lbs., and 27 lbs. respectively. Lamps, horns, etc., were also shown, as well as the Paree carburettor.

The Continental Automobile Company, Limited, showed the F.I.A.T. cars, the features of which were described in our issue of December 27th. They also exhibited a 14-h.p. "Continental" car, the engine of which is fitted with a regulator allowing the engine to run at from 200 to 2,000 revolutions without affecting either the carburettor or advancing the ignition. The transmission is by chain, but in the smaller-powered cars an universally-jointed shaft is used.

Messrs. H. M. Hobson, Limited, showed a 16-h.p. Dasse car, with fan cooled radiator and mechanical inlet valves. The car has three speeds and reverse and a tonneau body, seating four passengers and the driver. The firm also showed the Wydts electro-catalytic igniter, described in our columns on the 31st ult.

The Progress Cycle Co., Ltd., exhibited two of their neatly-finished 9-h.p. Progress cars, with tonneau bodies which have already been described in these columns. The chassis of a new 6½-h.p. two-seated car the company are bringing out was also on view. The motor, which is a single-cylinder Aster with a governor acting on a throttle-valve, is water cooled by natural circulation through a specially-designed water tank and radiator placed in the front of the bonnet. The frame of this vehicle is made of ash and strengthened by fitch plates, an underframe of light section channel steel being employed to support it. There are three speeds forward and reverse available, the drive on the top speed being

direct from the engine through the universally-pointed shaft and bevel gear to the live back axle. The rear axle and differential gear are contained in an oil-tight case. The end thrust is taken up by two large ball bearings. The speed control lever is arranged on a quadrant on the right hand side of the car, the hand lever controlling the expanding brakes on the back axle being fitted on the same quadrant. The application of either the hand or foot brake at the same time disengages the clutch.

Georges Richard and Mercedes cars formed the exhibit of Messrs. Mann and Overton. Of the former a 10-h.p. and 12-h.p. car were shown, both having double cylinder motors. The larger vehicle comprises a number of interesting new features, some of which were described in our report of the Paris Salon. The 12-h.p. double-cylinder engine (104 mm. diameter \times 100 mm. stroke) runs at a normal speed of 1,000 revolutions per minute, giving off 13-b.h.p.; it is automatically governed on the throttle, in a similar manner to the 10-h.p., the governor being entirely enclosed. The Brasier system of magneto ignition, arrangements being provided for the ignition to be retarded or advanced as desired. The water is circulated by a pump through the latest type of Loyal radiator. The transmission is by bevel gear on to a live axle, and is the same as in the 10-h.p. car, with the exception that there are four speeds forward instead of three, and a sliding universal joint without bolts. The universal joint between the clutch and the gear box works both ways, thus obviating any wear in the bushes of the engine and gear box. The engine is lubricated by means of an automatic lubricator on the dashboard: the live axle bearings are lubricated by means of rings running in an oil bath. Semi-irreversible steering, with tangent screw of the re-enforced Panhard type, with ball thrust bearing, is employed. Altogether the Georges Richard cars have been brought well up to date, and should continue to be a popular type in this country as well as in France. One of the handsome cars of the show was to be seen at this stand, viz.,

and a specimen of the ingenious change-speed and driving gear employed. A full description of the general arrangement adopted was given in our report of the 1902 Agricultural Hall Exhibition; a few slight modifications and improvements have been introduced, the main one being the provision of a reverse motion. No differential gear of the usual type is fitted, ratchet clutches being provided fitted to each driving wheel on the ends of the live axle to allow either wheel to over-run the other in turning corners.

Messrs. E. J. Coles and Co. showed a 22-h.p. four-cylindrical car, one with a 10-h.p. two-cylinder engine, and a 6-h.p. car, as well as the 8-h.p. "Belle" car, with which their name is favourably associated. The general arrangement of this car has already been described in the *Journal*, and in our issue of the 3rd ult. was a view of the latest type as shown at the Exhibition. The cylinders and water-jackets are cast in one piece and the valves and their seating can be taken out together. The tanks and radiators are of a larger size than those originally fitted.

Messrs. Botwood and Egerton drew attention to the well-known Gobron Brille cars, exhibiting specimens of the 9, 12, and 30-h.p. vehicles. These have already been described in the *Journal*, but mention should be made of the fine coach work of the bodies. This is done by Messrs. Botwood and Egerton at their Ipswich works, and was notable for its bold lines and for the excellent style of upholstery adopted. Examples of the Primus cars illustrated on page 977 were also shown, and served to attract many visitors to the stand. The 5-h.p. car has a single cylinder engine, the power being transmitted by a single belt to the change gears, which are directly connected with the differential shaft, and thence to the road wheels by chains. The gears are enclosed in an aluminium case, running in oil. A float-feed carburettor and electrical ignition are provided, while a half-turn of the handle is sufficient to start the engine. The radiator is on the side of the bonnet, the thermo-siphon system of

FIG. 48.—CHASSIS OF 12-H.P. GLADIATOR CAR. (See page 965.)

a 20-h.p. Mercedes-Simplex. The details of this well-known type need no description at this time, but we mention that the car exhibited was fitted with a comfortable tonneau body, painted in the usual Cannstatt red colour.

A 12-h.p. covered wagonette and a 16-h.p. four-cylinder tonneau, both of the Boyer type, were exhibited by the Automobile Supply Company, Limited, while Mr. F. H. Hunt had on view a chassis and two complete cars of the Maurer Union type, the feature of which is the friction drive. As this has already been dealt with in the *Journal*, a lengthy reference is unnecessary. The Burlington Carriage Company again exhibited a 16-h.p. De Dietrich chassis of the latest type.

The Wilson and Pilcher car has been dealt with at length in these columns, so that we need only mention that the main alteration for the 1903 season is the fitting of an engine of 10-h.p. in place of the 8-h.p. motor hitherto employed. The four cylinders are arranged in pairs on each side of the crank shaft, and a novel feature of the electrical ignition is the induction coil, which for four cylinders has only a single trembler. Four speeds forward and a reverse motion are available. The forward speeds are now controlled by a side hand lever, in place of the old rotating handle. The power is transmitted from the gear-box by a universally-jointed longitudinal shaft to the rear live-axle. The car is a remarkably silent one, a feature which has brought it well to the front in the motor world. In addition to the foregoing, Messrs. Wilson and Pilcher had on view samples of their special contact breakers, piston rings, and induction valves, of which we published descriptions last year.

A large array of the little 4½-h.p. two-seated Swift cars was to be seen on the stand of the Swift Motor Company, the exhibit including a chassis

circulation using on an average only three pints of water per 100 miles being adopted. A 9-h.p. car was also shown, and the bodies were fitted with every convenience for the tourist, even to such a detail as small pockets on the side of the vehicle for maps, papers, etc.

Two attractive stands were occupied by Mr. E. W. Hart, who has recently added the Parkside Garage, Regent's Park, to his other automobile activities. Among the cars shown were a 9-h.p. Renault, a 6-8-h.p. two-cylinder Panhard, and a 16-h.p. De Dietrich. The latter had a tonneau body fitted with a light canopy, giving the vehicle a most effective appearance. A 40-h.p. Panhard with a "Roi de Beige" body, attracted much attention, its white enamelled body, with red upholstery, giving it a charming appearance. Several Mercedes cars were staged, including the 16-20-h.p., and 28-35 h.p. types. Altogether Mr. Hart's display was thoroughly up to date, and well representative of the latest phases of motor-car design.

The Siddley Autocar Company made a very creditable first appearance as an exhibitor, showing three chassis, 8-11 h.p., 12-16 h.p. and 18-24 h.p., as well as two finished cars, one of 8-h.p. and the other, the "Little Siddley," a 6-h.p. The larger cars were of four cylinders, and followed well-known and approved lines, the features including mechanically operated inlet valves, and a Mercedes style of cooler with square air-tubes.

Several vehicles of the utilitarian type were shown by the Milnes Daimler, Limited, including a public service vehicle for the Penrith Motor Company, similar to the styles recently illustrated in the *Journal*. Two one-ton vans and a two-ton lorry were also shown. Fitted with a tonneau body was a 28-35-h.p. Mercedes car and also a 9-h.p. four-cylindrical car with a brougham top.

ELECTRICAL CARS.

The Automobile Supply Company, Limited, had on view a Scheele electrical car, supplied with two bodies—a victoria and a brougham—the connection being such that one can be quickly substituted for the other. The vehicle is provided with a battery of a capacity sufficient to run it a distance of 40 miles on one charge. A one-ton electrical delivery van was also shown by this company.

Two neat electrical runabouts formed the display of the Crowds Company. The frame is of tubular construction, the electric motor, which is supported at the rear, driving the rear axle through bevel gearing. The battery consists of 44 cells, one charge being sufficient to run the car a distance of about 50 miles. The feature of the vehicle is the one-lever control, all the various operations of steering, speed changing and applying the brakes being made by means of the tiller.

The exhibit of the Electromobile Company, Limited, was notable on account of the chassis which was exhibited, a display of this kind being not very usual. The Company has acquired the rights in the Contal system of electrical vehicles, which were shown for the first time in this country. The main features of the new vehicle are its "straight chassis" and "underslung interchangeable battery." The chassis is common to all types, so that any form of body can be attached to it. The frame is rectangular in plan, and is constructed of rolled channel steel. The wheel base is 7 feet, and the track 4 feet 6 inches; the road wheels are of the normal artillery pattern, fitted with either pneumatic tyres 810 by 90 mm., or 3 inch solid tyres. The underslung battery box system has been adopted to obtain (a) rapidly interchangeable batteries; (b) even distribution of weight on the wheels; (c) the collection of all the cells in a single box, to enable inspection to be thorough and manipulation simple; (d) a low centre of gravity to minimise side-slip. With the battery underslung, any acid fumes escape at once to the air instead of affecting the atmosphere inside the carriage. The wooden box containing the accumulators is braced by a light steel framework terminating in a lug at each corner. These lugs engage with strong taper pins sliding in brackets on the frame, and are operated from either side of the car by a simple screw mechanism. In the depot, the accumulator box is lowered from its position by a hydraulic lift, and conveyed to the battery department for examination and charging, thus avoiding the damage to the carriage that may ensue if the battery is charged *in situ*. The chassis and battery box together weigh 9½ cwt. The battery consists of 42 "Contal" cells of a special pasted type, and weighs about 8 cwt. Its capacity is 135 ampere hours, and affords sufficient power to propel the Victoria about fifty miles, and the double landaulette about forty-five miles, over average roads in fair condition. The motor is of 5-b.h.p. on a continuous load, but we are informed that it can safely exert over 10-h.p. for shorter periods. Its normal speed is about 1,500 revolutions per minute. It is a bi-polar and series-wound, having two separate commutators connected to separate armature windings. The motor, which weighs about 162 lbs., drives through a dual train of double helical gearing on to the differential, and thence to the hubs of the rear wheels by live shafts, which revolve in an external tubular axle. This axle is stationary except for the slight radial movement permitted by the suspension springs; carrying the motor. It consists of two tubes united by a cast steel gear box, and extending within the road wheel hubs, which revolve upon them. Thus the internal driving shafts are relieved of all bending stress, and are in simple torsion. The road wheels are so mounted that they can be removed as easily as ordinary carriage wheels. The motor casing is continued into the gear box, so that the entire driving mechanism is dust and waterproof, and can be entirely detached from the carriage by removing the spring clips and the pin by which the motor is suspended from the frame. The controller gives five forward speeds ranging from three to fifteen miles an hour, two electric brakes, and one reverse speed. Its position is horizontal, immediately below the floor boards, in which is a trap door exposing the brushes and terminals. The handle actuating the controller is below the steering wheel, and moves in a plane parallel to the wheel. The usual ratchet mechanism is provided to prevent any lingering between the positions of contact. The steering is effected by a wheel and spindle inclined at 30 deg. with the vertical, and transmitting motion to the ordinary levers through bevel gearing. In addition to the two electric brakes, a powerful double-acting expansion brake is fitted on the hubs of the rear wheels. It is applied by a pedal, and the pressure on the two wheels is equalised by the usual wire rope and pulley device. An ingenious form of quick break switch is connected with the brake pedal, so that the electric current is broken before the brake is applied. The cars exhibited comprised a two-seated Victoria, single and double landaulettes, and a brougham, the body work of which was of the highest class. The following are the approximate weights of the four types: Victoria, 22 cwt.; single landaulette, 23 cwt.; double landaulette, 23½ cwt.; and brougham, 22½ cwt., these weights including the whole battery and equipment.

A brougham of the Vehicle Equipment Company was shown on the stand of the Anglo-American Motor Car Company, Limited. The driver sits behind, giving the passengers an uninterrupted outlook before them. It will cover 35 miles on one charge. The under frame is an important feature, this being of the pedestal type, with full elliptical springs, both fore and aft. The yokes enclose the sliding blocks of the axle members and gives a universal movement to them, with all the desired flexibility. The battery is of the underslung type, cradled, and arranged in sections, each section comprising a separate tray. The double motor drive is used, the motors being of the General Electric type pivotally hung on the rear axle and driving directly to the spur gears of the rear wheels. Expansion brakes are used on drums on the rear wheels. The controller is of standard General Electric type, of the series parallel order, giving four speeds

ahead and two reverse, with an interlock between the reverse lever and main controller drum. The Baker electric racing car (Fig 49), of 7-h.p. nominal, attracted considerable attention. It is driven from storage batteries, and ball bearings are used everywhere to decrease the friction to the lowest possible point. Inside the long torpedo-shaped body two men sit tandem, the steerer peering out of the mica window of a small hatch coaming, while one confines his attention to the management of the propelling machinery.

MOTOR-CYCLES.

A representative collection of motor-cycles was to be found on the stand of Messrs. Humber, Ltd., these including motor-bicycles, tricycles, Olympia tandems as illustrated in our issue of the 24th ult., and a useful carrier, the latter being on the lines of the Olympia, but having a parcels chest in place of the front seat. The feature of all the machines is the chain-drive, which has already been dealt with in these columns. The motor-tricycle weighs about 170 lbs. In addition to a front-rim brake, the machine is fitted with the Humber double-action band-brake on the main axle, operated by a foot lever carried well forward of the bottom bracket and out of the way of the pedals.

Motor-bicycles fitted with 2-h.p. Minerva motors of the latest type were shown by Messrs. Alldays and Onions, Ltd.

The Bat Motor Manufacturing Company, Limited, made a big display of the Bat 2½-h.p. and 2½-h.p. motor-bicycles, which were described in our issue of November 29th last, and also a new avant-train, or fore-carriage. On the stand were also samples of the Batson's grip pulley, which is claimed to prevent any possibility of belt slip; the "Bat" instantaneous switch, which is fitted to the handlebar, and enabling the rider to cut the current and apply the brake simultaneously; and a patent belt fastener.

For the 1903 season the motor-bicycle of the Rex Motor Manufacturing Company, Limited, is being fitted with a 2½-h.p. engine, mounted vertically, near the crank bracket. Its main features have already been referred to in our pages, but we may refer to the method of carrying away the

FIG. 49.—THE BAKER TORPEDO AT FULL SPEED.

exhaust. The usual exhaust pipe and box are dispensed with, and instead the exhaust box is ingeniously designed so as to be part of the motor itself.

The Firefly Motor Company are introducing a new two-speed, chain-driven motor-bicycle fitted with 2-h.p. engine set vertically in the frame.

The General Motor Car Company, Limited, displayed a 2½-h.p. motor-bicycle, fitted with a free engine, chain drive, and magneto ignition. The motor is mounted vertically in the lower angle of frame, in such a way that the latter is strengthened considerably. The speed of the motor is reduced by enclosed spur-gearing, the power being then transmitted through a chain and clutch to the rear wheel. The engine can thus be started before mounting, and kept running, although disconnected from the machine.

From the Emerald Isle came Messrs. W. R. McTaggart, Limited, with the "F.N." bicycle, so well known on both sides of St. George's Channel. The machine for 1903 is of 2-h.p. with the motor still in the vertical position, placed so that the distance between the pulley and the rear wheel is increased, as compared with earlier types. The frame is greatly strengthened, and the solid forged bridle protects the cylinder in an effective way. The other features of the "F.N." motor-bicycle are so well known that further reference is unnecessary. London readers will, in future, be able to see machines at 48, Wells Street, W.

The Kerry motor-bicycle was given a place on the stand of the East London Rubber Company. The engine is of 2½-h.p., at a speed of 1,400 revolutions per minute, the cylinder having a bore of 70 mm., with 80 mm. stroke. It is hung low in a loop frame and drives by a V-shaped Lincona belt. A float feed carburettor is fitted, a sight feed lubricator being also provided. In addition to the finished machine a large assortment of parts and accessories were on view, as well as a trailer of neat appearance.

McCurd's automatic motor-cycle "supports" have been previously described in the *Journal* as applied to motor-tricycles, and the same principle has now been extended to motor-bicycles.

Messrs. Dennis Brothers, Limited, are still turning out motor tricycles and quadricycles, specimens of which were to be seen on their stand. The quad had a 2½-h.p. De Dion with water-cooled head, and the Dupont two-speed gear. Messrs. Hewetsons, Limited, had on view a couple of the Hewetson motor-bicycles which have already been described in the *Journal*. Magneto ignition is adopted, while the carburettor and exhaust valve are controlled by a lever fitted on the left side of the handle-bar. A flat belt conveys the power to the rear wheel.

The Regina motor-bicycle introduced by the Ilford Motor-Car and Cycle Company, Limited, is fitted with a 2½-h.p. De Dion engine. The engine, which makes 1,500 revolutions per minute, is placed in a vertical position low down between the wheels. A solid V belt transmits the power. The De Dion float feed carburettor with throttle is fitted. A positive sight feed pump lubricator with an oil tank capacity said to be for 400 miles is provided.

The Weller motor-bicycle was shown late during the progress of the show. This is made with engines of 1½-h.p. and 2½-h.p. The motor has a mechanically operated inlet valve and an exhaust valve lifter. The carburettor is of the spray type, and the engine self-lubricating. Two batteries are provided, either of which can be put in circuit by means of a compound plug. The tank has a capacity for two gallons of petrol and two pints of lubricating oil. The frame is designed to allow the motor being fixed in a vertical position, still, however, retaining the triangular form of frame at the bottom bracket.

Westfield's "Autobike" was shown by the Rising Sun Motor and Engineering Works. The engine was of 2½-h.p., hung vertically in front of the bracket. Other types shown were an Autobike with a 2½-h.p. Kelecom engine, and a 2½-h.p. Auto-tandem. Accessories for motor-bicycles were also on view, including a non-spilling accumulator, float-feed carburettor for engines up to 2½-h.p., etc. The Leonard avant-train was shown at this stand. It is fitted with telescopic axle, and its pulp cane body upholstered in red morocco gave it a fine appearance. This excellent fore-carriage has already been illustrated in the *Journal*.

Mr. Douglas Cox showed the "Barter" motor-bicycle of Messrs. Humpage, Jacques, and Pedersen, Limited. This has a 2½-h.p. engine mounted vertically within the frame. A float-feed type of carburettor is fitted, and the transmission can be obtained by belt or chain drive.

Mr. F. Greville is introducing the Greville two-speed motor-bicycle, fitted with a 1½-h.p. motor located inside the frame. A round belt drives from a two-speed pulley on to a second pulley, which is mounted on an adjustable bracket. The bracket is fitted to the back forks. A small pinion gearing into a toothed ring is carried on the second wheel, which, being keyed to the hub of the driving wheel, reduces the gear as much as necessary. Mr. Greville also showed a motor-bicycle set adaptable to ordinary bicycles.

The "Royal George" motor-bicycle was shown by Messrs. Bransom, Kent and Co., Limited. The engine is a 2-h.p. Minerva, fitted with mechanical inlet valve and spray carburettor. A belt drive of V section is provided. A large range of accessories for automobiles was also on view, including the "Basse Michel" coil, the B.K. non-slipping pulley, the B.K. sparking plugs, lamps, horns, and the hundred and one articles associated with that branch of Messrs. Bransom, Kent and Co.'s business.

The "Rudge Wedge" motor-bicycle was shown by Messrs. H. M. Hobson, Limited, the type on view being fitted with a 1½-h.p. engine attached to the diagonal tube. A Lincona belt drive is adopted, as well as a surface carburettor, wipe contact breaker, and trembler coil.

The Bichrone Company showed a two-cycle engine for motor-bicycles, one cylinder acting as a pump and supplying gas to the other.

A good display was made by the Quadrant Cycle Company, Limited, special attention being directed to the 2 and 3-h.p. motor-bicycles. The motor is supported by three lugs on the crank case, the drive being by means of a Lincona belt. The Quadrant motor-tricycle shown on the stand was illustrated and described in our issue of November 29th last.

The "King" chain-driven motor-bicycle was exhibited by Messrs. W. King and Co., of Cambridge. This is made with a 2½ or 2½-h.p. Kelecom motor, a 3½-h.p. machine being also supplied for racing purposes.

At the stand of the Primus Motor Works were shown the "Ixion" two-cycle motors of 1½ and 2½-h.p., which were described in our issue of December 6th last, when a sectional drawing was given. The Morette safety motor-carriage, recently illustrated in our columns, was also on view.

The Bowden motor-bicycles were shown by the E. M. Bowden's Patents Syndicate, who also had on view levers demonstrating the Bowden method of power transmission, motor-bicycle frames, the "Bowden" lubricator, patent clutch hub, and new throttle. In one style of the latter a hollow piston is drawn up from a recess in the bottom of a well in the induction tube, closing it, and falling again when the wire is set free owing to the action of a spiral spring within the throttle. In another pattern the gas passes through the hollow piston, unless the latter be drawn up by the action of the wire. Then the side of the piston closes the supply pipe.

Mr. J. Van Hooydonk made a bold display of his "Trimo" and Phoenix motor-bicycles, the features of which have been made familiar to our readers. A new variable gear was also shown.

GENERAL.

The Aachener Stahlwaaren Fabrik, who are represented in this country by Messrs. G. Strauss and Co., Limited, had an exhibit which appealed more to the trade than to the motorist. It comprised petrol motors ranging in power from 1½-h.p. to 16-h.p. The firm are also engaged on the construction of a 25-h.p. four-cylinder engine, running at a normal speed

of 900 revolutions per minute. Among the various change gears displayed we noticed one giving three speeds and reverse, the top speed being direct on the arrangement adopted. Live axles, differential and bevel gears are other specialities of the Aachener Company, who are also now devoting attention to combination sets of petrol motor and dynamo for electric lighting purposes.

The motor-lawn motor shown at the 1902 Agricultural Hall exhibition, and illustrated in our issue of May 3rd last, was to be seen on the stand of Messrs. Ransomes, Sims, and Jefferies, Limited, who have made one or two slight innovations, of which the fitting of a radiator, in addition to the cooling tank, is the chief. The mower is now made with smaller cutting cylinders than the 42 in. (6-h.p.) previously shown, and examples of the 24 in. (2½-h.p.), 30 in. (3½-h.p.), and 36 in. machines are on view. The same machine can also be adapted for rolling cricket grounds, etc., and there is shown a mower, for Uppingham School, which by weighting the front rail—the cutting cylinder being removed—answers admirably for that purpose.

Insurance rates and conditions could be obtained from the stands of the General Accident Assurance Corporation, Limited; or of the Law Accident Insurance Society, Limited, both of which were in proximity to the stand of the *Journal*. Policies are issued indemnifying owners of motor-cars against accidental damage and accidents to the public; the same facilities being also extended to those in the possession of motor-cycles. Burglary, fire, etc., can also be insured against.

The "Twentieth" Century motor head, side, and tail lights drew attention to the South British Trading Company, who also showed the "Sterling" motor tool kit, consisting of a leather wallet in which are fitted about a dozen high-grade tools of daily use by motorists. Mr. Eugen Baedeker flashed his Helios paraffin headlights every night in excellent style, thus demonstrating the value of this special light. Paraffin being obtainable everywhere renders the lamp one that can always be depended on so far as the fuel is concerned. There is a glass chimney kept in a rigid position by means of a metal cylinder, held by a coiled spring. Thus any possible vibration is thwarted. A parabolic reflector is fitted, and having regard to the economy of consumption the result is certainly a very satisfactory illuminating power. Mr. Baedeker also had an acetylene lamp, and the specialities in motor-car and cycle lamps on this stand received careful inspection. A collection of motor-car horns completed the display. The new Blieriot lamp, "Eclairer Elliptique," was exhibited by Mr. Charles Bardies, to whose similar display at the recent Earl's Court exhibition brief reference has been made. In this ordinary calcium carbide can be employed should the firm's acetylene not be readily available. "Solar" lamps for motor-cars, though not enumerated in the catalogue, were staged by Messrs. Davis, Allen, and Co., the most powerful example shown being the Phare Solar Acetylene gas headlight. This has a candle power of 1,164, and is fitted with an independent generator, in which the water supply and the feed of gas are both controlled by one valve. Side and rear lamps on the same principle were also exhibited. Lamps formed the feature of the display of Messrs. Salsbury and Son, Limited, their over-lights and headlights being conspicuous, particularly one of the former, with an oval face. Petrol filter-spouts, funnels, sparking plugs, jacks, etc., were also part of the exhibit. About 150 "Ducellier" acetylene lamps were staged by M. A. Godin, the English agent for this excellent illuminating agency. It was fully described and illustrated by sectional drawings in our issue of June 3rd last, so that we need now only remind readers that the generation of the acetylene gas is entirely automatic, ordinary commercial carbide of calcium being used and giving a pure white light, which in the case of the lenticular "Phare Ducellier" is projected a distance of 165 yards. Every provision is made for cleaning the various parts. Paraffin oil lamps and motor horns of good design were also shown by M. Godin.

The Compound pump for inflating pneumatic tyres has been made familiar to motorists by Messrs. Hedley S. Hunt and Co. This is also useful for obtaining air pressure in the petrol tanks for the self-starters of the Serpollet cars. The next stand was occupied by Messrs. W. H. Wilcox and Co., Ltd., who had a display comprised in the description of "general motor engineers" stores, including water lifters, gauges, valves, and steam fittings, jacks, spanners, etc., the Penberthy injectors for supplying steam-car boilers, driving bands, etc. The Wilcox semi-rotary motor pump was on view, and attention was also directed to the Jones-Wilcox patent wire-bound hose, which is being largely used in connection with motor-cars. Having no rubber in its composition, it will not deteriorate or perish, and it is claimed to last longer than ordinary rubber hoses.

Lubricating oils, greases, belting, etc., provided the substance of Mr. P. Lawrence's display. He is evidently watching motor-car developments, and his special oils, etc., are certainly suitable for their particular uses. Price's Patent Candle Company, Limited, have been content to maintain the standard of their original preparations for motorists rather than extend the variety of their specialities. The productions already familiar to our readers were, therefore, the staple part of their exhibit, which included lubricating oils for cylinders and engines, the Belmoline solidified oil for gearing and axles, the Battersea gear oil for change speed gear, etc. Messrs. Stern Bros. are developing their business in automobile lubricators and lubricants, and had a large assortment of greases and oils of good constituency, as well as Rusticide, Fernbicide, Universoline, and similar specialities. Various "Vacuum" oils for motors were shown by the Vacuum Oil Company, Limited, who also had an extra "Hecla" cylinder oil on their stand. The "Pony Rochester" automatic lubricators for steam cars, oil cabinets, sight oil feeders, etc., were also on view.

Of strictly utilitarian import was the collection of door furniture for

carriage bodies on the stand of Messrs. Lowe, Bevan, and Co. A new hinge allowing the door to swing back at a very wide angle without unduly protruding itself, is of interest to carriage builders, while a small lock to doubly secure the door is of importance to all who ride. Spring clips, handles, etc., were shown, as well as an assortment of fittings in Perfecta silver, and of various kinds of motor lamps. The Perfecta metal is one-third the weight of brass, and being claimed to keep its excellent colour despite climatic changes and hard wear, is admirably suited for the purpose.

Chains were shown by Messrs. Brampton Brothers, who also exhibited chain wheels, pinions, and milling cutters. Special attention is being drawn to the 2½ in. pitch compound chain. The Coventry Chain Company were also represented in this section, their display including a new belt in which fibre is fitted in a chain. Compressed felt and raw hide can also be introduced in a similar way. Specimens of the motor roller chain fitted to the latest Royal Daimler car, with the bushes an integral part of the side plate, were also on view.

Detachable brougham tops were shown by the Long Acre Motor-Car Company, Limited, the special point being the adaptability of the arrangement in connection with any type of automobile. The top is fitted with all the accessories necessary to make it as comfortable as an ordinary private brougham, while the windows can be raised or lowered at will. Carriage work was shown by Messrs. Hayes and Son, of Stamford—a long-established firm of van builders. Mr. A. Meier, of Redhill, had a good type of *tonneau* body painted in cream colour picked with green, the whole having a good effect. Another Southern firm, the Brighton and Sussex Motor and Carriage Works, showed three examples of coachbuilding, a well-designed *tonneau* car body, a body of the Limousine type, and a round-cornered governess car. In this no aluminium is used, mahogany panels being substituted and enhancing the appearance of the car in no small degree. Artillery wheels as well as bodies were displayed by the Mulliner Motor Body Company, of Accrington. A Limousine body for a steam car fitted with a movable top was a central feature here. This has a canopy over the driver's seat and a wind-glass in front. A phaeton body with a good serviceable canopy was also exhibited by this northern firm. Messrs. Savage Brothers, Limited, who are entering into the construction of heavy motor vans, were represented by their smaller manufactures, reserving their steam lorries, etc., for the forthcoming exhibition at the Agricultural Hall. The motor wheels shown were of the artillery pattern, one having bosses on the spokes for carrying the sprocket wheel or brake drum, and another being fitted with special bosses on the spokes to suit the sprocket and brake when attached to the hub of the Humber pattern. A good sound workmanship characterises these productions. Messrs. Thrupp and Maberley had several car bodies of good design, in which every detail had been considered. The "Duchess" Co.'s bodies for cars are attaining much popularity, as they can be readily adapted to any *tonneau* body, transforming it into a closed brougham. They were shown fitted to 8 and 10-h.p. cars, and the care with which the details have been thought out is very noticeable in the result. The parts forming the brougham top are folded together and lowered into a rectangular space, with a width of about six inches, behind the driver's seat and well out of sight.

Tubes of the "Old Weldless" brand were exhibited by the Weldless Steel Tube Company, Limited, the manufactures including steel cylinders, exhaust coils, steam coils, flash boiler coils, motor steering tubes and frame tubes, motor axles, and motor-bicycle handle-bars and fork sides.

An oil economiser suitable for private users was on the stand occupied by Messrs. Joseph Kaye and Sons, Limited, who also showed seamless copper, brass and steel petrol squirt oilcans of good design and finish. The Jack de Lux was exhibited by Messrs. J. G. Statter and Company. It closes down to such a short length that it may be used with voiturettes; while when opened it reaches to a length that it is applicable to large cars, two concentric steel screws, one working within the other, securing these advantages.

Messrs. S. Smith and Son, Ltd., have become almost universally familiar among motorists, their timepieces, speed indicators, chronographs, clocks, etc., keeping reliable time and occupying a minimum of space on the car. An electrically lighted motor timepiece was appreciated by visitors who indulge in evening rides. A new instrument on the stand was a combined motor chronograph and speed indicator recording speeds varying up to 120 miles an hour, evidently just the thing for the county constabulary.

The Eisemann system of high tension magnet ignition was demonstrated at the stand of Messrs. G. T. Riches and Co. This device was illustrated in the *Journal* on December 6th last, and takes the place of the accumulator and contact breaker and only one coil without trembler is used, no matter the number of cylinders used. Accumulator charging sets, spare parts for all the leading cars, carburettors, auto-tremblers, etc., were shown, the firm also drawing attention to their stocks of high-tension wire and electrical accessories. Messrs. Riches and Co. are devoting much study to the requirements of motor-cyclists, and that portion of their exhibit was not the least attractive. The Electric Battery Co. showed accumulators for electric ignition, and directed notice to a new grid for holding the active material. Sparking plugs, etc., were also shown. Lithanode accumulators for ignition purposes were exhibited by Longstreths, Ltd., who will fit the accumulators in the Star car which is to run in the Eliminating Test in connection with the Gordon Bennett race. Mr. H. Waterson demonstrated his enterprise by showing the new "E. H." honeycomb radiators. British made induction coils, electrical switches,

terminals, etc., were also shown, as well as an attractive collection of motor-horns, goggles, English-made motor-gloves, clocks, pumps, jacks, etc. A new trembler coil attracted much attention, securing such a rapid succession of sparks that an apparently continuous current is obtained.

The "P.M." contact-breakers and plugs were conspicuous on Messrs. Peto and Radford's stand who demonstrated how electrical ignition is maintained, even though the breakers are filled with oil and grease. The breaker has a cam of insulating material, with a metal projection embedded in it and protruding at the edge. This projection is in connection with the metal frame of motor, and is made the negative pole. The positive pole is connected to an outside terminal, in connection with a metal buffer, which works in a sleeve, and is kept highly pressed on the cam by a strong spring inside the sleeve. The cam being slightly eccentric, makes a hard rubbing and clean contact, as it revolves and passes under the metal buffer, whilst during the time it is not in contact the metal buffer is pressed tightly against the insulated portion of the cam. The effect of this causes an absolutely reliable contact every time; the cam also cleans itself, and cannot work loose by vibration. "P. and R." accumulators in celluloid and ebonite cases, "armoured" accumulators, voltmeters, inductions coils, etc., were also on view.

The East London Rubber Company showed a representative and comprehensive collection of motor-car parts and fittings, including the "Miller" lamps. They also had a *chassis* fitted with a 6-h.p. De Dion, and demonstrated their capacity to meet all the requirements of motor-car builders.

An interesting display was made by the Begbie Manufacturing Company, whose exhibit comprised many components of general interest. A large show of Aster engines was made, including the new 16-h.p. four cylinder type, at 950 revolutions. This is fitted with a wipe contact breaker, comprising a spring-controlled roller, which rolls against the inner periphery of the outer case. This is insulated, and has phosphor bronze introduced at various points of its circumference to correspond with the number of cylinders employed. The Aster air-cooled 2½-h.p.

FIG. 50.—THE ASTER CHANGE-SPEED GEAR.

engine for motor-bicycles has been re-introduced to meet the demand for an engine powerful enough to take a trailer anywhere, and the ignition is identical with that fitted on all Aster engines up to 9-h.p. The Aster three-speed gear (Fig. 50) and reverse, with differential and clutch, was shown in the 6½-h.p. and 12-h.p. sizes. Other exhibits included new patterns of Begbie-Audin radiator, electric lighting sets, tanks, bonnets, etc.

The displays made by the United Motor Industries, Ltd., at exhibitions are always interesting, and their stand at the Crystal Palace had several features worth mentioning. Among many useful accessories known under the trade name of the "Castle" were accumulators fitted with a new plate, which is so constructed that the active material is held in an unbroken line from top to bottom of the plate, and yet secured most effectively. The result is that a maximum of active material is held in the plate and the value of the "Castle" for ignition purposes is considerably enhanced. Acetyloid lamps were shown in variety, a new model of good appearance being designed for cars of the 6 or 8 h.p. De Dion-Bouton type. It gives two powerful lights. An ample generator is provided, to be placed under the seat or the bonnet. "Castle" horns, voltmeters, plugs, etc., were shown as well as new honeycomb radiators, "Henry" lubricators, Longue-nare carburettors, "Empress" jacks, "D" and "P." oil, and the "Castle" change speed gear for 10-h.p. cars, etc. In connection with the Basse and Michel coils the new high speed trembler was shown, and a new model with a voltmeter attached. Reference to a new tyre shown on this stand is made in our concluding report on tyres.

Since its introduction a few months ago two important alterations have been made in Williams's counter-skid, which was shown fitted to a Daimler car. The discs are larger than was formerly the case, and are

set at a different angle, securing a more effective result. The counter-skid is an attachment to the back axle of a car, and consists of two hinged brackets, which can be raised or lowered at will. The lowering is done in an instant by the touch of a lever at the driver's elbow. The raising, which is done when danger is passed, is accomplished by turning a small hand-wheel close to the brake handle. At the end of each bracket is a revolving saucer-shaped disc, which, when any tendency to side-slip occurs, engages instantly and automatically with the road surface and checks it.

Messrs. Philip and Co. showed the "Lux" cars as well as a large range of engines, parts, motor axles, springs, speed, steering and differential gears, motor artillery wheels, radiators, lubricators, etc., and accessories of every description.

Several good things were shown by the Automotor Accessories Company, including the caloric heater which, having been placed in hot water

FIG. 51.—THE BAILEY "WON'T SLIP" TYRE.

for about a quarter of an hour, will remain warm from six to eight hours. Sprags, accumulators, roller bearings, odometers, etc., found a place on the stand of this company.

A large display was made by the Simms Manufacturing Company Limited, including the "Welbeck" frame, which is built to take any make of engine. It is made in two sizes, No. 1 taking the 6-h.p. single-cylinder or 10 h.p. twin cylinder Simms motor, and No. 2 the 20-24 h.p. or 30-35 h.p. four cylinder motor. This chassis has a wooden frame with tapered fitch plates, the motor being carried on channel inner frames supported by brackets. Working models showing the high tension and low tension systems of magneto ignition were also shown, as well as a collection of motors with one, two, and four cylinders ranging from 2-h.p. to 24-h.p.

Messrs. Van Raden and Co.'s specialties made an effective display, including accumulators, voltmeters, charging boards and dynamos, sparking plugs, tremblers, and non-trembler coils, etc. A watch-pocket voltmeter for motor-cars and accumulators was included in the collection.

Messrs. R. Melhuish, Sons, and Co. had a large collection of tools and appliances for motor-car work as well as fittings for automobiles.

Stauffer's lubricant, special lubricators for cars, split grip pulleys, etc., were shown by Messrs. Trier Bros., who drew special attention to their grip belt pulley for motor-bicycles. The special point in the construction of this pulley is that the outside flange is moveable on a universal joint.

Aluminium alloy castings made a bold show on the stand of Messrs. Walter Mills and Co., of Sunderland, who have every facility for the efficient production of such goods. Here were crank cases for petroleum-spirit motors up to 70 h.p., silencers, water-jacket cases, bonnets, etc., in aluminium, and we understand that the firm have made contracts with many leading makers of automobiles for 1904, as well as for 1903. The Birmingham Aluminium Castings Company, Limited, also made a good display of aluminium castings for cars, motor-bicycles, etc. Gear and crank case chambers, steering wheels, and levers were comprised in the collection.

Steel frames formed the humble but useful exhibit of Messrs. Rubery and Co., whose works in South Staffordshire are being equipped with a plant for making pressed frames for light cars. They showed motor-car and wagon frames, pressed steel channel shaped and ordinary flat fitch plates, as well as angle and tee sections used in the construction of motor-car frames. A collection of "Castle nuts," bolts and nuts, set screws and studs completed this eminently utilitarian display.

CLOTHING.

Many visitors took advantage of the electric stairway to reach the gallery where clothing firms were congregated in neighbourly proximity. Messrs. A. Dunhill and Company had a large display of garments and motor accessories, a mere category of which would occupy considerable space. Among the novelties is the ladies' fan, mentioned in our report of the Stanley Automobile Show, and which is shortly to be made with mica as well as in the present serviceable gauze. Leather clothing of every variety was displayed, including "Regent" leather jackets and coats for the use of gentlemen. Umbrella coats, aprons, caps, gloves, overalls, etc., were a considerable factor in the firm's display; while seal-skin and foal-skin coats proved an attractive feature, vying in interest with the "Ideal" clothing, in which motorists' garments are made to appear like ordinary raiment, an interlining of leather giving the necessary wind and wet resisting qualities. Mr. T. H. Holding's exhibit of motoring garments was worth a visit, and as he makes his own leather from the skins, he, naturally, lays emphasis on its excellence. The "Ayrshire" coat was shown as well as kangaroo leather vests, a motoring apron for two persons, and other specialties in which Mr. Holding's practical knowledge is fully exemplified. From

Southampton, Messrs. G. W. Batten and Sons came with two special lines—one of which is burdened with an unnecessarily long name, viz., the "Notatidignum" coat, in which, by an ingenious arrangement of the lapels eight thicknesses of leather are provided as protection to the chest, the coat otherwise being inconspicuous, and therefore acceptable to the motorist who abhors the grotesque costumes which were affected in the early days of the pastime. The "Pantrug" was also shown by Messrs. Batten and Sons, this being an adaptation of the rug and trouser idea. A "motocote" of good appearance was shown by Messrs. Thomas and Son, which cannot slip off the knees when the wearer sits down, and effectually protects the body and legs against even the stormiest weather. The exterior cloth is waterproofed by the firm's own process—a process which has also been applied to gloves for motorists, and to veils for ladies. A "Surtout Militaire" is a coat that will appeal to lady motorists, its general appearance being smart and ladylike. The method of buttoning round the neck is decidedly good. Waterproof clothing was the feature of Messrs. Abbott's display, which included patent aprons with a V-piece, ensuring comfort when driving, as well as convenience when walking. They had also a "Daimler" overcoat and a "Relta" light coat—both possessed of waterproof properties. Car covers, rubber mats, hat covers, and a miscellaneous collection of such goods were also shown. Leather clothing—leggings, gaiters, overalls, coats, etc.—constituted the display made by Messrs. Gibberd, and then three well-known tailors and a new comer in this department completed the tour of the Tailors' Gallery at the show. Messrs. Salsbury and Co. have entered the lists, and at their Long Acre depot are now running a clothing department, which was represented in a corner of the show. Messrs. Hoare and Sons had a good display, embracing the "Trowbridge" surtout for ladies, automobile waistcoats with sleeves, motor-cycle suits, the "Mota perfecta" and "pioneer" motor coats, the "Rex" motor-car and all-wool clothing for lady and gentlemen motorist. Attention was specially directed to the new combination livery suits, comprising coat, jacket, and trousers as supplied to the Viceregal Lodge, Dublin. Messrs. J. W. Lovegrove and Co. had a large display, in which raiment and accessories mingled with good effect. Many were the inquiries for the "Drimosit" rug, to which reference has already been made in these columns. The "Ideal" overcoat was also shown, this being recommended as a rain defying garment that gives no loophole to the most abusive weather. Goggles, boots, gauntlets, caps, masks, and the hundred and one other "incidentals" required by the motorist were shown by this well-known Piccadilly firm. Complete motor outfits formed the staple part of Mr. C. R. Base's exhibit—the basic portion, if we may say so, of an interesting display. Recently we referred to the specialties of this firm, and it now only remains to be said that good workmanship as well as excellent style are factors in the success that has been attained.

TYRES.

On the stand of the Clarkson and Capel Steam Car Syndicate were shown samples of the Bailey "Won't Slip" pneumatic tyres (Fig. 51), for which they have secured the sole rights in this country. It is claimed for these tyres, which are of American manufacture, that they prevent all slipping and skidding. Mr. Clarkson informs us that the $\frac{3}{4}$ in. bosses of which the tread consists show no appreciable wear after 1,000 miles of running, and that the tread entirely obviates side-slip.

The Double Arch Tyre Company's tyre is of the familiar appearance, having a thick rubber arch inserted according to the usual practice. Right through the rubber, however, is a tunnel, in which, bearing on the rim, is a smaller tyre. It is claimed that this double arch tyre is a happy medium between pneumatic and solid tyres. It is so filled in the rim that it cannot creep, and side pressure only causes it to grip the tighter. It keeps its resiliency till it is worn close to the rim.

Late in the week a new tyre was placed on the stand of the Clipper Company, which, had it been on view earlier, would have been made the subject of much inquiry. This is being made by the Continental Caoutchouc and Gutta Percha Company, and at their works in Hanover and on the German highways it has been submitted to a series of tests which have demonstrated its property of reducing side-slip to a minimum; in fact, it is claimed to obviate it altogether, a point upon which the experience of English users will shortly be available. The tyre is fitted with a flat tread extending all round the tyre. In the centre of the tread is embedded corrugated metal discs, 1 in. diameter and about $1\frac{1}{4}$ in. apart, which discs are entirely vulcanised into the rubber, and lay flush with the tread itself. They can be replaced when the corrugations are worn down, by new ones, which are screwed into the tread in an easy and secure way. The corrugated surface of the discs performs the usual service of considerably reducing the chances of slide-slip.

The new armoured device for motor tyres of the solid rubber variety was shown by the Buckingham Steel Faced Tyre Company. This is really a solid rubber tyre upon which are projections of rubber, the spaces between these being fitted with rim plates, which complete the circular form of the outer side of the tyre. The armoured portions of the tyre are attached to the wheel by a flange projecting inwardly, and secured under the outwardly turned edge of the rim of the steel tyre.

THE Jehu Motor Company, Limited, has been registered with a capital of £1,000, and offices in Brooke Street, Holborn. Messrs. C. Clayton and J. C. Clarke are the first directors.

THE ABUSE OF THE MOTOR-CAR.

NEXT to a correct knowledge of how to use a motor-vehicle is a knowledge of how not to use it, and many otherwise good drivers do not possess this latter knowledge. The result is that they abuse their vehicles unnecessarily, and do damage to the vehicles not only needlessly, but recklessly, and then sometimes complain because repair bills are high. As an example of this abuse, recently an owner of a two-seated car wished to make a trip, taking with him four ladies, and, being unable to borrow a four or six-seated car for the occasion, he mounted a temporary seat on the front end for two, put the other two in the main seat with himself, and the whole party proceeded on their journey merrily. The fact that the vehicle carried the load does not prove that it was the proper thing to do, for a two-seated car is certainly overloaded when four are carried, while five becomes an abuse. Either we must assume

man, pleased with the power, speed, and staunchness of his car, is, in this strenuous age, inclined to get a lever in each hand, a pedal under each foot, the steering wheel in his teeth, and "let her go," regardless of consequences. Fortunately, as we get more experienced drivers we find them discouraging this sort of foolishness.

A further form of abuse is needless "racing" of the motor. The experienced driver does not, as a rule, throw the throttle wide open and let the motor try to fly out of the car while he puts on his gloves or attends to some other little errand before starting, but, on the other hand, he takes a pride in making each turn of the motor carry him as far as possible, to the saving of fuel, noise, vibration, and odour, and at all times aims to keep the motor running at the lowest practical rate of speed.

Coupled with the racing motor is the sudden clutching abuse practised by the new man. With the motor running at high speed a sudden application of the clutch will cause the vehicle to

DIFFICULTIES OF LOCOMOTION IN PORTO RICO—A LOCOMOBILE FORDING A STREAM.

this, or that the springs and similar parts were much too stiff and heavy for the two passengers for which the car was designed, remarks a writer in the "Automobile Trade Journal." The feeling that there is ample power, and that the motor does not care, is largely responsible for this tendency to abuse the motor-vehicle, for very few drivers would attempt to load five passengers in a two-seated horse-drawn trap, and if they did, the trap would not stand it long. The result of such abuse is likely to be a strained spring, wheel, or axle and a breakdown at some future time, dating its beginning from this strain.

A second form of abuse is due to the driver's laziness. Rather than take the trouble to slow down or lift out his clutch he will bump over a newly metalled road without slackening speed, thus subjecting his car to damaging shocks needlessly. The horse-vehicle driver by years of experience has learned better and does not do this, and the experienced automobilist, having paid many repair bills, is likewise apt to do better; but the new

jump forward or backward, as the case may be, straining all parts of the driving gear, and moving the car so quickly that persons to the front or rear are more or less in danger. Possibly such abuse is frequently due to the inexperience or ignorance of the proper way, and it seems more charitable to assume this. The experienced driver takes a pride in moving away without a jar or jerk, and this is as true in driving a motor-car as in handling a locomotive.

THE Bradford Corporation has lately put into service a motor telescopic tower for the inspection and repair of the overhead wires in connection with the electric tramways. The car, which was supplied by Messrs. G. F. Milnes and Company, Limited, carries, in addition to the telescopic tower, all the necessary tools, and is thus ready to be instantly despatched to the scene of a breakdown.

HERE AND THERE.

THE Gillet-Forest Company, of St. Cloud, near Paris, are building a 80-h.p. motor.

THE Frankfort Automobile Club will hold a series of track races on the 30th August next.

THE Anglo-American Motor-Car Company, Limited, has been registered with a capital of £20,000.

THE "NAPOLEON" CAR.

THE Northumberland County Council is making a reputation to the Local Government Board in favour of motor-cars carrying distinctive numbers.

THE postal service between Amsterdam and Haarlem, and Amsterdam and Utrecht, was recently carried on by automobiles, owing to the strike which occurred among the railwaymen on the Dutch railways.

THE Portuguese War Office has adopted the Locomobile for the use of officers. These machines have been used for some time by staff officers while making their tours of inspection among the several fortresses of the kingdom.

AN illustrated catalogue has been issued by Messrs. G. Straus and Company, Limited, giving illustrations and diagrams of the "Fafnir" petrol motors, speed gears, axles and accessories, as manufactured by the Aachener Stahlwaaren Fabrik, for whom they act as sole agents for England and the Colonies. The engines listed range from 1½-h.p. to 16-h.p. Motors for stationary use are also included, a petrol motor being shown coupled to a dynamo for electric lighting purposes.

WITH reference to the case at Marlborough Street, London, reported recently under the heading "Learning to Drive," the Motor Manufacturing Company, Limited, furnish us with the facts leading to the arrest of the accused. It appears that on the morning of the 23rd ult., Mrs. Hood informed the company that her husband's motor-car, a 7-h.p. M.M.C., had been stolen. About 5 o'clock in the afternoon the said car was brought to their premises in New Bond Street by A. Billings, who stated that he wanted certain things. [He was thereupon advised not to move from the spot if he valued his liberty, and Mr. Hood was sent for. That gentleman eventually arrived with two Scotland Yard officials, and the sequel was told in our issue of a fortnight ago.

THE Dudley, Stourbridge and District Electric Traction Company is using a 12-h.p. petrol motor-car for inspection purposes in its district. It has been in use since the beginning of December last, in all weathers, and is, we hear, giving great satisfaction.

A STRAKER five-ton steam lorry is now being used at Mr. J. Sweet's quarries at Liskeard.

THE Mayor of Southport, Mr. T. L. Scarisbrook, is a motorist, being the owner of a 12-h.p. Daimler.

FOR not stopping when requested to do so by the driver of a restive horse, S. Girling has been fined 23s., including costs, at Devizes.

THE *Journal* has not yet started a humorous page, but the following extract of a "technical" description of a locally built petrol car, from the pen of a special contributor to a Lancaster newspaper, should afford some amusement to our readers:—"Everybody knows that a motor-car has to store water to keep the working parts cool. A motor works at something like 1,500 revolutions per minute, so it is easily understood that there is friction and heat combined unless you are careful." The writer in question then goes on to describe how half a dozen years ago he rode on a motor-car from Skipton to Lancaster. "We carried eighteen gallons of water to keep the machinery cool, and every twenty miles we had to stop for more. . . . No more need for such midnight adventures. The new car only carries two gallons of water, yet it is quite sufficient. . . . The difference is due to the presence of what is known as a 'radiator.' I can hardly explain what that is, except to say that the water is sent along and through a great length of pipes, and that, being brought in contact with such a great area of pipe, it never becomes hot. The motor is connected up to the axles by a live axle, and thus all the machinery is right in front."

WITH a capital of £15,000 the Petrol Motor Power Company has been registered to adopt an agreement with Messrs. Davis, Allen and Company, Limited, and to deal in motor-vehicles, accessories, etc.

THE death is announced of Mr. James Glaisher, who in the sixties made several notable balloon ascents. In 1862 he made an ascent from Wolverhampton and succeeded in reaching an altitude of five miles.

CHASSIS OF "NAPOLEON" CAR. (See page 968.)

THE Locomobile Company are, we hear, bringing out a steam tonneau car.

AN attractive catalogue has been issued by the London Motor Garage, Limited, which should do much to educate the public as to the "Magnet" and "Pipe" cars, which are splendidly illustrated in colours. Particulars are also given of the company's tariff for storing cars, as well as for washing, lubricating, and other services. Repair work is also undertaken by the London Motor Garage, Limited, as well as the supply of spare parts, accessories, etc.

AN automobile club has just been formed at Magdeburg, Germany.

WE hear that some local agriculturists are arranging for their produce to be carried between Honiton and Tiverton Junction, in Devonshire, by means of motor-cars.

THE COTTEREAU 10-H.P. TONNEAU. (See page 968.)

LAST week the King's motor-car, which had been sent on to Chatsworth, in view of the contemplated visit of His Majesty to Derbyshire, was housed by Mr. W. S. Laycock, at Sheffield.

THE Wilkinson Tyre and Tread Company inform us that their street letter-box has been periodically robbed for the last few weeks, and ask us to request those who have not had replies to correspondence to write again.

FROM Mr. G. Braulik, of 217-218, Upper Thames Street, E.C., comes a catalogue of the "Protos" motor-car accessories, and an invitation to our readers to visit his showrooms to inspect the chassis and cars there on view. Drawing and descriptions of the motors, speed gear, axles, carburettors, etc., are given as well as of the smaller accessories incidental to the car.

THE Directors of the New Grappler Pneumatic Tyre Company, Limited, report that the motor tyre business is steadily increasing. During the three closing months of the year the motor tyre orders increased over 50 per cent. as against the corresponding period for the previous year, and since the accounts were closed on September 30th last orders have been greater for the three months by one-fifth than for the previous twelve months.

ON Tuesday week the foundation stone of the new offices and works of the Clarendon Motor Car and Bicycle Company, Limited, Earlsdon, Coventry, was laid by Mrs. A. E. Ramsay, of Kensington, W., in the presence of the directors of the company and a large gathering of friends. Mr. W. G. Hammon, manager, informed our representative that the new premises would give them much-needed room for a larger and increased output. Among those present were Messrs. M. Standbridge (Birmingham), Johnson (King's Lynn), Hillman (Norwich), W. Perrott (Australia), and Gompertz (Bedford).

FROM an American contemporary we learn that the Century Motor Vehicle Company, Syracuse, N.Y., has made arrangements with Messrs. R. Reynold Jackson and Company, of Stirling's London Automobile Agency, Knightsbridge, to have the exclusive sale of the Century Tourist petrol cars in Great Britain and Ireland for the coming year.

THE Parsons Non-skid Company, Limited, has been registered with a capital of £2,000 to carry on the business of makers of indiarubber and other tyres, etc. The first directors are Messrs. H. Parsons, H. Edmunds, W. J. Crampton, and P. E. Singer. The registered office is at 2, Queen Anne's Gate, S.W., and there will be no initial public issue of capital.

MESSRS. J. E. HOPKINSON AND COMPANY, LIMITED, send a price list of their motor-car tyres from their works, 121, Cromer Street, Gray's Inn Road, W.C. Prices are quoted for building up wheels on customers' own hubs and flanges, for tyreing and rubbering wheels with clinched rubber tyres, and also of inner tubes and outer sections. Drawings are given showing wired-on and clinched rubber tyre sections.

AN Automobile Exhibition is to be held in Stockholm, Sweden, in May next. The exhibition is intended more especially for motor-carriages and vehicles for industrial purposes, but will also include motor-cycles and their accessories. Applications for space must reach the Directorate of the Exhibition, Idrottsparc, Stockholm, by the end of March. We hear that a number of French and German concerns have already arranged to be represented.

THE Roots Oil Motor and Motor Car, Limited, have removed from Westminster Bridge Road, to Chicheley Street, York Road, S.E.

MR. G. F. RANSOME, of Liverpool, referring to recent offers of encouragement to locally-built motor-cars, says he is certain he can make a motor-car to withstand ten years' work without undue repair.

THE "PRIMUS" 5-H.P. VOITURETTE. (See page 970.)

MESSRS. F. F. WELLINGTON, LIMITED, have been appointed sole agents for the Brooke cars.

MESSRS. DE DION AND BOUTON, of Puteaux, near Paris, are at present engaged on the construction of a submarine boat, on the lines of the Goubet.

CORRESPONDENCE.

INLAND REVENUE METHODS

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In June last we opened an establishment as motor engineers for repairs, etc. About the middle of August a young man of respectable appearance presented himself at our premises, making all kinds of inquiries as though he was a possible purchaser of a car. About a month later he came again, making further inquiries, and closely followed by another person, and then they revealed themselves as Inland Revenue officers, and demanded from us the names and addresses of the owners of the cars which they saw before them in a tone and manner which we felt called upon in a measure to resent. The cars were with us for repairs.

On Saturday last our Mr. George Thornton was summoned to the Westminster police-court for keeping a carriage—i.e., a motor-car—without a license. And here comes the remarkable part of the case. The summons charged him with using a car for pleasure on September 19th. Now the only car outside our place on that date was one calling for some trifling repair, which was done in less than half an hour, and the car then proceeded on its way. But the vehicle in respect of which the summons was really taken out was seen by us for the first time and came into our hands on the morning of September 20th for the purpose of selling, and after giving our client a trial run the car was sold on that date, and for which a license has been taken out.

At the police-court the officer's only evidence was that on September 19th he saw a car outside our place covered in mud. He subpoenaed our client to give evidence. He did so with pleasure, confirming our statement in every particular. The magistrate dismissed the case, telling the officers it was no use taking such a case there without evidence.

Others may possibly find themselves in a similar position to the one here stated, and perhaps we may have an opinion from your readers as to whether they are required to reveal the names and addresses of their customers.—We are, obediently yours,

J. THORNTON AND SONS.

CARS FOR MEN OF MODERATE MEANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had a 10-h.p. Wolseley car with solid tyres about eighteen months, and always drive and do everything required to it myself. I have ample time, and a small engineer's workshop. The car is used for pleasure only. The cost from January to December, 1902, was as follows:—Petrol, 208 gallons, £12 10s. 6d.; recharging cells, two new cells, plugs, etc., £4 11s. 10d.; re-insurance, £10; my time at repairs (not upkeep), say 1s. per hour, 90½ hours, £4 10s. 6d.; repairs by others, £5 5s. 1d.; miles run in the year, 3,389; total cost for the year, £46 11s. 9d.

No allowance has been made for depreciation or my time in cleaning and adjusting. Running a car is just like running a yacht in one respect—one can spend almost anything on it, as witness Captain Campbell's description of his way of doing it; the above is my way of doing it. Each to his choice. My card is enclosed.—Yours truly,

WESTON-SUPER-MARE.

THE EXHIBITION QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The committee of the Automobile Mutual Protection Association, Limited, will be much obliged if you will give publication to the following warning in your next issue of the *Motor-Car Journal*.—Yours faithfully,

GEO. R. HELMORE, Secretary.

The Committee of the Automobile Mutual Protection Association, Limited, strongly advise members of the Association and the trade in general to refrain in their own interests from signing the bond attached to a document which has been issued by the committee of management of the Crystal Palace Automobile Show, stated to be the official show of the Society of Motor Manufacturers and Traders, Limited. The agreement in question purports to be between any company, firm, or person of the one part, and the Society of Motor Manufacturers and Traders, Limited, of the other part, and its terms are of so onerous and stringent a character that those who sign it may find themselves liable in heavy damages.

The Association views with great disfavour the attempt to boycott all shows other than the Crystal Palace Show. The trade should be unrestricted in their right to exhibit at any show they may choose to exhibit at. The terms of the bond in question are unjustifiable in the opinion of the Committee of this Association, and tend to hamper and restrict the trade in general and individual members of it in particular.

By order of the Committee of
THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION, LIMITED.

AN old resident of Bromley (Kent), suggests that drivers of motor-cars passing through that district should, even if their time is urgent, moderate their pace somewhat in the bye-roads and lanes off the main roads.

CLAIM FOR DAMAGES.

His Honour Judge Parry was the witness of a collision in Cross Street, Manchester, recently, as to which an action has just come before him in the Manchester County Court. As it happened there was no question of liability, the defendant failing to appear. The plaintiff was Thomas Wood, cab proprietor, and the defendant Mr. H. S. Buckley, of Wrycroft Hall, Audenshaw. The plaintiff was driving his cab when the defendant ran into him with a motor-car, doing serious damage to his cab. He consequently claimed £23 10s., the cost of repairs, etc. Judgment was given for the plaintiff for the amount claimed.

FATAL MOTOR-CAR ACCIDENT.

MR. WATLER SCHRODER, deputy coroner, held an inquiry on Saturday, at Hampstead, respecting the death of Mr. George Edward Colebrook, forty-two, an Australian merchant. It appeared that on the previous Sunday Mr. Colebrook went for a motor-car ride with his brother-in-law, being also accompanied by the owner of the car and a professional driver. There had been a sharp fall of snow and hail, and the roads were in a bad state. When attempting to pass at a moderate pace another car near the Royal Oak, Hendon, the hind wheels skidded, the car turned round and ran against a raised footpath, and then tilted over. Mr. Colebrook received severe injuries to his head, and died two days later from concussion of the brain, having been unconscious the whole time. His brother-in-law (Mr. Brooks) received a fractured arm and other injuries, and was too ill to attend the inquest, but it was stated that he had said there was no blame attaching to the driver. The jury returned a verdict of accidental death.

THE Marquis of Exeter has ordered a 20-h.p. Pick tonneau car.

A SCARCITY of petrol is being experienced in several places, and local agents would do well to keep their stocks well replenished.

MESSRS. W. R. McTaggart, Limited, Dublin, have opened a depot in London at 48, Wells Street, Oxford Street, W., for the sale of F.N. motor-cycles.

A SECTION devoted to automobiles is being organised in connection with the International Exhibition at Athens, to be held from April to October of the present year.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, FEBRUARY 21, 1903.

[No. 207.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON the afternoon of Saturday last the Yorkshire Club held their second run of the season, the venue being Knaresboro', a distance of some eighteen to twenty miles from Leeds and about twenty-four from Bradford. The day was very fine for the time of year, and the roads were in excellent condition; the wind, however, was very boisterous. Fourteen cars arrived at the Elephant and Castle Hotel, Knaresboro', before 4 p.m., some travelling via Harrogate and others via Follyfoot, in the latter case having to climb the steep hill (Brigate) into Knaresboro' (locally reported to have a gradient, in some places, of 1 in 6, though, from the way in which most cars negotiated it, we should think one in eight or nine is nearer the mark. Among those participating in the run were Messrs. H. R. Kirk, Dougill, Faiers, Broadbent, Jones, Woolf, Armitage, B. Walker, Wharam, Nicholls, Mortimer, W. F. Greenwood, H. A. Jones, and Dix, Mr. and Mrs. Harrison Benn, Mr. and Mrs. Atkinson, Mr. and Mrs. Bruce, Mr. and Mrs. Rowland Winn. After tea opportunity was taken of examining the various cars, which included Daimler, Gladiator, Loidis, Clement, Darraq, De Dion, Renault, and Pieper. The return journey was commenced at 6 p.m., and a fine though windy run home terminated one of the pleasantest outings the Club has had.

“Employment Bureau.”

“OWING to the increase of applications for experienced drivers and mechanics, we are compelled,” says the Auto-Motor Association, “to add yet another department to our extensive business.” The Auto-Motor Association is—according to its letter paper—“under distinguished patronage,” and its special department is an Employment Bureau. The address indicated as the office of this “Association” is occupied—according to the Directory—by a tobacconist, so it would appear that the “distinguished patronage” has not yet enabled this “extensive business” to occupy the whole of a building. A correspondent recently received a letter from the “Association” saying that they had vacancies for drivers and would forward a list “on receipt of registration fee of 2s. 6d.” He sent the half-crown and is still waiting for the list, despite the fact that a second application has been made.

The Legislative Proposals.

CONSIDERABLE discontent exists among metropolitan motorists, especially those who are members of the Automobile Club, with regard to the proposed discussion on the 6th prox. with reference to the legislative proposals of the Club. Of course the discussion has long been wanted, but the point of the dissatisfaction is that it is to take place at the Club House, which is by no means adequate for the large number of people who would like to take part in the meeting. Seeing the importance of the matter, we should have thought it would have been better

had the central organisation seen fit to take a large hall, and secure a really representative conference. As it is, we are afraid the discussion will leave much to be desired; and that those who are opposed to the action of the Committee will not have the opportunity they desire and deserve of making their views known. Certainly the room in which the meeting is to be held will not accommodate a tithe of the opposition.

Tram-rails v. Motor-Cars.

ON another page we report a case in which a well-known London stockbroker has secured damages against a tramway company. It appears he was touring in the South of England on a motor-car, when the off wheel of the vehicle sank into a rut in the roadway, an unfortunate accident occurring in consequence. His case was that the tramway company had not adequately maintained their lines, but the company, on their part, said that the accident was owing to the disgraceful state of the road and that the local authorities were responsible. Whichever was the delinquent hardly matters so long as the unoffending plaintiff secured his verdict. It is to be hoped that one result will be that the tramway companies and local authorities will be more anxious to mutually arrange that roads shall be kept in a proper state of repair. This particular accident is by no means an isolated case, and it is quite time matters were put right.

Military Motor-Cars.

THE Continental countries are apparently determined to keep abreast of the times with regard to the adoption of automobiles in connection with military affairs, and although the French Chamber of Deputies recently cut down the vote for motor-cars for the Army to £800, there are already misgivings in French military circles. The German Reichstag has just allocated £14,000 for the purpose of the maintenance of motor-cars for the German Army, and Italy is also giving great consideration to the matter. At present the English War Office has not gone far in encouraging the use of the automobile, although its determination to make an allowance to officers owning motor-cars of their own is a step in the direction of the more liberal employment of automobiles in connection with the manoeuvres. And that we regard as a preliminary to their general adoption in the Army.

Cost of Maintenance.

OUR columns have lately borne witness to the interest felt in the subject of motor-cars for men of moderate means, and in our present issue we give an interesting letter from a correspondent who has tabulated the cost of maintaining two horses and a gig, and compared it with the upkeep of an automobile. His steam car apparently cost him £124 a year, whereas the horses and vehicle had previously run up to an expense of over £200 a year. In both cases his mileage is calculated at 3,000 per year, so that there is a saving by adopting the steam car, namely £76 a year, a substantial amount. The letter from “Cautious” is a specimen of the sort of thing that should convince those who have not yet taken to automobilism of the economy that can be effected by its means, and we welcome any such contributions to the discussion.

In South Africa.

ON February 7th the first automobile sports meeting in South Africa was held on the Green Point Track, Cape Town—a preliminary meet having been held a few days before for the purpose of making trials and preparations. It was on this occasion that the accompanying photograph was taken—notable as being the first of what will probably be a long series of such events, for South Africa is taking kindly to motoring, and the

authorities there will probably recognise the necessity of considering automobile traffic when making main roads.

The Scottish Club.

THE annual dinner of the Eastern Section of the Scottish Automobile Club was held on the 13th inst., at Edinburgh, with Dr. Dawson Turner in the chair. Mr. N. D. Macdonald gave the toast of "Our Guests," coupling with it the name of Mr. S. F. Edge. In reply the latter paid tribute to the inventiveness of Mr. Napier, whose work should not be overlooked in connection with the British victory in last year's Gordon Bennett race. He hoped that the race would take place in Ireland, and he pointed out that if that came about the whole world would be impressed with the fact that Great Britain was an important automobile centre. Dr. Ronaldson proposed the Scottish Automobile Club, to which Mr. John Macdonald replied. He said that the Club had now 212 members and was the largest organisation affiliated to the parent body. During the evening a telegram of congratulation was received from Mr. Roger Wallace on behalf of the members assembled in Piccadilly to hear Mr. Scott Montagu's paper on motor-cars as feeders to railways—a paper listened to by, among others, the Right Hon. Sir J. H. A. Macdonald, who was in town. Mr. J. W. Stocks gave an account of his journey from London to Edinburgh. He mentioned that he started on the morning of Wednesday week at 7.35 a.m. for Edinburgh with a 6-h.p. and an 8-h.p. De Dion Bouton car, accompanied by Mr. J. S. Matthew, of the Scottish Automobile Club. They reached Edinburgh at 9 p.m. the next day, having accomplished a run of 404 miles in 22 hours 40 minutes.

Western Section

ON Monday the Western Section of the Scottish Club held its annual meeting at Glasgow, under the chairmanship of the Lord Provost, who proposed the toast of the evening, "Automobilism," which he said was a factor to be considered in the physical well-being of the nation. The Lord Justice-Clerk, Sir J. H. A. Macdonald, K.C.B., in replying to the toast, said that for a long time automobilism was regarded as the pleasure of the rich and the annoyance of everyone else. The motorist should consider the rest of the community in the use of his car.

He had seen motorists in England pass other vehicles at such a speed on a dirty road as to cover the occupants with dust. He had seen it with the greatest possible regret, and he thought that the best way to give pleasure to themselves was to see that they had due consideration for others. With regard to speed limits, he might say anyone who imagined that a motor-car could be run at a speed less than that at which he and others drove their carriages should be made to realise that such a thing was impossible and unworkable. If that state of things was not altered by the Legislature it would be altered by the ordinary rules of common sense. It was beginning to be realised that the new method of locomotion was not one which was confined to amusement, but was one which was likely in the future to confer the greatest possible benefits on the community in their social life and commercial prosperity. The state of the roads throughout the country was a disgrace, not only because of the discomfort they occasioned, but because they retarded the progress of commerce. A system of automobilism would benefit large centres of commerce like Glasgow, because it would relieve them of the mass of population which would tend more and more to congest them. Among those present were Mr. R. W. Wallace, K.C., Bailie Stevenson, Sheriff Fyfe, Lieutenant-Colonel M'Farlane, Chief Constable Stevenson, Professor Hugh Galt, Dr. James Kirkland, Colonel Smith Park, Messrs. James Ochs, N. D. Macdonald, C. Johnson and R. J. Smith (hon. secretary).

Motor-Car Obstructions.

AT Exeter a commercial traveller of Birmingham has been fined 10s. for obstructing the traffic of the High Street with a motor-car. According to the evidence of the police the vehicle was left for more than an hour. A large crowd collected and traffic was obstructed. It was pointed out on behalf of the defendant that he had stationed his car in the offending position on account of the steepness of an adjoining street. That of course did not avail him when before the magistrate. Another case of obstruction by motor-car occurred on Saturday night, when a large crowd on the south side of Blackfriars Bridge, London, enjoyed the spectacle of half a dozen policemen in charge of an automobile. Apparently the vehicle had been left by its owner while he kept some appointment in the neighbourhood. The police were unable to drive it, but by asserting their strength they managed to push it along the road to Kennington Lane Police Station. If such cases become frequent, the provision of motor garages as well as ordinary cells at police stations may become a question for Scotland Yard to seriously consider.

Manchester's Show.

THE Manchester Cycle and Motor Show at St. James's Hall, Manchester, has proved a great success, and at the opening ceremony Alderman Rudman referred to the great success and steady progress which had always marked the show, even before it was held in that hall. Its scope had developed wonderfully since the introduction of motor-cycles and motors generally, and the exhibition was now of great instructional value. This is a point which should not be overlooked in estimating the value of exhibitions.

The Cork Exhibition.

EVERYTHING looks well for the success of the Cork International Exhibition this year, and at a meeting of the committee the Lord Mayor has outlined a most elaborate programme. It is in contemplation to have a motor-car service to convey visitors through the grounds. The secretary of the Automobile Club has paid a visit to the site, and has promised that the cars which will compete in the great race this year will be on view at the exhibition after the finish of the race. He also asked the Lord Mayor to look out for a straight mile which could be closed at each end and where they could hold a race.

Automobiles and Public Service.

It is a pity that representatives of the London omnibus companies were not present at the Automobile Club on Friday, the 13th inst., when Mr. Scott Montagu read a paper on motor-cars as feeders to railways, a summary of which appears on another page. He pointed out how omnibus companies had failed to appreciate the value of mechanical traction, a statement which had been contradicted, in anticipation, earlier in the week by the chairmen and secretaries of the leading companies. At the same time we quite agree with him that the 'bus of to-day is as slow and cumbrous as the 'bus of twenty years ago, and the companies might have done much more than they have. Unless they take up the matter quickly we shall have the railway companies establishing intercommunication by means of motor-buses between railway termini, to replace their existing horse vehicles; and if the railways become serious competitors with the 'bus companies for ordinary street traffic the outlook would be an unpleasant one for the shareholders of the 'bus companies. Tubes are costly, and overhead lines are apparently out of the question, so that the ordinary thoroughfares will have to be utilised for many years to come, and the question is, how can that be done most efficiently and economically? The competition between the London 'bus companies as well as the continuance of the traditions of their forerunners are factors which will certainly not make for either of these things. They will have to come to a practical encouragement of motor traction far more quickly than was anticipated even a couple of years ago. It was satisfactory to hear in the course of the discussion that the new double-decked omnibus which has been placed on the road between Liverpool Street and Victoria is apparently doing well. Should it prove a financial success, it will do something to hasten the action of those responsible for the 'bus traffic of the metropolis. In this connection it is interesting to learn that a Stirling motor-omnibus of 24-h.p. to accommodate sixteen passengers, and similar to those used in London, has been ordered for Johannesburg.

London 'Bus Traffic.

DURING the past half-year the London General Omnibus Company carried nearly 4,000,000 more passengers than in the corresponding period of the previous year, and the receipts were £22,969 better. The Road Car Company's accounts for the same period showed an increase in passengers of 2,000,000, making a total of 36,504,894, and in money of £11,932. An examination of the weekly average receipts per car by the latter concern reveals the fact that for the last six months the sum was £17 2s. 2d., while in 1899, the year before the opening of the "tube" the amount was £17 3s. 2d., though in 1900 there was a fall of about 10s., and the following year a still further decline amounting to £1.

What the Chairmen Say.

SPEAKING on Tuesday at the forty-fourth annual meeting of the London General Omnibus Company, the chairman, Mr. Alderman Pound, said the company did not intend to run into any expense with regard to the provision of motor omnibuses until they had gone carefully into the cost and the questions of maintenance and depreciation. Mr. Hicks, deputy chairman, said there was no kind of motor traction that would pay the company to take up. If anything was done in that direction it would be in the use of petrol. Steam was of doubtful utility, and he was doubtful if the Government would permit 15,000 such omnibuses running over the streets. In his opinion the time to take up motor-omnibuses had not yet arrived. At the annual meeting of the Road Car Company on the same day, Mr. J. H. Moore, the chairman, said that during the next few months they would see in the streets of London several road cars, the vehicles themselves somewhat of the ordinary type, with garden seats, driven by mechanical power of different kinds. Whether there was to be any material

saving in the cost of running the cars by mechanical power it was at present impossible to say, but there was no doubt that the mechanically-propelled road-cars, being able to travel at a faster speed than at present, would perform longer and more frequent journeys, consequently earning more money, and they would doubtless be preferred by the public, owing to their being able to take up and put down passengers everywhere en route.

Motoring Annual.

THE "Motoring Annual and Motorist's Year Book for 1903" has just been issued by our contemporary "Motoring Illustrated." An endeavour has been made to give within a convenient compass a record of the miscellaneous information that circulates through the Press during the year. In addition there is a directory of the trade and of petrol suppliers, a list of members of the A.C.G.B.I., a synopsis of the leading events of the past year, the regulations for motor-cars in various countries, and much other equally useful information. A good many pages are devoted to "Who's Who in Motoring," in which brief biographical details are given of well-known people. This is of somewhat unequal interest, and, while we wonder while some names have been included, we are equally surprised at the omission of such prominent motorists as Mr. R. W. Wallace, Chairman of the A.C.G.B.I. Similarly, under the name of Johnson we look in vain for the secretary, the only leading motorist of the name—according to this Annual—being "Miss E. F. Johnson, one of America's fairest and most expert motorists. Owns and drives her own car, and was very successful in the autumn reliability trials of 1902 in which she took part." These, however, are matters that can be remedied in the next edition.

MR. AND MRS. P. RICHARDSON ON THEIR 12-H.P. DAIMLER.
Photo by [Argent Archer.]

Modern Motor-Cars.

BASED upon recently published works on automobiles, an article in the last number of *The Edinburgh Review* presents an interesting view of the present position of the motor-car. Naturally, it contains little new matter—for the pioneer labours of Cugnot, Trevithick, Gurney and Ogle have been so often recited that the constant reiteration has become almost wearisome. More interesting to the public will be the references to Daimler, Serpollet, Benz, and the resuscitators of the automobile. The writer of the article is evidently familiar with the progress of the industry in recent years, and also an equally close student of the automobile press. He recognises the influence of the car in fashionable circles, reminds us of its possibilities in helping to solve

some social problems, and points out the potential force it is capable of exerting for the benefit of the British agriculturist. But in order to derive all these benefits there must be a reform in our present highway administration, and Parliament and the magistracy must not allow traditional prejudice to warp their views of the new movement, and so thwart the development of automobilism. Such is the sane conclusion of a very lucid article.

Motor-Wagons to Assist Railways.

ALONG the docks at Liverpool there are about thirty receiving depots provided by the railway companies. Shippers and agents have been saved a great deal of expense through the abolition of long cartage. Still, the cartage cost is very heavy, and the probability of lines being taken alongside the docks is somewhat remote. If cargoes could be shipped or unshipped directly without the intervening handling necessary in transferring goods from ship to cart, and cart to rail, there would be a considerable reduction in charges. In this quandary it has been suggested that motor wagons would be an acquisition, for they could move freely in all directions. They would move with rapidity, and the docks would not present the dirty appearance they sometimes do owing to the accumulated equine ordure. This seems at present to be the probable outcome of conferences now being held between the Liverpool Dock Board and the railways whose systems cater for the docks.

Progress at Swansea.

A REPORT by the Borough Surveyor of Swansea with regard to the comparative cost of the haulage of road material by motor and horses respectively has been referred to a sub-committee of the Streets Committee of the Corporation. He estimated that during the year ending March 31st, 1902, the road metal was hauled to the streets and depots from East Burrows Yard at an average cost of 16·07d. per ton mile, against which he estimated that haulage by motor would cost 18·05d. per ton mile. This result, he said, was due to the fact that the quantity of stone to be hauled was not sufficient to keep a motor vehicle working to its full extent, but in reply to the chairman he said he had not taken into account the depreciation of horses. Probably this item would make a considerable difference in the comparison.

Ireland Again.

THE Gordon Bennett Race is providing an exciting subject of conversation in Ireland, and rarely has any question been raised in the Emerald Isle which has elicited such a unanimous chorus of approval. Men whose opinions are at variance on practically every other subject under the sun are agreed that the holding of the race will be one of the finest things for the prosperity of the country that has occurred certainly during the last fifteen years. Mr. T. M. Healy, M.P., has written with reference to the petition, the gist of which we gave last week, saying "That he does not think that there is the least necessity for it, judging from the outburst of support already received. Get your bill drawn, he says, and ask Mr. Wyndham or Redmond to bring it in." Now that Irish support is assured, members representing English and Scotch, and, we might add, Welsh constituencies will have to be carefully watched so that they may do nothing to thwart the wishes of those who have taken so much trouble and spared no efforts in this attempt to secure a substantial advantage for British industry.

The Gordon Bennett Race.

PROBABLE competitors in the Gordon Bennett cup race seem agreed as to the suitability of the date—July 9th—suggested by the British Club, and the reply of the French competitors is being awaited with some curiosity. Meanwhile we hope that everything will be done to secure an excellent road surface, and that the English Parliament will accede to the unanimous wish of the Irish people with regard to

the race taking place in the Emerald Isle. It is reported that the constructors of vehicles for the English Eliminating Contest are anxious to experiment with British-made sparking plugs, and that information as to the most efficient will be welcomed. Certainly every effort will be made to retain possession of the Cup. Since the above was written we learn that the Sporting Commission of the French Automobile Club has agreed to July 9th as the date for the race, provided that the Irish course is definitely selected. Germany and the United States have also agreed, so that all that is now necessary is the Government's authorisation.

Instructing the Workmen.

THE better understanding of the general principles of construction and operation of automobiles—a thorough knowledge of the purposes and value of the different component parts—is without question desirable among the growing number of automobile mechanics. That its own employees, whether they be assemblers or machine tool operators, may know what they are making and for what purpose, the Packard Motor Car Company, of Warren, O., U.S.A., has, reports the "Motor Age," instituted what is probably the first school for automobile employees. Regular classes have been formed, in which the subjects of automobile theory, practice, construction and design are fully and plainly discussed. These were organised in the hope that they would attract some of the more enterprising members of the working force, but the expectations of the company were more than realised, for the attendance from the first averaged over sixty, and the project is now firmly fixed as a feature of the establishment. In addition to the classes a library has been inaugurated, in which current and standard motor literature, including the *Motor-Car Journal*, will be kept, in order that the workmen may become familiar with the steady progress of automobile production.

THE case against the motor-car driver, Alfred Good, who was charged with causing the death of a little girl at Tipton, has been dismissed.

DURING the Brussels Motor-car Show, H.M. the King of the Belgians increased his automobile stud by purchasing a Charron-Girardot-Voigt car.

It was decided, at a meeting of the French Cabinet on Tuesday, to authorise the Paris-Madrid race on the condition that all possible precautions be taken to avoid accidents.

DAMAGES to the amount of £500, with costs, were on Wednesday awarded at Sussex Assizes to Mr. Owen Townsend, of Dalston, against Mr. William Kirk, of Bexhill, for injuries caused by the latter's motor-car. The plaintiff was staying at Bexhill when Mr. Kirk's car ran into him and so seriously injured him that he was detained in hospital for a month.

A MOTOR-CYCLING club is about to be formed in Birmingham. It has already received the promised support of from twenty-five to thirty motor-cyclists, so that a strong club may be assured. Those interested in the movement are invited to send in their names at once to the hon. secretary pro tem., Mr. J. R. Bedford, Haigh Villa, Hunton Road, Gravelly Hill, Birmingham.

IN view of the rapidly increasing use of electrically-driven vehicles and the probable development of electrical light railways being likely to create a large demand among engineers and artisans for a thorough knowledge of electrical traction work, the governing body of the Battersea Polytechnic is arranging a special scheme of instruction with a view to establishing a School of Electric Traction in connection with the Electrical Engineering Department of the Polytechnic.

THE City and Suburban Electric Carriage Company (1903), Limited, has been registered with a capital of £152,000, to acquire the business carried on by P. E. Singer, of 19, Kensington Court, London, at Niagara, York Street, Westminster, and elsewhere, as the City and Suburban Electric Carriage Company, and to carry on the business of manufacturers of, dealers in, and proprietors of motor conveyances and appliance-constructors and owners of power-houses, garages, etc.

IN SNOW TIME.

LATE on a recent Saturday, accompanied by my young mechanic, Herbert Warren, I arrived in Ipswich on my little Primus car after a most eventful journey, and was met in Carr Street by a large cheering crowd who were awaiting our return. On Thursday, the 15th ult., at 6.40 a.m., we left John o' Groat's House for the South. It was almost dawn, a bitterly keen wind blew in our faces, ice and snow lay all around as the car sped southward over miles and miles of large, newly-laid-down granite. She was shod with Clipper Continentals, but for all that it could not be helped and the stones could not be avoided, so we just had to let her go over them. Wick was not much awake as we entered, but, fortunately, there were a few stragglers about who directed us on to the right road. Near Latheron, down went one front tyre, and "that's what we expected. Oh, those beastly stones!" ; but it wasn't the stones at all, the inner tube had been badly pinched under a clip. The spare tubes we carried were quite useless, so we had to mend this very horrid place. This was the sole and only tyre trouble we had of any sort, despite the fact that "we carried weight" in the shape of spare things, and thirty gallons of petrol, etc. We came to Berriedale long before we expected, but scenting danger we crawled down to find that it really was the famous Berriedale Hill; and it was well we did, for the turn at the bottom is so dreadfully sharp that at any ordinary speed it would be impossible to negotiate it. After climbing the long, steep ascent on the other side, we took a wrong turn at either Helmsdale or Brora, and did not discover our mistake till we had gone eight miles inland. We also had much difficulty in finding Bonar Bridge, and darkness setting in all too soon, the run was not nearly so pleasant through Tain and Dingwall to Inverness.

At Inverness the road leaves the coast, and going by Daviot and Kingussie, one is soon in the heart of the Highlands and a great height above sea level. The moon was now up and we could see pretty clearly the white track before us, but on going up one or two steep hills in the district, we found the snow deeper and deeper, till there was not more than a faint wheel track in a boundless expanse of snow and fir woods. Slower and slower became our progress and deeper and deeper got the snow, till at last we thought we must be on some disused track and hopelessly lost. However, as it would have been quite impossible to turn the car round owing to the great depth of the snow on each side, we kept crawling forward. "Crawling," for that is the best word, as for some time the high gear had had to be abandoned for the second, and at last the first had to be resorted to. We plodded on till at last we were actually climbing down fairly steep hills on the low gear, and then at the rise the engine wouldn't do it. This was nice. What was to be done? We tried driving on the low gear and shoving at the same time; but one cannot do much of that, and "played out" we realised we were stuck. We therefore rested, cogitated, and looked about us. Sure enough near at hand was a cottage to which, in time, we walked and rapped upon the door. Soon a head looked out. "Puir bodies, have ye been in the snow all night? We won't be long and will let you in." While the good woman dressed we sat down on the snow in our ponchos, and, leaning back against the railing, were

immediately asleep. "You'll catch your deaths sleeping in the snow," in a kind Scotch voice came upon my sleepy brain, as I awoke and banged Herbert. In the afternoon, with four men pushing hard, we managed to get the car out of the drift, and turned round on the way back to Inverness. Our progress back to Inverness was almost as slow as it had been coming.

We passed through Nairn, making enquiries as to the road to follow, and took the way to Forres. How smoothly and quietly we glided along, and how enjoyable was the clear, cold air as it beat in our faces. "Ugh!!!" "Are you hurt?" "What bad luck; now our trip is all over." "Well I never!" "Railway gates; why don't they light them?" With a terrific shock the car had suddenly been brought to a standstill! It did not throw us out, nor did I move in my seat, though Herbert went forward against the petrol tank. We had collided with an iron railway gate, unlighted, right across the road! I went in search of the station-master, and said a few words; the wonderful thing is that he quite agreed with me and said he always had considered those gates were dangerous as they were *never lit up*. Just fancy what a murderous practice. We might most easily have been killed. We three then inspected the damage with lanterns, and though we jacked up the wheels and measured, and looked and tested, nothing broken and nothing bent could we find except a slight leak here and there. But the iron gate, though double-strutted on both sides for strength, was hopelessly upset, and the top rail, 1½ in. by ½ in. solid iron, was broken in two, and the whole gate was bent and doubled in the middle.

After passing through Keith the snow again got deeper and deeper, till at length each slight climb was all we could manage. Now coming to a fork road, with a sign post which pointed to places unheard of by us, we feared taking the wrong one and experiencing the previous night's "pleasure." Therefore, espying a farm some way off the road, we left Miss Primus to look after herself, and at last reached the farm. We tapped gently at the door for some time, and got an answer at last. When

we got back we found the cracked radiator leaking like a sieve; nearly all the water had gone out. The petrol pipe also was leaking fast. This I managed to put right by making a new flange to the copper pipe, the old one having probably been broken by the shock of the gate. We pushed the car back down the hill we had just come up, bit by bit; it was very hard work, and at last got it to the bottom, where was another farm. The inmates by this time, being early birds, were having breakfast, and we very readily joined them, after which we took off the leaky radiator, carried it into the house out of the cold, and proceeded to mend it with rubber tape and solution. It wasn't a good mend, but it certainly stopped it from leaking quite so fast for the time being, and as soon as possible we got on our way again. They told us, however, that we must return to Keith, as the road by Huntley was not opened yet; so back we went again to Keith, from Keith to Banff, and on to Turriff. We did not get there without great loss of time, for, when passing through a village called King Edward, the leaky radiator burst out afresh, and at last, after trying various things in the shop of a most kindly blacksmith there, we plugged up the waterholes with corks and pieces of iron to keep them in, and ran on only one layer. The engine got very hot indeed, but no lubrication troubles

MR. R. EGERTON LEAVING JOHN O' GROAT'S ON HIS 7-H.P. "PRIMUS" CAR.

occurred in spite of this. At Turriff we put up at the Commercial Hotel, had a very good dinner and actually went to bed. This was Saturday night, and the first bed since leaving John o' Groat's early on Thursday. We did not get away till after noon on Sunday. With my poncho on over my motor coat, I was proof against all weather. The "Sabbath" is not the best day to get things in Scotland, so we were lucky in being told of the Caledonian Motor Company, where we found Mr. Paterson, the manager, most obliging. Soon we were on our way south with all we wanted, and full instructions as to the route to take, and the distances, and so on. We stayed the night at the Commercial Hotel, Stonehaven, and had a most pleasant evening. On Monday morning we left this haven, and journeying still south through Montrose and Arbroath, soon reached the Marmalade town. Here we had great difficulty in finding the ferry from Dundee to Tayport, and were charged 4s. 10d. to cross. At last, after passing over the most appalling roads to Fifeshire, which had had much more snow than some of the parts we had just come through, we arrived at 2.30 p.m. at Balfour, near Markinch, where the host and hostess received us with open arms. It was Wednesday noon before we were able to get away, and 3.15 p.m. before we could cross the ferry from Burntisland to Granton. Having crossed, we took the road through Edinburgh, Haddington, Dunbar, and Berwick, as, having once

CONTINENTAL NOTES.

BY "AUTOMAN."

DIFFICULTIES with the police and magistrates are not peculiar to any one country, but seem to crop up wherever automobiles happen to be. The following incident occurred in Germany at the beginning of this month. A German purchased a 40-h.p. Georges Richard in Paris, and set off for his own country driven by a French *mecanicien*. Whilst on his journey the car passed a battery of artillery at a slow speed. Just after passing the military there was a steep hill, and on the hill a cart was right across the road barring the passage. Thus it is clear that the car could not have proceeded quickly, even after it left the soldiers behind. Arriving at Ulm, the vehicle was stopped, and the owner and driver were arrested, without even knowing what was the nature of their offence. It seems that after they had passed the soldiers the horses drawing one of the wagons became unmanageable and the cart was thrown into the ditch. Unfortunately the driver was killed. After some days the owner being a German was released on bail, but the French *mecanicien*, notwithstanding the fact that bail was offered, was kept in prison, where he became ill. At the trial the public prosecutor asked for the driver to be

THE M.M.C. 20-H.P. FOUR-CYLINDER CAR BUILT FOR MR. J. JOEL.

departed from the old historical route to Land's End, I had decided to run down to Ipswich.

The roads now were very bad; a good deal of snow had fallen, which had thawed and frozen, and partly thawed again. When within about twelve or fifteen miles of Morpeth we went down a short, steep hill, and partly up; but when on the steepest part the car, with hind wheels going forward, began to slide backwards. The hill was one sheet of ice covered with a little water. We tried everything we knew to get up that hill, but having no rope or anything to wind round the tyres to give them a grip, we failed entirely.

On Friday we journeyed through Darlington, Northallerton, and Thirsk, and here I could not help noticing the splendid way in which the roads were made, and what skill, care, and attention must have been given them. On the Saturday we drove through Newark, Grantham, and Peterborough, and then over abominable roads to March, Ely, and Newmarket. Then to Bury, and over perhaps the worst bit of the lot, to Ipswich. The distance is roughly, I believe, about 870 miles in all, and we traversed every kind of road in every kind of condition, experiencing every sort of weather, except thunder. We were about six and a-half days running—a good test for the Primus.

REGINALD EGERTON.

condemned to a month's imprisonment, and if it had not been for the directors of the Cannstatt Daimler Company, who made trials on the road, and came forward with evidence that it was impossible for the car to have exceeded the legal limit, the poor fellow would certainly have been condemned for an accident which he did not cause, and which he did not even see.

It has been stated in several technical journals that the automobile signals devised for marking the roads of France were the work of the "Chambre Syndical de l'Automobile." This is an error, the originator of the system was the Association Générale Automobile. I was talking the other day with the secretary, and he told me of the efforts that were being made by the A.G.A. to have these signals accepted by all the affiliated clubs, so that a traveller by motor-car, in whatever country he may find himself, will be able to read the same signs along the roads. The signals suggested by the A.C.G.B.I. seemed to have been slightly modified, and it will be a great pity if a complete unification cannot be arrived at in this matter at the very beginning, for later it would be difficult and expensive, if not impossible to rectify such a mistake.

THE "Concours de Chronometrage" competition between

the different systems of time keeping took place last week at Dourdan. Mors had an easy victory with his new recording timekeeper. The chronometer has no stop movement, but goes on all the time. As it works, a paper strip is drawn through it, an electric contact perforates the paper, and marks the minutes, seconds, and fifths of seconds. Whether the paper passes at the same speed or at varying speeds makes no difference to the result, for each perforation represents a fraction of a second registered by the watch. The passage of the car at the starting post and also at the finishing post is marked on the tape, and the number of perforations between the two marks gives the time which has been occupied by the car in covering the measured distance. The paper tape may be kept for reference, and no mistake can be made, for the perforated record establishes indisputably the time occupied by every car. The ordinary chronometer with a stop movement may have a Kew certificate, but this certificate only deals with the watch when it is going, and the stop, quick fly back and restart movement destroys in a large measure the accuracy of the very best chronometer; whilst the apparatus invented by Mors, or rather by M. Pottier, the electrical engineer, who is at the head of the electrical department of the Mors firm, utilises the chronometer without the stop motion and thus obtains its full accuracy. The second prize of the competition has been accorded to M. Stocker, of Vienna, who has also a very accurate apparatus; unfortunately it is three or four times the price of the first one, but I understand that these two are to be officially authorised by the A.C.F. The question, however, as to automatically registering the passage of a car over the starting and finishing point has not yet been settled, for the wire stretched across the track has been found a complete failure; a project of making an electrical contact by a wire touching the *chassis* as it passes is being studied.

The vetoes on automobile races still continue; the latest is the Pau races, which were to have taken place to-morrow. The following letter has been written by the Prefet of the department to the President of the Automobile Club Bearnais:—"By his telegram of 3rd February, the President of the Council and Minister of the Interior, to whom I have submitted your request to obtain authorisation to organise an automobile race on 22nd February, informs me that he cannot agree to encourage new speed trials on the public roads, and that he must, above all, after the promise given to the Chamber of Deputies by his predecessor on 28th June, 1901, refuse his consent I think the meaning of it is that the Government intend to limit the road races, for the present, to the most important annual events, and the Paris-Madrid will probably be authorised in France as well as in Spain.

The first series of the entries for the Paris-Madrid closed last Sunday at 6 p.m. at the offices of the A.C.F. The entries have beaten all previous records and all the estimates that have been made. Many more entries may be expected, and there will undoubtedly be a bigger field than has ever yet been, and I should not be at all surprised if the two minutes' interval were found to be almost unworkable, and if one minute were adopted in its stead. Two hundred starters would mean over six and a half hours starting. But how about the arrivals? In races that have been held in the last few years under the best conditions the fastest cars begin to arrive from 10 a.m. until noon; should the conditions be bad, say the weather wet and stormy and the roads slippery, the first arrivals will be, of course, much later. But these are only the very fast cars; what shall I say about the voiturettes, which in any case cannot cover the distance in such a short time? The best of them will only begin to arrive late in the afternoon, and those who are late starters and unlucky will require a plentiful supply of Bleriot's.

The two great French houses, Panhard and Mors, who have always been the giants struggling for supremacy, are not going to continue their annual duel alone. There is a third colossus in the field in the shape of the Hotchkiss Ordnance Company of France,

who have entered four cars in the 1,000 kilo. category. The Hotchkiss Ordnance Company of France is not exactly new to the work, for it has been for some time manufacturing the most difficult parts for the leading firms in the automobile trade in France. Many of the great racers have carried off their trophies with steel parts of difficult and delicate workmanship turned out by the high-class machinery of the St. Denis Works founded by Hotchkiss in 1870. The Hotchkiss is a very high-powered machine with four steel cylinders. It has been designed and is being made after a careful study and combination of the best points of the existing makes, and will have, in addition, certain new features which should make it not only very fast but also very reliable.

A TOURIST excursion in connection with the Paris-Madrid race has been decided on, and the following route will be followed—Paris, Pougues, Royat, Le Viaduc de Gabarit, Murat, Vic-sur-Cere, Padirac, Rocamadour or Alvignac, Cahors, Agen, Biarritz, Saint-Sebastian, Zaraus, Bilbao, Vittoria, Miranda, Del Ebro, Burgo, Venta de Banos, Valladolid, Salamanca, Avila, Madrid. The route chosen is perfectly ideal, and the caravan will leave Paris on May 12th. Tourists may join the caravan at any point in France, but between Saint-Sebastian and Madrid they must con-

Photo by] A SNAPSHOT AT SEVENOAKS. [Mr. E. E. Pearson.

form strictly to the route, and it is obligatory to be controlled every evening on the Spanish part of the tour in order to obtain a certificate.

THE English entries for the Paris-Madrid race so far comprise Messrs. H. R. Kirk, S. F. Edge, C. Jarrott, Mark Mayhew, J. A. Holder, J. E. Hutton, E. H. Arnott, and the Wolseley Company. Up to Monday, the 16th inst., no less than 229 entries had been received.

HERR CARL BENZ, who has hitherto supervised the technical part of the business of Messrs. Benz and Co., of Mannheim, has just retired from active service, and has been succeeded by his son, Herr Eugen Benz.

A SMALL outbreak of fire has occurred at the premises of Mr. Hayter, motor engineer, Anlaby Road, Hull.

To clean a sparking plug which is fouled with oil, pour a few drops of petrol upon it and apply a light. The oil will be burnt away without leaving a sooty deposit, as one would expect.

WHEN the leaf of a spring breaks, it generally does so at its centre, where it is bolted to the other leaves. Clips, which would hold such a leaf in position, enabling it to do temporary duty, may be bought, and should always be carried in case of need.

GEAR-BOX grease should always, previous to use, be mixed with lubricating oil until the whole is of the consistency of treacle. If grease alone is used the gear wheels merely cut a path through it, and no efficient lubrication takes place.

AN IMPROVED HIGH-SPEED TREMBLER.

A NEW form of trembler for induction coils, known as the "Vulcan," has been devised by Messrs. Arnoux and Guerre, of Paris. As is well known, difficulties have been experienced with internal combustion motors running at high speeds owing to imperfect ignition, many of the ordinary trembler coils being incapable of giving a satisfactory spark at speeds exceeding 1,000 r.p.m. without continual adjustment.

The "Vulcan" trembler (Fig. 1) has been designed with a view to permitting practically unlimited speed of the motor

FIG. 1.—GENERAL VIEW OF VULCAN TREMBLER.

with perfect ignition under every condition. It is claimed for the new trembler, which is being introduced into this country by Messrs. Geipel and Lange, that a motor may be run to as high a speed as 5,000 r.p.m. without "missing" in the slightest. Moreover, the trembler is of such sensitiveness that it makes and breaks the circuit infinitely more times than the ordinary tremblers, the actual number of ruptures being, approximately, 450 per second. This increased speed of vibration results in a spark of great energy, and permits of low efficiency coils being rendered highly efficient.

FIG. 2.—ARRANGEMENT OF VULCAN TREMBLER ON COIL.

The operation of the trembler is clearly shown in Fig. 2. The upper bar F is rigidly fixed at both ends to the pillars K B, and to its under side there is attached a subsidiary trembler, carrying at its free end a platinum contact C. The downward travel of this trembler is limited by the projection M on the pillar K. The actual trembler blade is of steel, and is fixed at one end in B; its free end, which is also furnished with a platinum contact C', vibrating in response to the impulses given by the core, which is magnetised and de-magnetised as the primary circuit

FIG. 3.—DIAGRAM SHOWING METHOD OF CONNECTING UP THE AUTO-TREMBLER.

is closed or opened by the wipe contact. It will be noted that there is no button of soft iron to add to the inertia of the trembler

blade, so that the total number of vibrations which may be made per second is practically unlimited. When the plate A is drawn down by the core I, the upper trembler blade D follows it until its end comes in contact with the projecting ledge M. The rupture is then made violently and suddenly between the two platinum points owing to trembler A being capable of further movement in the downward direction.

It will be noted that there is no regulating device for these blades, the trembler being sent out from the works permanently adjusted for use at any speed. The new trembler can be fitted to any existing coil by means of the two screws and nuts shown. The existing core does not require alteration, so that any ordinary low-speed coil may now be converted by means of this improved trembler to one of the latest pattern, and suitable for any high-speed duty.

A modification of the above trembler has also been arranged so that possessors of non-trembler coils can convert the same themselves without difficulty. The arrangement is that of a small primary winding in series with the primary winding of the existing coil. When the circuit is completed at the commutator, the trembler comes into action and makes and breaks the circuit as though it were attached to the coil itself. No structural alterations are necessary in adopting the auto-trembler, it being simply necessary to insert it in the primary circuit as shown in Fig. 3. The arrangement is most compact, the over-all size being 3 in. by 1½ in. by 3½ in., and the weight about four ounces.

SOME USEFUL NOTES.

AFTER each day's run it is advantageous to inject a tea-spoonful of paraffin into the cylinder or cylinders and give the engine a few sharp turns by hand; this will remove all "gumminess" from the cylinder walls and prevent the piston sticking. After about 500 miles running, it is also advisable to remove the sparking plugs and wash the engine out thoroughly by injecting about a wine glass full of paraffin into each cylinder; after turning sharply by hand for a few minutes remove the plug from the bottom of the crank case and allow all the waste oil and paraffin to drain off completely. Before starting the engine again it will be necessary, of course, to put a fresh charge of lubricating oil into the crank case.

WHEN the exhaust-valve is being ground in, it is advisable to place some cotton-wool between the combustion-chamber proper and the cylinder, in order to prevent any emery powder gaining access to the latter, which might result in the scoring of its walls. A mixture of emery powder and oil is generally used in this country for grinding in valves, but the use of paraffin instead of oil (a practice widely adopted in France) will be found to yield quicker and better results.

WHEN testing the spark by holding the end of the high tension wire near some part of the engine or frame, never hold it more than ¼ in. away. An attempt to get a longer spark may produce a short-circuit in the coil.

It is important to remember that much of the power of a motor depends on the correct tension of the inlet-valve spring. If this is too strong (in other words, if too much force is required to stretch it) the suction of the descending piston will not open the valve to its fullest extent, too little mixture will be admitted to the cylinder, and a feeble explosion will result. This is especially evident in hill-climbing, when the engine is slowing down, and there is rapid decrease of power, sometimes ending in complete extinction. The symptom of a weak inlet-valve spring is misfires when the engine is running fast on the level.

WHEN sparking troubles occur on the road, due to running down of the accumulator, place the points of the sparking plug a little closer together. This may save time, temper, and money, by enabling the exhausted cells to do temporary duty, unless they are *entirely* run out.

MOTOR-CYCLING NEWS.

As we mentioned last week, a Motor-Cycle Traders' Association is in course of formation, with Mr. E. H. Arnott as hon. sec. *pro tem*. A committee, consisting of Messrs. Arnott, Belcher, Citroen, Dring, Edge, Jackson, Garrard and Van Hooydonk, has been appointed to draw up a scheme for submission to a later meeting.

In connection with the 1903 Motor-Cycle Trials the following gentlemen will represent the trade in making arrangements with the Automobile Club in connection therewith, namely Messrs. J. Van Hooydonk, Cooper, Citroen, Arnott, Belcher, Goodwin, Martin, Jackson, Hart, and Batson.

MME. MADELEINE DE LA ROCHE ON HER WERNER MOTOR-BICYCLE.

At the Alexandra Palace Velodrome, on Saturday, Maurice Fournier broke his mile motor-bicycle record for the track by completing the distance in 1min 36 1-5sec., as against 1min. 38 1-5sec.

MOTOR-CYCLING suits are being made by Messrs. Holding and Son, whose garments for motor-carists have long been known. Among their leading lines is a Curragh Norfolk jacket made of West of England Riding Whipcords—a durable material that has the advantage of being waterproof and wind proof. It does not show the dust, an important consideration with motor-cyclists. The knickers are fitted with the Holding puttie knee band, which gives great elasticity and comfort. Overalls, waterproofs, vests, etc., specially designed for motor-cyclists form a special department of the enterprise of Messrs. Holding and Son, whose latest catalogue is a capital production.

THE Phoenix motor bicycles are illustrated and described in detail in the new catalogue just issued by Mr. J. Van Hooydonk. Reference is also made to the Phoenix "Trimo," tricycle and racer, and an illustration is given of the new lubricating device fitted to the 1903 machine.

THE inaugural dinner of the Motor Cycle Union of Ireland was held on Wednesday, under the presidency of Mr. J. B. Dunlop. Before the dinner a conference of motor-cyclists was held, attended by delegates from Belfast, Cork, and Ireland.

ON Saturday, the 7th prox., a motor-cycle event of considerable importance will be held on the Canning Town track. To obtain the track, Automobile Components, Limited, has had to purchase the gate of the football match. At four o'clock, Messrs. C. F. Barden and Fournier will race, riding in five heats of one mile, the contests beginning at 4 p.m. There will be two heats of one mile each with flying starts, two heats of one mile with standing starts, the remaining one to be decided with standing or flying start as may be decided, the decision on this point to be arrived at by the spinning of a coin.

The winner of the stakes and the whole of the gate money will be the man who wins three or more of the five heats.

ORIGINALLY the Automobile Components, Limited, included in their challenge a condition that the machine used should not exceed fifty kilos in weight. Barden, however, wished to ride a heavier motor-cycle, and this has been agreed to by the supporters of Fournier. The stakes have been raised to £500 a side, the amount of the prize money thus being £1,000. In addition to these interesting events Fournier will, at 5 p.m., make an attempt on the one hour's record with a machine fitted with the "Automotor" engine, and altogether a very exciting two hours will probably be enjoyed by those who go to the Canning Town track on the 7th prox.

QUITE a number of motor-bicycles have already been entered for the Paris-Madrid race, including Werners, Bichrones, and Rochets. As mentioned elsewhere, Mr. E. H. Arnott has sent in his entry for the race; he will also take part in the Circuit des Ardennes.

MR. LESLIE BUCKNALL, the well-known motorist and balloonist has recently purchased a Werner motor-bicycle for a novel purpose, namely, to take with him on his balloon ascents, as frequently the descent is made some miles from any town or railway.

THE New York Motor Cycle Club is setting an example which similar bodies in this country would do well to consider, if not to follow. To the member completing the greatest number of miles from March 1st to December 1st next, the New York Club will award a gold medal, and for the next best record a silver one. To all other members covering 3,000 miles or more bronze medals will be given.

A LADY'S motor-bicycle is one of the latest productions Mr. C. E. Carter, of the Dispatch Cycle Works, Grays, Essex. An illustration of the machine is given herewith. It is built up with Chater Lea fittings, having a very strong dropped frame, and the engine, a 1½-h.p. Minerva, is situated in the usual position under the down tube, the belt drive being neatly protected by an aluminium cover or shield. An F. N. carburettor supplies the mixture from a tank at the rear of the saddle, which is also

arranged to hold lubricating oil, and a special lubricating pump which can be operated from the saddle. Mr. Carter makes a special feature of the tank, which is well out of the way, giving plenty of dress room for the lady rider; its capacity for petrol is equal to eighty miles and of lubricating oil sufficient for 150 miles. Mr. Carter and his family are all expert motor-cyclists; not only do his wife and himself ride, but he has a daughter thirteen years and a son of ten years both of whom are experienced "tap twiddlers."

THE EFFECTS OF COMPRESSION IN EXPLOSION MOTORS.

ALTHOUGH gas and petroleum spirit motors are now in use to the number of many thousands, the average person seems to be better acquainted with the *modus operandi* of the steam engine than that of the explosion engine, and conditions of operation of the first are often erroneously applied to the second. Thus, for instance, the fact being well known that a high ratio of expansion in steam engines leads to economical results, petrol motor builders, imperfectly understanding the theory of that machine, often seek to devise means whereby similar effects can be produced in such engines. While it is true that carrying the expansion further than usual in explosive engines results in higher economy, the methods and means employed to this end must be entirely different from those used in steam engine practice. We have often heard it suggested that if the stroke of an engine were doubled, without increasing the bore, the gases would be expanded to a much lower pressure before the exhaust took place, and consequently a much greater proportion of the heat value of the gases would be

creases the proportion transformed into mechanical work, by decreasing the proportion going into the cooling water. A decrease of the compression space means, of course, a reduction of the cooling surface with which the burning charge is in contact, especially during the first part of the power stroke, and the direct cause of the diminished loss through this source is therefore apparent.

The question as to what influence the compression has upon the exhaust pressure is also of some interest. One manufacturer states that a low compression has the two serious disadvantages of the violence of the exhaust and the excess of heat thrown away due to a less complete expansion than would be obtained if the compression space were smaller. The "Horseless Age" takes the opposite view of the matter, namely, that the exhaust pressure will be higher, if anything, in a high compression engine. This would mean, of course, that the loss through the exhaust gases is greater with high compression, and this we believe to be the case, although the increase may be slight. The gain in mechanical power is then entirely due to a reduction of the jacket losses, while the increase in the exhaust losses is due to the same source. This conclusion is in line with the view entertained by M. Richard, a prominent gas engine authority, who states that any means by

THE MARSHALL 20-H.P. THREE-CYLINDER CAR. (See last issue, page 967.)

turned into useful work, whereas it is plain that such a proceeding would not result in increased expansion.

Similarly the effect of a higher or lower compression is not as well understood generally as it might be. It is known, of course, that the degree of compression employed affects the power of the motor, its fuel efficiency, the exhaust, the ignition, ease of starting, etc., but the nature of its relation to these various factors is not clear to many *chauffeurs* and experimenters. During the suction stroke the engine draws in a certain quantity of explosive mixture, depending upon the displacement of the piston per stroke, but independent of the compression space or the proportion of bore to stroke. After the mixture has been compressed it is ignited and burned, and the heat energy developed by this combustion is a fixed quantity, independent of the compression; the only thing which affects the quantity of heat developed is the proportion of the mixture, which is here assumed to be constant and the most favourable.

Of the heat liberated by the combustion of the mixture, a portion is converted into mechanical work, and the rest is dissipated through the cooling water and the exhaust gases. The distribution of the heat is affected by almost every change in the proportions of the combustion chamber, and a decrease in the compression space, and consequent increase in compression, in-

which the loss through one of these two great sources of waste (cooling water and exhaust) is reduced results usually in an increased loss through the other one. In two engines, otherwise the same, the quantity of gas per unit of cylinder volume (the density) at the end of the power stroke would be greater in the one with the smaller compression space; but density alone does not fix the pressure, which is also dependent upon temperature.

THE Delahaye Company, of Paris, are supplying a number of cars for the conveyance of the mails between Cattaro and Cettinge, Montenegro.

VISITORS to Nottingham, that favourite centre of automobilism, may like to know of the fine new garage recently opened by Messrs. Evarts-Hall, Limited. It is most centrally situated, being close to the Market Place, Theatre and Clarendon Hotel. Petrol and lubricating oil are stocked, and the premises are open day and night. The courteous manager, Mr. Binl gives personal attention to motorists. A large number of cars can be stored, and a special feature consists of a well-appointed reading-room, bath room and lavatories. The facilities offered by this fine garage for bringing purchaser and seller together supply a want long felt in that part of the Midlands.

HERE AND THERE.

THE sparking plug "discovery" continues to attract considerable attention, and devices providing for an external jump gap in the ignition circuit are making their appearance on the market in rapid succession. In Fig. 1 we illustrate the arrangement which has been introduced by Messrs. C. S. Rolls and Company. It will be seen that it is enclosed in a glass tube, so that it can be used on a tricycle, or on an engine exposed to rain, dirt and weather. The chief advantages of the external jump gap are that it ensures the sparking taking place at the plug, even though the

FIG. 1.

FIG. 2.

points be covered with soot, grease, or even rubber solution; it enables the engine to be run with more oil; it does away with miss-fires, facilitates starting the engine, and enables the sparking of all cylinders to be readily seen from the outside. Messrs. Rolls inform us that they have already received many letters from customers, stating in some cases that they find their cars will climb certain hills at a speed which they would not do before; in others that instances of persistent miss-fires have been cured by the use of the external gap. Fig. 2 shows the device serving the same purpose which Messrs. Gamage, Limited, have just put on the market, and to which they have given the name "Phaulak" spark intensifier.

A MOTOR CLUB is being formed for Brighton and district, Mr. J. Best having taken the initiative in the matter.

MR. F. SMITH, of Bowdon, has been elected Chairman of the Manchester Automobile Club Committee for the present year.

MESSRS. W. ATKINSON AND SONS, of Lancaster, have just issued a catalogue of their John o' Gaunt car, which is a belt-driven vehicle fitted with 6 or 8-h.p. M.M.C. motor.

THE Roadway Autocar Company, Limited, send the fifth edition of their catalogue, dealing with the Mors and Renault cars, the R.A.C. dust screen, and the various accessories stocked by the company, including lamps, plugs, accumulators, etc.

MR. A. ALBREGT, who has had several years' experience with a leading firm of motor-car constructors, has taken over the business of Mr. W. A. Hurren at Hythe (Kent) and will continue the same at 15, High Street, Hythe, and at Broadstairs. He is undertaking repairs and stocking accessories, petrol, etc.

MESSRS. S. F. EDGE have sent us an advance copy of the 1903 catalogue of Gladiator Light Motor Carriages, in which the most noticeable points of the new models are fully dealt with, and, so that clients may have a better impression as to the style and appearance of the cars, a large number of illustrations have been included. The catalogue also comprises a brief description of the chief characteristics of the cars and also a short resumé as to how they should be driven and kept in order.

WE hear that a great improvement has lately been made in the road between Whitby and Scarborough.

A MOTOR GARAGE has been established by Messrs. G. F. Heath and Company, at 49, John Bright Street, Birmingham.

THE Hadley Cycle Engineering Company, High Street, Barnet, are now keeping a stock of motor spirit, oils and grease, etc.

ON the recommendation of Major J. S. Wickham, a danger board has been erected by the Automobile Club near a dangerous hill in Wansford.

THE Windsor Motor and Engineering Company are about to open motor repairing works and a garage in Sheet Street, Windsor.

FROM the School of Motoring, Liverpool, comes the "The Darracq and its Management," an excellent book of sixty pages, in which Mr. Archibald Ford gives a complete course of instruction in driving the particular vehicle indicated in the title. The hints given will be of service to the owners or drivers of any motor cars, and we would congratulate all responsible for its production on the improvement as well as the expansion of the little pamphlet issued two years ago into the present lucid and well-illustrated volume. A prospectus of the School of Motoring has also been issued by Mr. William Lea, which gives much information of general interest.

ON another page of the present issue we illustrate the car recently supplied by Milnes-Daimler, Limited, to the Duke of Portland, for the use of the beaters when shooting is indulged in on the Welbeck estate. The frame on which the body is supported is of channel steel; to the latter is also attached a tubular underframe, carrying the engine and gear box. The motor has four cylinders, each 3.54 in. bore by 5.11 in. stroke, giving 16-h.p. on the brake at a normal speed of 950 revolutions per minute. The engine is governed on the induction pipe, the throttle being controllable by the driver independently of the governor. Magneto ignition is adopted, while the water circulation for the cooling of the cylinders is maintained by pump and Cannstatt marine-type cooler. The power of the motor is transmitted to the change-speed gear through a conical friction clutch; the change gear is adapted to give four speeds forward and a

THE 12-H.P. SUNBEAM CAR (See issue February 7th, p. 945.)

reverse. From the gear-box a longitudinal universally-jointed shaft conveys the power to a countershaft parallel with and directly over the rear axle. The countershaft carries the differential gear at its centre, and at either end has pinions meshing with internally-toothed rings bolted to the rear road wheels. The front wheels are 2ft. 7½ in. in diameter, and the rear wheels 3 ft. 5½ in. All are shod with Goodyear solid rubber tyres. Three extremely powerful brakes are fitted—one a pedal-operated double-acting band brake on the rear end of the second change-gear shaft, and hand-operated brakes acting on the tyres of the rear road wheels. The vehicle, which is fitted with canopy and storm curtains, has accommodation for twenty persons.

THE Association Generale Automobile, of Paris, is organising an Easter tour to the Loire district.

THE February motor-car auction sale by Mr. Albert House at the Drill Hall, Belle Vue, Bradford, took place on the 13th inst.

THE French Automobile Club has decided to officially take part in the next year's International Exhibition at St. Louis, U.S.A.

SECTION OF DOUBLE-ARCH TYRE. (See last issue, page 974.)

THE total exports of automobiles from the United States during 1902 amounted to £213,974, as compared with only £73,474 in 1901, an increase of nearly 200 per cent.

THE Belgian Automobile Club is organising a fete to be held in the Parc du Cinquantenaire, Brussels, in April next. It is proposed to hold a gymkhana, a procession of decorated cars, etc.

THE London County Council has appointed a special committee of fifteen members to conduct the Council's case before the Royal Commission on London traffic. Earl Russell and Mr. J. Williams Benn have been included.

MESSRS. R. M. WRIGHT AND COMPANY, of Lincoln, are issuing an interesting sixteen-page circular relating to their business activities, which will be of considerable local utility. They are developing the hiring-out of motors, and also doing considerable business in sale and exchange.

THE American entries for the Gordon Bennett cup race closed on January 31. The candidates for the eliminating race are: Mr. Percy Owen, New York (Winton); Mr. L. P. Mooers, Cleveland (Peerless); Mr. H. S. Harkness, New York, and Mr. C. W. Matheson, Grand Rapids, Mich. Mr. Alexander Winton has been accorded a place in the team without participation in the eliminating contest.

THE value of the motor-car as an adjunct of war was recently illustrated by the Second Signal Corps, N.G.N.Y., in Brooklyn, in establishing a signal station. To the vehicle was attached a tender corresponding to that of a locomotive, and from it were shown electric lights for night signalling. The power for the lights was generated by the automobile and communicated to the tender by a belt passing over one of the wheels.

AT the invitation of Mr. E. W. Hart, we had an enjoyable run down to Luton on a four-cylinder Flying Darracq on Thursday last week. The car is one of those which took part in the Paris-Vienna race last year, but has since been fitted with a luxurious tonneau body. M. Wehrle, of Paris, was at the wheel, and we were greatly struck with the ease with which the car mounted the hills, no diminution of speed whatever being noticeable.

THE Gradior Machine Company, of Stafford, have just built their first motor-cycle.

A STANLEY steam carriage is reported to have recently been driven a mile on the beach at Daytona, Florida, in one minute and fourteen and two-fifths seconds.

A NOVEL form of motor-car was seen in Regent's Park one day last week. It takes the form of an ordinary governess pony trap, a motor wheel taking the place of the pony in the shafts.

MR. WM. M. LETTS, of the Locomobile Company of Great Britain, in addition to purchasing a large number of Waverley electrical cars, during his recent visit to the United States, is reported to have placed orders for forty Locomobile petrol-cars.

A MOVEMENT is on foot to establish a racing track for motor-cars on the famous Daytona and Armand beach in Florida, U.S.A. This stretch of sand is about thirty miles long and as hard and smooth as a billiard table for making straight-away records of a mile or more. The Florida Automobile Association has been formed to further the project. The idea is to arrange annual tours to Florida for automobilists and an "automobile week."

MR. ALEXANDER WINTON and M. Henri Fournier have signed articles for a series of automobile races. The first event will take place at the Empire City Track, Yonkers, N.Y., on July 25. The second race will be run off at the Glenville track in Cleveland between August 1 and 12. The races will be for twenty-five miles, and standing starts will be made from opposite sides of the track. In case of accident to either vehicle in the first mile, the race will be stopped and restarted.

PROMPT steps are being taken to obtain the authority of Parliament for holding the Gordon Bennett motor-car race in Ireland. No opposition is anticipated from any quarter, but should any arise the Government will endeavour to overcome it. The Bill will be brought forward immediately the Address is agreed to, and the promoters maintain that the competition will not only take a great deal of money into Ireland, but do much to encourage the manufacture of cars of British design.

HEREWITH we illustrate the Abeille 4-cylinder motor with mechanically-operated inlet valves, which is being introduced by Messrs. Dalifol and Company, of Paris. The dimensions of the cylinders, which are cast in pairs, are 90 mm. bore by 180 mm. stroke, the normal speed being 900 revolutions per minute. The

carburettor is fixed to the motor, and has only one suction pipe for the four cylinders. The governor acts on the inlet by a valve operated by a double joint; the pump for the circulation of the water is placed in front of the motor and is driven by toothed wheels placed inside the case, as are the cams, operating the valves, so that they are always protected from dust, and run in an oil-bath. Messrs. Dalifol have also introduced two engines intended for use on motor boats. These have two or four cylinders, 140 mm. bore by 180 mm. stroke, with a normal speed of 750 revolutions per minute, giving 15 and 35-h.p. on the brake. Their low speed necessary for the good working of the screw is claimed to avoid vibration, and to ensure maximum efficiency.

MOTOR-CARS AS FEEDERS TO RAILWAYS.

MR. WORBY BEAUMONT presided at the Automobile Club on Friday, the 13th inst., when a paper on the above subject was read by the Hon. Scott Montagu, M.P., in the course of which he said:—In this paper I propose to deal with motor-cars as feeders for railways from two points of view—firstly that of passenger traffic, secondly that of goods traffic. The passenger may be divided roughly into two classes, the regular passenger and the occasional passenger. With the former, every minute is precious, and he has to reckon his journey, not by the time taken in the train only, but also the time taken from door to door. He does not use the expression, "I live so many miles from town," but "I live so many minutes from town." On a main line within five minutes' walk of, say, the following stations, all of them about 50 miles from London—Brighton, Basingstoke, Didcot, Bletchley, and Bedford—supposing that the terminus to which the passenger goes is fairly close to his business destination, he will probably reach his office from door to door in the space of about one hour and a quarter. If the same man lives within a 25 miles radius, say, for instance, at such places as Woking or Bishop's Stortford, and is about 4 miles from the station, he has to allow half an hour for the road portion of the journey, and is therefore approximately in the same position as the man living double the distance by rail. In these cases I think railway companies should collect their passengers by motor-car as they now collect goods by vans and horses. Supposing that the average Londoner is turning over in his mind whether he shall go for a day's excursion to the seaside, the company which will send a motor-car and collect him at his door and convey him to the terminal station from which he departs, will undoubtedly secure his fare. The connection of small centres of population by motor-cars would enable more people to live in the country, with greater economy of money and time, and if suitable fast trains were arranged—say, two in the morning and two in the evening—in connection with the motor-car services, a great increase in the number of persons travelling between these stations would almost immediately take place. If built on suitable lines, the motor-cars could be used for the conveyance of light parcels traffic at any time when all the space was not required for passengers. Business men would soon accommodate themselves to the two or three motor-car and fast train services in the morning and evening. I will now pass on to the second class of passenger, the occasional traveller. For the use of such people there might be a motor-car service running in connection with express trains stopping at principal stations, and distributing and collecting the passengers to and from villages and small towns which at present are not tapped, or are badly served by branch lines. There is no reason in this case why a motor-car service, averaging 20 miles an hour, should not be established between Peterborough and Stamford, which would serve not only Stamford, but intermediate districts as well. In the same way the Great Eastern might collect passengers from Dunmow on the one side and from the Hertford villages on the other, to a centre like Bishop's Stortford, saving much of the present train-running on the Dunmow branch line, and at the same time providing a more convenient local service. There are large areas of country in the Eastern counties which could be organised from the outskirts of such towns as Cambridge, Thetford, Ipswich, and Colchester. In the case of comparatively large towns like Stamford, a service three or four times a day each way would probably be found necessary, but in more rural districts the motor-car might work three days a week in one direction and three days in the other, thus giving travelling facilities to villages hitherto untapped. There are many places in Scotland where there are towns of considerable importance that have as yet no railway communication, owing sometimes to engineering difficulties and consequent prohibitive expense, and sometimes to the fact that the traffic is not constant, and would only pay during the summer and autumn months. In this case, the motor-cars could be suspended, or partially suspended, during the winter months, or else their activity shifted to another sphere. A large excursion traffic of superior character, i.e., first and second class, might thus be established which hardly exists to-day, the third-class excursionist being probably 90 per cent. of the passengers carried in this particular class of traffic. The railway manager might ask at this point: But who is to superintend and organise this new departure? My answer is that the same department which now supervises horses, vans, and parcels would take the matter in hand.

With reference to branch lines, some undoubtedly pay; but there are more cases where it would be economy to abandon them and substitute a motor-car service instead, and in some cases it would pay better to boldly make them into motor roads, which might easily be done by bringing the material on the road bed up to the level of the rails (without, of course, necessarily removing them) in a similar manner to the tramlines now laid in our streets to-day. The motor-car running on such a road would have no speed limits, and could prolong its journey beyond the present terminal station.

An obvious question has yet to be put and answered. Is there a reliable motor which, above all things, will be free from breakdowns? I think I may honestly say that there are several firms now in the market capable of building and supplying really reliable cars which have already proved of commercial value to the different firms using them. It would be invidious here to mention any particular firm; and, as to the expense, if the railway companies were to give a sufficiently large order to any of the bigger makers, they would find that on 100 motor-cars they would get a great reduction in cost.

I will now deal with a special class of traffic which is surely capable

of more development, and which should be encouraged and retained in this country by British railways. I refer to the milk traffic. We import foreign milk with cows at our doors. Here the automobile can help, and already there are farmers near London who are arranging to organise a motor-car service for the conveyance of their produce. If the railway companies in dairy districts would run motor services across country, say, from Peterborough to Leicester, or, to take a case on the South-Western line, down the Avon Valley from Salisbury, via Ringwood, to Christchurch, they would assist the farmers in such districts, who so far are backward in combining, and can rarely afford the capital requisite. Such a system would stimulate existing traffic, and could tap individual farms on the road, picking up agricultural products *en route*. On the return journey the cans could be dropped at the same points, and other goods distributed at the same time, and a farmer would be only too glad to be relieved of the trouble and expense of keeping a man, horse, and probably a cart for this special purpose. There is another use also which can be made of the automobile system, namely, the running of automotor railway carriages, similar to the ordinary tramcar. The charge for goods freight is made up of many items. One of the principal is the cost of distribution and collection from sender to receiver outside the mere train journey. In London, for instance, the goods van mileage compared with the weight of goods carried is ridiculous, and a van may often be seen leaving the various receiving offices of the different railway companies half or one-quarter loaded, or starting from a terminal station with goods for a certain district, possibly with one man

A WINTON CAR IN THE ROCKY MOUNTAINS.

and a boy in charge, two horses drawing the van, and the whole value of the consignment inside amounting to only a few shillings. Van horses cannot be expected to work every day of the week, and the distance they cover, I am told, rarely, if ever, exceeds 15 miles per day. While the horses are resting, a certain proportion of the staff must be resting too, whereas in the case of motor-car vans the latter would be able to cover much greater distances at less expense and be working continuously—in itself a great saving. Perhaps before long it will be found cheaper to organise a system of motor lorries to take freight and merchandise to some big goods stations outside the metropolitan area—for instance, to Willesden for the North-Western, instead of loading up the wagons at the present goods yard near Euston, where space is so valuable. There are numerous manufactories also dotted about all over the country, some distance from their main station and not connected by any siding, which are now heavily handicapped. These could be linked up if desirable, and a regular service established. From personal experience in the working of the Schultz Gunpowder Company, which has to convey its raw product, and eventually the manufactured article, some ten miles in each direction, I may say that the statistics which we have already show that the steam lorry now working in connection with the business is saving us eight horses, and works out at a far cheaper rate per mile than the former three-horse vans. I can think of no class

more suitable for the position of driver than the old locomotive driver, perhaps slightly past his prime, but steady and reliable, and fully fit for many more years' work, though perhaps not quite equal to the strain of express train driving. The question of cost of running will naturally be the first subject for consideration by the general managers. I therefore give a few facts as to cost, though, of course, if taken on a large scale, the cost per ton-mile would come out at a good deal less. For passenger conveyance it may be calculated that the consumption of petrol will not exceed 1d. per mile, while the wear and tear of solid rubber tyres, which will probably be found most suitable for this purpose, ought not to exceed 2d. Men's wages on the basis of a driver at 35s. and conductor at 25s. per week, and assuming that the vehicle covers 30 miles a day and works six days a week, would cost 4d. per mile, and 2d. should be written off for wear, tear, and depreciation. These figures must necessarily vary slightly according to speed and type of vehicle adopted, but they err on the extravagant side, and thus 9d. per mile is reached. Assuming that such vehicles capable of carrying twenty convey an average of twelve persons each journey, 1d. per mile might be charged, or possibly a higher fare for better seats or quicker services, which shows a profit of 3d. per mile. For comparison, the London United Tramways, in their last report, state that the average fare per passenger per mile is 49d., or half of the sum I suggest should be charged.

As to goods, the possibility of carrying heavier loads longer distances comes out cheaper as compared with short journeys. The horse hardly

Mr. Monkton, in opening the discussion, announced that the directors of the Great Central Railway were proposing to make a tramway line of their own to the new docks at Grimsby. He believed the time was coming when motor-cars as well as tramways would have to be considered by the railway companies.

Colonel Crompton said that although good points had been put forward, the railway directors would look at the matter from a financial point of view. It would pay them very well for the reason that the total return per annum that might be expected from 100 or 1,000 cars of standard type would be much greater than that capital could earn if expended on fixed plant. Traffic varied in different districts with the seasons, and there the convenience of the motor-car would be appreciated. Manufacturers would have to recognise the difference between pleasure and public service vehicles. The tyre question would also have to be considered, and it might be found well to go back to wheels of a larger diameter, which would alter the construction of cars.

Mr. R. W. Buttemer pointed out that in country districts it might be found better to leave the provision of motor-car services to private enterprise. If railway companies started depots out of town the question of widening the roads would have to be considered.

Mr. H. G. Burford regarded a speed of more than twelve miles an hour on ordinary roads to be impracticable in connection with public service vehicles. It was not advisable to allow those in charge of the horse departments to take over the supervision of motor-car work, and he would prefer

THE DUKE OF PORTLAND'S MILNES-DAIMLER 16-H.P. SHOOTING CAR. (See page 989.)

averages more than 10 to 15 miles a day; but the distance that could be covered by a motor lorry is limited only by its speed, and the number of hours the men in charge can work. Messrs. Bass have given me some figures as to cost of the motor-cars as compared with horses, which show that, although at first the motor-car proved slightly more expensive, when the men and the service were properly organised there was a slight saving over horses, and eventually they tell me they have no doubt that even better results will be shown.

I give the figures as given to me by a partner of the firm:—Tons carried, 2,326; cost per ton, 4s. 0½d.; cleaning, 36 days; repairs, 20½ days; wages, £224 16s.; fuel, etc., £72; repairs, £32 6s. 11d.; insurance, £15 16s.; total, £344 19s. 5d.; depreciation, £100; interest, £25; total cost, £469 19s. 5d. I doubt if the figures of pair-horse railway van work show per ton carried such good results as these.

"Festina Lente" may have been good enough in past years, but we live now in an age of hurry, and railway authorities must realise the demands of the age, and meet the wants and wishes of the population through which they run. To do this, every new mode of traction must be linked up and utilised in conjunction with existing methods. If, on the other hand, the gospel of the "have beens" prevails, I see a future by no means rosy for British railways. Progression or decay is as much a law of commerce as of Nature.

that a special department should be constituted for the work. Referring to the successful carrying of the mails between Liverpool and Manchester, he said it worked out at 8d. per mile.

Mr. J. S. Critchley agreed that a speed of twenty miles an hour was out of the question. He referred to the difficulty of getting suitable tyres. The lack of progress in the past had been mainly due, not to the manufacturers of automobiles, but to the makers of component parts.

Mr. E. V. Calthrop said that no public service of motor-cars could be run successfully unless efficient inspection was provided. That was necessary to the reliable running of the locomotive, and organisers of motor-car services should be equally careful.

Mr. Shrapnell Smith agreed that motor-cars would ultimately benefit the railways very largely. They might lose a certain amount of local traffic, but ultimately they would gain largely. The proposal to do away with local receiving stations in cities was one that would not commend itself to railway managers.

The chairman pointed out the importance of good roads in connection with the further developments of mechanical traction, and, in replying to the discussion, Mr. Montagu urged that, in some cases, the railway companies might contribute to the maintenance of local highways.

A vote of thanks to the writer of the paper brought the proceedings to a close.

CORRESPONDENCE.

THE SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It struck me, after reading in your issue of the 31st ult. *re* Pannhard's discovery by breaking the wire, and leaving a small gap before the current reaches the sparking plug, that this is a very useful hint. I have myself made a few experiments, and found it most valuable. I have made a small inexpensive arrangement whereby it can be placed on the dash-

A. Block of insulation fibre or vulcanite screwed to pushboard.
B. 1/4 in. hole in same.
C. Induction coil.
D. Sparking plug.
E. Spark gap.
F. Two-set screw, by means of which gap can be adjusted.
G. Dashboard.

board of the car, and the spark can be seen all the time. I think it would be a good thing for other users, and in the case of a make and break contact, by placing one's ear near the gap one can distinctly hear whether the trembler is trembling or not, a point which has been more than once discussed in your useful paper. I enclose rough sketch, which will explain itself.—Yours truly,

R. WINN.

CARS FOR MEN OF MODERATE MEANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that a correspondence is going on in your valuable journal with reference to the cost of maintaining small cars, it seems to me that a word of warning to the man of moderate means may not be out of place. Nothing is more sad than for a person who is not well off to save and scrape, perhaps for a couple of years, in order to be able to buy a car, and then find in the end that he has not purchased a suitable article. The market is now being flooded with cheap imitations of the De Dion *populaire*, which are as different from the original as light from darkness. What the poor man wants are good workmanship and accessibility. It is easy enough for our foreign friends to give a voiturette a grand name worthy of a British battleship, and supply a pleasing exterior as far as paint, varnish, and seats are concerned, but the luckless buyer soon discovers to his cost that he has purchased a pig in the poke. An instance is given. A friend recently wished to present his son with a voiturette from the Paris Show; he fixed his affections on a genuine De Dion, but the younger man thought he could go one better and invested his money in a car with three speeds and reverse, a tonneau body, and a 6-h.p. De Dion engine. He was uncommonly pleased with his bargain and drove it to England. Precisely four weeks later he asked the writer to go for a drive with him. The car was already rattled to pieces, and neither the foot nor hand-brake would act. The result was that, in rounding a corner, the driver unexpectedly came upon a horse and cart, and in his efforts to avoid them he took the curb stone. A stoutly-built vehicle would probably have suffered no damage; as it was the axle gave way, and we only escaped a serious accident by a miracle. We were forced to return by train, and a new axle had to be fitted. Shortly afterwards the owner drove the car back to town. He collided with a horse and cart and knocked a man over, owing to being minus brakes. Arrived at his destination, the whole of the gear smashed up, and the luckless *bargain* had to be towed to a repairing shop. When examined by experts, it was pronounced to be absolutely unsafe and a danger to human life. Wheels, axles, springs, were light to a degree, and the advice tendered was to sell it for what it would fetch. So much for safety. As to accessibility, the prevailing fashion places the radiators on the front of the bonnet, the water tank well over the engine. In a large car there is space, but on the small ones to get at the trembler and platinum screw resolves itself into a conjuring trick. To unscrew the inlet valve presents a similar problem, for if a spanner is used large enough to fit the nut of the pipe, then it is impossible to turn it on account of the water tank. A small spanner cannot be employed, owing to the jaws being deficient in width and strength. When the poor man buys a car he must buy wisely and well. It is of all importance. One had only to visit the Crystal Palace Show to perceive what immense strides our native manufacturers have made. If the person of moderate means wants a vehicle to wear well, look well, and last well, let him invest his money in a British article, home-made throughout, save for the 6-h.p. De Dion or Aster engine. There are many such on the market to be obtained for about £200. The native

product is a good, sterling little car, thoroughly soundly constructed, and not mere pretty, trumpery rubbish. After using it for two or three years, if a change is desired, the owner can always sell again at a reasonable loss, and, unlike the son of the writer's friend, he will not be told, after the lapse of a month or five weeks, that his vehicle is only fit to be placed on the scrap heap.—Yours truly,

(MRS) M. E. KENNARD.

SIR,—With reference to the interesting paper read by Captain Campbell on "Motors for Men of Moderate Means," I have carefully prepared tables showing the annual expense of maintaining, on one side a carriage and two horses, and on the other a steam motor-car costing £300. The first table is based on ten years' actual experience, but the figures that relate to the motor-car are largely estimated.

After a visit to the late exhibition, and a fair knowledge of the idiosyncrasies of motor-cars, I have come to the conclusion that a car capable of doing the mileage specified in the table, in a hilly district, would cost about £300; and for the comparatively short but hilly daily runs that my horse and gig has been doing for the last twelve years should be of the steam rather than the petrol motor type.

TABLE SHOWING THE COMPARATIVE COST PER ANNUM OF KEEPING TWO HORSES, WITH GIG, AND A MOTOR-CAR, BOTH TO COVER 3,000 MILES PER YEAR.

Two Horses and Gig.		£	s.	d.
(1) Maintaining, during ten years, two horses by buying (£270), and selling (£108) after a useful life averaging three years, i.e., net cost per annum		16	4	0
(2) Buying for £30 and selling for £12, after running 36,000 miles in twelve years, one gig, i.e., net cost per annum		1	10	0
(3) Forage at 10s. per horse, per week		52	0	0
(4) Veterinary expenses		5	6	0
(5) Shoeing		6	14	0
(6) Harness and stable utensils		9	13	10
(7) Carriage licence		0	15	0
(8) Man's licence		0	15	0
(9) Man's wages at £1 1s. per week		54	12	0
(10) Repairs, renewals, and repainting of gig		10	0	0
(11) Insurance for £100 at 1s. 6d. per cent. (fire only)		0	1	6
(12) Miscellaneous		4	0	0
(13) Man's livery		4	12	10
(14) Stabling (stables, coach house and harness room)		30	0	0
(15) Light and fuel for above		5	0	0
		£201	4	2

Steam Car.		£	s.	d.
(1) Buying for £300 and selling for £50 after running 21,000 miles in seven years, one steam car, i.e., net cost per annum		35	14	4
(2) Car licence		2	2	0
(3) Insurance for £300 at 15 per cent. (fire only)		2	5	0
(4) Running expenses:—				
(a) Petrol at 1·00d. per mile		12	10	0
(b) Lubricating oil, etc., at 0·10d. per mile		1	5	0
(c) Tyres, renewals, etc., at 1·12d. per mile		14	0	0
(d) All repairs at 1·60d. per mile		20	0	0
(e) Cleaning materials at 0·16d. per mile		2	0	0
(f) Miscellaneous at 0·32d. per mile		4	0	0
Total at 4·30d. per mile		53	15	0
(5) Boy's wages at 5s. per week		13	0	0
(6) Licence for boy		0	15	0
(7) Boy's uniform or livery		3	0	0
(8) Rent of car-house		12	0	0
(9) Light and fuel for above		2	0	0
		124	11	4
Saving effected over two horses and gig		76	12	10
		£201	4	2

It will be seen from the above that I have assumed the "man of moderate means" to be one who can afford to spend about £200 a year on horses and carriage. And that if, instead, he invests in a motor-car, but keeps on his man and his stabling for the use of visitors, etc., he will be able to indulge in a week's tour (700 miles) without additional cost; whilst if he can do with only a boy, and let his stables, he can get his tour and be £64 to the good at the end of the year.

Many of your readers can, perhaps, correct or confirm my figures, and if general experience should prove them to be right, they should go far to undo the damage to the motor-car trade that Captain Campbell's paper is so calculated to inflict.—Yours truly,

CAUTIONS.

M. D. writes:—Would any of your readers, more especially medical men, who are users of the White steam car, kindly give me their experiences of the same? Is the car a suitable one for all weathers, and all conditions of roads?

FURIOUS DRIVING CASES.

Derby	*S. R. Turner	—	20s., etc.

Where no alleged speed is given it is understood to be above the legal limit.
*Motor-Cycle Cases.

HEAVY PENALTIES AGAINST MOTORISTS.

At the Chippenham Petty Session, Talbot Clifton, of Lytham Hall, Lancashire, was summoned by Meredith M. Brown, of Nonsuch House (1), for negligently causing damage when driving motor-car; (2) driving motor at illegal speed; (3) not stopping motor when signalled to do so; and (4) driving motor at dangerous speed. Ernest Amor, in the employ of Mr. Brown, stated that on January 2nd he was in charge of two hunters, riding one and leading the other. He was coming along the London Road from Derry Hill, and when opposite the nurseries he saw a motor-car coming along at a terrific pace. He knew the horses were restive on meeting motors, and he put up his hand as well as he could (having the reins in it) for the driver to stop, but he did not, and one of the animals jumped back, pulling him on to the road. He was hurt a good deal. Both horses were injured. Walter Williams, in the employ of the defendant as mechanic, stated that the roads were very greasy, and the defendant had to drive cautiously until they got to the boundary of the borough, when the speed was increased, but it was not an excessive speed. The motor was 200 yards off when he first saw the horses. When they got to within 100 yards of him, Amor waved his hand for them to go from the left to the right hand side, which was done. They saw the man had fallen from the horse, and Mr. Clifton was prepared to stop, but Amor was up on his feet again in a moment, and the defendant then continued his journey.

The Bench, having consulted in private, said it was most heartless conduct on the part of the defendant in pursuing his way when he saw that an accident had occurred. All the charges had been proved with the exception of giving the signal, and the magistrates were not quite satisfied that Amor could carry that out. For the first and second offences a fine of £10 and costs would be imposed in each case, and for the fourth the penalty would be £5 and costs.

Sheriff J. Gray Webster, Elgin, has issued his decision in the action heard before him about a year ago at the instance of John Mavor, farmer, Lochyhill, Forres, against Sir Edward Sassoon, Bart, M.P., claiming £52 15s. This sum was sued for in name of damages alleged sustained by a flock of sheep which pursuer was driving from Rafford to Elgin. The sheep were met and passed by a motor-car hired by defender, at a narrow part of the road, and in consequence of the driver failing to stop, it was contended that the sheep were crushed and injured. Pursuer at the time was holding a bicycle, which was also damaged by the car. The Sheriff has awarded pursuer £24 16s. in respect of the damage to the sheep and £3 for the damage to the bicycle. He also found pursuer entitled to expenses.

ON THE WRONG SIDE.

At Derby, on Monday, Samuel Bakewell, Belper, was summoned for riding a motor-cycle on the wrong side of the road, on the 5th inst. Defendant was motoring towards Belper, and was drawing his wife in a "trailer." Being on his wrong side, and travelling at the rate of 8 miles an hour, he collided with a cab. All were thrown to the ground. Defendant pleaded that he was near-sighted, and could not avoid the accident. He was fined 20s. and the costs.

TRAM LINES v. MOTOR CAR.

BEFORE Mr. Justice Channell and a common jury at Winchester last week, the case of Torrington Monier-Williams and Wife v. The Provincial Tramways Company was heard. The claim was for damages done to a motor-car which the plaintiff was driving in Gosport, while on a tour with his wife. The car got to Gosport safely, but when it reached Forton Road the off-wheel sank and entered into a rut on the roadway. The car was thrown out of its course, became unmanageable, and dashed into a plate-glass window. Both the plaintiff and his wife were seriously shaken. The plaintiff's case was that the cause of the accident was the careless and improper way in which the defendants had laid their lines and maintained them. The defendants' case was that they had kept their line in excellent repair, but that the cause of the accident was the disgraceful state of the road,

for which the defendants were not liable, but that the persons responsible were the urban district council. A further plea of contributory negligence was alleged, the plaintiff being, it was said, on the wrong side of the road. The jury expressed a wish to see the place, and the Judge adjourned the case for that purpose. They subsequently returned a verdict for the plaintiffs for £40, and judgment was given accordingly.

POLICE AND MOTORIST.

WILLIAM GLASS, of High Street, Croydon, was summoned at Lambeth Police Court, by the police, for driving a motor-car to the common danger. Mr. C. H. Dewey, Streatham, stated that on the afternoon of Saturday, December 27th, he was sitting on the front seat on top of a tram-car at Brixton Hill proceeding towards Streatham. He saw a motor-car coming towards him driven at a very rapid rate—not less, he considered, than twenty miles an hour. Two other witnesses were called in support of the summons, but neither of them were able to identify the defendant, and they both agreed that the car was of a light colour. Mr. Firth, for the defendant, submitted that the case had not been made out, and that it must fall to the ground for want of identification. Mr. Glass, the defendant, went into the witness-box and gave evidence to the effect that on the day in question he was driving a car which was painted a bright Post Office red. Mr. Francis thereupon dismissed the summons. Mr. Firth asked for costs, but the magistrate declined to allow them.

THE Motor Club d'Epernay have just been formed at Epernay, France, with Count Gaston de Maignet as first president.

The Long Island Railroad is having several automobiles made to be used in the express service of New York.

A COMPANY has lately been formed in Sydney with the title the Victor Motor Company and a capital of £10,000. Works have been established at Double Bay, N.S.W., and these are now turning out heavy oil motors for launches. The plant is under the managership of Mr. Gustav Ey, who was formerly with the Cannstatt Daimler Company, so that it is not improbable that the construction of engines for motor-cars will be taken up in Australia at an early date.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

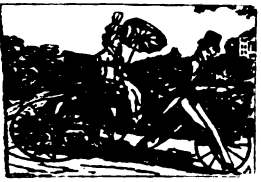

VOL. IV.]

LONDON, SATURDAY, FEBRUARY 28, 1903.

[No. 208.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THERE is plenty of fun to be obtained from the motor-bicycle, and, as was evidenced at the Automobile Club on the 20th, when Mr. Mervyn O'Gorman, scorning dull technicalities, and avoiding cranks and fads, treated the members to a display of Irish wit which should make them all the more

anxious to have the Gordon Bennett race run in the Emerald Isle. Elsewhere we give some extracts from the paper, and in our "Motor-Cycling News" appear some points from a rather feeble discussion. But we cannot refrain from giving in its entirety Mr. O'Gorman's recipe for courting on the motor-bicycle. Motor bicycling is not, he gravely informed his audience, a "solitary game. You will find in summer weather that free-wheeling is an exercise which your girl friends greatly enjoy. Now, waltzing is a very legitimate pastime, during which your right hand is gently pressed against the waist of your partner. I have heard that waltzing is also found agreeable. Imitate the position after you have mounted your motor-bicycle when *she* is on her 'free wheel.' Begin at ten miles per hour 'just to help'; she will soon stop pedalling, and you can increase to fifteen. You get to Henley quite nicely that way; you can chat, part company to pass a cart, meet again in front of it, allow her to help you by pedalling on the up grades, and on no account, if you value her safety and comfort, agree to any suggestion by which she is tied to you by a string, follows in your dust, consumes the exhaust gases, cannot converse with you, and listens appalled to the maxims which are being quick-fired at her by the engine. In fact, the popularity of the 'little bit of string' is on the wane with all who have tried it, despite the charms of a certain sweet singer. I much prefer this to a trailer, and do not find the extended arm grow tired. But, of course, the lady should be consulted." And all this in the course of a paper read to an audience over which a learned professor presided during a portion of the time!

The Crusade against Numbering.

THE fate which befel Mr. Montagu's Bill on Tuesday seems to be equally persistent with regard to the other Parliamentary measure with which his name is associated. The Wolverhampton and District Automobile Club is circularising Midland M.P.'s on the proposal to number automobiles, and points out that one object for which the Bill is being introduced is to ensure identification of the person unlawfully driving or assisting in driving a motor-propelled vehicle; "this object will not be accomplished in consequence of the vehicle bearing a number or other mark of identification, inasmuch as, in the event of an offence being committed, and it being admitted that the number of the vehicle has been accurately taken, that is no evidence that the owner of the car, or that any particular person was driving or assisting in driving it at the time of the offence complained of. The identification by means of numbering is objectionable, as, whether an offence has or has not been committed, any prejudiced person may take the number of a car, the driver of which he alleges has committed an offence, and may lay a complaint without the

knowledge of the driver until receipt by him of the summons, consequently no opportunity would be given to him to obtain evidence at the time and place where the offence is alleged to have been committed. The repugnance attaching to the disfigurement by numbering of private vehicles is equally strong, whether the vehicles are drawn by horses or propelled by motive power, and, in the event of the Bill passing, the members of the Wolverhampton Club have every reason to believe that many will decline to adopt a method of transport which is subject to such unfair and offensive regulations."

"General Con- demnation" of the Attitude of the A.C.G.B.I.

So strongly do the members of the Wolverhampton Club feel on the subject that, in addition to thus ably arguing it, they point out that the Automobile Club of Great Britain and Ireland, in a circular letter sent by them to the members of the County Councils in 1900, "protested strongly against the proposal to number motor propelled vehicles, and they then stated that 'by voting for the compulsory numbering of vehicles under existing or suggested conditions you will be imposing a restriction which will cripple, if not destroy, an important industry.' The attitude that Club is now assuming in supporting the proposed Bill has received general condemnation. We contend that any alteration in the law affecting motor-vehicles, except such as will place them on the same basis as other vehicles, is undesirable, and we therefore respectfully request you to oppose, except so far as relates to the repeal of the speed limit, the Bill referred to when introduced into Parliament, and to assist in the introduction of any measure which will provide increased facilities for locomotion, and encourage an industry the importance of which, upon social, sanitary, and commercial grounds, it is impossible to estimate."

Motor-Car Dangers.

AN engineer living at St. Helens was severely burnt on Saturday. It appears that he went underneath the motor-car to put the mechanism in order, when a quantity of waste was set on fire and he was burnt about the arms and face. Another motor-car mishap is reported from Blackpool. Mr. George Calvert, who was staying at the Victory Hotel, was found lying in an unconscious condition in the stable adjoining the hotel, where his motor-car was standing. He was conveyed to the Victoria Hospital, where he was found to be suffering from gas poisoning, and he now lies in a critical condition. It is supposed that he was overpowered by the exhaust from his motor-car.

The Annual Meeting of the A.C.G.B.I.

THE annual general meeting of the Automobile Club is to be held on Friday, the 27th. After deducting losses by deaths and resignations, the membership has reached 2,177, nearly half of which was added last year. There is little in the annual report to call for comment, although the policy of associating the Club with a proposal to provide for some means of the identification of motorists is of dubious value to the movement.

This is now regarded as such by some of the Committee, hence the suggestion to call a meeting of members on the subject. To this latter point we referred last week, and hope to learn that, even at this late hour, more adequate accommodation than was originally contemplated will be made for the large number who will doubtless want to attend.

Covered Vans.

THE Home Secretary has consented to a new bye-law suggested by the London County Council, which will prohibit the driving of any vehicle in London in which the driver cannot obtain a complete view of the traffic on either side as well as in front of him. The light covered vans in which the driver sits under the hood, and which are so familiar among our London traffic, are the cause of numerous accidents, even when driven by careful drivers; but when heedlessly driven they constitute a real danger in London streets. It will be interesting to watch the development of the form of the delivery van, should such bye-laws become general throughout the country. Certainly we would suggest to the makers of motor delivery vans who are considering designs in view of the trials to be held at the end of the year to give attention to this point, and see that the covered vans are so devised that the driver can see on either side of him and thus avoid passing traffic.

COL. CODY—"BUFFALO BILL"—ON A 20-H.P. WINTON CAR.

A Morning Run!

THE spring is beginning to make its influence felt in the country, and a pleasant spin through Richmond Park the other morning with Mr. A. E. Cohen, of the Weston Motor Syndicate, brought ample evidence of the fact. We were mounted on a 10-h.p. Chenard-Walcker car, the quiet behaviour and steady running of which contrasted well with the noisy, undulating method of progression associated with motoring in the pioneer days. From Mortimer Street we went in and out the traffic on top speed and glided along to the Marble Arch, where we watched the policeman's finger with the obedience to the powers that be that characterises all good and true users of the road. Thanks to the combination clutch and brake the driver had complete control of the car, and, driving on top speed all the way, was able to stop in traffic and get away again with a quietness of running that was distinctly notable. Curiously enough, on the same day we were enjoying our morning spin on a Chenard-Walcker car in London, the vehicles were winning distinction in the Consumption Trials in France, as recorded by our continental correspondent. The winning car, weighing 1,170 kilog., travelled a distance of 62 miles on an average of 46½ miles on one gallon of petrol, or, on a ton mile basis, 52 miles per gallon of petrol.

Motor-car Imports and Exports.

THE returns now available relating to the British imports and exports of motor-cars and cycles during January last show an increase both as regards the imports and exports. To deal first with the imports, no less than 540 cars and cycles were imported into this country last month, the value of the same being returned at £152,970. The value of the "parts thereof" is given as £14,142, so that we get a combined total of £167,112, as compared with only £62,473 in December last and £43,855 (representing 173 cars) in January, 1901. Indeed, it may be pointed out that the January total is the largest so far recorded in the history of the trade. Some of the imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised fourteen vehicles, amounting in value to £3,743, and £290 of parts, bringing down the net imports in January to £163,079, as against only £41,190 in the same month a year ago. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to sixty-two vehicles of a value of £14,955. Of parts, the exports attained a value of £1,921, making a combined total for January of £16,876, as compared with £33,395 in December last, and £10,992 (representing twenty-seven vehicles) in January, 1902. In the monthly Board of Trade Returns, both as regards the imports and exports, motor-cars and motor-cycles are lumped together. We had hoped the authorities would have seen their way this year to have given them separate classifications, a course which we trust they will deem it well to adopt when the question of revision next comes up for consideration.

Motor-cars at the Levee.

THE most noticeable feature of the King's recent Levee was the extraordinary number of guests who drove to Buckingham Palace in their motor-carriages. Never before had so large a number of automobiles carrying exalted personages been seen in the Mall. Most of the vehicles were of the type of electric brougham that may be seen any night in the West-End when the theatres are emptying. To go to the King's Levee in a hansom or four-wheeler is a perfectly correct thing, and many notabilities adopted this form of conveyance. It is one of the peculiarities of Court etiquette; but somehow to go to a Levee, which is one of the highest Court functions, in furs and goggles seems at first blush to be a feat of daring that only a modern D'Artagnan could accomplish. But we live and learn. The fashion has been set, and so it must remain. The scene in the Mall, where the carriages were drawn up, was unique. The man in the street who sauntered casually into this historic boulevard might have imagined himself in the midst of an automobile show. Extending halfway down the broad leafless avenues there were three parallel lines of carriages and motor-cars waiting to take away the King's guests. This famous lounge, so rich in historical associations, resembled for the time being, says the "Morning Post," a vast stableyard. The thoroughfare swarmed with coachmen, lackeys, and *chauffeurs*, idly chatting amongst themselves, and policemen with nothing to do. It was an up-to-date scene, very different from the days of pomp and pageantry with which the Mall is indelibly associated.

Scottish Automobile Club Runs.

THE Western section have issued the following programme of runs, etc., for the ensuing season:—March 28th, Ayr (Station Hotel), 3 o'clock; April 25th, Callander (Dreadnought Hotel), 2 p.m.; joint meet with Eastern section; May 13th and 14th, Glasgow to London non-stop trial; May 23rd, Lanark and hill-climbing competition on Kirkfieldbank Hill, jointly with Eastern section; June 13th, Tarbet, 3.30 o'clock; July 4th to 10th (provisional), Irish week, Gordon Bennett race;

August 8th, Biggar, 3.30 p.m.; September 19th, Aberfoyle, 3.30 o'clock; October 17th (provisional), "Anniversary" run, Dunblane, cars meet in Glasgow at noon. With the exception of the last named the times mentioned are the hours of arriving at the destination. At a meeting of the section on Monday, the 9th prox., Mr. Wm. Weir, of Cathcart, is to read a paper on "The Possible Developments of Automobiles and Automobilism."

Next Month's Exhibition.

INTEREST in the forthcoming Automobile Exhibition at the Agricultural Hall, London, is growing, and many new types of vehicles which the makers have been unable to get ready earlier for the coming season will be on exhibition for the first time. This fact alone will be sufficient to draw a large attendance of motorists, while the thoroughly representative character of the display of 1903 patterns will give the Exhibition an interest greater than that aroused by any previous display in this country. From the inquiries which the promoters are receiving daily, it is evident that there will not be a vacant space when the Exhibition opens on the 21st prox. Already all the spaces on the ground floor have been taken, as well as the gallery, minor halls, arcades, etc. As was the case last year, the Wednesday (March 25th) will be reserved as a Club day, when the admission will be half-a-crown. On other days the admission will be one shilling, and the convenience of the public as well as of exhibitors is being carefully considered.

The Tyre Trials.

ALTHOUGH the awards in connection with the tyre trials of the Automobile Club have been published, we have not yet heard the last of the matter. The view expressed in these columns a few weeks ago as to the unsatisfactory way in which the conclusion has been announced, has found expression in many letters we have received on the subject. Considerations of space preclude the publication of all these; but we would suggest that in future it would be well, firstly, that the points of the award should be distinctly stated before entrance fees are received; secondly, that no information with regard to matters of detail should be issued by those responsible for the conduct of the tests until the judges' award is made known; and thirdly, that when the awards are made they should not be vitiated by the official publication of the fact that Continental tyre makers did not enter, thus apparently robbing English firms of the credit to which they are entitled.

Down in Donegal.

At a meeting of the Finance Committee of the Donegal County Council, Captain Stoney, D.L., presiding, the condition of the roads in the district was discussed. Councillor Teague Magee, J.P., complained of the state of the roads in the southern division of the county, and was of opinion that the only way in which matters could be improved was to stop the salaries of the surveyors and their assistants. The latter, he contended, were devoting more time to private practice than to the discharge of their official duties. The Chairman and Councillor W. J. Hanna, J.P., deprecated such a drastic course as Councillor Magee suggested, but thought that the surveyors should be warned that such a proposal had come under the notice of the committee. Eventually, on the motion of the Chairman, seconded by Councillor Magee, the following resolution was unanimously adopted:—"That we have had complaints of the condition of the county roads in all directions brought before us, and the question of withholding the salaries of the county and assistant surveyors on this ground was suggested. It was resolved that no action of this kind should be taken at present, but that we recommend the County Council to consider what steps should be taken to remedy this state of things."

Moderate Speed Over the Course.

It has been agreed by the Executive Committee of the A.C.G.B.I. that any competitor in the Gordon Bennett race driving or being driven in or on a car over the course from this time forward until the start of the race shall be disqualified, if the car is capable of travelling on the flat at a speed exceeding forty miles an hour, it being understood that, in making this proviso, it must not be taken to imply that the cars should be driven at their maximum speed. Motorists generally, too, are requested not to drive over the course prior to the race in cars capable of travelling on the flat at over forty miles an hour, and to drive only at moderate speeds, and to show proper respect for the property and comfort of other users of the road. Any motorist who may disregard this request is liable, if a member of the Club, to expulsion or suspension, and if not a member of the Club, to disqualification from participation in any competition held under the rules of the Automobile Club.

A DURYEA CAR IN JAPAN. [Automobile Magazine.]

Improving the Route.

THE efforts of the Automobile Club to improve the roads on the proposed Gordon Bennett course is worthy the support of all enthusiastic motorists, and in several quarters appeals are being circulated which should have the effect of securing a substantial fund. Some clubs, like the Yorkshire, are specially urging their members to subscribe, and we would renew our suggestion of a fortnight ago that unattached *chauffeurs* should join their fellow motorists in this work and send subscriptions—10s. is the suggested amount—to the Secretary of the A.C.G.B.I., 119, Piccadilly, W.

Parliamentary Approval.

A PRELIMINARY Parliamentary skirmish in connection with the Bill legalising the Gordon Bennett race in Ireland took place on Monday, when Mr. James O'Connor asked the Chief Secretary for Ireland whether, in view of the desire in Ireland that the international automobile race should be run in that country, and considering that the local councils through whose districts the cars will speed were prepared to take every precaution for the safety of life, he would introduce a Bill to enable the competitors to hold the race in Ireland. Colonel

Saunderson asked for a favourable reply to the question, and the Chief Secretary in response said that in view of the unanimous desire which was shared by all the local bodies representing the districts through which the proposed route would run, and by all the members for Irish constituencies without distinction of party, he ventured to express the hope on the part of the Government that the Bill introduced by Mr. Scott Montagu would be regarded as non-controversial. He did not contemplate the possibility of those not directly interested in Ireland opposing a Bill brought forward with the unanimous support of the Irish members especially as no one could be interested in opposing it.

Unanimity.

THE "backers" of the Light Locomotives (Ireland) Bill which Mr. Scott Montagu has introduced, represent about as many interests as it would have been possible to have placed upon the rear page of this measure. They include the Hon. Arthur Stanley, a Conservative member, who is interested in motor-vehicles for heavy traffic; Mr. C. D. Rose, a newly-elected Liberal member, whose interest is confined to motoring for pleasure; Colonel Sanderson and Mr. Patrick O'Brien, who have rarely agreed upon any other subject; and Messrs. W. Delaney and M. J. Minch, the two Nationalist members for Queen's County and South Kildare, through whose constituencies it is proposed to run the great race. Mr. Scott Montagu only came out number 65 in his ballot, but news of his success in securing a first reading on Friday, the 20th inst., was received with enthusiasm when announced at the Automobile Club on the same evening.

Blocking the Bill.

By lifting his hat to block the Bill legalising the race, Mr. W. J. Galloway has incurred the wrath of Ireland and excited the indignation of his constituents, as well as the general body of motorists. Really we should have thought that a gentleman connected with the engineering industry, and whose versatility can embrace the advocacy of a National Opera House, the publication of a book on Australia, and the presidency of a bicycle club—the latter by way of recreation—would have recognised the injury he was doing to British industry in blocking this permissive Bill. Surely he must recognise the unsportsmanlike character of such a proceeding, and when he next enters one of his half-dozen clubs will have to encounter questioners among Society people who were anticipating the event with an extraordinary amount of pleasure.

Success in Sight.

MR. MONTAGU and Mr. Arthur Stanley intend being at the House each evening in order to take advantage of the first opportunity to secure the second reading of the Light Locomotives (Ireland) Bill. This will probably take place before our next issue, Mr. Galloway's "blocking" being on the technical ground that the measure had not been printed—a very poor excuse for delaying the matter.

A Case Struck Out.

THERE was a touch of humour in a case which has just been heard at Brentwood, and which has ended very satisfactorily for the defendant, Mr. Charles Watt, of Hutton, who was summoned for driving a motor-car at an excessive speed at Brentwood on Jan. 1st. As already reported in our columns, the matter was dismissed, the prosecution closing their case without putting in a copy of the regulations of the Local Government Board. The police, however, had determined to have their victim, and issued a fresh summons, which was heard last week. Mr. Watt's legal adviser, however, contended that as the case had already been dismissed the bench had no power to adjudicate—an interesting point that led to a further adjourn-

ment so that the magistrates might consider the nicety of the point raised. At the final hearing the Bench said they had no jurisdiction to try it, and therefore it was struck out. Such, we may rightly add, should be the fate of nine out of every ten of the summonses which are issued against motorists.

Trade v. Amateur.

AN interesting discussion has taken place at the Lincolnshire Automobile Club as to the advisability of gentlemen connected with the trade taking prominent official positions in automobile organisations. The meeting was somewhat divided, some members advocating that gentlemen with trading associations might be nominated for the committee, but not for chairmanship, secretaryship and other offices. Others stoutly declared for the amateur character of such clubs to be rigidly maintained, members of the trade being kept, as is now the case in Lincolnshire, off all committees. A few days ago the same question cropped up at another provincial club, and it is a point which all interested in the organisations connected with the industry should carefully watch. Up to the present little harm has been done by the presence of gentlemen prominently identified with the trade in the central councils of automobilism; but evidently there is a growing feeling that as the industry grows, it will become advisable to keep the social side of the movement quite distinct from the trade aspect. Members of the trade serving prominently on club committees, necessarily have great prominence in their locality, and the feeling that such may destroy the purely amateur side of club life is probably responsible for the interesting discussions now taking place on the subject.

LORD DUDLEY, Lord Lieutenant of Ireland, gave a most sympathetic consideration to the deputation from the Kildare County Council, which last week waited upon him, asking his lordship to use his influence in favour of the Bill to permit that the Gordon Bennett race should be run in the Emerald Isle.

MR. CLAUDE JOHNSON has informed the Executive Committee of the A.C.G.B.I. of his desire to resign his appointment to the International Racing Commission, as he ceases to be secretary of the Club on June 2nd, and does not know whether he will be in Europe at the time of the Gordon Bennett race. A sub-committee has been appointed to consider the question of a successor, or successors, with full power to act.

THE case of Mr. W. K. Vanderbilt, who some months ago was sentenced to two days' imprisonment and a fine of 8s. for driving his motor-car in Paris at more than regulation speed, has taken another turn. He has appealed against the sentence in the Paris Police Court, pointing out that it was monstrous to condemn him for an offence with which he had nothing to do. Thereupon M. Coubar, the *mecanic'en*, was asked if he would accept the sentence in lieu of his employer, but he declined with thanks. The case was accordingly adjourned until March 18th, when the *mecanicien* will appear with Mr. Vanderbilt as a defendant.

A GENERAL meeting of the Aeronautical Institute and Club was held at St. Bride's Institute, E.C., on Friday, the 20th inst., when a paper was read by Mr. W. J. Griffiths, entitled "A Novel Method of Navigating the Air," which gave some interesting particulars of a flying machine built on the aeroplane principle. The machine consists of superposed aeroplanes, supported by a framework, and capable of being adjusted at any required angle. The car containing the aeronaut and machinery is suspended below, and the machine is driven by six propellers. A paper which followed, entitled "An Improved Kite or Flying Machine," by Messrs. Tarozal, Poheim, and Simko, gave the description of a kite constructed of "stepped" aeroplanes. This apparatus, if furnished with suitable motive power and propellers, could be used as a flying machine, the design of the machine giving it great stability when in the air.

MECHANICAL INLET VALVES.

TRULY, "there is nothing new under the sun," and the mechanically-operated inlet valve is no exception to the old maxim. It had been used in internal combustion engines before automobiles—under that name—existed; while its superior efficiency has been asserted by scientific engineers, and demonstrated by laboratory tests at frequent intervals during the seven years of automobilism. All this, however, was but as a preaching in the wilderness until its adoption by the Mercedes firm at one end of the scale, and by one of the largest manufacturers of bicycle-motors at the other, and while it is to the former that the example is due, much of the popular interest in the subject is owing to the latter, and was the prelude to a general *volte-face* among the principal makers, nearly all of whom are now following the German lead. How far this has been an unmixed benefit is still, one may say, *sub judice*, and food for too often acrimonious discussion.

It is not difficult, of course, to describe the qualities that should belong to a perfect inlet valve. It should open instantaneously, and to its full extent, as soon as the exhaust gases have been so far got rid of that the pressure in the cylinder is equal to that of the atmosphere, *i.e.*, to such a point that no

seen, at times, in a pulsating or hammering of the valve, instead of the sharp opening and closing that is desirable; this also being an active cause of worn and broken valve stems.

The mechanical valve, on the other hand, can make a much nearer approach to perfect instantaneous opening and closing, and these can take place at a definitely predetermined point in the stroke. (The idea of making these points variable to suit the speed does not seem to have been suggested yet, and would probably be too complicated a refinement.) The valve may be heavier, if necessary, without detriment (so valve-stems need not be so fragile) and is less liable to be affected by dirt, burnt oil, and the like. As for the alleged extra complication, it is sufficient to ask which gives most trouble, an ordinary inlet valve with a spring, the adjustment of which for best efficiency is a delicate matter, or an ordinary exhaust valve if we exclude the burnt stems, regrinding, etc., which are due simply to its being exposed to exhaust gases, and not to its mechanical movement. The fitting of a mechanically-operated valve simply amounts to having two "exhaust" valves, one of which is exempt from the ills to which an exhaust valve is heir, and in return being free from the troubles of stuck inlet valves and the adjustment of light springs to them. As regards their increased efficiency, from 5 to as much as 25 per cent. has been claimed,

FIG. 1.—SECTION OF PETROL MOTOR WITH ORDINARY SUCTION INLET VALVE.

gas can return along the inlet pipe. This need not, and probably does not, mean at the exact commencement of outstroke. It should close as soon as the piston, passing its outer dead point, raises the pressure of the cylinder contents to that of the gas in the inlet pipe. This may be somewhat above atmospheric pressure, owing to the inertia of entering gas, and so need not—probably does not—coincide with end of outstroke.

How far, then, we may ask, does the ordinary atmospheric inlet valve fulfil these conditions? First of all, it must obviously open too late, owing to the resistance of its spring having to be overcome; too late again and too slowly, owing to its inertia, and the fault may be aggravated by accidental dirt or stickiness about its stem and seat. Next, it must tend to close too early at slow speeds, owing again to its spring, which may be neutralised or even over-corrected at high speeds by its inertia.

The absolutely correct times of opening and closing must vary somewhat for different speeds, and while the atmospheric valve cannot open too early, and may adapt itself somewhat to varying speeds as regards opening, though always a little late, its time of closing may be subject to more error, and that this is considerable under ordinary working conditions may be

FIG. 2.—SECTION OF PETROL MOTOR WITH MECHANICALLY-OPERATED INLET VALVE.

the latter at high speeds; while there are makers who disclaim increased efficiency, though still adopting them. Undoubtedly they should give it, but it lies with the manufacturers to turn them out with the nearest approach to correct timing for their particular engine, the power of adjustment which is possible with the spring of the atmospheric valve being absent. This, however, considering the difficulty of getting two or four light springs to be and remain of equal strength, is a doubtful loss, and perhaps the strongest argument in favour of the mechanically-operated valve is the improved synchronism that can be obtained in multiple-cylinder engines. The amount of power lost by want of equality in the performance of the two or more cylinders of a modern motor is hardly realised by many drivers, and it is by no means an easy task to obviate it with atmospheric inlet valves.

It may be fairly admitted, then, good design being presupposed, that a distinct improvement is to be expected from the adoption of mechanically-operated valves, slight perhaps at normal speeds, but increasing at speeds much above or below normal; while there is no reason to expect any additional trouble from their use,

As regards the timing of the valve, the general result of various experiments seems to show that the opening should take place when the crank has passed about 10 deg. beyond dead point, and close at a somewhat less interval after completion of outstroke; but exact data are wanting, and a comparison of the practice of the different makers who have adopted the mechanically-operated valve would be of interest.

R. W. BUTTEMER.

THE DE DION SELF-IGNITION DEVICE.

MESSRS. DE DION AND BOUTON have taken out a patent in France for a device intended to be used for the ignition of the charge in explosion motors, in which the heat of compression in a special small cylinder is caused to produce a flame. The small cylinder (*b*) is fastened to the side of the main cylinder, and is in communication with the compression space (*a*) of the latter by a small passage (*c*). In the small cylinder works a tight-fitting piston, which is forced upward in it, once for every two revolutions of the motor crank-shaft.

An explosive mixture is admitted to the cylinder at the upper end thereof through an automatic suction valve (*f*). When the piston in the small cylinder is forced upward the gaseous charge therein is compressed to the point of self-ignition, and the flame travels through the small passage to the compression chamber in the main cylinder and explodes the charge therein. In order to vary the time of ignition the mechanism by which the piston in the small cylinder is operated must be arranged to effect this operation at a variable period.

On Monday, Mr. W. Worby Beaumont will open a discussion on "Road Traffic in and near Large Cities" before the Society of Engineers.

MESSRS. HUGGINS AND CHAMBERS stock motor-spirit, oils, etc., at their premises in the High Street, Utttoxeter, and are always glad to help motorists in difficulties in their neighbourhood. There is an excellent garage at the White Hart Hotel, in Utttoxeter, and about half-a-dozen private owners of cars in the little town.

THE HYDROLEUM SYSTEM.

THE fuel system introduced by the Hydroleum Motor Company, Ltd., has been made the subject of trials by Mr. W. Worby Beaumont, a Locomobile being used for the purpose of the tests. In one case petrol was burned with the Locomobile burner, and in the other crude Texas oil with the Hydroleum burner. The trials consisted of two runs of fifty and fifty-two miles over practically the same road, namely, to and from the twenty-third milestone beyond Godstone, on days when the roads were in an approximately similar condition of surface and through similar traffic. The main purpose of the trials was to ascertain the relative evaporation power of the same boiler with the two very different kinds of fuel. The run with the petrol burner in use was made without any noteworthy incident, the burner behaving uniformly well. On the trials with the Hydroleum burner the driver was skilled in its use, but not sufficiently so on the road to avoid occasional excess in water level and consequent wetness of steam passed to the boiler. In the evaporation tests with the car standing, similar conditions as to feed-water temperature, and feeding were observed. The records were commenced after evaporative conditions had become normal, a two-hours test then being sufficient for so very small a boiler. From the table of results we notice that with the petrol the evaporation per lb. of fuel was much greater when the car was running and the boiler in a constant state of small oscillation and vibration than when the car was standing still. When referred to the usual standard of evaporation, namely, from and at 212 degrees, the evaporation on the road trial was 15.8 lbs. of water per lb. of petroleum spirit, while, with the car standing, the corresponding equivalent evaporation was 11.5 lbs. per lb. of fuel. The figures referring to the Hydroleum burner trials show that the equivalent evaporation with the car on the road was rather more than with the petroleum spirit with the car standing, but was rather less than with the Hydroleum burner with the car standing, the equivalent evaporation per lb. of oil being 11.88 and 11.92 lbs. from and at 212 degrees, which must be considered a highly satisfactory quantitative result with so small a boiler. If the Hydroleum burner had not been extinguished four times during the run from Godstone to Willesden, a higher rate of evaporation per lb. of oil would no doubt have been obtained when running. The water evaporated per gallon of fuel was higher with the oil than with the petroleum spirit, and the quantity of water evaporated per hour and per mile covered was greater with the oil than with the petroleum spirit, again pointing to wetness of steam during the oil run. The rate of evaporation per hour with the petroleum spirit burner was much lower when the highest duty per lb. of fuel was obtained than with the higher rates of evaporation per hour. When the boiler evaporated as much per hour during the petroleum spirit trial as in the oil trial on the road, the consumption of fuel was greater than with the oil. From this it will be seen that with the smaller rate of evaporation per hour dryer steam is obtained with greater economy and used with greater economy. The cost of fuel for the two journeys was 3s. 6d. with the standard petrol burner and only 8 1/32d. when the Hydroleum system was employed—a considerable economy being thus effected.

THE City Fathers of Edinburgh have been treated to an exhibition of the advantages of the motor fire engine, Messrs. Merryweather and Sons, of London, having sent to the Scotch capital the motor fire engine which they have built for the municipal authorities of Wanganui, New Zealand.

On Saturday evening Mr. Balfour went eastward on his 12-h.p. Napier car, calling for his cousin, Lady Gwendolen Cecil, at St. James's Church, Walthamstow, where she had been laying a foundation stone. Subsequently they drove in the direction of Tottenham on the way to Hatfield, amid the cheers of the crowd. Such excursions as this would have been impossible but for the use of the automobile.

THE COULTHARD SIX-TON STEAM LORRY.

WE are pre-eminently a commercial rather than a pleasure-seeking people, and, for this reason, perhaps, the heavier class of commercial vehicles has received keener attention in Great Britain than elsewhere. The matter has not been entirely overlooked on the Continent, but, undoubtedly, the pleasure automobile appeals more to the Continental nature; and the latter has been pushed prejudicially, perhaps, to the commercial vehicle.

The subject of the accompanying illustration is a motor-wagon built by Messrs. T. Coulthard and Company, Limited, Preston, and supplied to Messrs. Leslie and Company, Limited, contractors, of Kensington. This firm is amongst those who have been associated with the manufacture of commercial motor-vehicles since the "revival" of the industry; and with their lengthy experience, details of design and construction have been so perfected as to give practical, efficient, and durable vehicles for road service. The following description of the lorry illustrated, which is one of the largest type, gives the characteristic features of their products, the essential working parts being in

an outer shell with equal distribution of metal throughout, so minimising the risk of leaky tubes due to unequal expansion and contraction. The fire bars and ash pan are divided and hinged to allow the ashes and fire to be dropped out. The smoke box is of conical formation, making a receptacle for fuel, and the lid of the feed tube being lifted, the fuel automatically falls on to the fire. This fuel container is replenished from the bunkers at convenient times, as, for instance, when stopping. One man only is thus needed to manage the vehicle.

The power is sufficient for all ordinary purposes, but for any accidental emergencies the compound engine can be instantly converted into a double high-pressure engine with separate exhausts. Should soft ground be encountered and the wheels sink or revolve without driving, the differential gear can be locked and the two driving wheels made to act together, enabling the vehicle to better extricate itself from any difficulty.

The working pressure is 200lbs. to the square inch. Coke or coal is used for fuel, the bunkers having a capacity sufficient for a run of about thirty-five miles. The boiler is placed behind the front axle, and the fuel bunker in front. A very simple two-speed gear is provided giving normal speeds of $2\frac{1}{2}$ and 5 miles an hour, but, on average roads, 6 miles an hour can be easily maintained. The crank-shaft and the eccentrics are cut out of a

THE COULTHARD 5-6 TON STEAM LORRY.

all cases practically the same, although the superstructure or body can be made to suit requirements. Three sizes of vehicles are constructed, with a carrying capacity of two, four and six tons respectively, and, if necessary, under favourable conditions, a trailer may be used, transporting an additional one to four tons according to the size of the wagon.

The frame is of channel steel, strongly braced, and carries the whole of the machinery, but the engine and transmission gear are so attached as to render them quite insulated from any deleterious influence of torque or twisting of the frame, which is inevitably the result of uneven roads, and shifting and variation of loads. This resultant is obtained by means of a special system of spherical bearings and flexible connection difficult to explain without drawings, but making it impossible for the gears to get out of mesh or alignment though the framework may be actually buckled up.

The motive power consists of a 30-h.p. compound steam engine of the link reversing pattern, running at a normal speed of 450 revs. One cover is used for the two cylinders and piston valves, this cover also acting as a receiver and "multiplier," referred to below. The steam is generated in a vertical fire-tube boiler specially designed for vehicular work and centrally fed through a tube passing from the fire box through the water space. This enables a fire door to be dispensed with and allows

solid steel billet. On one end of the shaft is a pinion engaging with a spur wheel on the counter-shaft.

On a square in the centre of this shaft slide a pair of unequal pinions, either of which may be caused to engage with corresponding gear wheels carried on the crown of the differential gear. The engine and all gearing are contained in one casing, which acts as an oil bath in which the parts constantly run. The automatic feed pump is so constructed that no grit or dirt can get at the ram, and is regulated from the driver's seat. The water on its way to the boiler passes through a coil heated by the exhaust steam, for which it acts as a muffler. After passing through the feed-water heater the exhaust steam mingle with the combustion gases and passes out of the chimney, so superheated as to render it quite invisible. An auxiliary steam pump is provided in case of accident to the main pump, having a separate delivery and check valve on the boiler.

A double-acting brake operates on the driving wheels and is equally efficient in either direction. No strain is transmitted to any parts, the re-action being on one another. The steering is effected by means of enclosed worm and wheel running in oil. The front wheels are 33 inches in diameter and the rear wheels 36 inches. The wooden wheels have cast steel artillery hubs lined with phosphor bronze bushes. The weldless tyres are 5 inches and 7 inches wide respectively, and are of steel with smooth faces.

CONTINENTAL NOTES.

By "AUTOMAN."

THE authorisation for the French section of the Paris-Madrid motor-car road race has been granted by the Government. The Spanish authorisation was given more than a month ago, so that the event is now a certainty, and will be an end-to-end race, with as little neutralised ground as possible. I well remember, on the Berlin racecourse in 1901, the Baron von Zuylen, President of the A.C.F., saying regretfully that Paris-Berlin would be the last road race, and yet Paris-Vienna is now historic. At Vienna the consensus of opinion was that the last international race with neutralised areas had

dipped his hand in the urn and produced a number for each entry. The only incident was the annulment of three numbers representing three entries which were not regular, and the arrival of a cablegram from America which added three numbers at the end of the list. Last week's issue gave the British entries, now made complete by the inclusion of Lt. Mansfield Smith-Cumming, who will drive a 50-h.p. Wolseley car.

The race begins with a car, and properly ends (so far as this series is concerned) with a motor-cycle. De Dietrich is in luck, for not only has he won the No. 1, but he has two cars in the first five. Panhard, with twelve cars entered, has, it is true, No. 2, but has only one car in the first thirty-seven. Mercedes' first car

FILLING UP THE PETROL TANKS.

THE CONSUMPTION CRITERION.

been run, and yet we are now in full swing organising for Paris-Madrid and Paris-Rome is looming into view for 1904.

Two hundred and thirty-two entries for the Paris-Madrid race were registered at the A.C.F. when the first list closed, and on the following day the ballot for places took place in the library of the club, when an animated assembly of chauffeurs waited patiently or impatiently, as the case may be, the good or bad luck provided for them. The numbers were placed in an urn, and Monsieur Hoemelle, the Secretary of the Racing Committee, read out the names of the entries in their order, whilst Monsieur Chaix

starts No. 14, and the whole six Mercedes cars are in the first eighty-six starters. Out of ten entries, Renault Freres have No. 3, but, on the other hand, only three cars in the first 112. The first Mors starts No. 7, but out of ten entries only five are in the first 168. Hotchkiss has No. 12. Darracq, Serpollet, and C. G. V. have bad luck, and none of them have a car in the first forty-six. Darracq's first starts No. 47, C. G. V., No. 53, and Serpollet No. 90. The Englishmen have drawn the following numbers: Kirk, 17; Smith-Cumming, 22; Arnott, 84; Edge, 89; Mayhew, 138; Jarrott, 176; the Wolseley Company, 214; Hutton, 216; and Holder, 227. There are two motor-cycles in

the first thirty starters, the first of them having the No. 6. There is an old saying that "everyone must eat his peck of dust," but it is safe to say that if the weather is dry No. 6 will eat a considerable extra quantity of dust and more than his share before the big cars have done passing him. Out of 232 entries there are 98 heavy cars, entrance fee £16=£1,568; 58 light cars, ditto £12=£696; 36 voituresses, ditto £8=£288; 40 motor-cycles, ditto £2=£80—making a total entry fee of £2,632. The 232 cars are worth from £250,000 to £300,000, which is a large sum of money to have racing within a few hours' distance across France and Spain.

THE following are the principal conditions for running a car in the tourist section of the Paris-Madrid competition. Each car must be driven or accompanied by a member of one of the affiliated clubs, in whose name the car must be entered. The entrance fee of 200 francs, £8, must be paid before April 30th, either to the A.C.F., 6, Place de la Concorde, Paris, or to the R.A.C. d'Espagne, No. 1, Calle del Duque de Rivas at Madrid, and the entrance fee will be retained for the expenses of organising the tour, whether the car runs or not. The excursion will last six days, commencing at Paris May 14th, and ending at Madrid May 20th. Diplomas and medals will be given to all who complete the journey according to the regulations laid down. An excursion to Andalusia will be organised after the racing cars arrive in Madrid.

THE "Criterium de Consommation" organised by the *Auto* took place on the 19th inst., over a course of 100 kilometres, commencing at the Waterworks and ending at the Chalets du Cycle. Fifty-six cars were entered, and forty started, out of which thirty-eight completed the distance in the stipulated time. The weather in the morning was rather chilly, but in the afternoon the sun shone and the temperature was springlike. The success of the competition goes principally to Peugeot, whose lorry won the general classification per kilometric ton. He also won the light car category, and had four cars in the first nine vehicles in the kilometric ton general classification, which is a remarkable result. In the 650-1,000 kilog. category Messrs. Chenard and Walcker fully sustained the reputation they gained last year, and came out first, third, and seventh with three cars, Bardon being second and fourth. De Dion-Bouton won the voituress section with a 6-h.p. Populaire. The economic results show a considerable progress in comparison with last year, and this in every category without exception. From some statistics that have been prepared since the trial I take the following figures:—

Consumption in litres per kilometric ton.

	Voituresses.	Light cars.	Heavy cars.	Delivery wagons carrying more than one ton.
1901	0.171	0.136	0.113	0.096
1902	0.105	0.084	0.059	0.070
1903	0.0733	0.053	0.054	0.048

A glance at the figures above will show how little difference there is in efficiency between the different classes—if anything, as the cars get heavier the consumption is reduced. This trial, although it does not attract much attention, is certainly one of the most interesting of the year, for it affects most directly the user who does not require speed at the sacrifice of economy.

VISITORS to Paris in the late winter or early spring will remember the processions and carnivals which take place on Shrove Tuesday and on Mi-careme, or mid-Lent day. The boulevards on these occasions are crowded with sightseers and confetti throwers, and by evening there is a carpet of multi-coloured paper discs several inches deep. At the Mi-careme the Queen of Queens, in the shape of the prettiest washerwoman, is drawn round the city on a triumphal car, surrounded by her ladies-in-waiting. She calls on the President of the Republic, who even embraces her and gives her a present. The royal car and two others following it are this year to be automobile wagons, and four or five voituresses suitably decorated will also be in the pro-

cession, and the committees, who usually follow the procession in landaus, will this year be accommodated with motor-cars; in fact, the whole affair will be up-to-date, and it will be the first time on record that the new locomotion has "knocked the old horse out" for a French public fete.

NICE week is shorn of its important road race, and the following will be the programme:—March 26th, arrival of the caravan Paris-Nice at Pioula, where it will be met and there will be an evening fete; March 27th, entry into Nice of the caravan; March 28, brake tests; March 29th, automobile battle of flowers; March 30th and 31st, trials of endurance and efficiency of transmission; April 1st, hill-climbing trial at La Turbie; April 2nd, competition for appearance at Monte Carlo; April 3rd and 4th, exhibition; April 5th, kilometre and mile races; April 6th, De Caters Cup (one kilometre up hill).

In the basement, at the recent Salon I came across a novel motor for bicycles, which is at once simple and practical. It is called the G. V. after the inventor, whose name is Geyey. It has no valves, or rather the valves are replaced by openings in the cylinder which are closed by the piston itself. The crank chamber B is hermetically closed, but has a passage leading to the cylinder. The latter has therefore three different openings,

FIGS. 1 & 2.—SECTION VIEWS OF "G.V." TWO-CYCLE PETROL MOTOR.

namely, one which leads to the crank chamber (1), one which leads to the exhaust box (2), and one which leads to the carburettor (3). The first two orifices are opposite each other and on a higher level than the third. The piston block has on its upper surface a flange or projection on the same side as the orifice communicating with the crank chamber. Supposing the piston to be in its lowest position and that we turn the crank, as the piston rises it causes a vacuum in the crank chamber and draws in gas from the orifice which leads to the carburettor, and which becomes free when the piston passes above it, the exhaust orifice being closed by the piston. When the latter descends it compresses the gases in the crank chamber, but when the piston reaches the lowest part of its stroke the orifice of the pipe communicating between the crank chamber and the cylinder becomes free, and the gases rush into the cylinder, and, being guided by the projection on the piston, rise in the cylinder on the opposite side to the exhaust and thus force the exhaust gases of the last explosion out of the exhaust orifice. The piston next rises again, closing the exhaust and the orifice communicating with the crank chamber and re-compressing the gases, which, of course, are ignited by means of the sparking plug when the piston again reaches the end of its upward stroke. This ingenious little motor appears to work exceedingly well.

THE MALLINSON PETROL MOTOR.

MESSRS. MALLINSON, BROS., LIMITED, of Hipperholme (Yorks), are putting on the market a new petrol motor, which embraces several novel features. On reference to the illustrations, it will be seen from Fig. 2, showing the cover removed from the front of the crank case, that the half-speed shaft is driven by spiral cut gear wheels, and is placed across the front of the motor, the pump, contact breaker, governor, and cams being thus conveniently situated for adjustment. The exhaust cams act upon rollers, the latter revolving freely upon studs placed at the ends of levers secured to two shafts, one within the other. To each is attached a short lever, which lifts the valve-spindle. The speed of the motor is controlled by a governor, arranged to cut off the supply from the carburettor. The compression space in the cylinder head is so arranged that the exhaust discharge leaves the cylinder in a line with the path of the piston, and after taking a curve horizontally, leaves the outlet at an angle of 45 degrees. The cold ingoing charge passes over the head of the exhaust valve,

FIG. 1.—GENERAL VIEW OF MALLINSON MOTOR.

which cools it considerably. The sparking plug is placed midway in the compression space, so that the ignition may take place in both directions at once. The reciprocating parts are very light, the connecting rods being made of weldless steel tubing; the piston pins are hollow, and at the bottom of each stroke take a drop of oil from the feed-pipe, distributing the same to the opposite sides of the cylinder and the inner ends of the connecting rods. Balance weights are placed on the crank; the carburettor is of the float-feed type, and the spraying nipple is so fitted that it can easily be removed for cleaning purposes by simply loosening a screw. Messrs. Mallinson inform us that, owing to the reciprocating parts being made very light and the crank shaft being balanced, the vibration is almost imperceptible. The twin-cylinder motor illustrated is 4 in. bore and $4\frac{1}{2}$ in. stroke, and at the normal speed of 900 revolutions per minute develops 9-h.p. The weight is about 145 lbs., not including the fly-wheel, the latter weighing 80 lbs.

THE Brighton Council proposes to acquire a motor fire engine.

AN EARLY STEAM CARRIAGE.

MOST motorists are aware that seventy or eighty years ago there were quite a number of steam motor-cars running about, with more or less success, in the London district. The movement in favour of horseless vehicles was, however, "scotched," partly by adverse legislation, and particularly because of the advent of railways, which quickly attracted the attention of capitalists. We give an illustration on page 1011 of one of these old-time steam vehicles. It was built by Mr. J. Squire and Col. Maceroni in 1833, and was one of the most simple and compact to be seen at that time. It had a multitubular boiler, the joint invention of the builders, provided with a fan draught, and placed at the rear of the carriage, being driven by a horizontal two-cylinder engine, located below the body of the vehicle. On a trial from Paddington to Edgware in October, 1833, with ten persons on board, an average speed of ten miles an hour was attained. This carriage plied daily for some weeks in that year between Paddington and Edgware, and again in 1834 between Oxford Street and Edgware. Maceroni was not a man to hide his light under a bushel, and, accordingly, we find numerous accounts of the doings of his carriages in the newspapers of the time. He

FIG. 2.—VIEW OF MALLINSON MOTOR SHOWING HALF-SPEED SHAFT.

himself wrote several pamphlets on the subject of steam locomotion. The success attained, however, does not appear to have been great, and in 1834 Squire and Maceroni dissolved partnership, after having built two carriages, which remained in the possession of Maceroni, and were soon afterwards taken abroad, one to Paris, and the other to Brussels. They attracted considerable attention in both places. Maceroni made several other attempts to embark upon the building of steam carriages, and as late as 1841 one of his vehicles was built by an engineer at Greenwich for the General Steam Carriage Company, but some hitch arose as to payment, and the carriage remained in the hands of the builders.

MR. T. EISENBERG, of Chicago, who has just returned from a visit to the island of Jamaica, does not hold out much hope of a large demand for motor cars from that part of the world. He made one run on a Locomobile from Kingston to Newcastle, a hard climb of twelve miles, 4,000 feet being ascended in this distance. The roads on the island are very good, although there are many curves which make very high speed impossible.

MOTOR-CYCLING NEWS.

MESSRS. J. C. MEREDITH, LIMITED, have lately introduced a new pump for the forced lubrication of motor-cycles, illustrated in section herewith. The action of the pump is as follows: On the piston being lifted the baffle plate moves upwards, allowing the oil to flow through the feed-holes into the barrel, the flow being assisted by the vacuum caused by the displacement of piston. The piston on being pushed downwards returns the baffle plate to its seat, thereby closing the feed-holes, the oil then flowing through the central hole to the crank case of the motor. At first glance, it may appear that the central hole, being

clear, will pass the air into the pump instead of taking the oil from the tank. This, however, is not so; the resistance in this small hole is sufficient to prevent the air passing through—the natural weight of the oil forces it past the baffle plate immediately the latter is lifted. On the top of the pump a lock, or what may be described as a bayonet fixing, is provided. The object of this is: First to prevent mischievous persons tampering with the pump, and secondly, to prevent the piston moving upwards without the assistance of the operator. All that is necessary in order to lock the pump is to give the handle a quarter-turn either way.

MR. W. M. JENKINS holds the South African motor-cycling record, his time for the mile being 1 min. 36 3-5 seconds, on a 2½-h.p. Holley motor-bicycle, which is now in the possession of Mr. H. L. Jenkins. Messrs. Jenkins are the managers of Messrs. Garlick's Motor Supply at Cape Town.

THE Motor Cycling Club have decided to open the 1903 season with a run to Brighton on Saturday, the 7th prox., the destination being the Ship Hotel, where a dinner will be followed by a paper on Motor-cycle Touring and a musical programme. The starting-point will be Purley Corner at 3.30 p.m., the signal being given by the captain. A short halt will be made at Crawley en route. A few members will leave Hyde Park Corner at 2.15 p.m.

THE new catalogue of the "Coventry Eagle" motor-bicycle calls attention to the fact that the makers are now, with a single exception, fitting the engine in a vertical position. Particulars are also given of the Coventry Eagle Company's trailers, which can be detached, when necessary, in a few seconds.

As we briefly mentioned last week, the inaugural dinner of the Motor-Cycle Union has been held at Dublin, about one

hundred gentlemen taking part in the event, the speakers including Messrs. M. D. Bodkin, K.C., W. R. MacTaggart, F. W. Peare, of Waterford, and R. J. Meccredy. Mr. Shimmins proposed the toast of the evening, and in responding Dr. Lane-Joynt said that as a motorist he thoroughly realised the work of the movement in Ireland, and the benefits that would accrue to the country from it. Mr. J. W. Percy announced that the membership in Dublin had reached eighty, and that there were more than fifty members in the Ulster section.

MESSRS. RICHARD LLOYD AND COMPANY, of the Standard Belting Works, Birmingham, have just introduced a new motor-cycle driving belt which they have named the "Motorite." The leather from which the belt is made is specially selected to stand a great tensile strain, and is also dressed so as to withstand bad weather. It is of V-section, the sides being at an angle of 28 degrees to the vertical; it consists of three layers of leather cemented and sewn together with copper wire. The cement which is used to join the layers is unaffected by wet.

A MEETING of motor-cycle traders will be held at 4 p.m. on Wednesday next at Anderton's Hotel, Fleet Street, London, E.C. It is suggested that the association now being formed be called the Motor-Cycle Trades Association, Limited (limited by guarantee, and not having a capital divided into shares), and that the association should equally forward and protect the interests of all branches of the motor-cycle trade, whether directly or indirectly connected.

MR. CAMPBELL SWINTON, opened the discussion on Mr. Mervyn O'Gorman's paper (an abstract of which appears on another page) at the Automobile Club last week. He instanced the handiness of the motor-bicycle as compared with the car. Then Mr. J. Pennell advised makers to strengthen their frames, and Mr. E. H. Arnott deprecated increased weight in machines, preferring additional cylinder capacity instead of the adoption of the two-speed gear. Mr. C. A. Smith put in a word for the motor-tricycle, and a speaker, whose name did not transpire, declared strongly in favour of the chain drive. Regarded as a whole, the discussion was, however, somewhat disappointing.

MR. ARTHUR CANDLER writes in "Chambers's Journal" almost as enthusiastically as does Mr. M. O'Gorman on the virtues of the motor-bicycle. He has kept a record of his expenses with a Quadrant machine that has run 4,000 miles. A gallon of petrol will take him 200 miles, the electricity costs 6d. for 800 miles, and the lubricating oil 1s. for 1,000 miles. Thus he estimates the cost of running the latter distance at just over 6s., or about 14 miles for a penny. Mr. O'Gorman got to Oxford for 4½d.

AMONG the new details found on the "Bat" motor-bicycle is the belt fastener illustrated herewith. It has been specially designed

The spring arch, showing the niches which secure it to the plate.

The Fastener complete.

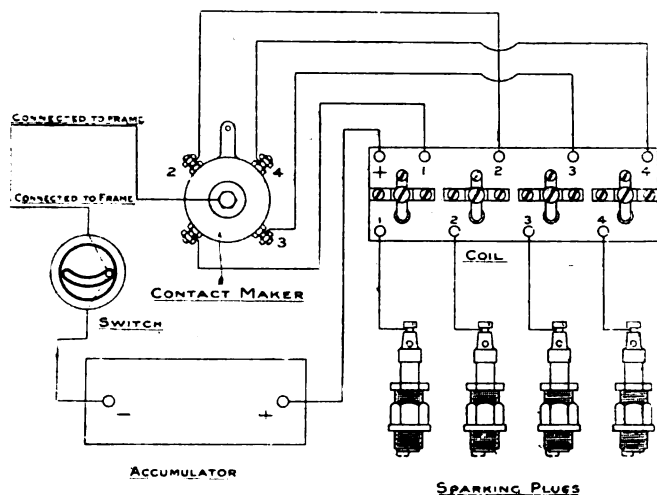

to obviate the possibility of belt breakages. With this fastener, the makers claim that riders may rely on the belt withstanding the heaviest strain that is imposed upon it.

THE London County Council, having recognised the inconvenience to London traffic caused by the streets being up, are now making it a condition in connection with the tenders for the paving of Waterloo Bridge that the whole of the work must be finished within a fortnight. A bonus for completion in less than this time will also be given.

SOME USEFUL NOTES.

BE sure that the "kit of tools" is complete before you start out for a long journey. If you are not systematic in this regard it is possible that the very thing you need the most has been left at home.

THE accompanying diagram, which is reproduced from the new catalogue of the Brush Motor-Car, may prove useful to those owning four-cylinder petrol cars. It shows the method of connecting up the wires on those vehicles in which the accu-

mulator and induction coil system of ignition is adopted, the contact breaker being of the usual make and break kind, and the tremblers fitted on the coil.

ONE of the features of the new "Columbia" petrol cars is the hand removable valves and sparking plugs. No wrench or tool of any kind is needed to enable the motorist to instantly take out the valves or any of the sparking plugs, examine, clean and return them. The accompanying illustrations, taken from the "Motor World," show the construction of the sparking plug,

which is operated as follows:—Holding the plug in the hand with the wrench arm in a vertical position, insert the threaded end of the plug into the hole in the cylinder provided to receive it, until the shoulder of the plug is fairly against the shoulder in the cylinder. Then turn the wrench arm to the right (which will engage the threads of the plug with those in the cylinder casting), continuing the motion of the wrench arm to the right until the plug is as tight as it would be if screwed up by means of the ordinary thread. The idea of cutting away the thread on the plug and in the cylinder is to simply provide a means by which the plug may be inserted until the shoulders engage by a forward motion of the hand and tighten in place by a rotary motion, which, in any case, will not exceed 50 or 55 degrees.

WHEN a sparking-plug is being placed in its socket the points are very liable to be knocked out of adjustment by accidental contact with the cylinder-wall, especially when the operation is being performed at night. The resulting misfires, or the entire refusal of the motor to start, often seem quite inexplicable.

THE steel rim of wire wheels and the iron rim of artillery wheels is very liable to rust. This, when it occurs at the spot where the tyre grips the rim, exerts a deleterious effect on the rubber. Tyres should be removed at least once a year and the edges of the rims coated with enamel after being freed from all traces of rust.

THE intending purchaser of a car should always make a point of seeing that the steering pillar, if not adjustable, is of suitable height, as subsequent alteration may mean considerable expense and annoyance.

THE carburettor should be periodically removed (about every 750 miles), dried, and carefully washed out with *fresh* petrol. In this way particles of dirt and any water which may be present are got rid of, and the chances of trouble on the road lessened.

A FRENCH motorist, M. Paul Debeauve, has devised a simple means by which to prevent the blows due to back-firing, which are often so great at the starting of a petrol motor, when the ignition handle has inadvertently not been drawn back. The device consists of a metal "shutter" V riveted to the contact-breaker cover A. The shutter is so arranged that when the sparking is advanced it falls, as shown at III., in front of the engine shaft on which the starting handle is placed. Thus the motorist, not being able to fix the crank in order to start, at once perceives what is the obstacle, and hastens to remedy the same by retarding the ignition. The shutter can be placed in such a manner that

even with only a slight advance of ignition it prevents the starting of the motor (see drawing II.). If, on the contrary, it is known that the motor will only start except with a slight advance given to the ignition, the shutter can be fixed in such a manner that it will only obstruct the handle if the ignition is set at a point in excess of the requisite position. The device, remarks M. Baudry de Saunier in "La Locomotion," cannot be applied in all cases; it can, however, with a little ingenuity, be adapted to the majority of petrol engines.

WHEN a large cut is found in a tyre cover, an early opportunity should be seized for effecting its repair, as the penetration of wet will rot the internal canvas fabric and prepare the way for a subsequent burst. The cut may be repaired from the outside by first carefully cleaning it out with petrol, and then inserting some self-vulcanising solution which may be bought for the purpose.

MR. HARRISON BENN presided over the last meeting of the Yorkshire Automobile Club, when Mr. H. A. Jones, of Bradford, gave a lecture on "Electricity as Applied to Motor-cars."

HERE AND THERE.

THE fire brigade authorities of Nurembourg, Germany, are at present making some experiments with an electrical fire-service wagon.

THE MAUDSLAY 20-H.P. LONSDALE WAGONETTE.
(See issue February 7th, page 942.)

To suit the purposes of the Royal Irish Constabulary, it may be necessary to arrange for the Gordon Bennett race being run a few days earlier than July 9th.

A MOVEMENT is on foot to inaugurate automobile racing on an extensive scale at Charter Oak Park, Hartford, Conn., and Oakley Park, Cincinnati, Ohio, U.S.A., during the coming season.

MESSRS. CAMMELL AND COMPANY, Sheffield, are reported to have purchased the business of Messrs. Mulliner, Wigley, and Company, Coventry and Birmingham, manufacturers of gun mountings, carriages, and motor-car bodies.

DURRANT'S MOTORS, LIMITED, has been registered, with a capital of £5,000, to acquire the benefit, for the British Isles, of an invention of Mr. A. Durrant relating to improvements in gas and oil engines and explosive motors generally; and to carry on the business of motor manufacturers, engineers, launch builders, machinery agents, etc.

SOMEWHAT as a surprise comes the news that the American National Association of Automobile Manufacturers has disapproved of the trial of commercial vehicles which the Automobile Club of America proposes to hold in the spring. The reasons for this decision of the Association are difficult to discover, especially seeing that a number of the members of the Committee which adopted the decision are representatives of firms which a short time ago were reported to have indorsed the plan of holding the trials.

WHAT will happen when the etheric waves transmitting power to motors meet or cross the waves of Marconi telegrams is a question which is suggested by the discovery of Mr. Thomas H. Williams, A.M.I.C.E., by which, he asserts, he can transmit power through space in such a way that it can be picked up by a collector attached to a motor-car and actuate the motor, thus dispensing with wires and accumulators. The inventor believes that further investigation will show that it is possible to run not only motor-cars on the roads by this means, but even an express train. The power would be supplied by a series of generating stations at convenient intervals, one, two, or three hundred miles apart. It might even be possible to apply a kind of penny-in-the-slot system to supply the power to motor-cars.

THE French Automobile Club has dropped the proposal to hold a competition of electric batteries this year.

THE Avignon Automobile Club will hold its annual hill-climbing competition up Mont Ventoux, France, early in July next.

UNDER the new Customs tariff a duty of 10 per cent. *ad valorem* will be imposed on all motor-cars and parts imported into Persia.

THE Fischer Motor Vehicle Syndicate has several omnibuses under construction for the London General Omnibus and the London Road Car Companies.

THE Earl of Mayo intends questioning the Government in the House of Lords (in view of the increasing number of small steam boilers in use in motor vehicles) as to what system of inspection is adopted with regard to these boilers.

LORD WOLVERTON'S motor-car recently made the first successful trip between Poona and Mahabaleshwar, India. The distance is seventy-six miles. It is reported that at Mahabaleshwar the police had to place a fence round the car to keep off the crowds of natives flocking to see it.

AT the Casino in Paris is being played a sketch in which amusement is derived from the present attitude of the police towards motorists. One of the songs is sung by a policeman, who describes the process of catching motorists who exceed the legal limit. Ambushed in a pleasant, leafy nook by the side of the road, he varies his communings with nature by jotting down the numbers of the cars which pass, and adds an element of chance by selecting at random from his list the motorists against whom he will formulate charges. The villain of the piece accuses the father and mother of the heroine of having travelled at eight miles an hour in the Bois. They are accordingly arrested, and are threatened with ten years' imprisonment.

MR. YERKES, as well as the Royal Commission, is considering the traffic of London, and has come to the conclusion that he will be able by his tramway schemes to carry passengers in the metropolis for 2d. for any distance. In this connection it is interesting to learn from Mr. Atherley Jones, M.P., that there are 1,305 miles of tramways open in this country; and we might add most of them possess rails which are a menace and danger to the motorist.

THE BRUSH 16-H.P. LIMOUSINE. (See issue February 14th, page 963.)

A COMPANY has just been formed in Brussels, with a capital of £16,000, to be known as La Compagnie Internationale d'Automobiles. Baron Pierre de Crawhez, M. P. de Crawhez, M. A. Gregoire, and M. E. Coppée, all well-known Belgian motorists, are interested in the new undertaking.

A MOTOR-CAR exhibition is to be held at Frankfort-am-Main from the 18th to the 28th June next.

FOR the 1903 season, the Aster Company have introduced a two and four cylinder slow-running engine developing 12 and 16-h.p. respectively. An illustration of the latter is given herewith. The Begbie Manufacturing Company inform us that the dimensions of the cylinders in the 12-h.p. engine are 105 mm. diameter

THE ASTER 16-H.P. FOUR-CYLINDER MOTOR.

by 130 mm. stroke and of the 14-h.p. 88 mm. by 110 mm., the normal speed of both being 1,000 revolutions. The cylinders are cast in one with the combustion chamber, while the water jacket extends well round the valve chests. The governor is enclosed; it is of the centrifugal type and acts on a valve in the admission pipe just above the carburettor.

A COMPANY has been formed to establish an automobile racing track at Paris-Plage, a popular seaside resort near Boulogne.

THE Board of Trade has now given petroleum spirit a separate heading in its monthly returns, which show that during last month such imports attained a total of 688,240 gallons.

MR. FRANK MORRISS, of King's Lynn, received a somewhat unusual order the other day, viz., to convey a corpse by motor-car from an asylum at Norwich to the village of Hilgay Fen, near Downham Market.

THE growing interest of the public in automobiles is well shown by the fact that the educational department of the Minneapolis Y.M.C.A. has prepared a course of sixteen lectures on petrol motors and motor-cars.

THE Right Rev. Francis Mostyn, Roman Catholic Vicar Apostolic of Wales, has caused a mild sensation in the locality by motoring to the Church of Our Lady of Grace and St. Edward, Chiswick.

OWING to the skidding of a motor-car a fatal accident has occurred at Congresbury (Somerset), a driver named Albert Frank dying from injuries received in being thrown from the vehicle. A verdict of "Accidental death" was returned by the coroner's jury.

"AN AMATEUR ANGLER" is a versatile old gentleman who has written with equal felicity on copyright and bookselling. Now he turns guide, and in "Dove Dale Revisited"—just published by Messrs. Sampson Low, Marston and Company, Limited, tells of holidays spent in regions where old Izaak Walton was wont to go a-fishing. Chapters are also included dealing with the Vale of the White Horse, Berkshire; the Wye in Herefordshire, the Lea, and fishing in the Isle of Wight. Chatterily and pleasantly written, the interest of the book is enhanced by several photographs.

THE Wasp Motor and Cycle Company, Limited, has been registered with a capital of £1,000 in £1 shares.

THE Dordogne Automobile Club is organising a hill-climbing competition, to be held at Perigueux, France, on June 1st next.

THE German Automobile Union is appealing to the Government to make a monetary grant for the establishment of an automobile museum to illustrate the development of the industry.

THE German Secretary of State of the Interior has announced that a Bill providing for uniform automobile traffic regulations throughout the whole of Germany is in course of preparation.

THE Spanish Government has issued a note to the municipal authorities of the towns between Irun and Madrid, asking them, in view of the forthcoming Paris-Madrid race, to see that the roads under their control are kept in good order.

MR. M. BLAKELY has secured the lease of the premises in Otago Street, off Great Western Road, Glasgow, at present occupied by a firm of horse-hirers, which he proposes to convert into a motor-car garage and repairing works.

THE Ilford Motor-Car and Cycle Company, Limited, has been registered, with a capital of £2,000 in £1 shares, to acquire and carry on the business now carried on by Messrs. F. G. Galley and G. T. Galley under the style of the Ilford Motor-Car and Cycle Company at 12, Market Parade, Ilford.

DOGS are becoming familiar objects on motor cars, and their noisy interest in automobiles is well-known to motorists. Hence the interest which attaches to such a book as the "Dog Owners' Annual for 1903," published by Messrs. Dean and Son, Ltd., and containing readable and useful articles by Dr. Gordon Stables and other authorities on the subject.

AFTER repeated rumours to the effect that Columbia University, N.Y., is to have an automobile course have been circulated and denied, it is now officially admitted that such a course is to be introduced in the near future. It will be designated as that of "Traction Engines and Automobile Carriages," and will consist of three lectures a week delivered by Professor Frederick R. Hutton, Dean of the School of Applied Science. The lectures will deal with rolling stock, self-propelling road engines, railway engines and automobiles of all kinds.

THE Adler Fahrradwerke Gesellschaft (Kleyer), of Frankfort-am-Main, Germany, which is now devoting considerable attention to motor-cars, has lately completed the motor service vehicle for the use of fire brigades illustrated herewith. So far as

the chassis is concerned it follows the lines of the Adler cars; it is, however, fitted with a special body to carry four firemen, scaling ladders, and other fire-extinguishing appliances, including a reel carrying 130 ft. of hose. The vehicle can attain a speed of 20 miles an hour on good roads.

AUTOMOBILES AND INDUSTRY.

AUTOMOBILISM is so frequently regarded wholly from the sportsman's point of view, or as a means of rapid locomotion, that its influence on industry is rarely recognised and never acknowledged. And yet it promises to develop a wholly new trade, without—for quite a number of years, at any rate—depreciating any other business or industry.

The way in which the cycle manufacturers are interesting themselves in motor-car work shows that they, at any rate, expect it to become an important adjunct to a trade that stood long in need of a fillip. In America the coach and carriage building industries are watching its progress with keenness and actively participating in the development. All over Europe engineers

In its effect on the aspect of cities and towns it is also likely to make its influence strongly felt. The extended use of the automobile will secure the improvement of our roads—an improvement highly desirable in many countries, notably Ireland and the United States—and so lead to a more scientific consideration of our highways than has ever seemed warranted in the past. The practice or art of road-making is generally a neglected one; often a haphazard performance indeed, and one that apparently leads to endless and extravagant repairs. With the advent of the motor-car and the general adoption of pneumatic tyres there will have to be developed a method of road construction which does not cause punctures and secures a fairly even road surface.

Against these three great advantages to industry—in developing a new outlet for capital, in effecting economies, and in causing great improvements in our roads—there seem to be no

THE MOTOR-CAR IN EGYPT.

The above is a reproduction of the handsome and interesting coloured poster lately issued by Messrs. Beissbarth Bros., Munich.

are experimenting and capital is flowing into the industry associated with automobilism. These are tangible proofs that there is commercial worth in the new movement and that it will enrich the industrial world to no small degree.

In addition to opening up a new sphere of enterprise, the automobile is capable of serving other industries in such a way as to be of real financial value. The great aim of business men nowadays is to ascertain means of economy. This is almost as important as fresh sources of business in some trades. Here the automobile will be of great use in effecting rapidity of delivery and so saving much time now wasted. In addition to that it will obviate the necessity for keeping many horses in large establishments and generally allow of the conveyance of goods at a cheaper and more expeditious rate than is now possible.

arguments of any very telling kind. The general employment of the motor-car would secure a cleanliness in our streets wholly unassociated with horse locomotion; it would tend to gradually reduce the number of stables in crowded localities, a desideratum greatly to be desired in the interests of sanitation; and would, when they were once well laid, contribute to the longer life of our common roads. For the present, horse-drawn traffic is most destructive of all ordinary road surfaces. Not only the wear of the wheels but the continual tramping and stamping of horses' hoofs is a very destructive quantity.

Fortunately the prejudice with which the automobile movement was assailed in its early days is passing away, and within the next decade great things will be done in the motor-car world.

MOTOR-BICYCLES.*

My experience is that as delivered by the maker the machine runs, but not for ever. You must first pass through the overhauling stage or trouble era. This "trouble stage" either makes or mars the machine; in fact, if you remedy every fault in such a way that it cannot recur, it *doesn't* recur, and after 500 miles you have almost doubled the original value of the machine, and thereafter it will never seriously delay you. Having got the motor-bicycle in order, here are its advantages:—(i.) Above all, exquisite simplicity. (ii.) Next in importance is safety. (iii.) Thirdly, there is the question of hill-climbing and speed. Barring breakdowns, the best motor-bicycle may make a better average speed than a car up to five times its price. It is largely due to the easy choice of the best track on the road, whether for surface or for the avoidance of other traffic. It is also ascribable to the ease of tyre repair. (iv.) It is unrivalled in cheapness in every department. It is cheapest to buy. It is cheapest in petrol and oil (Mr. A. Campbell-Swinton and I ran to Oxford on 4½d. each). It is cheapest to house and costs little to clean; it requires no *chauffeur*. Is it not the motor for the man of minute means? (v.) For a given speed it raises less dust than any other "car." Let us consider why this engaging "younger brother" of the motor-car deserves the most earnest and studied encouragement from all motorists, and pre-eminently from the Automobile Club and affiliated bodies:—(i.) It increases the places where petrol and oil are stored. (ii.) It increases the number of people who understand the explosion engine. (iii.) It increases the number of fast travellers on the road, and gives the weight of numbers to the whole automobile movement, and removes from the sport the absurd criticism of "rich men's juggernauts." (iv.) It increases the chance of road improvement, and affords an opportunity for the study of tyres and new devices which may be cheaply tried on a small scale first. (v.) It is a direct feeder to the membership of the Automobile Club, the Road Improvement Association, and the C.T.C.

These generalisations are dull, but I will conclude them by epitomising the drawbacks of the motor-bicycle to avoid being too partial:—(a) The rider is exposed to cold and mud, being only 6 in. off the road; (b) It is a lonely pastime; (c) The machine is punished for its accessibility by being exposed to wet and to blows; (d) The rider is not in an armchair; (e) He must dismount if stopped by traffic, and his machine will not stand (as they say in Ireland) when standing; (f) His carriage is so small and delicate that he is bullied by larger vehicles; (g) He must make violent bodily efforts to start his machine; (h) Skidding means bodily injury; (i) His weight of baggage is very restricted; (j) His position is fatiguing; (k) His mount is not compatible with the town clothes required for calling on friends; (l) Breakdowns are more frequent than on good cars; (m) The motor is not protected from road shocks by springs; (n) The good running of the motor cannot be tested except when the rider is on it; (o) The exposed position of his calves makes him particularly attractive to large dogs.

I want to accentuate a point which is too much overlooked in most road vehicle design—the extreme importance of surface smoothness, of the absence of unnecessary roughness, projections, straps, clamping pieces, mouldings, levers, ornaments, &c. Owing to the independent manufacture of accessories, almost every detail is an accessory, and seems to be added as an afterthought, so that numberless dust-catching straps, buckles, bolts, and holdfasts, Bowden wires, clamps, exposed electric wires, and petrol pipes pervade every part of the frame, and the machine is consequently uncleanable. Cycle makers are complacent about the nickel-plated glamour which these things give, but nickel plating, which will stand a month in the rain without rust peeping through, is apparently not sought for, and this glamour does not long remain.

I have skidded so little that I am scarcely competent to indicate the best way to do it. It is generally known that an exhaust valve lifter is indispensable in this connection; but a very delicate carburettor which does not fail to give mild explosions when the throttle is nearly closed, and which in conjunction with mechanical valves will keep the engine running "dead slow," is a useful safeguard against skidding. The next safeguard is a flexible drive. Advantage in this direction will be derived from fly-wheels being much larger without being heavier. The jerks will be diminished, and as it is the beginning of a slip that must be avoided, every trifle counts. Also, if these larger fly-wheels were to rotate in the opposite direction to the road wheels (like the Enfield), then gyrostatic action would assist the rider in keeping vertical instead of acting in the opposite sense, as they do now. The gyrostatic action would not even then diminish the amount of side pressure on the ground, but it would diminish the amount of slope of the bicycle, and I know from good cyclists that a slip in which the rider and both his wheels take part unanimously is not so disconcerting as one over which they are divided.

A stand is indispensable. Misfires on the road cannot be properly diagnosed without it. To watch the machine running and to attempt to hunt for a fault in the carburettor, induction valve spring, ignition wires, &c., while trotting by the side of a motor-bicycle that will not start is one of the most fatiguing and aggravating exercises that I know. It is better to find some cottage and build up. Shameful as it seems to our intelligence as men, as motorists, as sportsmen, or as engineers, the motor-bicycle is abandoning its simplicity for the sake of a meretricious imitation of the car. Take the vertical engine craze (there never was any question of a horizontal engine on bicycles, mind!). It is a matter of 15 deg. slope, and people will re-design and weaken their frames to make this change. The reasons alleged are that

the valves work better vertical, and the lubrication is better, and that the weight of the piston (forsooth!!) is now removed from the side of the cylinder.

Three things are retarding the progress of motor-cycle design:—(1) There is not enough work done in the engineer's drawing office. (2) The influence of fashion is far too strong, and is only inadequately counter-balanced by cranks and "mania." (3) Ready-made accessories, however good, which must be fitted in hamper and distort the unity of design. Little fads are admirable for us all, because the faddist gives an intensity of study to some excellent detail which results in its perfection. But it is time that an unbiased engineer should mass and collate information and give us first the drawing and then the fact of a well plated 100-lb. machine with a moderately narrow tread, full width bottom bracket, strong front forks and pedal cranks, a flexible chain-drive, two speeds, a cool 3-h.p. engine—with a third bearing on it—that can take its re-start from the road wheels and be free at will, mechanical valves, replaceable parts, sound and well-protected ignition gear, spring seat and handles if not a spring frame, good brakes, a carrier incorporated in the design, and also gear cases, &c., &c. Let even the accessories be so re-designed that they fall in perfectly with the general scheme.

As a basis of discussion, I should put forward the following proposals and reasons for a scheme of competition rules:—A competition ought to be fair, sporting, and useful, e.g., the track must be lengthy enough to equalise out the luck and stiff enough to eliminate the weaklings. (1) *To be fair* there must be artificial barriers, securing similarity between the competitors. (2) *To be useful*: (a) the artificial barriers must be few, and, in my opinion, should take the shape of ruling out some objectionable feature, such as excessive weight, rather than limiting a valuable feature like cylinder capacity, though this might be limited as well. I will return to this point. (b) In making a competition useful, a number of minor improvements can be encouraged by requiring the inclusion in the design of luggage carriers, brakes, spring handles, and seats, and good silencers. A preliminary hill test should eliminate all who do not conform to some standard of climbing speed, and noiselessness:—say the machine shall at 10 m.p.h. be inaudible at 100 yards to a blindfolded man on a still day on Dashwood Hill. (g) The competition should be on an average road, including time-hills, and to be useful should allow pedalling except on the timed hills, should allow of roadside repairs if possible, because, if they are easily done they imply accessibility, and at present they occupy a very important position in the eye of the public. (3) *To be sporting* it is necessary to keep in a special class to themselves mechanical monsters, because of their effect in choking off the more useful competitors. Monsters, however, should not be discouraged entirely; they are important experiments, expensive and educational; they show a determination to win, and require some daring to drive. There should be classes, say, up to 100 lb., up to 150 lb., and over 150 lb. One form of eliminating trial which I should like to hear discussed is the following:—(i.) The competitors' numbers should be reduced to about 25 by having one only of each make or by selection of the judges, or by the hill-climb and the silencer test. They should then run 1,000 miles in eight days, keeping always between a pair of cars to control the maximum and the minimum speed, the minimum to average 11 miles per hour. (ii.) Repairs, alterations, &c., may be made *en route* by the driver only, provided he be not passed by the minimum car, he may therefore pedal, dismount, or push without loss of marks save on the two test hills, which might be Westerham and River Hills. (iii.) Refill of petrol or oil allowed only every 100 miles and measured, the inlet hole being sealed. (iv.) Special timing of two hills, with special marks for accuracy of declared horse-power, for light weight in relation to power, and hill speed, pedalling not allowed. (v.) Maximum weight allowable when loaded, —lbs., all riders' weights to be equalised, and all to have a luggage carrier to facilitate this.

I want to introduce the weight limit, because hitherto the motor-bicycle has unfortunately not been restricted by any accepted standard of desirable weight, and therefore there has been no such studied attempt to get the highest weight efficiency as has been the case with cars competing under a definite weight limit—like the Auto. Club de France, 1,000 kilogrammes. Some of the pros and cons for cylinder capacity being considered as against a weight limit are:—(a) Limiting of cylinder capacity tends to encourage increased motor speeds for given power, so does limiting the weight. (b) Both tend to the disregard of fuel economy. (c) Limiting the weight only tends to turn attention to getting the most work out of a given weight, while limiting the capacity tends to getting the best work from a given volume of cylinder, and favours a two-stroke engine very largely; for I cannot suppose the pump used by such an engine would be measured as "working cylinder," though it might add largely to the weight. Yet the advantage of a two-stroke engine is small if no weight is saved thereby. (d) Limiting the capacity fails to encourage the development of a light vehicle, which is wanted. (e) Limiting the capacity does not tend to saving in weight on the frame, and therefore to a risky type of construction. On the other side, there are always safeguards against these risks, in the fact that nothing would discredit a maker more than a reputation for breaking in half before the end of an eight-day trial.

THE "Electrical Review" has been drawing up new rules with regard to the road traffic, based upon the rule of the road at sea, and it is rather remarkable how easily the two sets of regulations can be assimilated.

* From a paper by Mr. Mervyn O'Gorman, read Feb. 20th, 1903, before the Automobile Club of Great Britain and Ireland, London.

CORRESPONDENCE.

CARS FOR MEN OF MODERATE MEANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think "Cautious" could obtain a car for less than £300 to do the work he mentions, and I quite agree with him that steam is the only motive power that can be used with lowest cost of upkeep. As a result of practical experience I consider the extra cost of petrol is of little moment when compared to the bill for repairs to ordinary petrol cars. New clutches, gears, etc., make a sad inroad to one's pocket, whereas the steam car is free from most of these troubles, no speed or reverse gear being used, while for simplicity of driving it is an ideal ladies' car. My experience is that only reasonable care is required to keep a steamer in order, and with ordinary care in driving, a car will last well. The best thing is to have a rubber tread put on rear tyres, preferably when new; this will add to the life of tyres. Steam, air, and water pumps, etc., are very well for people who wish to have everything automatic. If an air pump is required, have one that works from engine cross head. This will answer every purpose. Personally I am not in favour of pneumatic tyres of any kind; I consider them an endless expense as well as worry; they make night driving a terror to me, thinking every moment I shall get a puncture.—Yours truly,

W. T. W.

INSTRUCTING WORKPEOPLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We were very interested in your paragraph, "Instructions to Workmen." We have had an evening class at our Glasgow works for

many guests assembled was a young lady, whose fearless horsemanship I had before remarked in the hunting field. Nothing would satisfy this gallant girl until I had promised her a ride on my trusty bike, so, notwithstanding a few unheeded protests from anxious elders and scandalised matrons, whose antiquated notions of extreme propriety were by no means in accordance with twentieth-century advance, after luncheon the brave Amazon found herself—her garments discreetly arranged by your obedient servant—safely enthroned on my reliable old 2-h.p. "Bucephalus," her feet barely touching the pedal rubbers. Whilst lecturing to an attentive gallery on the mysteries of advanced sparking, and the necessary control and true position for exhaust levers, my remarks were suddenly brought to an abrupt termination by the impatient "jockey" calmly informing me she had already learnt everything necessary, and was anxious to be off as soon as possible.

One or two welcome throbs proclaimed that mademoiselle's wishes were already gratified; the engine was in rapid motion, and away sped bike and rider like a huge swallow across the undulating park, at a pace considerably over twenty miles an hour. A faithful Strephon had already been despatched to catch with cautious care the fleeting maiden as she ascended a steep hill in the distance, for Chloe, although a good cyclist, had no notion how to descend from her perilous position on a gentleman's motor-frame, weighing 100 lbs. or thereabouts. What was our astonishment to find these precautions altogether unnecessary. The valiant rider, selecting a portion of the road that was not fifteen feet across, by opening the exhaust valve exactly at the right moment, whilst cleverly describing a circle not twelve feet in diameter, was soon observed to be safely returning at topmost speed, much to the relief of anxious friends and admiring relatives congregated on the doorstep of the Hall. The same course was traversed many times that afternoon with equal success. An hour had nearly elapsed before my bicycle was returned to me. I had made a

THE SQUIRE-MACERONI STEAM CARRIAGE, BUILT IN 1833. (See page 1004.)

some considerable time, which is greatly taken advantage of by the mechanics and the apprentices in the shop. Our experience is that it has stimulated intelligent interest in all the departments, with the result that better work is produced, and we are confident that this system, when properly organised, is worth adopting in all large motor works throughout the country.—Yours faithfully,

HOZIER ENGINEERING CO.

LADIES AND MOTOR-CYCLING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a proof of the extreme simplicity and easy manipulation of motor-bicycles, the following incident may amuse some of your readers, as well as those of the fair sex who are interested in automobilism. I had ridden my bike to Leicester for the purpose of testing the new 2½-h.p. Clyde bicycle, which is about to be placed on the market. Its speed, power, and freedom from vibration gave me the fullest satisfaction. On my return journey I was invited to lunch with some old friends who lived in that neighbourhood. Among the

friend for life and an ardent convert of a charming girl to automobilism. Never do I remember seeing anybody more supremely happy.—Yours truly,
EDWARD KENNARD.

THE SPARKING PLUG "DISCOVERY."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. R. Winn's letter in your last issue about the sparking plug discovery, and the special arrangement he has made and placed on the dashboard of his car so that the spark can be seen all the time, I may mention that at the Manchester Show last week Messrs. Horsfall and Bickham's 10-h.p. Horbick car was fitted up with this arrangement. Indeed, the firm went a step further, as just over the sparking apparatus a motor-watch was fitted up to enable the driver and others to see the time. The whole thing was very nicely enclosed in a box with a glass cover, and the arrangement has been well tested and found efficient.—Yours faithfully,

PERCY C. BRIGGS.

THE EXHIBITION QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Regarding the strenuous efforts now being put forth by the Society of Motor Manufacturers to induce exhibitors to participate in a ballot for space and the signing of bonds before the opening of the Exhibition at the Agricultural Hall, I would earnestly suggest to the trade (in view of the fact that the exhibitors at the Agricultural Hall will exceed by more than one hundred the number of those at the Crystal Palace), the advisability of postponing any definite action till after the conclusion of the Exhibition at the former place.

It is a matter of common knowledge that the Agricultural Hall Exhibition—the eighth of its series—promises to be most successful, and therefore in the interests of the industry and those who believe that one annual exhibition is sufficient, I would urge the trade to delay their decision in order to ascertain from exhibitors which has been the most successful show from a business, as well as from an artistic point of view.—Yours truly,

CHARLES CORDINGLEY.

DR. R. N. PICKERING would be obliged if any reader will inform him how to take the clutch in a 4½-h.p. De Dion car to pieces after the gear has been taken away, so as to get at the axle which carries the right and left hand thread for expanding and contracting the fibres in the event of it being broken or jammed.

Where no alleged speed is given it is understood to be above the legal limit.
*Motor-Cycle Case.

ON Saturday, at Coventry, Len Heath, who said he was employed by the Siddeley Autocar Company, was summoned for furiously driving a motor-car in Coventry. The policeman's time was fifteen miles an hour, and defendant did not stop when going up Smithford Street towards a tramcar passing the top of the thoroughfare. Defendant's plea was that it was a French car he had, and it ran out of his control. The Chief Constable said the defence was ingenious, but defendant was doing sixteen miles an hour in a narrower street just after the Smithford Street incident. The magistrates fined him 40s. and costs.

ROBERT GATER, farmer, Swaythling, was summoned at the Southampton Borough Bench for driving a motor-car at excessive speed in High Street, Southampton, on February 5th. Chief Constable Berry said he timed defendant and found he had covered a distance of 175 yards in less than twenty seconds, the speed working out at about fifteen miles per hour. Defendant stated that he was driving at a speed less than twelve miles per hour, but, in reply to the Chief Constable, admitted that that was a matter of conjecture on his part, and his inference might prove as unreliable as the "counting." The magistrates dismissed the case.

BEFORE Sheriff Lee, a case has been called in which Alex. Ross French, dentist, Forfar, was charged with having (1) on February 10th, on the public road leading between Forfar and Kirriemuir, and at a part opposite or near a dwelling-house at Padanarm village, occupied by David Walker, shoemaker, driven a motor-car in a reckless manner while meeting and passing a flock of 327 sheep, then in charge of John Duncan Edgar, shepherd, Carsegray, whereby one sheep was killed and several others injured; and (2) with having on the same road, and at a part some distance northwards from the Zoar Hotel, driven the car in a similar manner while overtaking and passing the same flock, to the danger and injury of the sheep. Accused failed to appear, but it is understood that shortly after eleven o'clock Mr. Findlay, Sheriff-Clerk Depute, received a telegram which had been handed in at Dunblane, stating that Dr. French could not attend, as his motor-car spirit was exhausted, and that the nearest supply was at Stirling. Mr. Hart stated that there were five witnesses in connection with the case. Service of complaint was proved, and the Sheriff granted a warrant for the apprehension of accused.

CLAIM FOR DAMAGES.

At Ipswich County Court, before Judge Eardley Wilmot, Messrs. Jackson Brothers claimed of Alfred F. Garnham, motor-car proprietor, Woodbridge Road, Ipswich, £25 damages for the loss of their pony, owing

to the negligent driving of a motor-car by defendant's servant, on January 6th, at Whitton. Defendant attributed negligence to plaintiffs, and counter-claimed for £15 for damages to his car. The jury retired, and on their return the foreman said they found carelessness on the part of the driver of the motor-car, and that the driver was a servant of the defendant. They gave a verdict for £20.

THE DELIVERY OF A MOTOR-CAR.

IN the King's Bench Division of the High Court of Justice, London, the case of the Long Acre Motor-Car Company v. Browning has been heard by Mr. Justice Ridley and a special jury. It was an action by the plaintiffs, who are the sole agents in London for the Wolseley Motor-Car Company, of Birmingham, to recover a sum of £50, balance of the price of a motor-car. The defendant denied his indebtedness. It appeared from Mr. Acland's statement of the plaintiff's case that in December, 1901, the defendant, Mr. Thomas Browning, who resides in Kent, went to the Wolseley Car Company at Birmingham with the object of purchasing one of their motor-cars, but they could not promise delivery before July or August in the following year. They, however, referred him to their London agents, the plaintiffs. He wrote to the Wolseley Company pressing the matter upon them, and they replied that they might be able to deliver the car about the first week in May. Defendant, after some demur, agreed to accept the car, the list price of which was £380, and to pay a premium of £50 for early delivery, which, according to his interpretation of the agreement, meant delivery the first week in May, 1902. Defendant paid £50 deposit, and a subsequent instalment of £93, but as the car was not delivered until the 29th July, he refused to pay any more money till the action was commenced, and he then paid the balance into court except the £50 which he had agreed to pay for early delivery, and the action had to proceed to recover that amount, to which the learned counsel contended the plaintiffs were entitled, the delay having occurred through an incident over which they had no control—namely, a strike of the men at the Birmingham works. The jury found for the defendant, for whom judgment was entered with costs.

MR. MINTON JAFFRAY, son of the late Sir John Jaffray, founder of the "Birmingham Post," was involved in a motor-car accident at Monte Carlo the other day, owing to his automobile running into a carriage and pair at a sharp curve on a hilly road just outside the town.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.
